> The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no `JOIN`, `ORDER BY`, `GROUP BY`, and so on.

`DBMS_RLS` also provides the interface to drop or enable security policies. For example, you can drop or enable the `EMP_POLICY` with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

152.2 DBMS_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

152.3 DBMS_RLS Constants

The `DBMS_RLS` package includes constants that can be used for specifying parameter values.

Table 152-1 DBMS_RLS Constants

Constant	Type	Value	Description
`ADD_ATTRIBUTE_ASSOCIATION`	`BINARY_INTEGER`	1	Used with `DBMS_RLS.ALTER_POLICY` and `DBMS_RLS_ALTER_GROUPED_POLICY`: adds the specified namespace and attribute to the policy or grouped policy
`REMOVE_ATTRIBUTE_ASSOCIATION`	`BINARY_INTEGER`	2	Used with `DBMS_RLS.ALTER_POLICY` and `DBMS_RLS.ALTER_GROUPED_POLICY`: removes the specified namespace and attribute to the policy or grouped policy.

152.4 DBMS_RLS Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from V$VPD_POLICIES.

A synonym can reference only a view or a table.

152.5 DBMS_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as object_schema, object_name, and policy_name, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

152.6 Summary of DBMS_RLS Subprograms

This table lists and briefly describes the subprograms available in DBMS_RLS.

Table 152-2 DBMS_RLS Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure	Adds a policy associated with a policy group
ADD_POLICY Procedure	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure	Adds the context for the active application
ALTER_POLICY Procedure	Associates an application context attribute with VPD policies
ALTER_GROUPED_POLICY Procedure	Adds application context related changes
CREATE_POLICY_GROUP Procedure	Creates a policy group
DELETE_POLICY_GROUP Procedure	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure	Drops a policy associated with a policy group
DROP_POLICY Procedure	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure	Reparses the SQL statements associated with a refreshed policy

Table 152-2 (Cont.) DBMS_RLS Package Subprograms

Subprogram	Description
REFRESH_POLICY Procedure	Causes all the cached statements associated with the policy to be reparsed

152.6.1 ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY(
   object_schema            IN  VARCHAR2        DEFAULT NULL,
   object_name              IN  VARCHAR2,
   policy_group             IN  VARCHAR2        DEFAULT 'SYS_DEFAULT',
   policy_name              IN  VARCHAR2,
   function_schema          IN  VARCHAR2        DEFAULT NULL,
   policy_function          IN  VARCHAR2,
   statement_types          IN  VARCHAR2        DEFAULT NULL,
   update_check             IN  BOOLEAN         DEFAULT FALSE,
   enable                   IN  BOOLEAN         DEFAULT TRUE,
   static_policy            IN  BOOLEAN         DEFAULT FALSE,
   policy_type              IN  BINARY_INTEGER  DEFAULT NULL,
   long_predicate           IN  BOOLEAN         DEFAULT FALSE,
   sec_relevant_cols        IN  VARCHAR2,
   sec_relevant_cols_opt    IN  BINARY_INTEGER  DEFAULT NULL,
   namespace                IN  VARCHAR2        DEFAULT NULL,
   attribute                IN  VARCHAR2        DEFAULT NULL);
```

Parameters

Table 152-3 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is added
`policy_group`	Name of the policy group to which the policy belongs
`policy_name`	Name of the policy; must be unique for the same table or view
`function_schema`	Schema owning the policy function. If no `function_schema` is specified or is `NULL`, then the current schema is used.
`policy_function`	Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
`statement_types`	Statement types to which the policy applies. It can be any combination of `INDEX`, `SELECT`, `UPDATE`, or `DELETE`. The default is to apply to all of these types except `INSERT` and `INDEX`.

Table 152-3 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE. The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	Default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 152-5. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
namespace	Name which determines the application context namespace
attribute	Attribute which determines the application context attribute name

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the CREATE_POLICY_GROUP Procedure.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.

152.6.2 ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

> **See Also:**
>
> Operational Notes

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
   object_schema            IN  VARCHAR2       DEFAULT NULL,
   object_name              IN  VARCHAR2,
   policy_name              IN  VARCHAR2,
   function_schema          IN  VARCHAR2       DEFAULT NULL,
   policy_function          IN  VARCHAR2,
   statement_types          IN  VARCHAR2       DEFAULT NULL,
   update_check             IN  BOOLEAN        DEFAULT FALSE,
   enable                   IN  BOOLEAN        DEFAULT TRUE,
   static_policy            IN  BOOLEAN        DEFAULT FALSE,
   policy_type              IN  BINARY_INTEGER DEFAULT NULL,
   long_predicate           IN  BOOLEAN        DEFAULT FALSE,
   sec_relevant_cols        IN  VARCHAR2       DEFAULT NULL,
   sec_relevant_cols_opt    IN  BINARY_INTEGER DEFAULT NULL,
   namespace                IN  VARCHAR2       DEFAULT NULL,
   attribute                IN  VARCHAR2       DEFAULT NULL);
```

Parameters

Table 152-4 ADD_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of table, view, or synonym to which the policy is added.
`policy_name`	Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.
`function_schema`	Schema owning the policy function. If no `function_schema` is specified or is `NULL`, then the current schema is used.
`policy_function`	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.

Table 152-4 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX .
update_check	Optional argument for the INSERT or UPDATE statement type. The default is FALSE. If you plan to use the INSERT statement type, then you must set update_check to TRUE. Otherwise, an ORA-28104 input value for string is not valid error is generated. The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privileged user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 152-5. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See Usage Notes for restrictions and additional information about this option.
namespace	Name which determines the application context namespace
attribute	Attribute which determines the application context attribute name

Table 152-5 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

> **See Also:**
>
> The *Oracle Database Development Guide* has more details about the RESTRICT_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.

- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

  ```
  "select c1, c2, ... from tab tab where <predicate>"
  ```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with `sec_relevant_cols_opt => dbms_rls.ALL_ROWS`) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as `NULL`. The restrictions for this option are as follows:
  - Only applies to `SELECT` statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
  - If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

    ```
    SELECT * FROM employees
    WHERE salary = 10
    ```

    This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.
- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- The maximum number of policies that can be created for a single object is 255.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
   DBMS_RLS.ADD_POLICY(
      object_schema      => 'hr',
      object_name        => 'employee',
      policy_name        => 'hr_policy',
      function_schema    => 'hr',
      policy_function    => 'hrfun',
      statement_types    => 'select,index',
      policy_type        => DBMS_RLS.CONTEXT_SENSITIVE,
      sec_relevant_cols  => 'salary,birthdate,ssn',
      namespace          => 'empno_ctx',
      attribute          => 'emp_id');
END;
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
   DBMS_RLS.ADD_POLICY(
      object_schema      => 'hr',
      object_name        => 'employee',
      policy_name        => 'hosting_policy',
      function_schema    => 'hr',
      policy_function    => 'subfun',
      policy_type        => dbms_rls.SHARED_STATIC);
END;
```

152.6.3 ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   namespace       IN VARCHAR2,
   attribute       IN VARCHAR2);
```

Parameters

Table 152-6 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is added.
`namespace`	Name which determines the application context namespace
`attribute`	Attribute which determines the application context attribute name

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `HR.EMPLOYEES` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS'
, 'HR.ACCESS');
```

152.6.4 ALTER_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

Syntax

```
DBMS_RLS.ALTER_POLICY (
   object_schema    IN VARCHAR2 DEFAULT NULL,
   object_name      IN VARCHAR2,
   policy_name      IN VARCHAR2,
   alter_option     IN NUMBER,
   namespace        IN VARCHAR2 DEFAULT NULL,
   attribute        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-7 ALTER_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is added
`policy_name`	Name of the policy, unique for the same table or view
`alter_option`	Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy
`namespace`	Name which determines the application context namespace
`attribute`	Attribute which determines the application context attribute name

Usage Notes

Note the following:

- This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for `DYNAMIC`, `STATIC` or `SHARED_STATIC` policies will result in an error. If `namespace` is specified, `attribute` should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of `ALTER_POLICY` which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY(
   'hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
```

152.6.5 ALTER_GROUPED_POLICY Procedure

This procedure adds application context related changes.

Syntax

```
DBMS_RLS.ALTER_GROUPED_POLICY (
   object_schema    IN VARCHAR2 DEFAULT NULL,
   object_name      IN VARCHAR2,
   policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,
   policy_name      IN VARCHAR2,
   alter_option     IN NUMBER,
   namespace        IN VARCHAR2 DEFAULT NULL,
   attribute        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-8 ALTER_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.

Table 152-8 (Cont.) ALTER_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_name`	Name of the table, view, or synonym to which the policy is added
`policy_group`	Name of the policy group to which this policy belongs; must be unique for the same table or view
`policy_name`	Name of the policy, unique for the same table or view
`alter_option`	Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy
`namespace`	Name that determines the application context namespace
`attribute`	Attribute determines the application context attribute name

Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for `DYNAMIC`, `STATIC` or `SHARED_STATIC` policies will result in an error. If `namespace` is specified, `attribute` should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of `ALTER_GROUPED_POLICY` which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY (
   'hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
```

152.6.6 CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_group    IN VARCHAR2);
```

Parameters

Table 152-9 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is added
`policy_group`	Name of the policy group that the policy belongs to

Usage Notes

The group must be unique for each table or view.

152.6.7 DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema   IN VARCHAR2 NULL,
  object_name     IN VARCHAR2,
  policy_group    IN VARCHAR2);
```

Parameters

Table 152-10 DELETE_POLICY_GROUP Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is added
`policy_group`	Name of the policy group that the policy belongs to

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

152.6.8 DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   group_name      IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 152-11 DISABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym
`object_name`	Name of the table, view, or synonym with which the policy is associated
`group_name`	Name of the group of the policy
`policy_name`	Name of the policy to be enabled or disabled

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the `ENABLE_GROUPED_POLICY` procedure is executed with "enable" set to `FALSE`.

152.6.9 DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_group    IN VARCHAR2 'SYS_DEFAULT',
   policy_name     IN VARCHAR2);
```

Parameters

Table 152-12 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is dropped
`policy_group`	Name of the policy group to which the policy belongs
`policy_name`	Name of the policy

152.6.10 DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

> **See Also:**
>
> Operational Notes

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 152-13 DROP_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	Name of the table, view, or synonym for which the policy is dropped
`policy_name`	Name of policy to be dropped from table, view, or synonym

Usage Notes

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

152.6.11 DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   namespace       IN VARCHAR2,
   attribute       IN VARCHAR2);
```

Parameters

Table 152-14 DROP_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym to which the policy is dropped
`namespace`	Namespace of the driving context
`attribute`	Attribute of the driving context

152.6.12 ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   group_name      IN VARCHAR2,
   policy_name     IN VARCHAR2,
   enable          IN BOOLEAN TRUE);
```

Parameters

Table 152-15 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym with which the policy is associated
`group_name`	Name of the group of the policy

Table 152-15 (Cont.) ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the policy to be enabled or disabled
enable	TRUE enables the policy; FALSE disables the policy

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

152.6.13 ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

> **See Also:**
>
> Operational Notes

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2,
   policy_name   IN VARCHAR2,
   enable        IN BOOLEAN TRUE);
```

Parameters

Table 152-16 ENABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of table, view, or synonym with which the policy is associated
policy_name	Name of policy to be enabled or disabled
enable	TRUE to enable the policy, FALSE to disable the policy

152.6.14 REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2 NULL,
   group_name      IN VARCHAR2 NULL,
   policy_name     IN VARCHAR2 NULL);
```

Parameters

Table 152-17 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of the table, view, or synonym with which the policy is associated
`group_name`	Name of the group of the policy
`policy_name`	Name of the policy

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

152.6.15 REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

> **See Also:**
>
> Operational Notes

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2 NULL,
   policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 152-18 REFRESH_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified or is `NULL`, then the current schema is used.
`object_name`	Name of table, view, or synonym with which the policy is associated
`policy_name`	Name of policy to be refreshed

Usage Notes

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

153
DBMS_ROLLING

The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option, and can be used for database version upgrades starting with the first patchset of Oracle Database 12*c*.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12*c* Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing XMLType stored as CLOB to XMLtype stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_ROLLING Subprograms

> **See Also:**
>
> - *Oracle Data Guard Concepts and Administration* for information about using DBMS_ROLLING to perform a rolling upgrade

153.1 DBMS_ROLLING Overview

The DBMS_ROLLING PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion, including a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)

The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle

Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the DBMS_ROLLING package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the DBMS_ROLLING.INIT_PLAN procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

153.2 DBMS_ROLLING Security Model

The DBMS_ROLLING package is available to users who have been granted the DBA role.

153.3 Summary of DBMS_ROLLING Subprograms

This table lists and briefly describes the DBMS_ROLLING package subprograms.

Table 153-1 DBMS_ROLLING Package Subprograms

Subprogram	Description
INIT_PLAN Procedure	Initializes a rolling operation plan with system-generated default values.
DESTROY_PLAN Procedure	Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation.
BUILD_PLAN Procedure	Validates plan parameters and creates or modifies a rolling operation plan.
SET_PARAMETER Procedure	Modifies a rolling operation parameter.
START_PLAN Procedure	Starts the rolling operation.
SWITCHOVER Procedure	Performs a switchover between the current primary database and the transient logical standby database.
FINISH_PLAN Procedure	Finalizes the rolling operation.
ROLLBACK_PLAN Procedure	Completely rolls back the rolling operation.

153.3.1 INIT_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

Syntax

```
DBMS_ROLLING.INIT_PLAN (
   future_primary   IN VARCHAR2);
```

Parameters

Table 153-2 *INIT_PLAN Procedure Parameters*

Parameter	Description
`future_primary`	`DB_UNIQUE_NAME` of the future primary (also known as the Leading Group Master (LGM))

Exceptions

- `ORA-45400`: operation not permitted on current database
- `ORA-45401`: upgrade plan is already active
- `ORA-45402`: `LOG_ARCHIVE_CONFIG` must contain the `DG_CONFIG` attribute
- `ORA-45403`: database %s must be specified in `DG_CONFIG`
- `ORA-45411`: operation requires additional arguments
- `ORA-65040`: operation not allowed from within a pluggable database

Usage Notes

- This procedure communicates with all databases defined in the `log_archive_config init.ora` parameter and validates that each database is a valid participant in the rolling upgrade. Valid participants other than the primary database must have a database role of either physical standby, DG, or logical standby.
- The designated future primary must be a physical standby or ADG.

153.3.2 DESTROY_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- `ORA-45422`: operation requires existing plan

- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- When a rolling operation is complete, this procedure can be called to completely purge all states related to a rolling operation.
- This procedure must also be called after a ROLLBACK_PLAN to purge the metadata.

153.3.3 BUILD_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the START_PLAN procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the BUILD_PLAN procedure to modify the existing plan. The DBA_ROLLING_EVENTS view will indicate if any invocation of the SET_PARAMETER procedure requires a plan rebuild. Failure to rebuild the plan will result in an ORA-45416 error when attempting to resume the rolling operation.

Syntax

```
DBMS_ROLLING.BUILD_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45403: database %s must be specified in the DG_CONFIG
- ORA-45414: could not connect to a remote database
- ORA-45419: DB_UNIQUE_NAME parameter must be specified
- ORA-45433: failover was detected on an unsupported database
- ORA-45434: multiple failovers of the same type detected
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

153.3.4 SET_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

Starting with Oracle Database 20c, a new parameter called BLOCK_UNSUPPORTED is added to the DBMS_ROLLING.SET_PARAMETER procedure. By default, BLOCK_UNSUPPORTED is set to 1, indicating that operations performed on tables that are unsupported by Transient Logical Standby will be blocked on the primary database. If set to 0, then the DBMS_ROLLING package does not block operations on unsupported tables. Those

tables will not be maintained by Transient Logical Standby, and will diverge from the primary database.

Syntax

```
DBMS_ROLLING.SET_PARAMETER (
   scope             IN VARCHAR2 DEFAULT NULL,
   name              IN NUMBER,
   value             IN VARCHAR2);
```

Parameters

Table 153-3 *SET_PARAMETER Procedure Parameters*

Parameter	Description
scope	Parameter scope. It can either be NULL for global parameters, or the DB_UNIQUE_NAME of a specific database for local parameters.
name	The DBMS_ROLLING constant for a given parameter.
value	New value for the parameter or NULL to revert to a default value.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- Changes to a parameter value may require a call to the DBMS_ROLLING.BUILD_PLAN procedure to modify the existing plan. Users should check the DBA_ROLLING_EVENTS view after setting a parameter to determine if a rebuild is necessary.
- Table 153-4 lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type VARCHAR2.
- The MINVAL and MAXVAL columns in the DBA_ROLLING_PARAMETERS view identify the valid range of values for a parameter. The view does not contain any parameters until the DBMS_ROLLING.INIT_PLAN procedure has been successfully invoked.

Table 153-4 Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
ACTIVE_SESSIONS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce ACTIVE_SESSIONS_WAIT before halting the rolling upgrade. This parameter is only valid if ACTIVE_SESSIONS_WAIT is set to 1.	3600
ACTIVE_SESSIONS_WAIT	Yes	Whether the switchover operation will wait for active sessions to finish. If set to 1, the SWITCHOVER procedure waits for active sessions to compete. If set to 0, the SWITCHOVER procedure kills active sessions to expedite the switchover.	0
BACKUP_CONTROLFILE	Yes	File name of the backup control file that is created during a rolling upgrade.	rolling_change_backup.f
BLOCK_UNSUPPORTED	Yes	This parameter can be set for Rolling Upgrade to Block Unsupported Operations on the source database. Possible values are 0 and 1. • 1: Turns blocking on. This is the default value. • 0: Turns blocking off. Scope is not considered for this parameter.	1
DGBROKER	Yes	Use Data Guard broker for managing apply, recovery, and log archive destinations.	1 if broker is enabled, 0 otherwise.
DICTIONARY_LOAD_TIMEOUT	Yes	The maximum amount of time in seconds to enforce DICTIONARY_LOAD_WAIT before halting the rolling upgrade. This parameter is only valid if DICTIONARY_LOAD_WAIT is set to 1.	3600
DICTIONARY_LOAD_WAIT	Yes	Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the START_PLAN procedure will not return until the dictionary has been completely loaded. If set to 0, then the START_PLAN procedure will only verify that the loading of the dictionary has started.	0
DICTIONARY_PLS_WAIT_INIT	Yes	The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo.	300
DICTIONARY_PLS_WAIT_TIMEOUT	Yes	The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo.	3600
EVENT_RECORDS	Yes	The maximum number of records to permit in DBA_ROLLING_EVENTS	10000
FAILOVER	Yes	Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to BUILD_PLAN.	0
GRP_PREFIX	Yes	Execution of procedures in DBMS_ROLLING results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix.	DBMSRU

Table 153-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
IGNORE_BUILD_WARNINGS	Yes	Ignore warnings which would otherwise raise exceptions during execution of the BUILD_PLAN procedure.	1
IGNORE_LAST_ERROR	Yes	Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade.	0
LAD_ENABLED_TIMEOUT	Yes	The maximum time in seconds to wait for a recently enabled log archive destination to reach a VALID state.	600
LOG_LEVEL	Yes	Logging level for the DBS_ROLLING PL/SQL package. A value of INFO results in the logging of errors and relevant non-fatal warnings. A value of FULL results in the logging of all events.	INFO
MEMBER	No	The upgrade group in which the specified database is a member. A value of LEADING indicates that the standby is a member of the leading upgrade group. As such, it is a standby of the Leading Group Master (LGM). The LGM is the database which is converted into the transient logical standby, and which becomes the new primary after the switchover. A value of TRAILING indicates that the standby is a member of the trailing upgrade group. As such, it is a standby of the Trailing Group Master (TGM). The TGM is the original primary database.	LEADING
READY_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the READY_LGM_LAG_WAIT parameter.	600
READY_LGM_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce READY_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if READY_LGM_LAG_WAIT is set to 1.	60
READY_LGM_LAG_WAIT	Yes	Whether the START_PLAN procedure will wait for the apply lag on the leading group master to fall below READY_LGM_LAG_TIME seconds before returning control back to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
SWITCH_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGM_LAG_WAIT parameter.	600
SWITCH_LGM_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce SWITCH_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGM_LAG_WAIT is set to 1.	60
SWITCH_LGM_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group master to fall below SWITCH_LGM_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1
SWITCH_LGS_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGS_LAG_WAIT parameter.	60

Table 153-4 (Cont.) Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

Parameter Name	Global?	Description	Default
SWITCH_LGS_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce SWITCH_LGS_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGS_LAG_WAIT is set to 1.	60
SWITCH_LGS_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group standbys to fall below SWITCH_LGS_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
UPDATED_LGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_LGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_LGS_WAIT is set to 1.	10800
UPDATED_LGS_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the leading group standbys to complete recovery of all upgrade redo before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed	1
UPDATED_TGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_TGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_TGS_WAIT is set to 1.	10800
UPDATED_TGS_WAIT	Yes	Whether the FINISH_PLAN procedure will wait for the trailing group standbys to complete recovery of all upgrade redo before returning control to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1

153.3.5 START_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the START_PLAN procedure is complete, the future_primary parameter in the INIT_PLAN procedure will be converted into a fully configured transient logical standby database.

Syntax

```
DBMS_ROLLING.START_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild

- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- A rolling operation plan must have previously been generated through the BUILD_PLAN procedure.

153.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database and the transient logical standby database.

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

Syntax

```
DBMS_ROLLING.SWITCHOVER ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running

- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.
- Once the future primary has been upgraded, logical apply should be restarted and allowed to catch up with the primary since the primary will have been open for business and generating redo which the standby must now apply. Failing to do so will cause the switchover to take a long time since it will have to apply all of that redo.

153.3.7 FINISH_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary as a physical standby of the new primary by flashing it back to an earlier taken GRP (guaranteed restore point), converting its role to physical standby, and then starting managed recovery which will recover all redo generated by the new primary including upgrade redo and any other redo generated before or after the upgrade.

Syntax

```
DBMS_ROLLING.FINISH_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode

- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

153.3.8 ROLLBACK_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the START_PLAN procedure was invoked.

Syntax

```
DBMS_ROLLING.ROLLBACK_PLAN;
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.

154
DBMS_ROWID

The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

> **Note:**
>
> DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- Security Model
- Types
- Exceptions
- Operational Notes
- Examples
- Summary of DBMS_ROWID Subprograms

154.1 DBMS_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

154.2 DBMS_ROWID Types

There are four DBMS_ROWID types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

Extension and Restriction Type

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

> **Note:**
>
> Extended ROWIDs are only used in Oracle database version 8.X*i* and higher.

Verification Types

Table 154-1 Verification Types

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 154-2 Object Types

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 154-3 Conversion Types

Result	Description
INTERNAL	Convert to/from column of ROWID type
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

154.3 DBMS_ROWID Exceptions

This table describes the Exceptions raised by DBMS_ROWID subprograms.

Table 154-4 Exceptions

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
   pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
   pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

154.4 DBMS_ROWID Operational Notes

These operation notes apply to DBMS_ROWID.

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

> **Note:**
>
> ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

  ```
  SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
     FROM emp
     WHERE ename = 'KING';
  ```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

154.5 DBMS_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no   INTEGER;
  row_id      ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
    WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

154.6 Summary of DBMS_ROWID Subprograms

This table lists the DBMS_ROWID subprograms and briefly describes them.

Table 154-5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function	Returns the block number of a ROWID
ROWID_CREATE Function	Creates a ROWID, for testing only
ROWID_INFO Procedure	Returns the type and components of a ROWID
ROWID_OBJECT Function	Returns the object number of the extended ROWID
ROWID_RELATIVE_FNO Function	Returns the file number of a ROWID
ROWID_ROW_NUMBER Function	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function	Returns the absolute file number associated with the ROWID for a row in a specific table
ROWID_TO_EXTENDED Function	Converts a ROWID from restricted format to extended
ROWID_TO_RESTRICTED Function	Converts an extended ROWID to restricted format
ROWID_TYPE Function	Returns the ROWID type: 0 is restricted, 1 is extended
ROWID_VERIFY Function	Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function

154.6.1 ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input `ROWID`.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
   row_id      IN   ROWID,
   ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted
`ts_type_in`	The type of the tablespace (bigfile/smallfile) to which the row belongs

Examples

The example SQL statement selects the block number from a `ROWID` and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
   FROM some_table
   WHERE key_value = 42);
```

154.6.2 ROWID_CREATE Function

This function lets you create a `ROWID`, given the component parts as parameters.

This is useful for testing `ROWID` operations, because only the Oracle Server can create a valid `ROWID` that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (
   rowid_type    IN NUMBER,
   object_number IN NUMBER,
   relative_fno  IN NUMBER,
   block_number  IN NUMBER,
   row_number    IN NUMBER)
  RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended) Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted)
relative_fno	Relative file number
block_number	Block number in this file
row_number	Returns row number in this block

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

154.6.3 ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
   rowid_in         IN   ROWID,
   rowid_type       OUT  NUMBER,
   object_number    OUT  NUMBER,
   relative_fno     OUT  NUMBER,
   block_number     OUT  NUMBER,
   row_number       OUT  NUMBER);
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended)
object_number	Returns data object number (rowid_object_undefined for restricted)
relative_fno	Returns relative file number
block_number	Returns block number in this file
row_number	Returns row number in this block

> **See Also:**
>
> "ROWID_TYPE Function"

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
   my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

154.6.4 ROWID_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

> **Note:**
>
> The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
   FROM emp
   WHERE empno = 7499;
```

154.6.5 ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
   rowid_id      IN   ROWID,
   ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-10 ROWID_RELATIVE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	Type of the tablespace (bigfile/smallfile) to which the row belongs

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
   file_number    INTEGER;
   rowid_val      ROWID;
BEGIN
   SELECT ROWID INTO rowid_val
     FROM dept
     WHERE loc = 'Boston';
   file_number :=
     dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

154.6.6 ROWID_ROW_NUMBER Function

This function extracts the row number from the `ROWID IN` parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (
   row_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)
   FROM emp
   WHERE ename = 'ALLEN';
```

154.6.7 ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a `ROWID`, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as `IN` parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
   row_id      IN ROWID,
   schema_name IN VARCHAR2,
   object_name IN VARCHAR2)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 154-12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
schema_name	Name of the schema which contains the table
object_name	Table name

Examples

```
DECLARE
   abs_fno        INTEGER;
   rowid_val      CHAR(18);
   object_name    VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
     FROM emp
     WHERE empno = 9999;
     abs_fno := dbms_rowid.rowid_to_absolute_fno(
     rowid_val, 'SCOTT', object_name);
```

> **Note:**
>
> For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

154.6.8 ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
   old_rowid       IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 154-13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted
schema_name	Name of the schema which contains the table (optional)
object_name	Table name (optional).
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
   dbms_rowid.rowid_to_extended (
      rowid_col, 'SCOTT", TABLE_COL, 0);
```

Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.
- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.
- ROWID_TO_EXTENDED cannot be used with partition tables.

> **See Also:**
>
> The ROWID_VERIFY Function has a method to determine if a given ROWID can be converted to the extended format.

154.6.9 ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
   old_rowid       IN ROWID,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

154.6.10 ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 154-15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
   my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

154.6.11 ROWID_VERIFY Function

This function verifies the `ROWID`.

It returns 0 if the input restricted `ROWID` can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

> **Note:**
>
> You can use this function in a `WHERE` clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
   rowid_in        IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 154-16 ROWID_VERIFY Function Parameters

Parameter	Description
`rowid_in`	`ROWID` to be verified
`schema_name`	Name of the schema which contains the table
`object_name`	Table name
`conversion_type`	The following constants are defined: `ROWID_CONVERT_INTERNAL` (:=0) `ROWID_CONVERT_EXTERNAL` (:=1)

Examples

Considering the schema in the example for the `ROWID_TO_EXTENDED` function, you can use the following statement to find bad `ROWID`s prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
   FROM SCOTT.RIDS
   WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

155
DBMS_RULE

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_RULE Subprograms

155.1 DBMS_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

> **See Also:**
>
> - Rule TYPEs for more information about the types used with the DBMS_RULE package
> - DBMS_RULE_ADM

155.2 DBMS_RULE Security Model

PUBLIC is granted EXECUTE privilege on this package.

> **See Also:**
>
> *Oracle Database Security Guide* for more information about user group PUBLIC

155.3 Summary of DBMS_RULE Subprograms

This table lists the DBMS_RULE subprograms and briefly describes them.

Table 155-1 DBMS_RULE Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure	Closes an open iterator

Table 155-1 (Cont.) DBMS_RULE Package Subprograms

Subprogram	Description
EVALUATE Procedure	Evaluates the rules in the specified rule set that use the evaluation context specified
EVALUATE_EXPRESSION Procedure	Evaluates an expression under the logged in user in a session
EVALUATE_EXPRESSION_ITERATOR Procedure	Finds the relevant datapoints and pass `re$value_list` into evaluation interface
EVALUATE_RULE Procedure	Evaluates the condition defined in the Rule
EVALUATE_RULE_ITERATOR Procedure	Finds the relevant datapoints and pass `re$value_list` into evaluation interface
GET_NEXT_HIT Function	Returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator; returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.
IS_FAST Procedure	Returns `TRUE` if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.
GET_NEXT_RESULT Function	Iterates over result from the expression given `result_val_iterator`.

155.3.1 CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
   iterator  IN  BINARY_INTEGER);
```

Parameter

Table 155-2 CLOSE_ITERATOR Procedure Parameter

Parameter	Description
`iterator`	Iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

> **See Also:**
>
> EVALUATE Procedure

155.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE(
   rule_set_name          IN     VARCHAR2,
   evaluation_context     IN     VARCHAR2,
   event_context          IN     SYS.RE$NV_LIST               DEFAULT NULL,
   table_values           IN     SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
   column_values          IN     SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
   variable_values        IN     SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
   attribute_values       IN     SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

  skip_rules           IN   SYS.RE$RULE_NAME_LIST        DEFAULT NULL,

  dop                  IN   NUMBER,

   result_cache           IN     BOOLEAN                      DEFAULT FALSE,
   stop_on_first_hit      IN     BOOLEAN                      DEFAULT FALSE,
   simple_rules_only      IN     BOOLEAN                      DEFAULT FALSE,
   true_rules             OUT    SYS.RE$RULE_HIT_LIST,
   maybe_rules            OUT    SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE(
   rule_set_name          IN     VARCHAR2,
   evaluation_context     IN     VARCHAR2,
   event_context          IN     SYS.RE$NV_LIST               DEFAULT NULL,
   table_values           IN     SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
   column_values          IN     SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
   variable_values        IN     SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
   attribute_values       IN     SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

  skip_rules            IN   SYS.RE$RULE_NAME_LIST        DEFAULT NULL,

  dop                   IN   NUMBER,

   simple_rules_only      IN     BOOLEAN                      DEFAULT FALSE,
   true_rules_iterator    OUT    BINARY_INTEGER,
   maybe_rules_iterator   OUT    BINARY_INTEGER);
```

Parameters

Table 155-3 EVALUATE Procedure Parameters

Parameter	Description
rule_set_name	Name of the rule set in the form [*schema_name.*]*rule_set_name*. For example, to evaluate all of the rules in a rule set named hr_rules in the hr schema, enter hr.hr_rules for this parameter. If the schema is not specified, then the schema of the current user is used.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
event_context	A list of name-value pairs that identify events that cause evaluation
table_values	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
column_values	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.
variable_values	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
attribute_values	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.
stop_on_first_hit	If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule. If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.
simple_rules_only	If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If FALSE, then evaluates all rules.

Table 155-3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
true_rules	Receives the output of the EVALUATE procedure into a varray of RE$RULE_HIT_LIST type. If no rules evaluate to TRUE, then true_rules is empty. If at least one rule evaluates to TRUE and stop_on_first_hit is TRUE, then true_rules contains one rule that evaluates to TRUE. If stop_on_first_hit is FALSE, then true_rules contains all rules that evaluate to TRUE.
maybe_rules	If all rules can be evaluated completely, without requiring any additional data, then maybe_rules is empty. If stop_on_first_hit is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then maybe_rules contains one rule that may evaluate to TRUE. If stop_on_first_hit is FALSE, then maybe_rules contains all rules that may evaluate to TRUE given more data.
true_rules_iterator	Contains the iterator for accessing rules that are TRUE
maybe_rules_iterator	Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL
skip_rules	List of rules to skip within this evaluation.
dop	Degree of parallelism
result_cache	If TRUE, Result Cache will be created. If evalate procedure is called with either true_rules_iterator or maybe_rules_iterator, then result_cache is not enabled.

Usage Notes

> **Note:**
>
> Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for table_values, column_values, variable_values, and attribute_values. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using stop_on_first_hit, if evaluation must stop as soon as the first TRUE rule or the first MAYBE rule (if there are no TRUE rules) is found.

The caller may also specify, using simple_rules_only, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as MAYBE rules.

Partial evaluation is supported. The EVALUATE procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as MAYBE rules, unless they can be determined to be TRUE or FALSE based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as TRUE, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- TRUE rules, which is the list of rules that evaluate to TRUE based on the given data. These rules are returned either in the OUT parameter true_rules, which returns all of the rules that evaluate to TRUE, or in the OUT parameter true_rules_iterator, which returns each rule that evaluates to TRUE one at a time.
- MAYBE rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
  - The rule is not simple enough to be evaluated fast (without SQL) and simple_rules_only is specified as TRUE, or partial data is available.

  Maybe rules are returned either in the OUT parameter maybe_rules, which returns all of the rules that evaluate to MAYBE, or in the OUT parameter maybe_rules_iterator, which returns each rule that evaluates to MAYBE one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to TRUE and MAYBE for the event or an iterator for rules that evaluate to TRUE and MAYBE. A true rules iterator enables the client to fetch each rule that evaluates to TRUE one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to MAYBE one at a time.

If you use an iterator, then you use the GET_NEXT_HIT function in the DBMS_RULE package to retrieve the next rule that evaluates to TRUE or MAYBE from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The CLOSE_ITERATOR procedure in the DBMS_RULE package is run with the iterator specified.
- The iterator returns NULL because no more rules evaluate to TRUE or MAYBE.
- The session in which the iterator is running ends.

To run the DBMS_RULE.EVALUATE procedure, a user must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE_SET privilege on the rule set
- Have EXECUTE_ANY_RULE_SET system privilege
- Be the rule set owner

> **Note:**
>
> The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

> **See Also:**
>
> - Rule TYPEs for more information about the types used with the `DBMS_RULE` package
> - GET_NEXT_HIT Function
> - CLOSE_ITERATOR Procedure

155.3.3 EVALUATE_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION(
   rule_expression         IN         VARCHAR2,
   table_aliases           IN         SYS.RE$TABLE_ALIAS_LIST:= NULL,
   variable_types          IN         SYS.RE$VARIABLE_TYPE_LIST:= NULL,
   table_values            IN         SYS.RE$TABLE_VALUE_LIST:= NULL,
   column_values           IN         SYS.RE$COLUMN_VALUE_LIST:=NULL,
   variable_values         IN         SYS.RE$VARIABLE_VALUE_LIST:=NULL,
   attribute_values        IN         SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,
   cache                   IN         BOOLEAN DEFAULT FALSE,
   result_val              OUT        BOOLEAN);
```

Parameters

Table 155-4 EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
`rule_expression`	Contains an expression string.
`table_alias`	Contains alias of tables referred in the expression string.
`variable_types`	Contains type definitions of variables used in expression.
`table_values`	Contains `ROWID` of table row for expression evaluation.
`column_values`	Contains values of columns referred in the expression.
`variable_values`	Contains values of variables referred in the expression.
`attribute_values`	Contains values of attributes referred in the expression.
`cache`	If `TRUE`, Result Cache will be created.

Table 155-4 (Cont.) EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
result_val	Result of the evaluation.

155.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure

This is an user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass re$value_list into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (re$value_list) element.

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
       rule_expression        IN              varchar2,
       table_aliases          IN              sys.re$table_alias_list:= NULL,
       variable_types         IN              sys.re$variable_type_list:= NULL,
       values                 IN              sys.re$value_list,
       cache                  IN              boolean DEFAULT FALSE,
       result_val_iter_id     OUT             BINARY_INTEGER)
```

Parameters

Table 155-5 EVALUATE_EXPRESSION_ITERATOR Procedure Parameter

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Alias of tables referred in the above expression string.
variable_types	Type definitions of variables used in expression.
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using value.

155.3.5 EVALUATE_RULE Procedure

The Rule Evaluation API expects that CREATE_RULE procedure has been called with an legitimate EVALUATION_CONTEXT prior. This API will evaluate the condition defined in the Rule.

Syntax

```
DBMS_RULE.EVALUATE_RULE(
  rule_name            IN   VARCHAR2,
  event_context        IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values         IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values        IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values      IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values     IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
```

```
  cache               IN   BOOLEAN DEFAULT FALSE,
  result_val          OUT  BOOLEAN);
```

Parameters

Table 155-6 EVALUATE_RULE Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation.
table_values	ROWID of table row for expression evaluation.
column_values	Values of columns referred in the expression
variable_values	Values of variables referred in expression
attribute_values	Values of attributes referred in expression
cache	If TRUE, Result Cache will be created.
result_val	Result of the evaluation

155.3.6 EVALUATE_RULE_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass re$value_list into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (re$value_list) element. User can use DBMS_RULE.GET_NEXT_RESULT procedure to iterate through the result list.

Syntax

```
DBMS_RULE.EVALUATE_RULE_ITERATOR)
  rule_name            IN       VARCHAR2,
  event_context        IN       SYS.RE$NV_LIST DEFAULT NULL,
  values               IN       SYS.RE$VALUE_LIST,
  cache                IN       BOOLEAN DEFAULT FALSE,
  result_val_iter_id   OUT      BINARY_INTEGER);
```

Parameters

Table 155-7 EVALUATE_RULE_ITERATOR Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using values

155.3.7 GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(
   iterator  IN  BINARY_INTEGER)
 RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 155-8 GET_NEXT_HIT Function Parameter

Parameter	Description
iterator	The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

> **Note:**
>
> This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

> **See Also:**
>
> - Rule TYPEs for more information about the types used with the DBMS_RULE package
> - EVALUATE Procedure
> - CLOSE_ITERATOR Procedure

155.3.8 GET_NEXT_RESULT Function

This function iterates over result from the expression given in RESULT_VAL_ITERATOR. It returns the expression at iterator evaluated to TRUE or FALSE.

Syntax

```
DBMS_RULE.GET_NEXT_RESULT (
 result_val_iterator_id    IN   BINARY_INTEGER)
 RETURN  BOOLEAN;
```

Parameter

Table 155-9 GET_NEXT_RESULT Function Parameter

Parameter	Description
result_val_iterator_id	Iterator returned from EVALUATE_EXPRESSION_ITERATOR

155.3.9 IS_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return TRUE if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

Syntax

```
DBMS_RULE.IS_FAST(
   expression            IN       VARCHAR2,
   table_aliases         IN       SYS.RE$TABLE_ALIAS_LIST:= NULL,
   variable_types        IN       SYS.RE$VARIABLE_TYPE_LIST:= NULL,
   result_val            OUT      BOOLEAN);
```

Parameter

Table 155-10 IS_FAST Procedure Parameter

Parameter	Description
expression	Expression to check
table_aliases	Alias of tables referred in the above expression string
variable_types	Type definitions of variables used in expression
result_val	If the expression can be evaluated as fast

156
DBMS_RULE_ADM

The DBMS_RULE_ADM package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_RULE_ADM Subprograms

156.1 DBMS_RULE_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

> **See Also:**
>
> - Rule TYPEs for more information about the types used with the DBMS_RULE_ADM package
> - DBMS_RULE

156.2 DBMS_RULE_ADM Security Model

PUBLIC is granted EXECUTE privilege on this package.

> **See Also:**
>
> *Oracle Database Security Guide* for more information about user group PUBLIC

156.3 Summary of DBMS_RULE_ADM Subprograms

This table lists the DBMS_RULE_ADM subprograms and briefly describes them.

Table 156-1 DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ADD_RULE Procedure	Adds the specified rule to the specified rule set

Table 156-1 (Cont.) DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ALTER_EVALUATION_CONTEXT Procedure	Alters a rule evaluation context
ALTER_RULE Procedure	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure	Creates a rule evaluation context
CREATE_RULE Procedure	Creates a rule with the specified name
CREATE_RULE_SET Procedure	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure	Drops the rule evaluation context with the specified name
DROP_RULE Procedure	Drops the rule with the specified name
DROP_RULE_SET Procedure	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure	Revokes the specified system privilege from the specified user or role

Note:

All subprograms commit unless specified otherwise.

156.3.1 ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
   rule_name           IN  VARCHAR2,
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2   DEFAULT NULL,
   rule_comment        IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 156-2 ADD_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as [*schema_name.*]*rule_name*. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as [*schema_name.*]*rule_set_name*. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE privilege on the rule
- Have EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

156.3.2 ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                    DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                    DEFAULT FALSE);
```

Parameters

Table 156-3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
`evaluation_context_name`	The name of the evaluation context you are altering, specified as `[`*`schema_name`*`.]`*`evaluation_context_name`*. For example, to alter an evaluation context named `dept_eval_context` in the `hr` schema, enter `hr.dept_eval_context` for this parameter. If the schema is not specified, then the current user is the default.
`table_aliases`	If `NULL` and `remove_table_aliases` is `FALSE`, then the procedure retains the existing table aliases. If `NULL` and `remove_table_aliases` is `TRUE`, then the procedure removes the existing table aliases. If non-`NULL`, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
`remove_table_aliases`	If `TRUE` and `table_aliases` is `NULL`, then the procedure removes the existing table aliases for the evaluation context. If `TRUE` and `table_aliases` is non-`NULL`, then the procedure raises an error. If `FALSE`, then the procedure does not remove table aliases.

Table 156-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
variable_types	If NULL and remove_variable_types is FALSE, then the procedure retains the variable types. If NULL and remove_variable_types is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.
remove_variable_types	If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the variable types.
evaluation_function	If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function. If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function. An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See CREATE_EVALUATION_CONTEXT Procedurefor more information about evaluation functions.
remove_evaluation_function	If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation function.
evaluation_context_comment	If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment. If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment. An evaluation context comment is an optional description of the rule evaluation context.

Table 156-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

> **See Also:**
>
> Rule TYPEs for more information about the types used with the DBMS_RULE_ADM package

156.3.3 ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
   rule_name                 IN  VARCHAR2,
   condition                 IN  VARCHAR2        DEFAULT NULL,
   evaluation_context        IN  VARCHAR2        DEFAULT NULL,
   remove_evaluation_context IN  BOOLEAN         DEFAULT FALSE,
   action_context            IN  SYS.RE$NV_LIST  DEFAULT NULL,
   remove_action_context     IN  BOOLEAN         DEFAULT FALSE,
   rule_comment              IN  VARCHAR2        DEFAULT NULL,
   remove_rule_comment       IN  BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 156-4 ALTER_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as [*schema_name*.]*rule_name*. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [*schema_name*.]*evaluation_context_name*. If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.
remove_rule_comment	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule

- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:**
>
> Rule TYPEs for more information about the types used with the DBMS_RULE_ADM package

156.3.4 CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

Table 156-5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as [*schema_name.*]*evaluation_context_name*. For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context

Table 156-5 (Cont.) CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "Usage Notes" for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

> **See Also:**
>
> Rule TYPEs for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name       IN   VARCHAR2,
  evaluation_context  IN   VARCHAR2,
  event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values       IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit   IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only   IN   BOOLEAN                      DEFAULT FALSE,
  true_rules          OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules         OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

> **Note:**
>
> Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- DBMS_RULE_ADM.EVALUATION_SUCCESS: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation

obtained by the evaluation function to the rules engine client using the DBMS_RULE.EVALUATE procedure.

- DBMS_RULE_ADM.EVALUATION_CONTINUE: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- DBMS_RULE_ADM.EVALUATION_FAILURE: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

156.3.5 CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
   rule_name           IN  VARCHAR2,
   condition           IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2        DEFAULT NULL,
   action_context      IN  SYS.RE$NV_LIST  DEFAULT NULL,
   rule_comment        IN  VARCHAR2        DEFAULT NULL);
```

Parameters

Table 156-6 CREATE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are creating, specified as [*schema_name.*]*rule_name*. For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: `department_id = 30` Ensure that the proper case is used for text in rule conditions. **Note:** Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [*schema_name.*]*evaluation_context_name*, which is associated with the rule. If the schema is not specified, then the current user is the default. If evaluation_context is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:**
>
> Rule TYPEs for more information about the types used with the DBMS_RULE_ADM package

156.3.6 CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2  DEFAULT NULL,
   rule_set_comment    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 156-7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are creating, specified as [*schema_name.*]*rule_set_name*. For example, to create a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An optional evaluation context name in the form [*schema_name.*]*evaluation_context_name*, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
rule_set_comment	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have CREATE_RULE_SET_OBJ system privilege
- Have CREATE_ANY_RULE_SET system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

156.3.7 DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
   evaluation_context_name  IN  VARCHAR2,
   force                    IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are dropping, specified as [*schema_name*.]*evaluation_context_name*. For example, to drop an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule evaluation context from all rules and rule sets that use it. If FALSE and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If FALSE and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. **Caution:** Setting force to TRUE can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the ADD_RULE procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have DROP_ANY_EVALUATION_CONTEXT system privilege

156.3.8 DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE(
   rule_name  IN  VARCHAR2,
   force      IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-9 DROP_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [*schema_name.*]*rule_name*. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule from all rule sets that contain it. If FALSE and no rule sets contain the rule, then the procedure drops the rule. If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

> **Note:**
>
> – To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
>
> – The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

156.3.9 DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
   rule_set_name  IN  VARCHAR2,
   delete_rules   IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-10 DROP_RULE_SET Procedure Parameters

Parameter	Description
`rule_set_name`	The name of the rule set you are dropping, specified as `[schema_name.]rule_set_name`. For example, to drop a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default.
`delete_rules`	If `TRUE`, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If `FALSE`, then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `DROP_ANY_RULE_SET` system privilege
- Be the owner of the rule set

> **Note:**
>
> The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

156.3.10 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   object_name   IN  VARCHAR2,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" for the available object privileges.

Table 156-11 (Cont.) GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [*schema_name*.]*object_name*. For example, to grant the privilege on a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 156-12 lists the object privileges.

Table 156-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee      => 'hr',
    grant_option => FALSE);
END;
/
```

156.3.11 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

Table 156-14 lists the system privileges.

Table 156-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema

Table 156-14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee      => 'strmadmin',
    grant_option => FALSE);
END;
/
```

156.3.12 REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
   rule_name                IN  VARCHAR2,
   rule_set_name            IN  VARCHAR2,
   evaluation_context       IN  VARCHAR2  DEFAULT NULL,
   all_evaluation_contexts  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 156-15 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are removing from the rule set, specified as [*schema_name.*]*rule_name*. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.

Table 156-15 (Cont.) REMOVE_RULE Procedure Parameters

Parameter	Description
`rule_set_name`	The name of the rule set from which you are removing the rule, specified as `[schema_name.]rule_set_name`. For example, to remove the rule from a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default.
`evaluation_context_name`	The name of the evaluation context associated with the rule you are removing, specified as `[schema_name.]evaluation_context_name`. For example, to specify an evaluation context named `dept_eval_context` in the `hr` schema, enter `hr.dept_eval_context` for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the `ADD_RULE` procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify `NULL` if you did not specify an evaluation context when you added the rule to the rule set. If you specify `NULL` and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
`all_evaluation_contexts`	If `TRUE`, then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If `FALSE`, then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

> **Note:**
>
> This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

156.3.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
   privilege    IN  BINARY_INTEGER,
   object_name  IN  VARCHAR2,
   revokee      IN  VARCHAR2);
```

Parameters

Table 156-16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege on the object to revoke from the revokee. See GRANT_OBJECT_PRIVILEGE Procedure for a list of the object privileges.
`object_name`	The name of the object for which you are revoking the privilege from the revokee, specified as `[schema_name.]object_name`. For example, to revoke an object privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

156.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
   privilege  IN  BINARY_INTEGER,
   revokee    IN  VARCHAR2);
```

Parameters

Table 156-17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to revoke from the revokee. See GRANT_SYSTEM_PRIVILEGE Procedure for a list of the system privileges.
`revokee`	The name of the user or role from which the privilege is revoked

157
DBMS_SCHEDULER

The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- Deprecated Subprograms
- Security Model
- Rules and Limits
- Operational Notes
- Data Structures
- Summary of DBMS_SCHEDULER Subprograms

> **See Also:**
>
> *Oracle Database Administrator's Guide* for more information regarding how to use DBMS_SCHEDULER

157.1 DBMS_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with Oracle Database 12*c* Release 1 (12.1):

- CREATE_CREDENTIAL Procedure
- DROP_CREDENTIAL Procedure

157.2 DBMS_SCHEDULER Security Model

The DBMS_SCHEDULER package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

157.3 DBMS_SCHEDULER Rules and Limits

These rules apply when using the DBMS_SCHEDULER package.

- Only SYS can perform actions on objects in the SYS schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

157.4 DBMS_SCHEDULER Operational Notes

The Scheduler uses a rich **calendaring syntax** to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, * means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause][";" periods_clause]
[";" byperiod_clause]

frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
   "HOURLY" | "MINUTELY" | "SECONDLY"

dur_weeks = numofweeks "W"
dur_days = numofdays "D"
numofweeks = 1 through 53
numofdays = 1 through 376
minus = "-"

combined_schedule = schedule_list
```

Table 157-1 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.

Table 157-1 (Cont.) Values for repeat_interval

Name	Description
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.
BYWEEKNO	This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY;BYWEEKNO=53;BYMONTH=1".
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows: BYDATE=0115,0315,0615,0915,1215,20060115 The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10: BYDATE=0110+SPAN:5D The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of *n* days or weeks centered around the supplied date. If *n* is an even number, it is adjusted up to the next odd number. Offsets adjust the supplied date by adding or subtracting *n* days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.

Table 157-1 (Cont.) Values for repeat_interval

Name	Description
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: `FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1` Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.
EXCLUDE	This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.

Table 157-1 (Cont.) Values for repeat_interval

Name	Description

INTERSECT	This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.
	For example, assume that the named schedule `last_sat` indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule `end_qtr` indicates the last day of each quarter in 2005:
	`3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	These calendaring expressions result in the dates that follow:
	`3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	`FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr`
	In this example, the terms `FREQ=MONTHLY; BYMONTHDAY=-1` indicate the last day of each month.
	This clause only works on a full day and therefore cannot be used with `BYHOUR`, `BYMIN`, and `BYSECOND`.

PERIODS	This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the `repeat_interval` expression of the schedule that defines the user-defined frequency. It is mandatory when the `repeat_interval` expression in the main schedule contains a `BYPERIOD` clause. The following example defines the quarters of a fiscal year. `FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4`
BYPERIOD	This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause `BYPERIOD=2,4` in the main schedule selects the 2nd and 4th fiscal quarters.

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules

  For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.

- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

  With this method, the embedded schedules inherit certain attributes from the main schedule.

  – Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.

- Days that are added by the INCLUDE clause follow the hourly/minutely/secondly execution pattern of the main schedule.
- When the INCLUDE clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "Start Dates and Repeat Intervals", later in this section.) For example, a repeat_interval of FREQ=MONTHLY;INCLUDE=HOLIDAY executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the INTERVAL clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User-Defined Frequencies

Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following repeat_interval expression is used in a schedule named fiscal_year that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the fiscal_year schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the BYSETPOS clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the BYPERIOD clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a PERIODS clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the repeat_interval clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the repeat_interval. For example, if the specified frequency is yearly and there is no BYMONTH or BYMONTHDAY clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency

is monthly but there is no BYMONTHDAY clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, BYHOUR, BYMINUTE, and BYSECOND defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the INCLUDE, EXCLUDE, or INTERSECT clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a repeat_interval of FREQ=YEARLY;BYDATE=0701.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an INCLUDE clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the include, exclude, and intersect clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific BY clause do not need to be ordered.
- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

  "FREQ=YEARLY;BYMONTH=JAN,JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21", which means every year on January 21 and July 21.
- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a

BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1,53" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=-1 will give you the last day of the month.

  This is not supported for BY clauses that are fixed in size. In other words, BYMONTH, BYHOUR, BYMINUTE, and BYSECOND are not supported.

- The basic values for the BYDAY clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY, BYDAY=40MON, indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

  Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

  If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.

- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.

- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the start_date argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the start_date. For example specifying the start_date time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the start_date is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.

- When start_date is NULL, the Scheduler determines the time zone for the repeat interval as follows:

1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
   - Issuing an `ALTER SESSION` statement, for example:

     ```
     SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
     ```

   - Setting the `ORA_SDTZ` environment variable.
2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the `DEFAULT_TIMEZONE` Scheduler attribute. For more information, see the SET_SCHEDULER_ATTRIBUTE Procedure.
3. If the `DEFAULT_TIMEZONE` attribute is `NULL`, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled.

BYSETPOS Clause Rules

The following are rules for the `BYSETPOS` clause.

- The `BYSETPOS` clause is the last clause to be evaluated. It is processed after all other `BY` clauses and the `INCLUDE`, `EXCLUDE` and `INTERSECT` clauses have been evaluated.
- The `INTERVAL` clause does not change the size of the period to which the `BYSETPOS` clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which `BYSETPOS` is applied is generated from a month, not a quarter. The only impact of the `INTERVAL` clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

  ```
  FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
  ```

  provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.
- To get consistent results, the set to which `BYSETPOS` is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

  ```
  FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
  ```

  on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

  ```
  freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
  ```

  then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
     exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 157-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
 dbms_scheduler.create_schedule('year_start', repeat_interval=>
       'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
 dbms_scheduler.create_schedule('retail_fiscal_year',
        to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
         'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
 dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
    BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

157.5 DBMS_SCHEDULER Data Structures

The DBMS_SCHEDULER package defines OBJECT types and TABLE types.

OBJECT Types

- JOBARG Object Type
- JOB_DEFINITION Object Type
- JOBATTR Object Type
- SCHEDULER$_STEP_TYPE Object Type
- SCHEDULER$_EVENT_INFO Object Type
- SCHEDULER_FILEWATCHER_RESULT Object Type
- SCHEDULER_FILEWATCHER_REQUEST Object Type

TABLE Types

- JOBARG_ARRAY Table Type
- JOB_DEFINITION_ARRAY Table Type
- JOBATTR_ARRAY Table Type
- SCHEDULER$_STEP_TYPE_LIST Table Type

157.5.1 DBMS_SCHEDULER JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
   arg_position         NUMBER,
   arg_text_value       VARCHAR2(4000),
   arg_anydata_value    ANYDATA,
   arg_operation        VARCHAR2(5));
```

Attributes

Table 157-2 JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: • SET • RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Constructs a job argument with an `AnyData` value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN ANYDATA)
   RETURN SELF AS RESULT;
```

Constructs a job argument with a `NULL` value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_reset           IN BOOLEAN DEFAULT FALSE)
   RETURN SELF AS RESULT;
```

Parameters

Table 157-3 JOBARG Constructor Function Parameters

Parameter	Description
`arg_position`	Position of the argument
`arg_value`	Value of the argument
`arg_reset`	If `arg_reset` is `TRUE`, then the argument at that position is reset. Setting `arg_reset` to FALSE (which is the default) will create an argument with a NULL value.

JOBARG_ARRAY Table Type

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

157.5.2 JOBARG_ARRAY Table Type

The `jobarg_array` type is a table of `jobarg`.

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

157.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

This type is used by the CREATE_JOBS procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job_definition IS OBJECT (
  job_name                       VARCHAR2(100),
  job_class                      VARCHAR2(32),
  job_style                      VARCHAR2(11),
  program_name                   VARCHAR2(100),
  job_action                     VARCHAR2(4000),
  job_type                       VARCHAR2(20),
  schedule_name                  VARCHAR2(65),
  repeat_interval                VARCHAR2(4000),
  schedule_limit                 INTERVAL DAY TO SECOND,
  start_date                     TIMESTAMP WITH TIME ZONE,
  end_date                       TIMESTAMP WITH TIME ZONE,
  event_condition                VARCHAR2(4000),
  queue_spec                     VARCHAR2(100),
  number_of_arguments            NUMBER,
  arguments                      SYS.JOBARG_ARRAY,
  job_priority                   NUMBER,
  job_weight                     NUMBER,
  max_run_duration               INTERVAL DAY TO SECOND,
  max_runs                       NUMBER,
  max_failures                   NUMBER,
  logging_level                  NUMBER,
  restartable                    VARCHAR2(5),
  stop_on_window_close           VARCHAR2(5),
  raise_events                   NUMBER,
  comments                       VARCHAR2(240),
  auto_drop                      VARCHAR2(5),
  enabled                        VARCHAR2(5),
  follow_default_timezone        VARCHAR2(5),
  parallel_instances             VARCHAR2(5),
  aq_job                         VARCHAR2(5),
  instance_id                    NUMBER,
  credential_name                VARCHAR2(65),
  destination                    VARCHAR2(4000),
  database_role                  VARCHAR2(20),
  allow_runs_in_restricted_mode  VARCHAR2(5);
  restart_on_recovery            BOOLEAN;
  restart_on_failure             BOOLEAN;)
```

Object Attributes

Table 157-4 provides brief descriptions of the attributes of the JOB_DEFINITION object type. For more complete information about these attributes, see the "CREATE_JOB Procedure" and the "SET_ATTRIBUTE Procedure".

Table 157-4 JOB_DEFINITION Object Types

Attribute	Description
job_name	Name of the job

Table 157-4 (Cont.) JOB_DEFINITION Object Types

Attribute	Description
job_class	Name of the job class
job_style	Style of the job: • REGULAR • LIGHTWEIGHT • IN_MEMORY_RUNTIME • IN_MEMORY_FULL
program_name	Name of the program that the job runs
job_action	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.
job_type	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Maximum delay time between scheduled and actual job start before a job run is canceled
start_date	Start date and time of the job
end_date	End date and time of the job
event_condition	Event condition for event-based jobs
queue_spec	File watcher name or queue specification for event-based jobs
number_of_arguments	Number of job arguments
arguments	Array of job arguments
job priority	Job priority
job_weight	*** Deprecated in Oracle Database 11*g*R2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures tolerated before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (TRUE) or not (FALSE)
stop_on_window_close	Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure.
raise_events	State changes that raise events
comments	Comments on the job
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed

Table 157-4 (Cont.) JOB_DEFINITION Object Types

Attribute	Description
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then an event is discarded if it is raised while the job that handles it is already running,
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.
credential_name	The credential to use for a single destination or the default credential for a group of destinations
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode
restart_on_recovery	If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered. If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.
restart_on_failure	If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED. If set to FALSE (the default), a failed job is immediately marked FAILED.

JOB_DEFINITION Constructor Function

This constructor function constructs a job_definition object.

Syntax

```
constructor function job_definition (
    job_name                IN     VARCHAR2,
```

```
    job_style               IN     VARCHAR2 DEFAULT 'REGULAR',
    program_name            IN     VARCHAR2 DEFAULT NULL,
    job_action              IN     VARCHAR2 DEFAULT NULL,
    job_type                IN     VARCHAR2 DEFAULT NULL,
    schedule_name           IN     VARCHAR2 DEFAULT NULL,
    repeat_interval         IN     VARCHAR2 DEFAULT NULL,
    event_condition         IN     VARCHAR2 DEFAULT NULL,
    queue_spec              IN     VARCHAR2 DEFAULT NULL,
    start_date              IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date                IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments     IN     NATURAL DEFAULT NULL,
    arguments               IN     SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class               IN     VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit          IN     INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority            IN     NATURAL DEFAULT NULL,
    job_weight              IN     NATURAL DEFAULT NULL,
    max_run_duration        IN     INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs                IN     NATURAL DEFAULT NULL,
    max_failures            IN     NATURAL DEFAULT NULL,
    logging_level           IN     NATURALN DEFAULT 64,
    restartable             IN     BOOLEAN DEFAULT FALSE,
    stop_on_window_close    IN     BOOLEAN DEFAULT FALSE,
    raise_events            IN     NATURAL DEFAULT NULL,
    comments                IN     VARCHAR2 DEFAULT NULL,
    auto_drop               IN     BOOLEAN DEFAULT TRUE,
    enabled                 IN     BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN     BOOLEAN DEFAULT FALSE,
    parallel_instances      IN     BOOLEAN DEFAULT FALSE,
    aq_job                  IN     BOOLEAN DEFAULT FALSE,
    instance_id             IN     NATURAL DEFAULT NULL,
    credential_name         IN     VARCHAR2 DEFAULT NULL,
    destination             IN     VARCHAR2 DEFAULT NULL,
    database_role           IN     VARCHAR2 DEFAULT NULL,
    allow_runs_in_restricted_mode IN BOOLEAN DEFAULT FALSE)
    RETURN SELF AS RESULT;
```

JOB_DEFINITION_ARRAY Table Type

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

157.5.4 JOB_DEFINITION_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

157.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
   job_name             VARCHAR2(100),
```

```
   attr_name           VARCHAR2(30),
   char_value          VARCHAR2(4000),
   char_value2         VARCHAR2(4000),
   args_value          JOBARG_ARRAY,
   num_value           NUMBER,
   timestamp_value     TIMESTAMP(6) WITH TIME ZONE,
   interval_value      INTERVAL DAY(2) TO SECOND(6));
```

Attributes

Table 157-5 JOBATTR Object Type Attributes

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2,
   attr_value          IN VARCHAR2,
   attr_value2         IN VARCHAR2 DEFAULT NULL)
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2,
   attr_value          IN [NUMBER, BOOLEAN,
                           TIMESTAMP WITH TIME ZONE,
                           INTERVAL DAY TO SECOND, JOBARG_ARRAY])
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Parameters

Table 157-6 JOBATTR Constructor Function Parameters

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

JOBATTR Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

157.5.6 JOBATTR_ARRAY Table Type

The type jobattr_array is a table of jobattr.

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

157.5.7 SCHEDULER$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a list of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
   step_name  VARCHAR2(32),
   step_type  VARCHAR2(32));
```

Attributes

Table 157-7 SCHEDULER$_STEP_TYPE Object Type Attributes

Attribute	Description
step_name	Name of the step
step_type	State of the step

157.5.8 SCHEDULER$_STEP_TYPE_LIST Table Type

This type is a table of scheduler$_step_type.

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

157.5.9 SCHEDULER$_EVENT_INFO Object Type

This the datatype of the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type         VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg          VARCHAR2(4000),
  event_status       NUMBER,
  log_id             NUMBER,
  run_count          NUMBER,
  failure_count      NUMBER,
  retry_count        NUMBER,
  spare1             NUMBER,
  spare2             NUMBER,
  spare3             VARCHAR2(4000),
  spare4             VARCHAR2(4000),
  spare5             TIMESTAMP WITH TIME ZONE,
  spare6             TIMESTAMP WITH TIME ZONE,
  spare7             RAW(2000),
  spare8             RAW(2000));
```

Attributes

Table 157-8 SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see Table 157-84.
object_owner	Owner of the job that raised the event
object_name	Name of the job that raised the event
event_timestamp	Time at which the event occurred
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.

Table 157-8 (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_status	Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry. If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind. If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE.
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 – spare8	Not currently in use.

157.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination         VARCHAR2(4000),
  directory_path      VARCHAR2(4000),
  actual_file_name    VARCHAR2(4000),
  file_size           NUMBER,
  file_timestamp      TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch    NUMBER,
  matching_requests   SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

Attributes

Table 157-9 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
destination	Destination at which the file was found, expressed as a host name or IP address.
directory_path	Absolute path of directory in which the file was found.
actual_file_name	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.

Table 157-9 (Cont.) SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
file_size	Size of the file that was found, in bytes.
file_timestamp	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
ts_ms_from_epoch	For internal use only.
matching_requests	List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See "SCHEDULER_FILEWATCHER_REQUEST Object Type".

157.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the matching_requests attribute of the SCHEDULER_FILEWATCHER_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner                 VARCHAR2(4000),
  name                  VARCHAR2(4000),
  requested_path_name   VARCHAR2(4000),
  requested_file_name   VARCHAR2(4000),
  credential_owner      VARCHAR2(4000),
  credential_name       VARCHAR2(4000),
  min_file_size         NUMBER,
  steady_state_dur      NUMBER);
```

Attributes

Table 157-10 SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

Attribute	Description
owner	Owner of the matched file watcher.
name	Name of the matched file watcher.
requested_path_name	Value of the directory_path attribute of the matched file watcher.
requested_file_name	Value of the file_name attribute of the matched file watcher.
credential_owner	Owner of the credential referenced by the matched file watcher.
credential_name	Name of the credential referenced by the matched file watcher.
min_file_size	Value of the min_file_size attribute of the matched file watcher.
steady_state_dur	Value of the steady_state_duration attribute of the matched file watcher.

157.6 Summary of DBMS_SCHEDULER Subprograms

This table lists the `DBMS_SCHEDULER` subprograms and briefly describes them.

Table 157-11 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure	Adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
ADD_GROUP_MEMBER Procedure	Adds one or more members to an existing group
ADD_JOB_EMAIL_NOTIFICATION Procedure	Adds e-mail notifications for a job for a list of recipients and a list of job state events
ADD_TO_INCOMPATIBILITY Procedure	Adds jobs or programs to an existing incompatibility definition
ALTER_CHAIN Procedure	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure	Alters specified steps of a running chain
CLOSE_WINDOW Procedure	Closes an open window prematurely
COPY_JOB Procedure	Copies an existing job
CREATE_CHAIN Procedure	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure	Creates a credential
CREATE_DATABASE_DESTINATION Procedure	Creates a database destination for use with remote database jobs
CREATE_EVENT_SCHEDULE Procedure	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_FILE_WATCHER Procedure	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
CREATE_GROUP Procedure	Creates a group
CREATE_INCOMPATIBILITY Procedure	Creates an incompatibility definition
CREATE_JOB Procedure	Creates a single job
CREATE_JOB_CLASS Procedure	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure	Creates multiple jobs
CREATE_PROGRAM Procedure	Creates a program

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
CREATE_RESOURCE Procedure	Specifies resources used by jobs or creates a new resource
CREATE_SCHEDULE Procedure	Creates a schedule
CREATE_WINDOW Procedure	Creates a window, which provides a way to automatically activate different resource plans at different times
DEFINE_ANYDATA_ARGUMENT Procedure	Defines a program argument whose value is of a complex type and must be passed encapsulated in an `AnyData` object
DEFINE_CHAIN_EVENT_STEP Procedure	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: `DEFINE_CHAIN_STEP`.
DEFINE_CHAIN_RULE Procedure	Adds a rule to an existing chain
DEFINE_CHAIN_STEP Procedure	Defines a chain step, which can be a program or another (nested) chain. See also: `DEFINE_CHAIN_EVENT_STEP`.
DEFINE_METADATA_ARGUMENT Procedure	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.
DEFINE_PROGRAM_ARGUMENT Procedure	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure	Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibilty
DROP_AGENT_DESTINATION Procedure	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
DROP_CHAIN Procedure	Drops an existing chain
DROP_CHAIN_RULE Procedure	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure	Drops a chain step
DROP_CREDENTIAL Procedure	Drops a credential
DROP_DATABASE_DESTINATION Procedure	Drops one or more database destinations
DROP_FILE_WATCHER Procedure	Drops one or more file watchers
DROP_GROUP Procedure	Drops one or more groups
DROP_INCOMPATIBILITY Procedure	Drops an existing incompatibility definition

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DROP_JOB Procedure	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure	Drops a job class
DROP_PROGRAM Procedure	Drops a program
DROP_PROGRAM_ARGUMENT Procedure	Drops a program argument
DROP_SCHEDULE Procedure	Drops a schedule
DROP_WINDOW Procedure	Drops a window
ENABLE Procedure	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
END_DETACHED_JOB_RUN Procedure	Ends a running detached job
EVALUATE_CALENDAR_STRING Procedure	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_CHAIN Procedure	Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied
GENERATE_JOB_NAME Function	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named `sally1`, `sally2`, and so on
GET_AGENT_INFO Function	Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected
GET_AGENT_VERSION Function	Returns the version string of a Scheduler agent that is registered with the database and is currently running
GET_ATTRIBUTE Procedure	Retrieves the value of an attribute of an object
GET_FILE Procedure	Retrieves a file from a host
GET_SCHEDULER_ATTRIBUTE Procedure	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure	Purges specific rows from the job and window logs
PUT_FILE Procedure	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure	Unsubscribes a user from the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
REMOVE_FROM_INCOMPATIBILITY Procedure	Removes jobs or programs from an incompatibility definition

Table 157-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
REMOVE_GROUP_MEMBER Procedure	Removes one or more members from a group
REMOVE_JOB_EMAIL_NOTIFICATION Procedure	Removes e-mail notifications for a job
RESET_JOB_ARGUMENT_VALUE Procedure	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedure	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure	Changes an attribute of an object to `NULL`
SET_JOB_ANYDATA_VALUE Procedure	Sets the value of a job argument encapsulated in an `AnyData` object
SET_JOB_ARGUMENT_VALUE Procedure	Sets the value of a job argument
SET_JOB_ATTRIBUTES Procedure	Sets the value of a job attribute
SET_RESOURCE_CONSTRAINT Procedure	Specifies the resources used by jobs
SET_SCHEDULER_ATTRIBUTE Procedure	Sets the value of a Scheduler attribute
STOP_JOB Procedure	Stops a currently running job or all jobs in a job class

157.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-12 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
`subscriber_name`	Name of the Oracle Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If `NULL`, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

157.6.2 ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   member                  IN VARCHAR2);
```

Parameters

Table 157-13 ADD_GROUP_MEMBER Procedure Parameters

Parameter	Description
`group_name`	The name of the group.
`member`	A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members. An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated. The keyword `LOCAL` can be included as a member for database destination or external destination groups. See the "CREATE_GROUP Procedure" for information about this keyword.

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the `ALTER` object privilege on the group
- A user with the `CREATE ANY JOB` system privilege

You must have the `MANAGE SCHEDULER` privilege to add a member to a group of type `WINDOW`.

> **See Also:**
>
> "CREATE_GROUP Procedure"

157.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
    job_name             IN VARCHAR2,
    recipients           IN VARCHAR2,
    sender               IN VARCHAR2 DEFAULT NULL,
    subject              IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
    body                 IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
    events               IN VARCHAR2 DEFAULT 'JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,
                            JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR',
    filter_condition     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-14 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
`job_name`	Name of the job that e-mail notifications are added for. Cannot be `NULL`.
`recipients`	Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be `NULL`.
`sender`	e-mail address to use as the sender address (the From: address) in the e-mail header. If `NULL` or omitted, the e-mail address specified in the Scheduler attribute `email_sender` is used. See *Oracle Database Administrator's Guide* for more information on this Scheduler attribute.
`subject`	The subject to use in the e-mail header. Table 157-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If `subject` is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable: `'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%'`

Table 157-14 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
body	The body of the e-mail message. Table 157-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If body is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable: 'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'
events	Comma-separate list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 157-84 lists the valid events for this parameter. If events is omitted, notifications are sent for the following default events: JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR
filter_condition	Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. filter_condition must be a boolean SQL WHERE clause that may refer to the :event bind variable. This bind variable is automatically bound to an object of type SCHEDULER$_EVENT_INFO that represents the raised event. For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following filter_condition: :event.error_code=600 or :event.error_code=700 See "SCHEDULER$_EVENT_INFO Object Type".

Table 157-15 lists the variables that you can use in the subject and body arguments.

Table 157-15 Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
%job_owner%	Schema in which job was created
%job_name%	Name of the job that e-mail notifications are added for
%job_subname%	Present for event-based jobs with the parallel_instances attribute set and for chain steps
%event_type%	Valid values are listed in Table 157-84
%event_timestamp%	Time at which the event occurred

Table 157-15 (Cont.) Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
%log_id%	Refers to the LOG_ID column in views *_SCHEDULER_JOB_LOG and *_SCHEDULER_JOB_RUN_DETAILS
%error_code%	Number of the error code.
%error_message%	The text of the error message
%run_count%	Run count for the job when the event was raised
%failure_count%	Failure count for the job when the event was raised
%retry_count%	Retry count for the job when the event was raised

Usage Notes

You can call ADD_JOB_EMAIL_NOTIFICATION once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, and JOB_CHAIN_STALLED events to the principle DBA and all senior DBAs, but send a notification for the JOB_OVER_MAX_DUR event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute email_server is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the CREATE ANY JOB system privilege or have the ALTER object privilege on the job.

157.6.4 ADD_TO_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (
   incompatibility_name    IN VARCHAR2,
   object_name             IN VARCHAR2);
```

Parameters

Table 157-16 ADD_TO_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.
object_name	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.

> **See Also:**
>
> Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.5 ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   char_value              IN VARCHAR2);
```

Parameters

Table 157-17 ALTER_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter
`step_name`	The name of the step or a comma-separated list of steps to alter. This cannot be `NULL`.

Table 157-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
attribute	The attribute of the steps to change. Must be one of the following: • 'PAUSE' If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. • 'PAUSED_BEFORE' If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run. If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true. Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps. • 'SKIP' If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED. • 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If set to FALSE (the default), a failed chain step is immediately marked FAILED. • 'RESTART_ON_RECOVERY' If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered. If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues. • 'DESTINATION_NAME' The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default. • 'CREDENTIAL_NAME' The credential to use when running this step. NULL by default.

Table 157-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

Usage Notes

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

157.6.6 ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
   job_name               IN VARCHAR2,
   step_name              IN VARCHAR2,
   attribute              IN VARCHAR2,
   value                  IN {BOOLEAN|VARCHAR2});
```

Parameters

Table 157-18 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain are altered.

Table 157-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute	The attribute of the steps to change. Valid values are: • 'PAUSE' If the PAUSE attribute is set TRUE for a step, then after the step runs, its state changes to PAUSED (and the completed attribute remains false). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to completion (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE is set to TRUE for all steps of this running chain. • 'PAUSE_BEFORE' If set to TRUE for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run. If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true. Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps. If step_name is set to NULL, then PAUSE_BEFORE is set to the specified value for all steps of this running chain.

Table 157-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute CONTINUED	• 'SKIP' If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED. • 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If set to FALSE (the default), a failed chain step is immediately marked FAILED. • 'RESTART_ON_RECOVERY' If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. • 'STATE' This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED *error_code*' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED *error_code*'

Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

When trying to update a step defined with a nested chain, it is necessary to specify the job_name as <SCHEMA>.<JOB_NAME>.<STEP_NAME_IN_TOP_LEVEL_CHAIN> to be able to make reference to the steps inside the subchain.

157.6.7 CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the

one that is in effect outside the window, or in the case of overlapping windows, to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
   window_name             IN VARCHAR2);
```

Parameters

Table 157-19 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute stop_on_window_close is set to TRUE for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type WINDOW as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute stop_on_window_close set to TRUE.

Closing a window requires the MANAGE SCHEDULER privilege.

157.6.8 COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
   old_job                 IN VARCHAR2,
   new_job                 IN VARCHAR2);
```

Parameters

Table 157-20 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the CREATE JOB system privilege if it is in your own schema, otherwise, the CREATE ANY

JOB system privilege). If the old job is not in the your own schema, then you must also have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

157.6.9 CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, myschema.myname).

A chain is always created as disabled and must be enabled with the ENABLE Procedure before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
   chain_name              IN VARCHAR2,
   rule_set_name           IN VARCHAR2 DEFAULT NULL,
   evaluation_interval     IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-21 CREATE_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.
rule_set_name	In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET${N} and the evaluation context created is of the form SCHED_EVCTX${N}
evaluation_interval	If this is NULL, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-NULL value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at NULL if possible. evaluation_interval cannot be less than a minute or greater than a day.
comments	An optional comment describing the purpose of the chain

Usage Notes

To create a chain in your own schema, you must have the CREATE JOB system privilege. To create a chain in a different schema you must have the CREATE ANY JOB system privilege. If you do not provide a rule_set_name, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the privileges required to create these objects. See the DBMS_RULE_ADM.CREATE_RULE_SET and DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedures for more information.

157.6.10 CREATE_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

> **Note:**
>
> This procedure is deprecated with Oracle Database 12*c* Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the CREATE_CREDENTIAL Procedure.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
   credential_name          IN VARCHAR2,
   username                 IN VARCHAR2,
   password                 IN VARCHAR2,
   database_role            IN VARCHAR2 DEFAULT NULL,
   windows_domain           IN VARCHAR2 DEFAULT NULL,
   comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-22 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to NULL. It is converted to uppercase unless enclosed in double quotation marks.
username	The user name for logging into to the host operating system or remote Oracle database. This cannot be set to NULL and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.
password	The password for the user name. This cannot be set to NULL and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.
database_role	The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.
comments	A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

157.6.11 CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
   destination_name        IN VARCHAR2,
   agent                   IN VARCHAR2,
   tns_name                IN VARCHAR2,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-23 CREATE_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be `NULL`. It is converted to uppercase unless enclosed in double quotation marks.
`agent`	The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.
`tns_name`	An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration.The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a *net service name*, which is an alias for a connect descriptor. The alias must be resolved in the tnsnames.ora file on the local computer. The maximum size for `tns_name` is 2000 characters. If `tns_name` is `NULL`, the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the `ORACLE_HOME` and `ORACLE_SID` parameters in the agent configuration file, schagent.conf, located in the agent home directory. See *Oracle Database Net Services Administrator's Guide* for more information on connect identifiers.
`comments`	A text string that describes the database destination. Scheduler does not use this argument.

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

157.6.12 CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
   schedule_name           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2 DEFAULT NULL,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-24 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
`schedule_name`	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
`start_date`	This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
`event_condition`	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with `tab.user_data`. For more information on rules, see the `DBMS_AQADM.ADD_SUBSCRIBER` procedure.
`queue_spec`	This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the **source queue**). If the source queue is a secure queue, the `queue_spec` argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
`end_date`	The date and time after which jobs do not run and windows do not open. An event schedule that has no `end_date` is valid forever. `end_date` must be after the `start_date`. If it is not, then an error is generated when the schedule is created.

Table 157-24 (Cont.) CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

You must have the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

> **See Also:**
>
> "CREATE_FILE_WATCHER Procedure"

157.6.13 CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
   file_watcher_name            IN VARCHAR2,
   directory_path               IN VARCHAR2,
   file_name                    IN VARCHAR2,
   credential_name              IN VARCHAR2,
   destination                  IN VARCHAR2  DEFAULT NULL,
   min_file_size                IN PLS_INTEGER DEFAULT 0,
   steady_state_duration        IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                     IN VARCHAR2 DEFAULT NULL,
   enabled                      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157-25 CREATE_FILE_WATCHER Parameters

Parameter	Description
file_watcher_name	The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.

Table 157-25 (Cont.) CREATE_FILE_WATCHER Parameters

Parameter	Description
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
destination	Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value.
comments	Optional comment.
enabled	If TRUE (the default), the file watcher is enabled.

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

157.6.14 CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
   group_name           IN VARCHAR2,
   group_type           IN VARCHAR2,
   member               IN VARCHAR2 DEFAULT NULL,
   comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-26 CREATE_GROUP Procedure Parameters

Parameter	Description
group_name	The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.
group_type	The type of members in the group. All members must be of the same type. Possible types are: • 'DB_DEST' Database destination: Members are database destinations, for running remote database jobs. • 'EXTERNAL_DEST External destination: Members are external destinations, for running remote external jobs. • 'WINDOW' Members are Scheduler windows. You must have the MANAGE SCHEDULER privilege to create a group of this type. Members in database destination and external destination groups have the following format: [[*schema*.]*credential*@][*schema*.]*destination* where: • *credential* is the name of an existing credential. • *destination* is the name of an existing database destination or external destination. The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential. Members in window groups are window names. Because all Scheduler windows reside in the SYS schema, you do not specify a schema name for windows.
member	Optional comma-separated list of group members. The default is NULL. If NULL, use the ADD_GROUP_MEMBER procedure to add members. You can also use ADD_GROUP_MEMBER to add additional members at a later time. The keyword LOCAL can be used as a member in database destination groups and external destination groups. • In database destination groups, LOCAL represents the source database on which the job is created. It cannot be preceded with a credential. • In external destination groups, LOCAL represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential.
comments	A text string that describes the group. Scheduler does not use this argument.

Usage Notes

Groups reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a group in a schema other than your own, you must have the CREATE ANY JOB privilege. The group name must be unique among all Scheduler objects.

You can grant the SELECT or READ privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the ALTER privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named production_dest1, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME    => 'production_dest1',
    GROUP_TYPE    => 'DB_DEST',
    MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS      => 'All sector1 production machines');
END;
```

157.6.15 CREATE_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

Syntax

```
DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (
   incompatibility_name    IN VARCHAR2,
   object_name             IN VARCHAR2,
   constraint_level        IN VARCHAR2 DEFAULT 'JOB_LEVEL',
   enabled                 IN BOOLEAN DEFAULT TRUE,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-27 CREATE_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.
object_name	One or more (comma-separated) programs or jobs.
constraint_level	One or more (comma-separated) programs or jobs.
enabled	Specifies whether the constraint is initially enabled (true) or not enabled (false).
comments	Optional descriptive comment.

Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB_LEVEL'. For programs, `constraint_level` can be either `'JOB_LEVEL'` or `'PROGRAM_LEVEL'`. When set to the default value `'JOB_LEVEL'`, only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When `constraint_level` is set to `'PROGRAM_LEVEL'`, the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is `'P1,P2,P3'` and `constraint_level` is `'PROGRAM_LEVEL'`, many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to `'JOB_LEVEL'`, then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

> Using Incompatibility Definitionsin *Oracle Database Administrator's Guide*

157.6.16 CREATE_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the SET_ATTRIBUTE Procedure.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   job_type             IN VARCHAR2,
   job_action           IN VARCHAR2,
   number_of_arguments  IN PLS_INTEGER              DEFAULT 0,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL,
   credential_name      IN VARCHAR2                 DEFAULT NULL,
   destination_name     IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   program_name            IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   job_class               IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN               DEFAULT FALSE,
   auto_drop               IN BOOLEAN               DEFAULT TRUE,
   comments                IN VARCHAR2              DEFAULT NULL,
   job_style               IN VARCHAR2              DEFAULT 'REGULAR',
   credential_name         IN VARCHAR2              DEFAULT NULL,
   destination_name        IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   program_name         IN VARCHAR2,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL,
   job_style            IN VARCHAR2                 DEFAULT 'REGULAR',
   credential_name      IN VARCHAR2                 DEFAULT NULL,
   destination_name     IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2          DEFAULT NULL,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   program_name            IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   job_style               IN VARCHAR2          DEFAULT 'REGULAR',
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Parameters

Table 157-28 ***CREATE_JOB Procedure Parameters***

Parameter	Description
job_name	The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" for more information.

Table 157-28 (Cont.) *CREATE_JOB Procedure Parameters*

Parameter	Description
job_type	This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See job_action in the next row for related information. The supported values are: • 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. • 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. • 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. Anydata arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run. • 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0. • 'EXTERNAL_SCRIPT' This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!. • 'SQL_SCRIPT' This specifies that the job is a SQL*Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by the SQL*Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. The job owner must have the CREATE EXTERNAL JOB system privilege. • 'BACKUP_SCRIPT' This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the CREATE EXTERNAL JOB system privilege.

Table 157-28 (Cont.) *CREATE_JOB Procedure Parameters*

Parameter	Description
`job_action`	This attribute specifies the action of the job. If `job_action` is not specified for an inline program, then an error is generated when creating the job. The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action. The following actions are possible: • For a PL/SQL block: The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;`. Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 157-40 for details on available metadata attributes. • For a stored procedure: The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, `job_action_action=>'"Schema"."Procedure"'`. PL/SQL procedures with `INOUT` or `OUT` arguments are not supported as `job_action` when the job or program type is `STORED_PROCEDURE`. • For an executable: The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance. NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported. • For a chain: The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job. • For an external script: The `job_action` must be either the path to an operating system script or an inline operating system script. If the `job_action` is a path to a script, then the script must reside on every computer that the job runs on. The `job_action` may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password. • For a SQL script:

Table 157-28 (Cont.) *CREATE_JOB Procedure Parameters*

Parameter	Description
	The `job_action` must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the `job_action` is a path to a script, then the script must reside on every computer that the job runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session. • For a backup script: The `job_action` is either the path to a RMAN script or an inline RMAN script. If the `program_action` is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.
`number_of_arguments`	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
`program_name`	The name of the program associated with this job. If the program is of type `EXECUTABLE`, the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.
`start_date`	This attribute specifies the first date and time on which this job is scheduled to start. If `start_date` and `repeat_interval` are left null, then the job is scheduled to run as soon as the job is enabled. For repeating jobs that use a calendaring expression to specify the repeat interval, `start_date` is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time. The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.
`event_condition`	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with `tab.user_data`. For more information on rules, see the `DBMS_AQADM.ADD_SUBSCRIBER` procedure.
`queue_spec`	This argument specifies either of the following: • The source queue where events that start this particular job are enqueued. If it is secure, then the `queue_spec` argument is a pair of values of the form *`queue_name, agent name`*. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. • A file watcher name. For more information on this option, see *Oracle Database Administrator's Guide*.
`repeat_interval`	This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions. The expression specified is evaluated to determine the next time the job should run. If `repeat_interval` is not specified, the job runs only once at the specified start date. See "Calendaring Syntax" for further information.
`schedule_name`	The name of the schedule, window, or window group associated with this job.
`job_class`	The class this job is associated with.

Table 157-28 (Cont.) *CREATE_JOB Procedure Parameters*

Parameter	Description
end_date	This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.
job_style	Style of the job being created. This argument can have one of the following values: • 'REGULAR' creates a regular job. This is the default. • 'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain. • 'IN_MEMORY_RUNTIME' creates an in-memory runtime job. These jobs are based on lightweight job structures, so the same rules and restrictions apply; however, they further boost performance by keeping an in-memory cache, so they minimize disk access for pre-run and post-run actions. • 'IN_MEMORY_FULL' creates an in-memory full job. In-memory full jobs require a program and cannot have a schedule or repeat interval. They run automatically when the job is enabled, and after running they are discarded. They keep all the job information in memory and are not backed up on disk, meaning that they are lost when the instance is rebooted. They are designed to run actions that must be performed immediately with the least amount of overhead possible.
credential_name	The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist. For local database jobs, it must be NULL. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See *Oracle Database Administrator's Guide* for information about preferred credentials for local external jobs. See also: "CREATE_CREDENTIAL Procedure"

Table 157-28 (Cont.) *CREATE_JOB Procedure Parameters*

Parameter	Description
destination_name	The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables). This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist. The following applies to this attribute: • If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure. • If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database. • If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "CREATE_GROUP Procedure". destination_name cannot reference a destination group when: • The job type is 'CHAIN' • The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL', If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format: *credential.destination* The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential. You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members. *** destination job attribute is deprecated in Oracle Database 11*g*R2 and superseded by destination_name.
enabled	This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.
auto_drop	This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if: • Its end date (or the end date of the job schedule) has passed. Note that a job with a Window schedule will not be auto-dropped when the window closes, because this is not considered to be the end of the Window. • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. • It is not a repeating job and has run once. A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.

Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The JOB_QUEUE_PROCESSES initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11*g* Release 2, JOB_QUEUE_PROCESSES applies to DBMS_SCHEDULER jobs. Setting this parameter to 0 disables DBMS_SCHEDULER jobs.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedure or the SET_JOB_ANYDATA_VALUE Procedure. Other job attributes, such as job_priority and max_runs, are set with the SET_ATTRIBUTE Procedure.

To create multiple jobs efficiently, use the CREATE_JOBS procedure.

> **Note:**
>
> The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

157.6.17 CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
   job_class_name            IN VARCHAR2,
   resource_consumer_group   IN VARCHAR2 DEFAULT NULL,
   service                   IN VARCHAR2 DEFAULT NULL,
   logging_level             IN PLS_INTEGER
                                DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
   log_history               IN PLS_INTEGER DEFAULT NULL,
   comments                  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-29 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name to assign to the job class. Job classes can only be created in the SYS schema. This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.
resource_consumer_group	This attribute specifies the resource consumer group that his class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class. If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group. If no resource consumer group is specified, job classes are associated with the default resource consumer group. If the specified resource consumer group does not exist when creating the job class, an error occurs.
service	This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service. Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence. If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service. If the specified service does not exist when creating the job class, then an error occurs.
logging_level	This attribute specifies how much information is logged. The possible options are: • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. • DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.

Table 157-29 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
comments	This attribute is for an optional comment about the job class. By default, this attribute is NULL.

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

157.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
   jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-30 CREATE_JOBS Procedure Parameters

Parameter	Description
jobdef_array	The array of job definitions. See "Data Structures" for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.
commit_semantics	The commit semantics. The following types are supported: • STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default. • TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back. • ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size.

Calling `CREATE_JOBS` with a small array size may not be much faster than calling `CREATE_JOB` once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the `destination` attribute of the `job_definition` object cannot reference a destination group.

Examples

See *Oracle Database Administrator's Guide*.

157.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
   program_name             IN VARCHAR2,
   program_type             IN VARCHAR2,
   program_action           IN VARCHAR2,
   number_of_arguments      IN PLS_INTEGER DEFAULT 0,
   enabled                  IN BOOLEAN DEFAULT FALSE,
   comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-31 CREATE_PROGRAM Procedure Parameters

Parameter	Description
`program_name`	The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_type	This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for program_type: • 'PLSQL_BLOCK' This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. • 'STORED_PROCEDURE' This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported. • 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE. • 'EXTERNAL_SCRIPT' project 25230, this bullet and next two This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!. • 'SQL_SCRIPT' This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. • 'BACKUP_SCRIPT' This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
`program_action`	This attribute specifies the action of the program. If `program_action` is not specified, an error is generated. project 25230 last 3 bullets The following actions are possible: • For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;`. Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 157-40 for details on available metadata attributes. If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: `job_name`, `job_owner`, `job_start`, `window_start`, `window_end`. For more information, see the "DEFINE_METADATA_ARGUMENT Procedure". • For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, `program_action=>'"Schema"."Procedure"'.` • For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign ('@') and the job is local, the at sign is replaced with the SID of the current Oracle instance. • For an external script, the action must be either the path to an operating system script or an inline operating system script. If the `program_action` is a path to a script, then the script must reside on every computer that the program runs on. The `program_action` may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points

Table 157-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
	to a credential that contains a valid operating system username and password. • For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the `program_action` is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session. • For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the `program_action` is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.
`number_of_arguments`	This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments. If the `program_type` is `PLSQL_BLOCK`, then this parameter is ignored.
`enabled`	This flag specifies whether the program should be created as enabled or not. If the flag is set to `TRUE`, then validity checks are made and the program is created as `ENABLED` if all the checks be successful. By default, this flag is set to `FALSE`, meaning not created enabled. You can also call the `ENABLE` procedure to enable the program before it can be used.
`comments`	A comment about the program. By default, this attribute is `NULL`.

Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

> **See Also:**
>
> "DEFINE_PROGRAM_ARGUMENT Procedure"

157.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name    IN VARCHAR2,
  units            IN PLS_INTEGER,
  status           IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-32 CREATE_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.
status	The status of the resource. • 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started. • 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource. • 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL. For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.
comments	Descriptive comment about the resource.

Usage Notes

The following example creates a new resource.

```
BEGIN
   DBMS_SCHEDULER.CREATE_RESOURCE(
      resource_name => 'my_resource',
      units => 3,
      state => 'ENFORCE_CONSTRAINTS',
      comments => 'Resource1'
   )
END;
/
```

See Also:

- Creating or Dropping a Resource in *Oracle Database Administrator's Guide*
- SET_RESOURCE_CONSTRAINT Procedure

157.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
   schedule_name          IN VARCHAR2,
   start_date             IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   repeat_interval        IN VARCHAR2,
   end_date               IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-33 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See "Calendaring Syntax" for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying

schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

157.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the SYS schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval         IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-34 CREATE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the SYS schema, so the preface 'SYS' is optional.
resource_plan	This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.

Table 157-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
start_date	This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created. For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.
duration	This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.
schedule_name	This attribute specifies the name of the schedule associated with the window.
repeat_interval	This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See "Calendaring Syntax" for more information. A PL/SQL expression cannot be used to specify the repeat interval for a window. The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.
end_date	This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE. A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever. The end_date must be after the start_date. If it is not, then an error is generated when the window is created.
window_priority	This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the MANAGE SCHEDULER privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the ALTER SYSTEM SET RESOURCE_MANAGER_PLAN statement or the DBMS_RESOURCE_MANAGER.SWITCH_PLAN package procedure. Note that either of these manual methods can also disable resource plan

switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "SWITCH_PLAN Procedure".

157.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN SYS.ANYDATA,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-35 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
`program_name`	The name of the program to be altered. A program with this name must exist.
`argument_position`	The position of the argument as it is passed to the executable. Argument numbers go from one to the `number_of_arguments` specified for the program. This must be unique, so it can replace any argument already defined at this position.
`argument_name`	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure.
`argument_type`	The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
`default_value`	The default value to be assigned to the argument encapsulated within an `AnyData` object. This is optional.
`out_argument`	This parameter is reserved for future use. It must be set to `FALSE`.

Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

> **See Also:**
>
> - "DEFINE_PROGRAM_ARGUMENT Procedure"
> - "SET_JOB_ANYDATA_VALUE Procedure"

157.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_schedule_name     IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);

DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

Parameters

Table 157-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the `queue_spec` parameter, or use a file watcher schedule for the `event_schedule_name` parameter.

> **See Also:**
>
> "DEFINE_CHAIN_STEP Procedure"

157.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form `SCHED_RULE${N}`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   condition               IN VARCHAR2,
   action                  IN VARCHAR2,
   rule_name               IN VARCHAR2 DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-37 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter

Table 157-37 (Cont.) DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
condition	A boolean expression which must evaluate to TRUE for the action to be performed. Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax. • Scheduler Chain Condition Syntax See "Scheduler Chain Condition Syntax" and *Oracle Database Administrator's Guide* for details • SQL WHERE Clause Syntax Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is *:step_name.attribute*. (*step_name* refers to a typed object.) Possible attributes are: completed, state, start_date, end_date, error_code, and duration. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'.
action	The action to be performed when the rule evaluates to TRUE. The action must consist of at least one keyword with an optional value and an optional delay clause. Possible actions include: • [AFTER *delay_interval*] START *step_1*[,*step_2* ...] • STOP *step_1*[,*step_2* ...] • END [{*end_value*|*step_name.error_code*}] At the beginning of the START action, a delay clause can specify a delay interval before performing the action. *delay_interval* is a formatted datetime interval of the form HH:MM:SS. The END action ends the chain with an error code equal to either the supplied end_value or the error code that step_name completes with. The default error code is 0, indicating a successful chain run.
rule_name	The name of the rule being created. If no rule_name is given, one is generated in the form SCHED_RULE$_{N}.
comments	An optional comment describing the rule. This is stored in the rule object created.

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

These boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when
any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

Rule Conditions Using SQL Syntax

```
':step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'
```

```
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval ''5'' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

157.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   program_name            IN VARCHAR2);
```

Parameters

Table 157-38 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter.
`step_name`	The name of the step being defined. If a step already exists with this name, the new step replaces the old one.
`program_name`	The name of a program or chain to run during this step. The chain owner must have `EXECUTE` privileges on this program or chain.

Usage Notes

Defining a chain step requires `ALTER` privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

> **See Also:**
>
> - "ALTER_CHAIN Procedure"
> - "DEFINE_CHAIN_EVENT_STEP Procedure"

157.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name            IN VARCHAR2,
  metadata_attribute      IN VARCHAR2,
  argument_position       IN PLS_INTEGER,
  argument_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-39 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
`program_name`	The name of the program to be altered
`metadata_attribute`	The metadata to be passed. Valid metadata attributes are: '`job_name`', '`job_subname`', '`job_owner`', '`job_start`', '`window_start`', '`window_end`', and '`event_message`'. Table 157-40 describes these attributes in detail.
`argument_position`	The position of the argument as it is passed to the executable. The position cannot be greater than the `number_of_arguments` specified for the program. It must be unique, so it replaces any argument already defined at this position.
`argument_name`	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 157-40 Metadata Attributes

Metadata Attribute	Datatype	Description
`job_name`	VARCHAR2	Name of the currently running job

Table 157-40 (Cont.) Metadata Attributes

Metadata Attribute	Datatype	Description
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See "SCHEDULER_FILEWATCHER_RESULT Object Type".

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

157.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-41 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure.
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses argument_type when deciding what value to assign to the argument. Any valid SQL datatype is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

DEFINE_PROGRAM_ARGUMENT only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- "DEFINE_ANYDATA_ARGUMENT Procedure"
- "SET_JOB_ARGUMENT_VALUE Procedure"

157.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
   name              IN VARCHAR2,
   force             IN BOOLEAN DEFAULT FALSE,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-42 DISABLE Procedure Parameters

Parameter	Description
`name`	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.
`force`	If `TRUE`, objects are disabled even if other objects depend on them. See the usage notes for more information.
`commit_semantics`	The commit semantics. The following types are supported: • `STOP_ON_FIRST_ERROR`: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. • `TRANSACTIONAL`: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when `force` is set to `TRUE`. • `ABSORB_ERRORS`: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view `SCHEDULER_BATCH_ERRORS` for details. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run.If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur.If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime.Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

157.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

> **Note:**
>
> External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
   destination_name        IN VARCHAR2);
```

Parameters

Table 157-43 DROP_AGENT_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	A comma-separated list of external destinations to drop. Because user SYS owns all external destinations, do not prefix them with a schema name. The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped. Cannot be `NULL`.

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

157.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
   chain_name              IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-44 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to drop. Can also be a comma-delimited list of chains.
force	If force is set to FALSE, the chain must not be referenced by any job, otherwise an error will occur. If force is set to TRUE, all jobs pointing to the chain are disabled before the chain is dropped.Running jobs that point to this chain are stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the DBMS_RULE_ADM.DROP_RULE_SET and DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT procedures for more information.

If force is FALSE, no jobs may be using this chain. If force is TRUE, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

157.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   rule_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-45 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If force is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If force is set to FALSE and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

157.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-46 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted.If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

157.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

> **Note:**
>
> This procedure is deprecated with Oracle Database 12*c* Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
   credential_name         IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-47 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
`credential_name`	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to `NULL`.
`force`	If set to `FALSE`, the credential must not be referenced by any job, or an error will occur. If set to `TRUE`, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the `CREATE ANY JOB` system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

157.6.35 DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
   destination_name        IN VARCHAR2);
```

Parameters

Table 157-48 DROP_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be `NULL`.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOB_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

> **See Also:**
>
> CREATE_DATABASE_DESTINATION Procedure

157.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
   file_watcher_name       IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-49 DROP_FILE_WATCHER Procedure Parameters

Parameter	Description
file_watcher_name	The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.
force	If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

> **See Also:**
>
> "CREATE_FILE_WATCHER Procedure"

157.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (
   group_name       IN VARCHAR2,
   force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-50 DROP_GROUP Procedure Parameters

Parameter	Description
`group_name`	A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be `NULL`.
`force`	If `FALSE`, the group must not be referenced by any job, otherwise an error occurs. If `TRUE`, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the `*_SCHEDULER_JOB_DESTS` views.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop a group. You must have the `MANAGE SCHEDULER` privilege to drop a group of type `WINDOW`.

> **See Also:**
>
> "CREATE_FILE_WATCHER Procedure"

157.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (
   incompatibility_name    IN VARCHAR2);
```

Parameters

Table 157-51 DROP_INCOMPATIBILITY Procedure Parameters

Parameter	Description
`incompatibility_name`	The name of the incompatibility definition.

Usage Notes

> **See Also:**
>
> Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
   job_name                IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE,
   defer                   IN BOOLEAN DEFAULT FALSE,
   commit_semantics        IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-52 DROP_JOB Procedure Parameters

Parameter	Description
`job_name`	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
`force`	If `force` is set to `TRUE`, the Scheduler first attempts to stop the running job instances (by issuing the `STOP_JOB` call with the `force` flag set to `false`), and then drops the jobs.
`defer`	If `defer` is set to `TRUE`, the Scheduler allows the running jobs to complete and then drops the jobs.

Table 157-52 (Cont.) DROP_JOB Procedure Parameters

Parameter	Description
commit_semantics	The commit semantics. The following types are supported: • STOP_ON_FIRST_ERROR returns on the first error and previous successful drop operations are committed to disk. This is the default. • TRANSACTIONAL returns on the first error. Everything that happened before that error is rolled back. This type is not supported when force is set to TRUE. • ABSORB_ERRORS tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. Only STOP_ON_FIRST_ERROR is permitted when job classes are included in the job_name list.

Usage Notes

If both force and defer are set to FALSE and a job is running at the time of the call, the attempt to drop that job fails. The entire call to DROP_JOB may then fail, depending on the setting of commit_semantics.

Setting both force and defer to TRUE results in an error.

Dropping a job requires ALTER privileges on the job either as the owner of the job or as a user with the ALTER object privilege on the job or the CREATE ANY JOB system privilege.

157.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
   job_class_name          IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-53 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name of the job class. Can be a comma-delimited list.
force	If force is set to FALSE, a class being dropped must not be referenced by any jobs, otherwise an error occurs. If force is set to TRUE, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped. Running jobs that belong to the job class are not affected.

Usage Notes

Dropping a job class requires the MANAGE SCHEDULER system privilege.

157.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
   program_name            IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-54 DROP_PROGRAM Procedure Parameters

Parameter	Description
program_name	The name of the program to be dropped. Can be a comma-delimited list.
force	If force is set to FALSE, the program must not be referenced by any job, otherwise an error occurs. If force is set to TRUE, all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the DROP_PROGRAM call and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program if you have the CREATE ANY JOB privilege.

157.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 157-55 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_position	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

157.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (
   resource_name  IN VARCHAR2,
   force          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-56 DROP_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource to be dropped. Can be a comma-delimited list.
force	If force is set to FALSE, the resource must not have any existing constraints, otherwise an error occurs. If force is set to TRUE, the resource will be dropped and any constraints defined on this resource will also be dropped.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the resource.

> **See Also:**
>
> Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

157.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (
   schedule_name    IN VARCHAR2,
   force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-57 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If force is set to FALSE, the schedule must not be referenced by any job or window, otherwise an error will occur. If force is set to TRUE, any jobs or windows that use this schedule are disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have ALTER privileges for the schedule or the CREATE ANY JOB privilege.

157.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
   window_name             IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-58 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.

Table 157-58 (Cont.) DROP_WINDOW Procedure Parameters

Parameter	Description
force	If force is set to FALSE, the window must be not be open or referenced by any job, otherwise an error occurs. If force is set to TRUE, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule is allowed to continue, unless the stop_on_window_close flag is set to TRUE for the job. If this is the case, the job is stopped when the window is dropped.

Usage Notes

Dropping a window requires the MANAGE SCHEDULER privilege.

157.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its enabled attribute is set to TRUE. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job RUN_COUNT, FAILURE_COUNT and RETRY_COUNT columns in the *_SCHEDULER_JOBS data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
   name              IN VARCHAR2,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-59 ENABLE Procedure Parameters

Parameter	Description
name	The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.
commit_semantics	The commit semantics. The following types are supported: • STOP_ON_FIRST_ERROR - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default. • TRANSACTIONAL - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. • ABSORB_ERRORS - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Window names must be preceded by SYS.

To run ENABLE for a window or group of type WINDOW, you must have the MANAGE SCHEDULER privilege. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the EXECUTE privilege on the designated credential.

You can use ENABLE with any schema except the SYS schema.

157.6.47 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the detached attribute set to TRUE.

A detached job run does not end until this procedure or the STOP_JOB Procedure is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
   job_name          IN VARCHAR2,
   error_number      IN PLS_INTEGER DEFAULT 0,
   additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-60 END_DETACHED_JOB_RUN Procedure Parameters

Parameter	Description
job_name	The name of the job to end. Must be a detached job that is running.
error_number	If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number.
additional_info	This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run.

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

> **See Also:**
>
> *Oracle Database Administrator's Guide* for information about detached jobs.

157.6.48 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "Operational Notes".

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
   calendar_string    IN  VARCHAR2,
   start_date         IN  TIMESTAMP WITH TIME ZONE,
   return_date_after  IN  TIMESTAMP WITH TIME ZONE,
   next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 157-61 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
calendar_string	The calendar expression to be evaluated. The string must be in the calendaring syntax described in "Operational Notes".

Table 157-61 (Cont.) EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
start_date	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.
return_date_after	The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.
next_run_date	The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date        TIMESTAMP;
return_date_after TIMESTAMP;
next_run_date     TIMESTAMP;
BEGIN
start_date :=
  to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
  DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
    'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
    start_date, return_date_after, next_run_date);
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
```

Usage Notes

No specific Scheduler privileges are required.

157.6.49 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (`RUN_JOB` can be used to start the job.)

If any of the steps of the chain are themselves running chains, another `EVALUATE_RUNNING_CHAIN` is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
   job_name              IN VARCHAR2);
```

Parameters

Table 157-62 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
`job_name`	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running `EVALUATE_RUNNING_CHAIN` on a job requires alter privileges on the job (either as the owner, or as a user with `ALTER` privileges on the job or the `CREATE ANY JOB` system privilege).

Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. `EVALUATE_RUNNING_CHAIN` should be used only under the following circumstances:

- After manual intervention of a running chain with the `ALTER_RUNNING_CHAIN` procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, `EVALUATE_RUNNING_CHAIN` may not be needed if you set the `evaluation_interval` attribute when you created the chain.

157.6.50 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form `{prefix}N` where `N` is a number from a sequence. If no prefix is specified, the generated name will, by default, be `JOB$_1`, `JOB$_2`, `JOB$_3`, and so on. If `'SCOTT'` is specified as the prefix, the name will be `SCOTT1`, `SCOTT2`, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
   prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 157-63 GENERATE_JOB_NAME Function Parameter

Parameter	Description
`prefix`	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to `NULL`, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the `DBMS_SCHEDULER` calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the `GENERATE_JOB_NAME` function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

157.6.51 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
   agent_name        IN VARCHAR2,
   attribute         IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 157-64 GET_AGENT_INFO Function Parameter

Parameter	Description
`agent_name`	The name of an external destination where the agent is running

Table 157-64 (Cont.) GET_AGENT_INFO Function Parameter

Parameter	Description
attribute	Possible Attributes values • VERSION:. Returns the agent version number. Requires the CREATE JOB system privilege. • UPTIME: Returns the time the agent has been up and running. Requires the CREATE JOB system privilege. • NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the CREATE JOB system privilege. • TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the CREATE JOB system privilege. • RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the MANAGE SCHEDULER system privilege. • ALL: Returns all the information the previous options return. It requires the MANAGE SCHEDULER system privilege.

Usage Notes

This function returns the same information as the schagent utility status option. See *Oracle Database Administrator's Guide*.

157.6.52 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. GET_AGENT_VERSION throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
   agent_host        IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 157-65 GET_AGENT_VERSION Function Parameter

Parameter	Description
agent_host	Either the hostname and port on which the agent is running in the form hostname:port or the name of the agent as shown in the destination_name column of the ALL_SCHEDULER_EXTERNAL_DESTS view which lists all Scheduler agents registered with the database.

Usage Notes

This function requires the CREATE EXTERNAL JOB system privilege.

157.6.53 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                       TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                       INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT VARCHAR2,
   value2         OUT VARCHAR2);
```

Parameters

Table 157-66 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values.
value	The existing value of the attribute
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

See the SET_ATTRIBUTE Procedure for tables of attribute values that you can retrieve for the various Scheduler object types.

157.6.54 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedures differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
   source_file                 IN VARCHAR2,
   source_host                 IN VARCHAR2,
   credential_name             IN VARCHAR2,
   file_contents               IN OUT NOCOPY {BLOB|CLOB});

DBMS_SCHEDULER.GET_FILE (
   source_file                 IN VARCHAR2,
   source_host                 IN VARCHAR2,
   credential_name             IN VARCHAR2,
   destination_file_name       IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_permissions     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-67 GET_FILE Procedure Parameters

Parameter	Description
source_file	Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host. If the format of this parameter is *external_log_id*_stdout, then the stdout from the designated external job run is returned. If the format of this parameter is *external_log_id*_stderr, the error text from the designated external job run is returned. You obtain the value of *external_log_id* from the ADDITIONAL_INFO column of the *_SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the external_log_id name/value pair, and then append either "_stdout" or "_stderr" to its value. The external job must have an associated credential. The credential_name parameter of GET_FILE must name the same credential that is used by the job, and the source_host parameter must be the same as the destination attribute of the job.
source_host	If the file is to be retrieved from a remote host, then this parameter must be a valid an external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.) If source_host is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.
credential_name	The name of the credential to use for accessing the file system.
file_contents	The variable into which the file contents is read.
destination_file_name	The file to which the file contents is written.

Table 157-67 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
`destination_directory_object`	The directory object that specifies the path to the destination file, when `destination_file_name` is used. The caller must have the necessary privileges on the directory object.
`destination_permissions`	Reserved for future use

Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

157.6.55 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          OUT VARCHAR2);
```

Parameters

Table 157-68 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
`attribute`	The name of the attribute
`value`	The existing value of the attribute

Usage Notes

To run `GET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE SCHEDULER` privilege.

Table 157-69 lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see Table 157-101 and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 157-69 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
`current_open_window`	Name of the currently open window
`default_timezone`	Default time zone used by the Scheduler for repeat intervals and windows
`email_sender`	The default e-mail address of the sender for job state e-mail notifications

Table 157-69 (Cont.) Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.
log_history	Retention period in days for job and window logs. The range of valid values is 0 through 1000000.
max_job_slave_processes	This Scheduler attribute is not used.

157.6.56 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
   window_name             IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 157-70 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.

Table 157-70 (Cont.) OPEN_WINDOW Procedure Parameters

Parameter	Description
`force`	If `force` is set to `FALSE`, then opening an already open window generates an error. If `force` is set to `TRUE`: You can open a window that is already open. The window stays open for the duration specified in the call, from the time the `OPEN_WINDOW` command was issued. For example: `window1` was created with a duration of four hours. It has how been open for two hours. If, at this point, you reopen `window1` using the `OPEN_WINDOW` call and do not specify a duration, then `window1` stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes. The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

157.6.57 PURGE_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
   log_history             IN PLS_INTEGER  DEFAULT 0,
```

```
   which_log              IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
   job_name               IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 157-71 PURGE_LOG Procedure Parameters

Parameter	Description
log_history	This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.
which_log	This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.
job_name	This specifies which job-specific entries must be purged from the jog log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.

Usage Notes

This procedure requires the MANAGE SCHEDULER privilege.

Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

157.6.58 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```
DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
   file_contents            IN {BLOB|CLOB},
   destination_permissions  IN VARCHAR2 DEFAULT NULL);

DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
```

```
   source_file_name         IN VARCHAR2,
   source_directory_object  IN VARCHAR2,
   destination_permissions  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-72 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The variable from which the file contents is read.
source_file_name	The file from which the file contents is written
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

157.6.59 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-73 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

157.6.60 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
   incompatibility_name    IN VARCHAR2,
   object_name             IN VARCHAR2);
```

Parameters

Table 157-74 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.
object_name	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

> **See Also:**
>
> Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

157.6.61 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   member                  IN VARCHAR2);
```

Parameters

Table 157-75 REMOVE_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member_name	The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

> **See Also:**
>
> "CREATE_GROUP Procedure"

157.6.62 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name             IN VARCHAR2,
    recipients           IN VARCHAR2 DEFAULT NULL,
    events               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-76 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job to remove e-mail notifications for. Cannot be NULL.
recipients	E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.

Table 157-76 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
events	Job state event to remove e-mail notification for. Comma-separate list of job state events.

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If recipients is NULL, e-mail notifications for the specified events are removed for all existing recipients. If events is NULL, notifications for all events are removed for the specified recipients. If both recipients and events are NULL, all e-mail notifications are removed for the job.

For example, if recipients is 'jsmith@example.com,rjones@example.com' and events is 'JOB_FAILED,JOB_BROKEN', then notifications for both the JOB_FAILED and JOB_BROKEN events are removed for both jsmith and rjones. If recipients is NULL, then notifications for both the JOB_FAILED and JOB_BROKEN events are removed for jsmith, rjones, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the CREATE ANY JOB system privilege or ALTER object privilege on the job.

> **See Also:**

> "ADD_JOB_EMAIL_NOTIFICATION Procedure"

157.6.63 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 157-77 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

157.6.64 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no job_name is given, one is generated of the form RUN_CHAIN$_*chainnameN*, where *chainname* is the first 8 characters of the chain name and *N* is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If start_steps is NULL, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name                IN VARCHAR2,
   start_steps               IN VARCHAR2,
   job_name                  IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name               IN VARCHAR2,
```

```
   step_state_list          IN SYS.SCHEDULER$_STEP_TYPE_LIST,
   job_name                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-78 RUN_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to run
job_name	The name of the job to create to run the chain
start_steps	Comma-separated list of the steps to start when the chain starts running
step_state_list	List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of sys.scheduler$_step_type as follows: step_name The name of the stepstep_type 'SUCCEEDED' or 'FAILED *error_number*' where *error_number* is a positive or negative integer.

Usage Notes

Running a chain requires CREATE JOB if the job is being created in the user's schema, or CREATE ANY JOB otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the EXECUTE privilege on the chain or the EXECUTE ANY PROGRAM system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

157.6.65 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call RUN_JOB to run a job according to its schedule. Use RUN_JOB to run a job outside of its normal schedule.

Syntax

```
DBMS_SCHEDULER.RUN_JOB (
   job_name                 IN VARCHAR2,
   use_current_session      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 157-79 RUN_JOB Procedure Parameters

Parameter	Description
job_name	A job name or a comma-separate list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator. If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.
use_current_session	This specifies whether or not the job run should occur in the same session that the procedure was invoked from.The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential. When use_current_session is set to TRUE: • You can test a job and see any possible errors on the command line. • state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated. • RUN_JOB can be run in parallel with a regularly scheduled job run. When use_current_session is set to FALSE: • You need to check the job log to find error information. • All relevant fields in *_scheduler_jobs are updated. • RUN_JOB fails if a regularly scheduled job is running. For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.

Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

  above bug fix 1261887 6.12.11

When use_current_session is TRUE, the call to RUN_JOB blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the RUN_JOB procedure.

Using RUN_JOB with use_current_session=TRUE does not update the job state and the job will not appear in *_SCHEDULER_RUNNING_JOBS views.

above bug fix 19185117 9.15.14

When use_current_session is FALSE, RUN_JOB returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use RUN_JOB in their sessions simultaneously when use_current_session is set to TRUE.

RUN_JOB requires that you own the job or have ALTER privileges on that job. You can also run a job if you have the CREATE ANY JOB privilege.

Example

The following is an example of using RUN_JOB.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME            => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

157.6.66 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
   registration_password   IN VARCHAR2,
   expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

Table 157-80 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
registration_password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.

Table 157-80 (Cont.) SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the MANAGE SCHEDULER system privilege.

By default, max_uses is set to NULL, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

157.6.67 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to NULL, use the SET_ATTRIBUTE_NULL procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN {BOOLEAN|DATE|TIMESTAMP|
                      TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                      INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN VARCHAR2,
   value2         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157-81 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object.
attribute	See Table 157-83 through Table 157-93.

Table 157-81 (Cont.) SET_ATTRIBUTE Procedure Parameters

Parameter	Description
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

Table 157-82 is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

Table 157-82 Attribute Tables for Scheduler Object Types

Scheduler Object Type	Table of Attributes
Job	Table 157-83
Program	Table 157-85
Schedule	Table 157-86
File Watcher	Table 157-87
Job Class	Table 157-88
Window	Table 157-89
Chain	Table 157-90
Database Destination	Table 157-91
External Destination	Table 157-92
Group	Table 157-93
Credential	Table 157-94
Resource	Table 157-95

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.

Job Attribute Values

Table 157-83 lists attribute values for jobs.

> **Note:**
>
> See the CREATE_JOB procedure and the CREATE_JOBS procedure for more complete descriptions of the attributes in this table.

Table 157-83 Job Attribute Values

Name	Description
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default.
auto_drop	This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: • Its end date (or the end date of the schedule) has passed. • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. • It is not a repeating job and has run once. A job is automatically disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.
comments	An optional comment.
connect_credential_name	feature 25230 This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails. Using a connect_credential_name is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script.
credential_name	This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See *Oracle Database Administrator's Guide* for information about preferred credentials for local external jobs.
database_role	This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby. Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.

Table 157-83 (Cont.) Job Attribute Values

Name	Description
destination	***** Deprecated in Oracle Database 11*g* Release 2. Use destination_name instead.** This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format: *hostname*:*port* This attribute is set to NULL by default.
destination_name	The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL. See Table 157-28 for details about this attribute.
end_date	Specifies the date and time after which the job expires and is no longer run. After the end_date, if is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.
event_spec	This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the "CREATE_JOB Procedure".
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone. For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone. If the job start_date is not null, then the time zone for the run date and time for the job is always specified by the time zone of the start_date. If FALSE, the next start date and time for the job is not recomputed when the default_timezone scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone. Summer and winter transitions do not change the default time zone name.
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.

Table 157-83 (Cont.) Job Attribute Values

Name	Description
instance_stickiness	This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to TRUE. If you set instance_stickiness to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, instance_stickiness is ignored and the job is handled as if it were a non-sticky job. If instance_stickiness is set to FALSE, each instance of the job runs on the first instance available. For environments other than Oracle RAC, this attribute is not useful because there is only one instance.
job_action	The action that the job performs, depending on the job_type attribute. For example, if job_type is 'STORED_PROCEDURE', job_action contains the name of the stored procedure.
job_class	The class this job is associated with.
job_priority	This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution. If no job priority is specified when creating a job, the default priority of 3 is assigned to it.
job_type	The type of this job.Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT'. If this is set, program_name must be NULL.
job_weight	*** Deprecated in Oracle Database 11*g*R2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
logging_level	This attribute specifies how much information is logged. The possible options are: DBMS_SCHEDULER.LOGGING_OFF (The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence. DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.

Table 157-83 (Cont.) Job Attribute Values

Name	Description
max_failures	This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views. max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job are started regardless of how many previous instances have failed.
max_run_duration	This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.
max_runs	This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED. max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it repeats forever or until end_date or max_failures is reached.
number_of_arguments	The number of arguments if the program is inlined. If this is set, program_name should be NULL.
parallel_instances	This is a boolean attribute that can be set only for event-based jobs. If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored. If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its *parent job*). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources. The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.
program_name	The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.

Table 157-83 (Cont.) Job Attribute Values

Name	Description
raise_events	This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it. • job_started CONSTANT PLS_INTEGER := 1 • job_succeeded CONSTANT PLS_INTEGER := 2 • job_failed CONSTANT PLS_INTEGER :=4 • job_broken CONSTANT PLS_INTEGER :=8 • job_completed CONSTANT PLS_INTEGER :=16 • job_stopped CONSTANT PLS_INTEGER :=32 • job_sch_lim_reached CONSTANT PLS_INTEGER :=64 • job_disabled CONSTANT PLS_INTEGER :=128 • job_chain_stalled CONSTANT PLS_INTEGER :=256 • job_all_events CONSTANT PLS_INTEGER := 511 • job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped Table 157-84 describes these event types in detail.
repeat_interval	Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" for more information.
restartable	This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job. In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.) Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job. Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries. The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter. Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1. The Scheduler stops retrying a job when: • One of the retries succeeds. • All of its six retries have failed. • The next retry would occur after the next regularly scheduled run of the job. The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.

Table 157-83 (Cont.) Job Attribute Values

Name	Description
schedule_limit	In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m. If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.
schedule_name	The name of a schedule, window, or group of type WINDOW to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.
start_date	The original date and time on which this job started or is scheduled to start. If this is set, schedule_name should be NULL.
stop_on_window_close	This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should stop once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE. By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job continues after the window closes. Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.
store_output	This is a boolean attribute. If set to TRUE, then for job runs that are logged, all job output and error messages are stored in the *_JOB_RUN_DETAILS views. If set to FALSE, then the output and messages are not stored. For new jobs, this is set, by default, to TRUE.

The following event types are valid values for the raise_events attribute in Table 157-83.

Table 157-84 Event Types Raised by the Scheduler

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute
job_chain_stalled	A job running a chain is in the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress is made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its max_runs or end_date

Table 157-84 (Cont.) Event Types Raised by the Scheduler

Event Type	Description
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_failed	The job failed, either due to an error or an abnormal termination.
job_over_max_dur	The job exceeded the maximum run duration specified by its max_run_duration attribute. (Note: you do not need to enable this event with the raise_events job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to STOP_JOB
job_succeeded	The job completed successfully

Program Attribute Values

Table 157-85 lists program attribute values.

> **Note:**
>
> See the "CREATE_PROGRAM Procedure" for more complete descriptions of the attributes in this table.

Table 157-85 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does or give usage details.
detached	If TRUE, the program is a detached program. See *Oracle Database Administrator's Guide* for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, indicated by the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.
program_type	The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

Schedule Attribute Values

Table 157-86 lists schedule attribute values.

> **Note:**
>
> See "CREATE_SCHEDULE Procedure" for more complete descriptions of the attributes in this table.

Table 157-86 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule does not specify any dates.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments to the "CREATE_JOB Procedure".
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. See "Calendaring Syntax" for more information.
start_date	The start or reference date and time used by the calendaring syntax.

File Watcher Attribute Values

Table 157-87 lists file watcher attribute values.

Table 157-87 File Watcher Attribute Values

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL.
min_file_size	Minimum file size in bytes before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used. The lower limit for this attribute is 10 seconds.
comments	Optional comment.

Job Class Attribute Values

Table 157-88 lists job class attribute values.

> **Note:**
>
> See the "CREATE_JOB_CLASS Procedure" for more complete descriptions of the attributes in this table.

Table 157-88 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
logging_level	This attribute specifies how much information is logged. The valid values are: • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.
resource_consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See *Oracle Database Administrator's Guide* for a description of resource consumer groups and the Database Resource Manager.
service	The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.

Window Attribute Values

Table 157-89 lists window attribute values.

> **Note:**
>
> See the "CREATE_WINDOW Procedure" for more complete descriptions of the attributes in this table.

Table 157-89 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window no longer opens. If this is set, schedule_name must be NULL.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See "Calendaring Syntax" for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the force option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL.
window_priority	The priority of the window. Must be either 'LOW' (default) or 'HIGH'.

Chain Attribute Values

Table 157-90 lists chain attribute values.

> **Note:**
>
> See the "CREATE_CHAIN Procedure" for more complete descriptions of the attributes in this table.

Table 157-90 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives) This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.

Table 157-90 (Cont.) Chain Attribute Values

Name	Description
rule_set_name	In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET${N} and the evaluation context created is of the form SCHED_EVCTX${N}

Database Destination Attribute Values

Table 157-91 lists database destination attribute values.

> **Note:**
>
> See the "CREATE_DATABASE_DESTINATION Procedure" for more complete descriptions of the attributes in this table.

Table 157-91 Database Destination Attribute Values

Name	Description
agent	The name of the external destination (also known as agent destination) that is used to connect to the remote database. You can obtain valid external destination names from the view ALL_SCHEDULER_EXTERNAL_DESTS.
connect_info	The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in tnsnames.ora that resolves to the connect descriptor. Note: This corresponds to the tns_name argument of CREATE_DATABASE_DESTINATION.
enabled	If TRUE, the database destination is enabled.
comments	An optional comment about the database destination.

External Destination Attribute Values

Table 157-92 lists external destination attribute values.

> **Note:**
>
> External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 157-92 External Destination Attribute Values

Name	Description
`hostname`	(`GET_ATTRIBUTE` only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
`port`	(`GET_ATTRIBUTE` only) The TCP port number on which the agent listens.
`ip_address`	(`GET_ATTRIBUTE` only) The IP address of the host on which the agent resides.
`enabled`	If `TRUE`, the external destination is enabled.
`comments`	An optional comment about the external destination.

Group Attribute Values

Table 157-93 lists group attribute values.

> **Note:**
>
> See the "CREATE_GROUP Procedure" for more complete descriptions of the attributes in this table.

Table 157-93 Group Attribute Values

Name	Description
`group_type`	(`GET_ATTRIBUTE` only) The group type (either `WINDOW`, `DB_DEST`, or `EXTERNAL_DEST`).
`member_name`	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use `ADD_GROUP_MEMBER`. Note: this attribute corresponds to the `member` argument of `CREATE_GROUP`.
`enabled`	If `TRUE`, the group is enabled.
`comments`	An optional comment about the group.
`number_of_members`	(`GET_ATTRIBUTE` only) The number of members in the group.

Credential Attribute Values

Table 157-94 lists credential attribute values.

> **Note:**
>
> Credential attribute values for the SET_ATTRIBUTE and GET_ATTRIBUTE procedures are deprecated with Oracle Database Release 12*c* Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the attribute parameter in the UPDATE_CREDENTIAL Procedure.

Table 157-94 Credential Attribute Values

Name	Description
username	The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.
password	The password for the user name. Maximum length is 128.
comments	A description of the credential. Maximum length is 240.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.
database_role	The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER.

Resource Attribute Values

Table 157-95 lists resource attribute values.

Table 157-95 Resource Attribute Values

Name	Description
resource_name	The name of the resource
units	The number of units of this resource that the job or program uses.
status	The status of the resource. ENFORCE_CONSTRAINTS. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started. IGNORE_CONSTRAINTS. When set, the scheduler will ignore any constraints on this resource. BLOCKED_ALL_JOBS. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.
comments	Descriptive comment about the resource.

157.6.68 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
   name              IN VARCHAR2,
   attribute         IN VARCHAR2);
```

Parameters

Table 157-96 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

157.6.69 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an AnyData object.

It overrides any default value set for the program argument. NULL is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_ANYDATA_ARGUMENT Procedure

Scheduler does no type checking of the argument at any time.

SET_JOB_ANYDATA_VALUE is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
```

```
   argument_position       IN PLS_INTEGER,
   argument_value          IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN SYS.ANYDATA);
```

Parameters

Table 157-97 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
`job_name`	The name of the job to be altered
`argument_name`	The name of the program argument being set
`argument_position`	The position of the program argument being set
`argument_value`	The new value to be assigned to the program argument, encapsulated in an `AnyData` object

Usage Notes

`SET_JOB_ANYDATA_VALUE` requires that you own the job or have `ALTER` privileges on that job. You can also set a job argument value if you have the `CREATE ANY JOB` privilege.

`SET_JOB_ANYDATA_VALUE` does not apply to lightweight jobs because lightweight jobs cannot take `AnyData` arguments.

> **See Also:**
>
> - "SET_JOB_ARGUMENT_VALUE Procedure"
> - "DEFINE_ANYDATA_ARGUMENT Procedure"

157.6.70 SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_PROGRAM_ARGUMENT Procedure or the DEFINE_METADATA_ARGUMENT Procedure

Scheduler does no type checking of the argument at any time.

`SET_JOB_ARGUMENT_VALUE` is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_value          IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN VARCHAR2);
```

Parameters

Table 157-98 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- "SET_JOB_ANYDATA_VALUE Procedure"
- "DEFINE_PROGRAM_ARGUMENT Procedure"

157.6.71 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
   jobattr_array     IN JOBATTR_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-99 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: • STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default. • TRANSACTIONAL returns on the first error and rolls back everything that happened before that error. • ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

157.6.72 SET_RESOURCE_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
   object_name       IN VARCHAR2,
   resource_name     IN VARCHAR2,
   units             IN NUMBER DEFAULT 1);
```

Parameters

Table 157-100 SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
object_name	The name of a program or a job, or a comma separated list of these objects.
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.

Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to `0`, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting `units` to `0` on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

157.6.73 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

Table 157-101 provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          IN VARCHAR2);
```

Parameters

Table 157-101 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the Scheduler attribute. Possible values are: • 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" for more information. • 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. • 'email_sender': The default e-mail address of the sender of job state e-mail notifications. • 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications. • 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: – NONE: the default, indicating no encryption used – SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection – STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption • 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours. • 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000. • 'max_job_slave_processes': This Scheduler attribute is not used.
value	The new value of the attribute

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

> **See Also:**
>
> *Oracle Database Administrator's Guide* for more detailed descriptions of Scheduler attributes

157.6.74 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
   job_name         IN VARCHAR2
   force            IN BOOLEAN DEFAULT FALSE
   commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 157-102 STOP_JOB Procedure Parameters

Parameter	Description
`job_name`	Name of a job to stop. Can be a comma-separate list of jobs, where each entry can be one of the following: • Job name: the name of an existing job, optionally preceded by a schema name and dot separator. • Job destination ID: a number, obtained from the `JOB_DEST_ID` column of the `*_SCHEDULER_JOB_DESTS` views, that represents the unique combination of a job, a credential, and a destination. • Job class: the name of a job class. Must be preceded by the SYS schema name and a dot separator. If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its `destination_name` attribute, all job instances on all destinations are stopped.

Table 157-102 (Cont.) STOP_JOB Procedure Parameters

Parameter	Description
force	If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler immediately terminates the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege.
commit_semantics	The commit semantics. The following two types are supported: • STOP_ON_FIRST_ERROR: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default. • ABSORB_ERRORS: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the job_name list. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

Example

The following is an example of using STOP_JOB.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB, 984, 1223, SYS.ETL_JOBCLASS');
END;
```

158
DBMS_SERVER_ALERT

The DBMS_SERVER_ALERT package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- Security Model
- Object Types
- Relational Operators
- Supported Metrics
- Summary of DBMS_SERVER_ALERT Subprograms

158.1 DBMS_SERVER_ALERT Security Model

The user needs DBA or IMP_FULL_DATABASE roles to use the DBMS_SERVER_ALERT package.

158.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 158-1 Object Types Defined as Constants

Constant	Description
OBJECT_TYPE_SYSTEM	Metrics collected on the system level for each instance.
OBJECT_TYPE_FILE	Metrics collected on the file level. These are used for AVG_FILE_READ_TIME and AVG_FILE_WRITE_TIME metrics.
OBJECT_TYPE_SERVICE	Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.
OBJECT_TYPE_TABLESPACE	Metrics collected on the tablespace level. **Note**: Dictionary managed tablespaces are not supported.
OBJECT_TYPE_EVENT_CLASS	Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.
OBJECT_TYPE_WRCLIENT	Refers to a group of metrics (WCR_...) used during replay to monitor the replay clients' performance

158.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 158-2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

158.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 158-3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
AVG_FILE_READ_TIME	Average File Read Time	Microseconds
AVG_FILE_WRITE_TIME	Average File Write Time	Microseconds
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses

Table 158-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second

Table 158-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
HARD_PARSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
LOGONS_CURRENT	Current Number of Logons	Number of Logons
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OS_SCHED_CPU_WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction

Table 158-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort

Table 158-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSES_SEC	Total Parses (for each second)	Parses for each Second
TOTAL_PARSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
USER_CALLS_PCT	User Calls (%)	% of all calls
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
WCR_AVG_IO_LAT	Average IO response time (for a WRC client)	Milliseconds
WCR_PCPU	Percentage of replay threads on CPU (for a WRC client)	% of total replay threads
WCR_PIO	Percentage of replay threads doing IOs (for a WRC client)	% of total replay threads

158.5 Summary of DBMS_SERVER_ALERT Subprograms

This table lists the DBMS_SERVER_ALERT subprograms and briefly describes them.

Table 158-4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function	Expands alert messages
GET_THRESHOLD Procedure	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure	Sets the warning and critical thresholds for a specified metric

158.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
   user_language            IN   VARCHAR2,
   message_id               IN   NUMBER,
   argument_1               IN   VARCHAR2,
   argument_2               IN   VARCHAR2,
   argument_3               IN   VARCHAR2,
   argument_4               IN   VARCHAR2,
   argument_5               IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 158-5 *EXPAND_MESSAGE Function Parameters*

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

158.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         OUT  BINARY_INTEGER,
   warning_value            OUT  VARCHAR2,
   critical_operator        OUT  BINARY_INTEGER,
   critical_value           OUT  VARCHAR2,
   observation_period       OUT  BINARY_INTEGER,
   consecutive_occurrences  OUT  BINARY_INTEGER,
```

```
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 158-6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics".
warning_operator	The operator for the compa3ring the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.

158.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         IN   BINARY_INTEGER,
   warning_value            IN   VARCHAR2,
   critical_operator        IN   BINARY_INTEGER,
   critical_value           IN   VARCHAR2,
   observation_period       IN   BINARY_INTEGER,
   consecutive_occurrences  IN   BINARY_INTEGER,
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 158-7 SET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics".
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See "Relational Operators".
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See "Relational Operators".
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See "Object Types".
object_name	The name of the object. This is NULL for SYSTEM.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the DBA_THRESHOLDS view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

159
DBMS_SERVICE

The DBMS_SERVICE package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operating Procedures
- Exceptions
- Summary of DBMS_SERVICE Subprograms

> **See Also:**
>
> *Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

159.1 DBMS_SERVICE Overview

DBMS_SERVICE supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through SRVCTL. The DBMS_SERVICE package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

> **See Also:**
>
> For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

159.2 DBMS_SERVICE Security Model

The DBMS_SERVICE package has certain security requirements.

Privileges

The client using this package must have the ALTER SYSTEM execution privilege and the V$SESSION table read privilege.

Schemas

This package must be installed under SYS schema.

Roles

The EXECUTE privilege of the package is granted to the DBA role only.

159.3 DBMS_SERVICE Constants

The DBMS_SERVICE package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in Table 159-1
- Constants used in connection balancing goal arguments are described in Table 159-2
- Constants used in TAF failover attribute arguments are described in Table 159-3

Table 159-1 Constants Used in Calling Arguments

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 159-2 Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.

Table 159-2 (Cont.) Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 159-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.
FAILOVER_TYPE_NONE	VARCHAR		Server side TAF type is NONE
FAILOVER_TYPE_SESSION	VARCHAR		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SELECT	VARCHAR		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30.
FAILOVER_RESTORE_NONE	CONSTANT VARCHAR2	NONE	The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.
FAILOVER_RESTORE_BASIC	VARCHAR2	LEVEL1	This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.

Table 159-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_DELAY	NUMBER		Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1)is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes).
STOP_OPTION_NONE	VARCHAR		Sessions are not disconnected.
STOP_OPTION_IMMEDIATE	VARCHAR		Sessions are disconnected immediately after the drain_timeout expires.
STOP_OPTION_TRANSACTIONAL			Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires.
DYNAMIC	NUMBER		For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.

159.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- – CREATE_SERVICE Procedure
  - – DELETE_SERVICE Procedure
  - – MODIFY_SERVICE Procedure

  - START_SERVICE Procedure
  - STOP_SERVICE Procedure
- With Oracle Database 12*c* release 1, you are advised to use the parameter interface in all service -related subprorgrams.
- If you wish to use `DBMS_SERVICE` on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

159.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the `DBMS_SERVICE` package.

Table 159-4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
`NULL_SERVICE_NAME`	44301	Service name argument was found to be `NULL`
`NULL_NETWORK_NAME`	44302	Network name argument was found to be `NULL`
`SERVICE_EXISTS`	44303	Service name already exists
`SERVICE_DOES_NOT_EXIST`	44304	Specified service does not exist
`SERVICE_IN_USE`	44305	Specified service was running
`SERVICE_NAME_TOO_LONG`	44306	Service name was too long
`NETWORK_PREFIX_TOO_LONG`	44307	Network name, excluding the domain, was too long
`NOT_INITIALIZED`	44308	Services layer was not yet initialized
`GENERAL_FAILURE`	44309	An unknown failure
`MAX_SERVICES_EXCEEDED`	44310	Maximum number of services has been reached
`SERVICE_NOT_RUNNING`	44311	Specified service was not running
`DATABASE_CLOSED`	44312	Database was closed
`INVALID_INSTANCE`	44313	Instance name argument was not valid
`NETWORK_EXISTS`	44314	Network name already exists
`NULL_ATTRIBUTES`	44315	All attributes specified were `NULL`
`INVALID_ARGUMENT`	44316	Invalid argument supplied
`DATABASE_READONLY`	44317	Database is open read-only
`MAX_SN_LENGTH`	44318	Total length of all running service network names exceeded the maximum allowable length
`ERR_AQ_SERVICE`	44319	Cannot delete AQ service
`ERR_GLB_SERVICE`	44320	Cannot delete global service
`ERR_INVALID_PDB_NAME`	44771	Invalid name for a pluggable database
`ERR_CRS_API`	44772	Cluster ready services (CRS) operation failed

Table 159-4 (Cont.) DBMS_SERVICE Exceptions

Exception	Error Code	Description
ERR_PDB_CLOSED	44773	Cannot perform requested service operation
ERR_PDB_INVALID	44774	Pluggable database attribute cannot be changed
ERR_PDB_NAME	44775	Pluggable database service cannot be created
ERR_PDB_EXP	44776	Pluggable database service cannot be deleted
ERR_PDB_FAIL	44777	Pluggable database service cannot be started

159.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

Table 159-5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure	Creates service
DELETE_SERVICE Procedure	Deletes service
DISCONNECT_SESSION Procedure	Disconnects sessions running under this service
MODIFY_SERVICE Procedure	Modifies service
START_SERVICE Procedure	Activates service
STOP_SERVICE Procedure	Stops service

159.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

> **Note:**
>
> Starting with Oracle Database 21c, the combination of session attribute values `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = STATIC` is deprecated.
>
> Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.
>
> You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
   service_name               IN VARCHAR2,
   network_name               IN VARCHAR2,
   parameter_array            IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE(
   service_name               IN VARCHAR2,
   network_name               IN VARCHAR2,
   goal                       IN NUMBER DEFAULT NULL,
   dtp                        IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications        IN BOOLEAN DEFAULT NULL,
   failover_method            IN VARCHAR2 DEFAULT NULL,
   failover_type              IN VARCHAR2 DEFAULT NULL,
   failover_retries           IN NUMBER DEFAULT NULL,
   failover_delay             IN NUMBER DEFAULT NULL,
   clb_goal                   IN NUMBER DEFAULT NULL,
   edition                    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 159-6 CREATE_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service, limited to 64 characters in the Data Dictionary

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
network_name	Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see *Oracle Database Net Services Reference*).
parameter_array	Associative array with name-value pairs of the service attributes. Supported names: • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_retries • failover_restore • failover_delay • clb_goal • edition • commit_outcome • reset_state • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • drain_timeout • stop_option • placement_policy
goal	Workload management goal directive for the service. Valid values: • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12*c*, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_type	TRANSACTION for Application Continuity. SELECT or BASIC for TAF.

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
failover_retries	Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.
edition	If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).
drain_timeout	If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, so stopping and relocating drains for this time by default.
stop_option	Provides options to terminate a session. The supported values are: • TRANSACTIONAL drain_timeout applies to the transactions. After the drain_timeout expire, the sessions are immediately killed. • IMMEDIATE The sessions are killed after drain_timeout expires. • NONE Sessions are not terminated. However, these parameter values can be overridden using the command line.
commit_outcome	Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note: • Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set. • commit_outcome has no effect on active Data Guard and read-only databases. • commit_outcome is only allowed on the database service and on user-defined database services
reset_state	Clears the session state usage between requests, so that each new request starts clean (usage web and stateless applications).

Table 159-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
retention_timeout	Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
replay_initiation_timeout	For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
session_state_consistency	Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.
sql_translation_name	Name of SQL translation unit
clb_goal	Method used for Connection Load Balancing (see Table 159-2)
placement_policy	NUMBER Placement policy for the service. Possible values: • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

> **Note:**
>
> Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
   params dbms_service.svc_parameter_array;
   BEGIN
      params('FAILOVER_TYPE')            :='TRANSACTION';
      params('REPLAY_INITIATION_TIMEOUT'):=1800;
      params('RETENTION_TIMEOUT')        :=86400;
      params('FAILOVER_DELAY')           :=10;
      params('FAILOVER_RETRIES')         :=30;
      params('DRAIN_TIMEOUT')            :=60;
      params('STOP_OPTION')              :='DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
      params('FAILOVER_RESTORE')         :='DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
      params('commit_outcome')           :='true';
```

```
    params('aq_ha_notifications')      :='true';
    DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

159.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

> **Note:**
>
> Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.
>
> You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(
   service_name   IN VARCHAR2);
```

Parameters

Table 159-7 DELETE_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service, limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```

159.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
   service_name         IN VARCHAR2,
   disconnect_option    IN NUMBER DEFAULT POST_TRANSACTION;
```

Parameters

Table 159-8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
`service_name`	Name of the service, limited to 64 characters in the Data Dictionary

Table 159-8 (Cont.) DISCONNECT_SESSION Procedure Parameters

Parameter	Description
`disconnect_option`	The options, package constants, are expressed as `NUMBER`: • `POST_TRANSACTION` = `0`: session disconnects after the current transaction commits or rolls back • `IMMEDIATE` = `1`: session disconnects immediately • `NOREPLAY` = `2`: session disconnects immediately and be flagged to not be replayed by application continuity, that is `IMMEDIATE` and `NOREPLAY` together **Note**: `IMMEDIATE` or `POST_TRANSACTION` and `NOREPLAY` is automatically translated as `1` or `0` or `2` respectively. However, passing a string literal (quoted using either the `'` or `"` characters, such as `"IMMEDIATE"` or `'POST_TRANSACTION'` or `'NOREPLAY'`) raises an error.

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the `DBMS_JOB` package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with `service_name 'ernie.example.com'`.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

159.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

> **Note:**
>
> You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
   service_name               IN VARCHAR2,
   parameter_array            IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(
   service_name               IN VARCHAR2,
   goal                       IN NUMBER DEFAULT NULL,
   dtp                        IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications        IN BOOLEAN DEFAULT NULL,
   failover_method            IN VARCHAR2 DEFAULT NULL,
   failover_type              IN VARCHAR2 DEFAULT NULL,
   failover_retries           IN NUMBER DEFAULT NULL,
   failover_delay             IN NUMBER DEFAULT NULL,
   clb_goal                   IN NUMBER DEFAULT NULL,
   edition                    IN VARCHAR2 DEFAULT NULL,
   modify_edition             IN BOOLEAN DEFAULT FALSE;
```

Parameters

Table 159-9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary
parameter_array	Associative array with name/value pairs of the service attributes. Supported names: • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_restore • failover_retries • failover_delay • drain_timeout • stop_option • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_name • placement_policy
goal	Workload management goal directive for the service. Valid values: • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)

Table 159-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12*c*, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_type	Failover TYPE for the service for Application Continuity and TAF.
failover_restore	For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state. For AC OCI, use NONE for applications that are not STATIC.
failover_retries	Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.
drain_timeout	When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, to stop and relocate drains for this time by default.
edition	If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).

Table 159-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
commit_outcome	Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable.Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note: • Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set. • commit_outcome has no effect on active Data Guard and read-only databases. • commit_outcome is allowed only on user-defined database services
retention_timeout	Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
replay_initiation_timeout	For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
session_state_consistency	Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.
sql_translation_name	Name of SQL translation unit
modify_edition	If TRUE, the edition service attribute is updated to use the edition argument value. If FALSE or NULL, the edition attribute is not updated.
clb_goal	Method used for Connection Load Balancing (see Table 159-2)
placement_policy	NUMBER Placement policy for the service. Possible values: • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

> **Note:**
>
> Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

159.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

> **Note:**
>
> You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.START_SERVICE(
   service_name  IN VARCHAR2,
   instance_name IN VARCHAR2);
```

Parameters

Table 159-10 *START_SERVICE Procedure Parameters*

Parameter	Description
`service_name`	Name of the service limited to 64 characters in the Data Dictionary
`instance_name`	Name of the instance where the service must be activated (optional). `NULL` results in starting of the service on the local instance. In single instance, this can only be the current instance or `NULL`. Specify `DBMS_SERVICE.ALL_INSTANCES` to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

159.6.6 STOP_SERVICE Procedure

This procedure stops a service.

> **Note:**
>
> You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(
   service_name   IN VARCHAR2,
   instance_name  IN VARCHAR2  DEFAULT NULL,
   stop_option    IN VARCHAR2  DEFAULT NULL,
   drain_timeout  IN NUMBER    DEFAULT NULL,
   replay         IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 159-11 STOP_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.
stop_option	To specify how sessions are stopped with draining. The possible values are as follows: • IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout. • TRANASCTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated. • NONE: sessions are not terminated. These values can be overridden on the command line using SRVCTL.
drain_timeout	The time in seconds for the session to drain.
replay	Enable application continuity replay.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

160
DBMS_SESSION

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Data Structures
- Summary of DBMS_SESSION Subprograms

160.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

160.2 DBMS_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

160.3 DBMS_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

Table Types

- INTEGER_ARRAY Table Type
- LNAME_ARRAY Table Type

160.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

160.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

160.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 160-1 ***DBMS_SESSION Package Subprograms***

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure	Clears all context information
CLEAR_CONTEXT Procedure	Clears the context
CLEAR_IDENTIFIER Procedure	Clears the identifier
CLOSE_DATABASE_LINK Procedure	Closes database link
CURRENT_IS_ROLE_ENABLED Function	Determines if the named role is currently enabled.
FREE_UNUSED_USER_MEMORY Procedure	Lets you reclaim unused memory after performing operations requiring large amounts of memory
GET_PACKAGE_MEMORY_UTILIZATION Procedure	Describes static package memory usage
IS_ROLE_ENABLED Function	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function	Determines if the specified session is active
LIST_CONTEXT Procedures	Returns a list of active namespace and context for the current session
MODIFY_PACKAGE_STATE Procedure	Used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session
RESET_PACKAGE Procedure	De-instantiates all packages in the session
SESSION_IS_ROLE_ENABLED Function	Determines if the named role is enabled at the session level.
SESSION_TRACE_DISABLE Procedure	Resets the session-level SQL trace for the session from which it was called.
SESSION _TRACE_ENABLE Procedure	Enables session-level SQL trace for the invoking session
SET_CONTEXT Procedure	Sets or resets the value of a context attribute
SET_EDITION_DEFERRED Procedure	Requests a switch to the specified edition
SET_IDENTIFIER Procedure	Sets the identifier
SET_NLS Procedure	Sets Globalization Support (NLS)
SET_ROLE Procedure	Sets role
SET_SQL_TRACE Procedure	Turns tracing on or off
SLEEP Procedure	Suspends the session for a specified period of time.
SWITCH_CURRENT_CONSUMER_GROUP Procedure	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function	Returns an identifier that is unique for all sessions currently connected to this database

160.4.1 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
   connection_test          IN VARCHAR2
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 160-2 ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier.

Usage Notes

The ADD_SQL_CONNECTION_TEST Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view DBA_CONNECTION_TESTS.

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

160.4.2 CLEAR_ALL_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
   namespace         VARCHAR2);
```

Parameters

Table 160-3 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

160.4.3 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
   namespace         VARCHAR2,
   client_identifier VARCHAR2
   attribute         VARCHAR2);
```

Parameters

Table 160-4 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	Namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.

- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

160.4.4 CLEAR_IDENTIFIER Procedure

This procedure removes the set_client_id in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

160.4.5 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement: ALTER SESSION CLOSE DATABASE LINK <name>

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
   dblink VARCHAR2);
```

Parameters

Table 160-5 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
dblink	Name of the database link to close

160.4.6 CURRENT_IS_ROLE_ENABLED Function

This function determines if the named role is currently enabled.

Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (
   rolename    VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 160-6 CURRENT_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

160.4.7 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

> **Note:**
>
> This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server**: This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server**: This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies.

They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared.After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
   type number_idx_tbl is table of number indexed by binary_integer;

   store1_table  number_idx_tbl;     --  PL/SQL indexed table
   store2_table  number_idx_tbl;     --  PL/SQL indexed table
   store3_table  number_idx_tbl;     --  PL/SQL indexed table
   ...
END;            --  end of foobar

DECLARE
   ...
   empty_table   number_idx_tbl;     --  uninitialized ("empty") version
BEGIN
   FOR i in 1..1000000 loop
     store1_table(i) := i;           --  load data
   END LOOP;
   ...
   store1_table := empty_table;      --  "truncate" the indexed table
   ...
   -
   dbms_session.free_unused_user_memory;  -- give memory back to system

   store1_table(1) := 100;           --  index tables still declared;
   store2_table(2) := 200;           --  but truncated.
   ...
END;
```

160.4.8 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the FREE_UNUSED_USER_MEMORY Procedure is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
   owner_names     OUT NOCOPY LNAME_ARRAY,
   unit_names      OUT NOCOPY LNAME_ARRAY,
   unit_types      OUT NOCOPY INTEGER_ARRAY,
   used_amounts    OUT NOCOPY INTEGER_ARRAY,
   free_amounts    OUT NOCOPY INTEGER_ARRAY);
```

Parameters

Table 160-7 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

160.4.9 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

> **Note:**
>
> This function is deprecated starting in Oracle Database 19c. Use DBMS_SESSION.CURRENT_IS_ROLE_ENABLED or DBMS_SESSION.SESSION_IS_ROLE_ENABLED instead.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
   rolename    VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 160-8 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.\

Return Values

Table 160-9 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

160.4.10 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
   uniqueid VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 160-10 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 160-11 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

160.4.11 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
   namespace VARCHAR2(30),
   attribute VARCHAR2(30),
   value     VARCHAR2(256));
```

```
TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
   list OUT AppCtxTabTyp,
   size OUT NUMBER);
```

Parameters

Table 160-12 LIST_CONTEXT Procedure Parameters

Parameter	Description
`list`	Buffer to store a list of application context set in the current session

Return Values

Table 160-13 LIST_CONTEXT Procedure Return Values

Return	Description
`list`	A list of (namespace, attribute, values) set in current session
`size`	Returns the number of entries in the buffer returned

Usage Notes

The context information in the list appears as a series of `<namespace>` `<attribute>` `<value>`. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

160.4.12 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the `DBMS_SESSION` constants listed in Table 160-15.

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(
   action_flags IN PLS_INTEGER);
```

Parameters

Table 160-14 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
action_flags	Bit flags that determine the action taken on PL/SQL program units: DBMS_SESSION.FREE_ALL_RESOURCES (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking MODIFY_PACKAGE_STATE with the DBMS_SESSION.FREE_ALL_RESOURCES parameter provides functionality identical to the DBMS_SESSION.RESET_PACKAGE( ) interface. DBMS_SESSION.REINITIALIZE (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the DBMS_SESSION.REINITIALIZE flag is similar to the DBMS_SESSION.FREE_ALL_RESOURCES flag in that both have the effect of reinitializing all packages. However, DBMS_SESSION.REINITIALIZE should exhibit better performance than the DBMS_SESSION.FREE_ALL_RESOURCES option because: • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.

Usage Notes

See the parameter descriptions in Table 160-17 for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 160-15 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
FREE_ALL_RESOURCES	PLS_INTEGER:= 1
REINITIALIZE	PLS_INTEGER:= 2

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v   varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting `P.n` to `NULL`
- Invoking function `P2.foo` and setting `P.m` to the value returned from `P2.foo`
- Setting `P.d` to the return value of `SYSDATE` built-in
- Closing cursor `P.c` if it was previously opened
- Setting `P.v` to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using `FREE_ALL_RESOURCES` or `REINITIALIZE`, make sure that resetting package variable values does not affect the application.
- Because `DBMS_SESSION.REINITIALIZE` does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the `FREE_ALL_RESOURCES` flag or the `RESET_PACKAGE` procedure had been used. For instance, after performing `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`, if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until `DBMS_SESSION.RESET_PACKAGE` is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`does not compile on the client because it uses the constant `DBMS_SESSION.REINITIALIZE`.

  Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
  4   P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2   P.print_status;
  3  end;
  4  /
```

```
P.cnt = 0
P.c is CLOSED

PL/SQL procedure successfully completed.
```

160.4.13 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

> **Note:**
>
> See "SESSION _TRACE_ENABLE Procedure" . The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

> **Note:**
>
> `RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXCECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

160.4.14 SESSION_IS_ROLE_ENABLED Function

This function determines if the named role is enabled for the login user session.

Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (
   rolename    VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 160-16 SESSION_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

160.4.15 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

160.4.16 SESSION _TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(
   waits     IN   BOOLEAN DEFAULT TRUE,
   binds     IN   BOOLEAN DEFAULT FALSE,
   plan_stat IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 160-17 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	Specifies if wait information is to be traced
`binds`	Specifies if bind information is to be traced
`plan_stat`	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

160.4.17 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
   namespace VARCHAR2,
   attribute VARCHAR2,
   value     VARCHAR2,
   username  VARCHAR2,
   client_id VARCHAR2 );
```

Parameters

Table 160-18 SET_CONTEXT Procedure Parameters

Parameter	Description
`namespace`	Namespace of the application context to be set, limited to 30 bytes
`attribute`	Attribute of the application context to be set, limited to 30 bytes
`value`	Value of the application context to be set, limited to 4 kilobytes.
`username`	Database username attribute of the application context. Default: NULL

Table 160-18 (Cont.) SET_CONTEXT Procedure Parameters

Parameter	Description
client_id	Application-specific client_id attribute of the application context (64-byte maximum). Default: NULL

Usage Notes

- The first three parameters are required for all types of context.
- The username parameter must be a valid SQL identifier.
- The client_id parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for set_identifier.
- If the namespace parameter is a global context namespace, then the username parameter is matched against the current database user name in the session, and the client_id parameter is matched against the current client_id in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, SET_CONTEXT overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

> **See Also:**
>
> *Oracle Database Security Guide* for more information about
>
> - "Setting the username and client ID"
> - "Example: Creating a Global Application Context that Uses a Client Session ID"

160.4.18 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (
   edition    IN    VARCHAR2);
```

Parameters

Table 160-19 SET_EDITION_DEFERRED Procedure Parameters

Parameter	Description
`edition`	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have USE privilege on the named edition.

160.4.19 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
   client_id VARCHAR2);
```

Parameters

Table 160-20 SET_IDENTIFIER Procedure Parameters

Parameter	Description
`client_id`	Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, the additional bytes are truncated.

Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

160.4.20 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

Syntax

```
DBMS_SESSION.SET_NLS (
   param VARCHAR2,
   value VARCHAR2);
```

Parameters

Table 160-21 SET_NLS Procedure Parameters

Parameter	Description
param	Globalization Support parameter. The parameter name must begin with 'NLS'.
value	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls ('nls_date_format','"DD-MON-YY"')".

160.4.21 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the SET ROLE SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
   role_cmd VARCHAR2);
```

Parameters

Table 160-22 SET_ROLE Procedure Parameters

Parameter	Description
role_cmd	Text is appended to "set role" and then run as SQL

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

160.4.22 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement ALTER SESSION SET SQL_TRACE ....

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (
   sql_trace boolean);
```

Parameters

Table 160-23 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

160.4.23 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_SESSION.SLEEP (
   seconds  IN NUMBER);
```

Parameters

Table 160-24 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

160.4.24 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
   new_consumer_group     IN  VARCHAR2,
   old_consumer_group     OUT VARCHAR2,
   initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 160-25 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
new_consumer_group	Name of consumer group to which you want to switch
old_consumer_group	Name of the consumer group from which you just switched out
initial_group_on_error	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

Return Values

This procedure outputs the old consumer group of the user in the parameter old_consumer_group.

> **Note:**
>
> You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

Table 160-26 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to `TRUE`, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
   old_group varchar2(30);
   prev_group varchar2(30);
   curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
     -- It is possible that the procedure owner does not have privileges
     -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
     -- that the user is moved out of the privileged group in such a
     -- situation

     dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
```

```
    RAISE;
   END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

160.4.25 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 160-27 UNIQUE_SESSION_ID Function Return Values

Return	Description
unique_session_id	Returns up to 24 bytes

161
DBMS_SFW_ACL_ADMIN

The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- DBMS_SFW_ACL_ADMIN Security Model
- DBMS_SFW_ACL_ADMIN Operational Notes
- DBMS_SFW_ACL_ADMIN Examples
- Summary of DBMS_SFW_ACL_ADMIN Subprograms

161.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFWUSER schema. The procedures in this package can be run only by the DBSFWUSER user.

161.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to `DBMS_SFW_ACL_ADMIN`.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the IP_ADD_ACE Procedure and IP_ADD_PDB_ACE Procedure. After calling these procedures, you call the COMMIT_ACL Procedure to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the IP_REMOVE_ACE Procedure, IP_REMOVE_ACL Procedure, IP_REMOVE_PDB_ACE Procedure, or IP_REMOVE_PDB_ACL Procedure, you need to call theCOMMIT_ACL Procedure to update the ACL on the listeners.
- Access control must be enabled using the new `FIREWALL` endpoint attribute and the new `LOCAL_REGISTRATION_ADDRESS_`*listenerName* parameter. The configuration can be done manually in `listener.ora` or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the `IP_ACL` table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the `V$IP_ACL` or `GV$IP_ACL` view. The `IP_ACL` table can contain ACLs that are not in `[G]V$IP_ACL` because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the COMMIT_ACL procedure again to send the committed ACLs in the IP_ACL table to the local listeners.

  In an Oracle RAC environment, `GV$IP_ACL` can be used to query ACLs across the database cluster, and `V$IP_ACL` to query ACLs in the connected instance.

161.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how DBMS_SFW_ACL_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFWUSER
SQL> connect dbsfwuser/Welcome1
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME              HOST
------------------------  -------------------
"SVC1.EXAMPLE.COM"        192.168.12.1
"SVC1.EXAMPLE.COM"        192.168.12.2
"SVC1.EXAMPLE.COM"        TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME              HOST                   CON_ID
------------------------  -----------------      --------
SVC1.EXAMPLE.COM          192.168.12.1           1
SVC1.EXAMPLE.COM          192.168.12.2           1
SVC1.EXAMPLE.COM          TEST02.EXAMPLE.COM     1
```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

161.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 161-1 DBMS_SFW_ACL_ADMIN Package Subprograms

Subprogram	Description
COMMIT_ACL Procedure	Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances.
IP_ADD_ACE Procedure	Adds an access control entry to the ACL for a database service.
IP_ADD_PDB_ACE Procedure	Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_ACE Procedure	Removes an entry from the ACL for a database service.
IP_REMOVE_ACL Procedure	Removes all entries from the ACL for a database service.
IP_REMOVE_PDB_ACE Procedure	Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_PDB_ACL Procedure	Removes all entries from the ACL for all the database services in a pluggable database (PDB).

161.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None

161.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (
  p_service_name  IN  VARCHAR2,
  p_host          IN  VARCHAR2);
```

Parameters

Table 161-2 IP_ADD_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service for which you want to add an access control entry.
p_host	The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

161.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (
  p_pdb_name  IN  VARCHAR2,
  p_host      IN  VARCHAR2);
```

Parameters

Table 161-3 IP_ADD_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

161.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (
  p_service_name  IN  VARCHAR2,
  p_host          IN  VARCHAR2);
```

Parameters

Table 161-4 IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service from which you want to remove an access control entry.

Table 161-4 (Cont.) IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the `IP_ACL` table to get the list of entries for a database service.

161.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (
  p_service_name  IN  VARCHAR2);
```

Parameters

Table 161-5 IP_REMOVE_ACL Procedure Parameters

Parameter	Description
p_service_name	The name of the database service whose ACL you want to clear.

161.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (
  p_pdb_name  IN  VARCHAR2,
  p_host      IN  VARCHAR2);
```

Parameters

Table 161-6 IP_REMOVE_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the `IP_ACL` table to get the list of entries for a database service.

161.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (
  p_pdb_name  IN  VARCHAR2);
```

Parameters

Table 161-7 IP_REMOVE_PDB_ACL Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.

162
DBMS_SODA

The DBMS_SODA package is a PL/SQL package implementing Simple Oracle Document Access (SODA). SODA allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by SODA is that of document collections. The DBMS_SODA package allows you to create, list, and delete document collections from PL/SQL, and to perform CRUD (create, replace, update, delete) operations on documents. All DDL functions are encapsulated within this package.

This chapter contains the following topics:

- DBMS_SODA Security Model
- Summary of DBMS_SODA Subprograms
- Summary of SODA Online Redefinition Subprograms

> **See Also:**
>
> - *Oracle Database SODA for PL/SQL Developer's Guide*
> - SODA Types

162.1 DBMS_SODA Security Model

This package is available to users with the SODA_APP role.

All SODA types (packages and types) are SYS types. PUBLIC is granted EXECUTE privilege on the DBMS_SODA described in this chapter.

162.2 Summary of DBMS_SODA Subprograms

This table lists the DBMS_SODA subprograms in alphabetical order and briefly describes them.

Table 162-1 DBMS_SODA Package Subprograms

Subprogram	Purpose
CREATE_COLLECTION Function	Creates a collection using the collection name and metadata.
DROP_COLLECTION Function	Drops an existing collection from the user's schema. This also removes all the documents in the collection.
GET_AS_OF_SCN Function	This function returns the current database SCN number.

Table 162-1 (Cont.) DBMS_SODA Package Subprograms

Subprogram	Purpose
GET_AS_OF_TIMESTAMP Function	This function returns the current database timestamp value.
GET_DEFAULT_METADATA_AS_CLOB Function	This function returns the default metadata.
GET_DEFAULT_METADATA_AS_VARCHAR2 Function	This function returns the default metadata.
LIST_COLLECTION_NAMES Function	Lists the collection names in the user's schema as a table of NVARCHAR2.
OPEN_COLLECTION Function	Opens an existing collection.

162.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to `NULL`, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

```
DBMS_SODA.CREATE_COLLECTION (
     collection_Name      IN NVARCHAR2,
     metadata             IN VARCHAR2 DEFAULT NULL,
     create_Mode          IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
 RETURN SODA_Collection_T;
```

Parameters

Table 162-2 CREATE_COLLECTION Parameters

Parameter	Description
`collection_Name`	The name of the collection. The value of `collection_Name` is case-sensitive.
`metadata`	The metadata of the collection in VARCHAR2 format.

Table 162-2 (Cont.) CREATE_COLLECTION Parameters

Parameter	Description
create_Mode	Valid values are: • `DBMS_SODA.CREATE_MODE_DDL` (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). • `DBMS_SODA.CREATE_MODE_MAP`. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).

Return Values

The function returns a `Soda_Collection_T` object representing the collection.

Exceptions

- `Descriptor Error`—if the input descriptor is invalid
- `Error`—if an error occurs while creating the collection

> **See Also:**
>
> *Oracle Database SODA for PL/SQL Developer's Guide*

162.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

```
DBMS_SODA.DROP_COLLECTION (
     collection_Name      IN NVARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 162-3 DROP_COLLECTION Parameters

Parameter	Description
`collection_Name`	The name of the collection. The value of `collection_Name` is case-sensitive.

Return values

This function returns the following values:

- `1`—if the collection was dropped successfully
- `0`—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

> **See Also:**
>
> *Oracle Database SODA for PL/SQL Developer's Guide*

162.2.3 GET_AS_OF_SCN Function

This function returns the current database SCN number.

Syntax

```
DBMS_SODA.GET_AS_OF_SCN ( )
 RETURN NUMBER;
```

Return values

This function returns the current database SCN number.

162.2.4 GET_AS_OF_TIMESTAMP Function

This function returns the current database timestamp value.

Syntax

```
DBMS_SODA.GET_AS_OF_TIMESTAMP ( )
 RETURN NUMBER;
```

Return values

This function returns the current database timestamp value.

162.2.5 GET_DEFAULT_METADATA_AS_CLOB Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_CLOB ( )
 RETURN CLOB;
```

Return Values

This function returns the default metadata using the `CLOB` datatype.

162.2.6 GET_DEFAULT_METADATA_AS_VARCHAR2 Function

This function returns the default metadata.

Syntax

```
DBMS_SODA.GET_DEFAULT_METADATA_AS_VARCHAR2 ( )
 RETURN VARCHAR2;
```

Return Values

This function returns the default metadata using the `VARCHAR2` datatype.

162.2.7 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user's schema as a table of `NVARCHAR2`.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ()
 RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of `NVARCHAR2(255)`. The collection list is empty if there are no collections in the schema.

Exceptions

`Error`—if an error occurs while listing the collection names.

> **See Also:**
>
> *Oracle Database SODA for PL/SQL Developer's Guide*

162.2.8 OPEN_COLLECTION Function

Opens an existing collection for `read` and/or `write` operations.

Syntax

```
DBMS_SODA.OPEN_COLLECTION (
     collection_Name      IN NVARCHAR2)
 RETURN SODA_Collection_T;
```

Parameters

Table 162-4 OPEN_COLLECTION Parameters

Parameter	Description
`collection_Name`	The name of the collection. The value of `collection_Name` is case-sensitive.

Return Values

This function returns the following values:

- a collection object which is open
- `NULL`, if the collection does not exist

Exceptions

`Error`—if an error occurs while creating the collection

> **See Also:**
>
> - Opening an Existing Document Collection with SODA for PL/SQL
> - Checking Whether a Given Collection Exists with SODA for PL/SQL

162.3 Summary of SODA Online Redefinition Subprograms

This table lists the SODA Online Redefinition subprograms in alphabetical order and briefly describes them.

Table 162-5 SODA Online Redefinition Subprograms

Subprogram	Purpose
ABORT_REDEF_COLLECTION Procedure	This procedure reverts the changes made to a collection if there are any errors in `CREATE_INTERIM_COLLECTION`, `START_REDEF_COLLECTION`, `COPY_COLLECTION_DEPENDENTS`, `SYNC_INTERIM_COLLETION`, or due to any other reasons.
CAN_REDEF_COLLECTION Procedure	This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised.
COPY_COLLECTION_DEPENDENTS Procedure	This procedure copies all the dependents that are defined on the original table to the interim table. However, if the interim table is JSON type, constraints like `IS JSON NOT NULL` will not be copied because those are extraneous.

Table 162-5 (Cont.) SODA Online Redefinition Subprograms

Subprogram	Purpose
CREATE_INTERIM_COLLECTION Procedure	This procedure creates an interim SODA collection. The interim_metadata specifies the changes the user needs to make. For example, a delta applied as a patch to the original matadata.
FINISH_REDEF_COLLECTION Procedure	This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a SODA data table is present on the interim collection, otherwise an error is raised.
START_REDEF_COLLECTION Procedure	This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns.
SYNC_INTERIM_COLLETION Procedure	This procedure syncronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised.
TO_UUID Function	This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP_DATA feature of Data Pump.

162.3.1 ABORT_REDEF_COLLECTION Procedure

This procedure reverts the changes made to a collection if there are any errors in `CREATE_INTERIM_COLLECTION`, `START_REDEF_COLLECTION`, `COPY_COLLECTION_DEPENDENTS`, `SYNC_INTERIM_COLLETION`, or due to any other reasons.

Syntax

```
DBMS_SODA.ABORT_REDEF_COLLECTION (
   collection_name         IN  NVARCHAR2,
   interim_collection_name IN  NVARCHAR2);
```

Parameters

Table 162-6 ABORT_REDEF_COLLECTION Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.
`interim_collection_name`	The name used for the interim collection.

162.3.2 CAN_REDEF_COLLECTION Procedure

This procedure checks if the data table can be redefined. If the data table cannot be redefined, errors are raised.

Syntax

```
DBMS_SODA.CAN_REDEF_COLLECTION (
   collection_name   IN  NVARCHAR2);
```

Parameters

Table 162-7 CAN_REDEF_COLLECTION Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.

162.3.3 COPY_COLLECTION_DEPENDENTS Procedure

This procedure copies all the dependents that are defined on the original table to the interim table.

Syntax

```
DBMS_SODA.COPY_COLLECTION_DEPENDENTS (
   collection_name         IN  NVARCHAR,
   interim_collection_name IN  NVARCHAR2,
   ignore_error            IN  BOOLEAN DEFAULT NULL,
   num_errors              OUT PLS_INTEGER);
```

Parameters

Table 162-8 COPY_COLLECTION_DEPENDENTS Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.
`interim_collection_name`	The name used for the interim collection.
`ignore_error`	Ignore the errors encountered in the process and proceed.
`num_errors`	The number of errors encountered in the process.

162.3.4 CREATE_INTERIM_COLLECTION Procedure

This procedure creates an interim `SODA` collection. The `interim_metadata` specifies the changes the user needs to make. For example, a delta applied as a patch to the original matadata.

Syntax

```
DBMS_SODA.CREATE_INTERIM_COLLECTION (
   collection_name            IN  NVARCHAR2,
```

```
   interim_collection_name    IN  NVARCHAR2,
   interim_metadata           IN  VARCHAR2);
```

Parameters

Table 162-9 CREATE_INTERIM_COLLECTION Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.
`interim_collection_name`	The name used for the interim collection.
`interim_metadata`	The metadata snippet specifying the columns that need to be redefined and how they need to be redefined.

Usage Notes

The `interim_metadata` parameter can contain the following fields. An error is raised if other fields are present and if the fields are not the same as those in the metadata for the original collection.

- Set `contentColumn.sqlType` to `JSON` in order to redefine the `CONTENT` column to `JSON` type, automatically generating the `VERSION` column if needed.
- Set `versionColumn.method` to `UUID` to redefine the `VERSION` column to use `UUID`.
- Set `tableName` to specify a name for the data table of this interim collection. If this field is not present, a default data table name will be generated according to the rules of table name defaulting outlined in Default Naming of a Collection Table. However, if the table already exists, the collection is created using the `MAP` mode. In this scenario, make sure that the mapped table does not have any constraints defined.
- The user can combine the above fields in the supplied `interim_metadata` snippet. For example, the most common use case is to both redefine the content column to `JSON` type and redefine the version column to `UUID`, which can be achieved by setting the `interim_metadata` parameter to `{“contentColumn” : {“sqlType”: “JSON”}, “versionColumn” : {“method”: “UUID”}}`.

162.3.5 FINISH_REDEF_COLLECTION Procedure

This procedure performs the following tasks in one atomic transaction. It introduces a downtime. This can only be called after every dependent required for a `SODA` data table is present on the interim collection, otherwise an error is raised.

Syntax

```
DBMS_SODA.FINISH_REDEF_COLLECTION (
   collection_name         IN  NVARCHAR,
   interim_collection_name IN  NVARCHAR2,
   dml_lock_timeout        IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 162-10 FINISH_REDEF_COLLECTION Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.
`interim_collection_name`	The name used for the interim collection.
`dml_lock_timeout`	The wait period in seconds. If the lock is not acquired within this wait period, an error occurs.

Usage Notes

This action cannot be undone. After this procedure is executed, you cannot perform `ROLLBACK` procedure provided by the `DBMS_REDEFINITION` package.

> **Caution:**
>
> Before calling `FINISH_REDEF_COLLECTION Procedure`, the interim collection should be tried out to make sure it can be accessed and is working as expected. In case of any issues, use ABORT_REDEF_COLLECTION Procedure.
>
> It is very important to do this before calling `FINISH_REDEF_COLLECTION` because the latter cannot be reversed.

162.3.6 START_REDEF_COLLECTION Procedure

This procedure starts the redefinition process. Copies the existing data from the original table to the interim table and performs the required transformations on the redefined columns.

Syntax

```
DBMS_SODA.START_REDEF_COLLECTION (
   collection_name         IN  NVARCHAR,
   interim_collection_name IN  NVARCHAR2,
   copy_vpd_opt            IN  DEFAULT NULL,
   refresh_dep_mviews      IN  DEFAULT NULL);
```

Parameters

Table 162-11 START_REDEF_COLLECTION Procedure Parameters

Parameter	Description
`collection_name`	The name of the collection to be redefined.
`interim_collection_name`	The name used for the interim collection.

Table 162-11 (Cont.) START_REDEF_COLLECTION Procedure Parameters

Parameter	Description
copy_vpd_opt	Can be either DBMS_REDEFINITION.CONS_VPD_MANUAL or DBMS_REDEFINITION.CONS_VPD_NONE. DBMS_REDEFINITION.CONS_VPD_MANUAL is used to indicate to copy VPD policies manually. DBMS_REDEFINITION.CONS_VPD_NONE is used to indicate that there are no VPD policies on the original table. If NULL, DBMS_REDEFINITION.CONS_VPD_NONE is used.
refresh_dep_mviews	Can be N or Y. When set to N, fast refresh of dependent materialized views is performed when the START_REDEF_TABLE procedure is run, each time the SYNC_INTERIM_TABLE procedure is run, and when the FINISH_REDEF_TABLE procedure is run. If NULL, N is used.

162.3.7 SYNC_INTERIM_COLLETION Procedure

This procedure synchronizes the changes to the interim table if the original data table was changed. This procedure can only be called after every dependent required for the SODA data table is present on the interim collection, otherwise, an error is raised.

Syntax

```
DBMS_SODA.SYNC_INTERIM_COLLETION (
   collection_name         IN  NVARCHAR,
   interim_collection_name IN  NVARCHAR2);
```

Parameters

Table 162-12 SYNC_INTERIM_COLLETION Procedure Parameters

Parameter	Description
collection_name	The name of the collection to be redefined.
interim_collection_name	The name used for the interim collection.

162.3.8 TO_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP_DATA feature of Data Pump.

Syntax

```
DBMS_SODA.TO_UUID (
     placeholder      IN   NVARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 162-13 TO_UUID Parameters

Parameter	Description
`placeholder`	This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump `REMAP_DATA` function.

Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

> **See Also:**
>
> REMAP_DATA in the *Oracle® Database Utilities Guide*.

163
DBMS_SHARED_POOL

The DBMS_SHARED_POOL package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. DBMS_SHARED_POOL enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of DBMS_SHARED_POOL Subprograms

163.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

163.2 DBMS_SHARED_POOL Operational Notes

To create DBMS_SHARED_POOL, run the DBMSPOOL.SQL script. The PRVTPOOL.PLB script is automatically executed after DBMSPOOL.SQL runs. These scripts are *not* run by as part of standard database creation.

163.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the DBMS_SHARED_POOL subprograms and briefly describes them.

Table 163-1 *DBMS_SHARED_POOL Package Subprograms*

Subprogram	Description
ABORTED_REQUEST_THRESHOLD Procedure	Sets the aborted request threshold for the shared pool
KEEP Procedure	Keeps an object in the shared pool
MARKHOT Procedure	Marks a library cache object as a hot object

Table 163-1 (Cont.) *DBMS_SHARED_POOL Package Subprograms*

Subprogram	Description
PURGE Procedure	Purges the named object or specified heap(s) of the object
SIZES Procedure	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure	Unkeeps the named object
UNMARKHOT Procedure	Unmarks a library cache object as a hot object

163.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
   threshold_size NUMBER);
```

Parameters

Table 163-2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
`threshold_size`	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of `threshold_size` is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an '`ALTER SYSTEM FLUSH SHARED_POOL`'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than `thresh_hold` size. This user gets the 'out of memory' error without attempting to search the LRU list.

163.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for

frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
   name         VARCHAR2,
   flag         CHAR DEFAULT 'P');

DBMS_SHARED_POOL.KEEP (
   schema         VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER,
   heaps          NUMBER,
   edition_name   VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.KEEP (
   hash           VARCHAR2,
   namespace      NUMBER,
   heaps          NUMBER);
```

Parameters

Table 163-3 KEEP Procedure Parameters

Parameter	Description
name	The name of the object to keep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. • Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. • Set to 'Q' or 'q' to specify that the input is the name of a sequence. • Set to 'R' or 'r' to specify that the input is the name of a trigger. • Set to 'T' or 't' to specify that the input is the name of a type. • Set to 'JS' or 'js' to specify that the input is the name of a java source. • Set to 'JC' or 'jc' to specify that the input is the name of a java class. • Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. • Set to 'C' or 'c' to specify that the input is the name of a cursor.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to keep.
namespace	A number indicating the library cache namespace in which the object has to be searched for.
heaps	The heaps to keep. For example, if heap 0 and heap 6 are to be kept.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by DBMS_SHARED_POOL.KEEP('0034CDFF,20348871','C'), 0034CDFF being the ADDRESS and 20348871 the HASH_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.

163.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.MARKHOT (
   schema         VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER DEFAULT 1,
   global         BOOLEAN DEFAULT TRUE,
   edition_name   VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.MARKHOT (
   hash           VARCHAR2,
   namespace      NUMBER DEFAULT 1,
   global         BOOLEAN DEFAULT TRUE);
```

Parameters

Table 163-4 MARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ$.
global	If TRUE (default), mark the object hot on all Oracle RAC instances
hash	16-byte hash value for the object

Table 163-4 (Cont.) MARKHOT Procedure Parameters

Parameter	Description
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, V$DB_OBJECT_CACHE.PROPERTY, to see whether or not the object has been marked hot. The values for PROPERTY are:

- HOTCOPYnnn- An object that is a hot copy with integer identifier of 'nnn'. For example, HOTCOPY5, HOTCOPY94, and HOTCOPY125.
- HOTCOPY-As above but the identifier is unknown
- HOT-The "root" kgl object that has been marked as hot
- NULL-A normal object

163.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
   name         VARCHAR2,
   flag         CHAR DEFAULT 'P',
   heaps        NUMBER DEFAULT 1);

DBMS_SHARED_POOL.PURGE (
   schema       VARCHAR2,
   objname      VARCHAR2,
   namespace    NUMBER,
   heaps        NUMBER,
   edition_name VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.PURGE (
   hash         VARCHAR2,
   namespace    NUMBER,
   heaps        NUMBER);
```

Parameters

Table 163-5 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 | 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default value is 1, that is, heap 0 which means the whole object would be purged
schema	User name or the schema to which the object belongs
objname	Name of the object to purge
namespace	Parameter is a number indicating the library cache namespace in which the object is to be searched
hash	16-byte hash value for the object
edition_name	The name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the KEEP Procedure are supported for PURGE.

163.3.5 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
   minsize NUMBER);
```

Parameters

Table 163-6 SIZES Procedure Parameters

Parameter	Description
`minsize`	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the SQLDBA or SQLPLUS `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

163.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
   name         VARCHAR2,
   flag         CHAR DEFAULT 'P');

DBMS_SHARED_POOL.UNKEEP (
   schema       VARCHAR2,
   objname      VARCHAR2,
   namespace    NUMBER,
   edition_name VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.UNKEEP (
   hash         VARCHAR2,
   namespace    NUMBER);
```

> **WARNING:**
>
> This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 163-7 UNKEEP Procedure Parameters

Parameter	Description
name	The name of the object to unkeep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to unkeep.
namespace	A number that indicates the library cache namespace in which the object has to be searched for.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found

163.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (
   schema         VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER  DEFAULT 1,
   global         BOOLEAN DEFAULT TRUE,
   edition_name   VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.UNMARKHOT (
   hash           VARCHAR2,
   namespace      NUMBER DEFAULT 1,
   global         BOOLEAN DEFAULT TRUE);
```

Parameters

Table 163-8 UNMARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object

Table 163-8 (Cont.) UNMARKHOT Procedure Parameters

Parameter	Description
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE, unmark the object hot on all Oracle RAC instances. The default value of this parameter is TRUE.
hash	A 16-byte hash value for the object
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

164
DBMS_SPACE

The DBMS_SPACE package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Security Model
- Data Structures
- Summary of DBMS_SPACE Subprograms

164.1 DBMS_SPACE Security Model

This package runs with SYS privileges. The execution privilege is granted to PUBLIC. Subprograms in this package run under the caller security. The user must have ANALYZE privilege on the object.

164.2 DBMS_SPACE Data Structures

The DBMS_SPACE package defines an OBJECT type, a RECORD type, and a TABLE type.

OBJECT Types

CREATE_TABLE_COST_COLINFO Object Type

RECORD Types

ASA_RECO_ROW Record Type

TABLE Types

ASA_RECO_ROW_TB Table Type

164.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(
    col_type    VARCHAR(200),
    col_size    NUMBER)
```

Attributes

Table 164-1 CREATE_TABLE_COST_COLINFO Object Type

Attribute	Description
col_type	Column type
col_size	Column size

164.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
   tablespace_name       VARCHAR2(30),
   segment_owner         VARCHAR2(30),
   segment_name          VARCHAR2(30),   segment_type          VARCHAR2(18),
   partition_name        VARCHAR2(30),
   allocated_space       NUMBER,
   used_space            NUMBER,
   reclaimable_space     NUMBER,
   chain_rowexcess       NUMBER,
   recommendations       VARCHAR2(1000),
   c1                    VARCHAR2(1000),
   c2                    VARCHAR2(1000),
   c3                    VARCHAR2(1000),
   task_id               NUMBER,
   mesg_id               NUMBER);
```

Attributes

Table 164-2 ASA_RECO_ROW Attributes

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation

Table 164-2 (Cont.) ASA_RECO_ROW Attributes

Field	Description
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

Related Topics

- DBMS_SPACE ASA_RECOMMENDATIONS Function
  This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

164.2.3 DBMS_SPACE ASA_RECO_ROW_TB Table Type

The type asa_reco_row_tb is a table of asa_reco_row.

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

164.3 Summary of DBMS_SPACE Subprograms

This table lists the DBMS_SPACE subprograms and briefly describes them.

Table 164-3 *DBMS_SPACE Package Subprograms*

Subprogram	Description
ASA_RECOMMENDATIONS Function	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures	Determines the size of the table given various attributes
FREE_BLOCKS Procedure	Returns information about free blocks in an object (table, index, or cluster)
ISDATAFILEDROPPABLE_NAME Procedure	Checks whether a datafile is droppable
OBJECT_DEPENDENT_SEGMENTS Function	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure	Returns information about unused space in an object (table, index, or cluster)

164.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
   all_runs        IN    VARCHAR2 DEFAULT := TRUE,
   show_manual     IN    VARCHAR2 DEFAULT := TRUE,
   show_findings   IN    VARCHAR2 DEFAULT := FALSE)
 RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 164-4 ASA_RECOMMENDATIONS Procedure Parameters

Parameter	Description
all_runs	Returns the results of all the auto advisor runs or only the results of the latest run. The valid values are TRUE and FALSE. The default value is TRUE. If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	This parameter is used to indicate if the results of manual jobs should be included. If TRUE, results of manual tasks are shown. If FALSE, results of manual tasks are not shown. Specifying manual=true does not negate the specification of auto advisor tasks. However, the all_runs settings may override manual. If all_runs is FALSE, implying we only want to see the latest of auto advisor job, then manual may not be specified as TRUE. The valid values are TRUE and FALSE. The default value is TRUE.
show_findings	Shows only the findings instead of the recommendations. The valid values are TRUE and FALSE. The default value is FALSE.

Table 164-5 Parameter Usage

all_runs	show_manual	show_ findings	Outcome
TRUE	TRUE	TRUE	All findings from auto advisor and manual tasks.
TRUE	TRUE	FALSE	All recommendations from auto advisor and manual tasks.
TRUE	FALSE	TRUE	All findings from auto advisor tasks.
TRUE	FALSE	FALSE	All recommendations from all auto advisor tasks.

Table 164-5 (Cont.) Parameter Usage

all_runs	show_manual	show_ findings	Outcome
FALSE	TRUE	TRUE	N/A
FALSE	TRUE	FALSE	N/A
FALSE	FALSE	TRUE	Findings for the latest auto advisor task.
FALSE	FALSE	FALSE	Recommendations from the latest auto advisor task.

164.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
   ddl             IN    VARCHAR2,
   used_bytes      OUT   NUMBER,
   alloc_bytes     OUT   NUMBER,
   plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

Table 164-6 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

164.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   avg_row_size       IN NUMBER,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   colinfos           IN CREATE_TABLE_COST_COLUMNS,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
   COL_TYPE   VARCHAR(200),
   COL_SIZE   NUMBER);
```

Parameters

Table 164-7 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
 ub NUMBER;
 ab NUMBER;
 cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

164.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
   segment_owner     IN  VARCHAR2,
   segment_name      IN  VARCHAR2,
   segment_type      IN  VARCHAR2,
```

```
   freelist_group_id IN  NUMBER,
   free_blks         OUT NUMBER,
   scan_limit        IN  NUMBER DEFAULT NULL,
   partition_name    IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 164-8 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

> **Note:**
>
> An error is raised if scan_limit is not a positive number.

164.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
   filename     IN     VARCHAR2,
   value        OUT    NUMBER);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 164-9 ISDATAFILEDROPPABLE_NAME Procedure Parameters

Parameter	Description
filename	Name of the file
value	Values: 0 if the file is not droppable, 1 if the file is droppable.

Examples

```
DECLARE   fname    VARCHAR2(100);   retval   NUMBER;BEGIN   SELECT file_name   INTO
fname   FROM dba_data_files   WHERE file_name like
'%empty%';DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,
retval);DBMS_OUTPUT.PUT_LINE(retval);END;/
```

164.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
   objowner     IN     VARCHAR2,
   objname      IN     VARCHAR2,
   partname     IN     VARCHAR2,
   objtype      IN     NUMBER)
  RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 164-10 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition

Table 164-10 (Cont.) OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objtype	Type of the object: • OBJECT_TYPE_TABLE constant positive := 1; • OBJECT_TYPE_NESTED_TABLE constant positive := 2; • OBJECT_TYPE_INDEX constant positive := 3; • OBJECT_TYPE_CLUSTER constant positive := 4; • OBJECT_TYPE_TABLE_PARTITION constant positive := 7; • OBJECT_TYPE_INDEX_PARTITION constant positive := 8; • OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; • OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; • OBJECT_TYPE_MV constant positive := 13; • OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
   segment_owner      VARCHAR2(100),
   segment_name       VARCHAR2(100),
   segment_type       VARCHAR2(100),
   tablespace_name    VARCHAR2(100),
   partition_name     VARCHAR2(100),
   lob_column_name    VARCHAR2(100));
```

Table 164-11 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

164.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
   object_owner           IN    VARCHAR2,
   object_name            IN    VARCHAR2,
   object_type            IN    VARCHAR2,
   partition_name         IN    VARCHAR2 DEFAULT NULL,
   start_time             IN    TIMESTAMP DEFAULT NULL,
   end_time               IN    TIMESTAMP DEFAULT NULL,
   interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
   skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',
   timeout_seconds        IN    NUMBER DEFAULT NULL,
   single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE')
 RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 164-12 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

Return Values

The object_growth_trend_row and object_growth_trend_table are used by the OBJECT_GROWTH_TREND table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
   timepoint      TIMESTAMP,
   space_usage    NUMBER,
   space_alloc    NUMBER,
   quality        VARCHAR(20));
```

Table 164-13 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space

Table 164-13 (Cont.) OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

164.3.8 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBs.

> **Note:**
>
> For LOB segments, the number of blocks that is returned from full_blocks and unformatted_blocks is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN  VARCHAR2,
   segment_name            IN  VARCHAR2,
   segment_type            IN  VARCHAR2,
   unformatted_blocks      OUT NUMBER,
   unformatted_bytes       OUT NUMBER,
   fs1_blocks              OUT NUMBER,
   fs1_bytes               OUT NUMBER,
   fs2_blocks              OUT NUMBER,
   fs2_bytes               OUT NUMBER,
   fs3_blocks              OUT NUMBER,
   fs3_bytes               OUT NUMBER,
   fs4_blocks              OUT NUMBER,
   fs4_bytes               OUT NUMBER,
   full_blocks             OUT NUMBER,
   full_bytes              OUT NUMBER,
   partition_name          IN  VARCHAR2 DEFAULT NULL);

DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN    VARCHAR2,
```

```
segment_name            IN    VARCHAR2,
segment_type            IN    VARCHAR2,
segment_size_blocks     OUT   NUMBER,
segment_size_bytes      OUT   NUMBER,
used_blocks             OUT   NUMBER,
used_bytes              OUT   NUMBER,
expired_blocks          OUT   NUMBER,
expired_bytes           OUT   NUMBER,
unexpired_blocks        OUT   NUMBER,
unexpired_bytes         OUT   NUMBER,
partition_name          IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 164-14 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
unformatted_blocks	For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment.
unformatted bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
ful1_blocks	The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment

Table 164-14 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                       'TABLE',
                       :unf, :unfb,
                       :fs1, :fs1b,
                       :fs2, :fs2b,
                       :fs3, :fs3b,
                       :fs4, :fs4b,
                       :full, :fullb);
end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

164.3.9 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
   segment_owner              IN  VARCHAR2,
   segment_name               IN  VARCHAR2,
   segment_type               IN  VARCHAR2,
   total_blocks               OUT NUMBER,
   total_bytes                OUT NUMBER,
   unused_blocks              OUT NUMBER,
   unused_bytes               OUT NUMBER,
   last_used_extent_file_id   OUT NUMBER,
   last_used_extent_block_id  OUT NUMBER,
   last_used_block            OUT NUMBER,
   partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 164-15 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
   :total_bytes,:unused_blocks, :unused_bytes, :lastextf,
   :last_extb, :lastusedblock);
```

165
DBMS_SPACE_ADMIN

The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- Security Model
- Constants
- Operational Notes
- Summary of DBMS_SPACE_ADMIN Subprograms

> **See Also:**
>
> *Oracle Database Administrator's Guide* for an example and description of using DBMS_SPACE_ADMIN.

165.1 DBMS_SPACE_ADMIN Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

165.2 DBMS_SPACE_ADMIN Constants

The DBMS_SPACE_ADMIN package provides constants that can be used for specifying parameter values.

Table 165-1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_VERIFY_EXTENTS	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
SEGMENT_VERIFY_EXTENTS_GLOBAL	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
SEGMENT_MARK_CORRUPT	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)

Table 165-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the block range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the block range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks high water mark (HWM)
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option

Table 165-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

165.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the SYSTEM tablespace, certain conditions must be met. These conditions are enforced by the TABLESPACE_MIGRATE_TO_LOCAL procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not SYSTEM.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

165.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the DBMS_SPACE_ADMIN subprograms and briefly describes them.

Table 165-2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure	Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces
ASSM_TABLESPACE_VERIFY Procedure	Verifies ASSM tablespaces
DROP_EMPTY_SEGMENTS Procedure	Drops segments from empty tables or table fragments and dependent objects
GET_SEGADV_ATTRIB Procedure	returns the values of attributes of DBSM_SPACE_ADMIN package
MATERIALIZE_DEFERRED_SEGMENTS Procedure	Materializes segments for tables and table fragments with deferred segment creation and their dependent objects
SEGMENT_CORRUPT Procedure	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure	Verifies the consistency of the extent map of the segment
SET_SEGADV_ATTRIB Procedure	Sets/changes the values of attributes of DBSM_SPACE_ADMIN package

Table 165-2 (Cont.) DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
TABLESPACE_FIX_BITMAPS Procedure	Marks the appropriate block range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STATES Procedure	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure	Migrates a locally managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure	Migrates a tablespace from dictionary-managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure	Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized

165.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN VARCHAR2,
   partition_name  IN VARCHAR2,
   verify_option   IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
   attrib          IN POSITIVE  DEFAULT NULL);
```

Parameters

Table 165-3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	Schema that owns the segment
segment_name	Name of the segment to be verified
segment_type	Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	One of the following options: • SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default) • SEGMENT_VERIFY_DEEP := 10. Performs deep verification • SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: • HWM_CHECK := 12. Checks whether high water mark information is accurate • BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header • SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate • EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps • DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks • EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment • BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_*process_ID*.trc to the location specified in the USER_DUMP_DEST initialization parameter.

165.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedures verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
   tablespace_name   IN VARCHAR2,
   ts_option         IN POSITIVE,
   segment_option    IN POSITIVE DEFAULT NULL);
```

Parameters

Table 165-4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
`tablespace_name`	Name of the tablespace to verify. The tablespace must be an ASSM tablespace.
`ts_option`	• `TS_VERIFY_BITMAPS` := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against `file$` and control file. • `TS_VERIFY_DEEP` := 20. This option is used to verify the file bitmaps as well perform checks on all the segments. • `TS_VERIFY_SEGMENTS` := 21. This option is used to invoke `SEGMENT_VERIFY` on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke `SEGMENT_VERIFY`.
`segment_option`	When `TS_VERIFY_SEGMENTS` is specified, `segment_option` can be one of the following: • `SEGMENT_VERIFY_BASIC` := 9 • `SEGMENT_VERIFY_DEEP` := 10 The value of `segment_option` is `NULL` when `TS_VERIFY_DEEP` or `TS_VERIFY_BITMAPS` is specified.

Usage Notes

- Using this procedure requires `SYSDBA` privileges.
- This procedure outputs a dump file named `sid_ora_`*`process_ID`*`.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

165.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedures drops segments from empty tables or table fragments and dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (
   schema_name       IN     VARCHAR2   DEFAULT NULL,
```

```
   table_name        IN     VARCHAR2   DEFAULT NULL,
   partition_name    IN     VARCHAR2   DEFAULT NULL);
```

Parameters

Table 165-5 DROP_EMPTY_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No schema_name is specified, in which case tables belonging to all schemas are scanned
- Both schema_name and table_name are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

165.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(
   attribute  IN  NUMBER,
   value      OUT NUMBER);
```

Parameters

Table 165-6 GET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: • COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. • COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.

Table 165-6 (Cont.) GET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
value	Supported values: • ATTR_ENABLE : 1 • ATTR_DISABLE : 0

165.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
   schema_name       IN     VARCHAR2   DEFAULT NULL,
   table_name        IN     VARCHAR2   DEFAULT NULL,
   partition_name    IN     VARCHAR2   DEFAULT NULL);
```

Parameters

Table 165-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No schema_name is specified, in which case tables belonging to all schemas are scanned
- Both schema_name and table_name are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

165.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    NUMBER,
   corrupt_option          IN    POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 165-8 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Usage Noes

You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

165.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    NUMBER);
```

Parameters

Table 165-9 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Usage Notes

- The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

165.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    NUMBER,
   dump_option             IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 165-10 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
dump_option	One of the following options: • SEGMENT_DUMP_EXTENT_MAP • SEGMENT_DUMP_BITMAP_SUMMARY

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

165.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    NUMBER,
   verify_option           IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 165-11 SEGMENT_VERIFY Procedure Parameters

Parameters	Description
`tablespace_name`	Name of tablespace in which segment resides
`header_relative_file`	Relative file number of segment header
`header_block`	Block number of segment header
`verify_option`	What kind of check to do: `SEGMENT_VERIFY_EXTENTS` or `SEGMENT_VERIFY_EXTENTS_GLOBAL`

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

165.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of `DBMS_SPACE_ADMIN` package.

Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB(
   attribute  IN  NUMBER,
   value      IN  NUMBER);
```

Parameters

Table 165-12 SET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
`attribute`	Supported attributes: • `COMP_ADVISOR` — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. • `COMP_LOB` — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
`value`	Supported values: • `ATTR_ENABLE : 1` • `ATTR_DISABLE : 0`

165.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   dbarange_relative_file  IN    POSITIVE,
   dbarange_begin_block    IN    POSITIVE,
   dbarange_end_block      IN    POSITIVE,
   fix_option              IN    POSITIVE);
```

Parameters

Table 165-13 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
`tablespace_name`	Name of tablespace

Table 165-13 (Cont.) TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
dbarange_relative_file	Relative file number of block range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	One of the following options: • TABLESPACE_EXTENT_MAKE_FREE • TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of TABLESPACE_EXTENT_MAKE_FREE marks the bits free in bitmaps. The BEGIN and END blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

165.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
   tablespace_name     IN    VARCHAR);
```

Parameters

Table 165-14 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments must be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

165.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
   tablespace_name         IN    VARCHAR2);
```

Parameter

Table 165-15 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

165.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
   tablespace_name     IN     VARCHAR2,
   unit_size           IN     POSITIVE DEFAULT NULL,
   rfno                IN     POSITIVE DEFAULT NULL);
```

Parameters

Table 165-16 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace to be migrated
unit_size	Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks
rfno	Relative File Number of the file where the bitmap blocks are placed

Usage Notes

- Before you migrate the SYSTEM tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the SYSTEM tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

> **See Also:**
>
> *Oracle Database Administrator's Guide*

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the MINIMUM EXTENT for the tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the unit_size calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

165.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   bitmap_relative_file    IN    POSITIVE   DEFAULT NULL,
   bitmap_block            IN    POSITIVE   DEFAULT NULL);
```

Parameters

Table 165-17 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

165.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
   tablespace_name         IN    VARCHAR2);
```

Parameters

Table 165-18 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

165.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
   tablespace_name    IN      VARCHAR2,
   filno              IN      POSITIVE,
   blkno              IN      POSITIVE);
```

Parameters

Table 165-19 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Description
tablespace_name	Name of tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination range

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the TABLESPACE_RELOCATE_BITMAPS command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the SYSTEM tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE  DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

> **Note:**
>
> The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

165.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
   tablespace_name         IN    VARCHAR2,
   verify_option           IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 165-20 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	One option is supported: TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

166
DBMS_SPD

The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- Overview
- Security Model
- Views
- Summary of DBMS_SPD Subprograms

> **See Also:**
>
> - DBMS_STATS
> - *Oracle Database SQL Tuning Guide* regarding SQL plan directives

166.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

166.2 DBMS_SPD Security Model

DBMS_SPD is an invoker-rights package. The invoker requires ADMINISTER SQL MANAGEMENT OBJECT privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

166.3 DBMS_SPD Views

The DBA view DBA_SQL_PLAN_DIRECTIVES shows all the directives created in the system and the view DBA_SQL_PLAN_DIR_OBJECTS displays the objects that are included in the directives.

166.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the DBMS_SPD package subprograms.

Table 166-1 DBMS_SPD Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_DIRECTIVE Procedure	Changes different attributes of a SQL plan directive
CREATE_STGTAB_DIRECTIVE Procedure	Creates a staging table into which to pack (export) SQL plan directives.
DROP_SQL_PLAN_DIRECTIVE Procedure	Drops a SQL plan directive
FLUSH_SQL_PLAN_DIRECTIVE Procedure	Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.
GET_PREFS Function	Gets the values for preferences for SQL plan directives
PACK_STGTAB_DIRECTIVE Function	Packs (exports) SQL plan directives into a staging table.
SET_PREFS Procedure	Allows the setting of different preferences for SQL plan directives
UNPACK_STGTAB_DIRECTIVE Function	Unpacks (imports) SQL plan directives from a staging table.

166.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
   directive_id        IN     NUMBER,
   attribute_name      IN     VARCHAR2,
   attribute_value     IN     VARCHAR2);
```

Parameters

Table 166-2 *ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
directive_id	SQL plan directive ID
attribute_name	• ENABLED • AUTO_DROP
attribute_value	Possible values: • ENABLED: - If YES directive is enabled and may be used - If NO directive is not enabled and will not be used • AUTO_DROP: - If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior. - If NO directive will not be dropped automatically

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.
- `ORA-13158 OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

166.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
   table_name         IN VARCHAR2,
   table_owner        IN VARCHAR2  := USER,
   tablespace_name    IN VARCHAR2  := NULL);
```

Parameters

Table 166-3 *CREATE_STGTAB_DIRECTIVE Procedure Parameters*

Parameter	Description
`table_name`	Name of staging table
`table_owner`	Name of schema owner of staging table. Default is current schema.
`tablespace_name`	Name of tablespace. Default `NULL` means create staging table in the default tablespace:

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.
- `ORA-44001 INVALID_SCHEMA`: The input schema does not exist.
- `ORA-13159 TABLE_ALREADY_EXISTS`: The specified table already exists.
- `ORA-29304 TABLESPACE_MISSING`: The specified tablespace does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

166.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (
   directive_id        IN     NUMBER);
```

Parameters

Table 166-4 *DROP_SQL_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
`directive_id`	SQL plan directive ID

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.
- `ORA-13158 OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);
END;
```

166.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

`ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

166.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```
DBMS_SPD.GET_PREFS (
   pname     IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 166-5 *GET_PREFS Function Parameters*

Parameter	Description
`pname`	Preference name. The procedure supports the preference `SPD_RETENTION_WEEKS`.

Return Values

Preference value

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.

Usage Notes

- The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.
- `SPD_RETENTION_WEEKS` - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

166.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
   table_name         IN VARCHAR2,
   table_owner        IN VARCHAR2  := USER
   directive_id       IN NUMBER    := NULL,
   obj_list           IN OBJECTTAB := NULL)
 RETURN NUMBER
```

Parameters

Table 166-6 *PACK_STGTAB_DIRECTIVE Function Parameters*

Parameter	Description
`table_name`	Name of staging table
`table_owner`	Name of schema owner of staging table. Default is current schema.
`directive_id`	SQL plan directive ID. Default `NULL` means all directives in the system.
`obj_list`	Used to filter the directives to be packed based on the objects used in directives. If `obj_list` is not `NULL`, a directive is packed only if all the objects in the directive exist in `obj_list`.

Return Values

Number of SQL plan directives packed.

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.
- `ORA-44001 INVALID_SCHEMA`: The input schema does not exist.
- `ORA-29304 INVALID_STGTAB`: The specified staging table is invalid or does not exist.
- `ORA-13158 OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
```

```
-- Pack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

166.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

```
DBMS_SPD.SET_PREFS (
   pname     IN   VARCHAR2,
   pvalue    IN   VARCHAR2);
```

Parameters

Table 166-7 *SET_PREFS Procedure Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.

Table 166-7 (Cont.) *SET_PREFS Procedure Parameters*

Parameter	Description
pvalue	Preference value. • SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

166.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
   table_name         IN VARCHAR2,
   table_owner        IN VARCHAR2  := USER,
   directive_id       IN NUMBER    := NULL,
   obj_list           IN OBJECTTAB := NULL)
 RETURN NUMBER
```

Parameters

Table 166-8 *UNPACK_STGTAB_DIRECTIVE Function Parameters*

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.

Table 166-8 (Cont.) *UNPACK_STGTAB_DIRECTIVE Function Parameters*

Parameter	Description
`directive_id`	SQL plan directive ID. Default `NULL` means all directives in the system.
`obj_list`	Used to filter the directives to be unpacked based on the objects used in directives. If `obj_list` is not `NULL`, a directive is unpacked only if all the objects in the directive exist in `obj_list`.

Return Values

Number of SQL plan directives unpacked.

Exceptions

- `ORA-38171 INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- `ORA-28104 INVALID_INPUT`: The input value is not valid.
- `ORA-44001 INVALID_SCHEMA`: The input schema does not exist.
- `ORA-29304 INVALID_STGTAB`: The specified staging table is invalid or does not exist.
- `ORA-13158 OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
begin
  my_list.extend(2);

  -- SALES table
```

```
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

167
DBMS_SPM

The DBMS_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Examples
- Data Structures
- Summary of DBMS_SPM Subprograms

> **See Also:**
>
> For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

167.1 DBMS_SPM Overview

The DBMS_SPM package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production

configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

167.2 DBMS_SPM Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

167.3 DBMS_SPM Constants

The DBMS_SPM package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the time_limit parameter of the EVOLVE_SQL_PLAN_BASELINE Function.

Table 167-1 DBMS_SPM Constants

Constant	Type	Value	Description
AUTO_LIMIT	INTEGER	2147483647	Oracle determines the appropriate time spent by the EVOLVE_SQL_PLAN_BASELINE Function.
NO_LIMIT	INTEGER	2147483647 -1	There is no limit to the time spent by the EVOLVE_SQL_PLAN_BASELINE Function.

167.4 DBMS_SPM Examples

These examples will help you understand use of DBMS_SPM.

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration

167.5 DBMS_SPM Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- DBMS_SPM NAMELIST Table Type

167.5.1 DBMS_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE  name_list  IS TABLE OF VARCHAR2(30);
```

167.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the `DBMS_SPM` package subprograms.

Table 167-2 DBMS_SPM Package Subprograms

Subprogram	Description
ACCEPT_SQL_PLAN_BASELINE Procedure	Accepts a plan based on the recommendation of an evolve task
ALTER_SQL_PLAN_BASELINE Function	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CANCEL_EVOLVE_TASK Procedure	Cancels a currently executing evolve task
CONFIGURE Procedure	Sets configuration options for SQL management base, in parameter/value format
CREATE_EVOLVE_TASK Function	Creates an advisor task and sets its parameters
CREATE_STGTAB_BASELINE Procedure	Creates a staging table that used for transporting SQL plan baselines from one system to another
DROP_EVOLVE_TASK Procedure	Drops an evolved task
DROP_SQL_PLAN_BASELINE Function	Drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function	Evolves SQL plan baselines associated with one or more SQL statements
EXECUTE_EVOLVE_TASK Function	Executes a previously created evolve task
IMPLEMENT_EVOLVE_TASK Function	Implements a plan based on the recommendation of an evolve task
INTERRUPT_EVOLVE_TASK Procedure	Interrupts a currently executing evolve task
LOAD_PLANS_FROM_CURSOR_CACHE Functions	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_AWR Function	Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded
LOAD_PLANS_FROM_SQLSET Function	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
MIGRATE_STORED_OUTLINE Functions	Migrates existing stored outlines to SQL plan baselines

Table 167-2 (Cont.) DBMS_SPM Package Subprograms

Subprogram	Description
PACK_STGTAB_BASELINE Function	Packs (exports) SQL plan baselines from SQL management base into a staging table
RESET_EVOLVE_TASK Procedure	Resets an evolve task to its initial state
RESUME_EVOLVE_TASK Procedure	Resumes a previously interrupted task
REPORT_AUTO_EVOLVE_TASK Function	Displays the results of an execution of an automatic evolve task.
REPORT_EVOLVE_TASK Function	Displays the results of an evolved task
SET_EVOLVE_TASK_PARAMETER Procedure	Sets a parameter of an evolve task
UNPACK_STGTAB_BASELINE Function	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

167.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE  (
   task_name       IN  VARCHAR2,
   object_id       IN  NUMBER    := NULL,
   task_owner      IN  VARCHAR2  := NULL,
   force           IN  BOOLEAN   := FALSE);
```

Parameters

Table 167-3 ACCEPT_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Identifier of task to implement
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
force	Accept the plan even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

167.6.2 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
   sql_handle        IN VARCHAR2 := NULL,
   plan_name         IN VARCHAR2 := NULL,
   attribute_name    IN VARCHAR2,
   attribute_value   IN VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 167-4 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 167-5 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30 characters
description	Plan description.	String of up to 500 bytes

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

167.6.3 CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK  (
   task_name        IN  VARCHAR2);
```

Parameters

Table 167-6 CANCEL_EVOLVE_TASK Procedure Parameters

Parameter	Description
`task_name`	Identifier of task to cancel

167.6.4 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax

```
DBMS_SPM.CONFIGURE (
   parameter_name    IN VARCHAR2,
   parameter_value   IN VARCHAR2 := NULL,
   allow             IN BOOLEAN := TRUE);
```

Parameters

Table 167-7 CONFIGURE Procedure Parameters

Parameter	Description
`parameter_name`	Name of parameter to set (see table below).
`parameter_value`	Value of parameter to use (see table below). The maximum length of `parameter_value` is 1000 characters.
`allow`	Whether to include (`true`) or exclude (`false`) matching SQL statements and plans for the`auto_capture_*` parameters. If null, then the procedure ignores the specified parameter.

Table 167-8 Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
auto_capture_action	Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.	Action name, for example, R%
auto_capture_module	Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Module name, for example, LOGGER
auto_capture_parsing_schema_name	Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Schema name, for example, HR
auto_capture_sql_text	Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Text of a SQL statement, for example, SELECT a%
auto_spm_evolve_task	Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans. The default value is OFF, which means the high-frequency SPM Evolve Advisor task is disabled. In this release, AUTO is equivalent to OFF. The value of allow is ignored. **Note:** See *Oracle Database Licensing Information User Manual* for details on which features are supported for different editions and services.	ON, OFF, AUTO
plan_retention_weeks	Number of weeks to retain unused plans before the database purges them. A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of allow is ignored.	5–523 (default is 53)

Table 167-8 (Cont.) Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base. The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of allow is ignored.	1–50 (default is 10)

Exceptions

Table 167-9 CONFIGURE Exceptions

Error Number	Description
ORA-38133	Invalid parameter name
ORA-38134	Invalid parameter value
ORA-38150	Not enough space for new filter
ORA-38151	Module name too long
ORA-38152	Action name too long
ORA-38304	Missing or invalid user name

Usage Notes

- When parameter_name is auto_capture_sql_text, the parameter_value is an automatic search filter. The filter uses the search pattern of LIKE *parameter_name* when allow=>true. The filter uses the pattern NOT LIKE *parameter_name* when allow=>false.

  For all other non-null parameter_name values, the search pattern depends on the allow setting. The parameter uses an equal sign (=) when allow=>true. The parameter uses a not-equal sign (<>) when allow=>false.

- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying auto_capture_sql_text to be '%TABLE1%', TRUE, and '%TABLE2%', FALSE will result in matching SQL text LIKE '%TABLE1%' and NOT LIKE '%TABLE2%'. The database uses these configuration settings only when the initialization parameter OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is set to TRUE.
- A null value for parameter_value removes the filter for parameter_name entirely. By using paramter_value=>'%' in combination with allow=FALSE, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The DBA_SQL_MANAGEMENT_CONFIG view shows the current filters.
- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).

- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any `LIKE` or `NOT LIKE` filters for the SQL text `select a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate `NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL__')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL__', 'FALSE');
```

167.6.5 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
   sql_handle     IN  VARCHAR2  := NULL,
   plan_name      IN  VARCHAR2  := NULL,
   time_limit     IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,
   task_name      IN  VARCHAR2  := NULL,
   description    IN  VARCHAR2  := NULL)
  RETURN VARCHAR2;

DBMS_SPM.CREATE_EVOLVE_TASK (
   plan_list      IN  DBMS_SPM.NAME_LIST,
   time_limit     IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,
```

```
  task_name     IN  VARCHAR2  := NULL,
  description   IN  VARCHAR2  := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 167-10 CREATE_EVOLVE_TASK Function Parameters

Parameter	Description
sql_handle	Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.
plan_list	List of plan names. The plans may belong to different SQL statements.
plan_name	Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.
time_limit	Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.
task_name	Evolve task name
description	Description of the task (maximum 256 characters)

Return Values

SQL evolve task unique name

167.6.6 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
   table_name        IN VARCHAR2,
   table_owner       IN VARCHAR2 := NULL,
   tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

Table 167-11 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
table_name	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
table_owner	Name of owner of the staging table. Default NULL means current schema is the table owner.

Table 167-11 (Cont.) CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

167.6.7 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK  (
   task_name        IN  VARCHAR2);
```

Parameters

Table 167-12 DROP_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to drop

167.6.8 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
   sql_handle     IN VARCHAR2 := NULL,
   plan_name      IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 167-13 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

Return Values

The number of plans dropped

167.6.9 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter verify = 'YES'), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter commit = 'YES').

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   sql_handle   IN VARCHAR2 := NULL,
   plan_name    IN VARCHAR2 := NULL,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   plan_list    IN DBMS_SPM.NAME_LIST,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;
```

Parameters

Table 167-14 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement identifier. Unless plan_name is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.
plan_name	Plan identifier. Default NULL means to consider all non- accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if sql_handle is NULL.
plan_list	A list of plan names. Each plan in the list can belong to same or different SQL statement.
time_limit	Time limit in number of minutes. This applies only if verify = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. • DBMS_SPM.AUTO_LIMIT (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. • DBMS_SPM.NO_LIMIT means there is no time limit. • A positive integer value represents a user specified time limit.
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. • 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan • 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans
commit	Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. • 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'. • 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

167.6.10 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK  (
   task_name        IN  VARCHAR2,
   execution_name   IN  VARCHAR2  := NULL,
   execution_desc   IN  VARCHAR2  := NULL);
 RETURN VARCHAR2;
```

Parameters

Table 167-15 EXECUTE_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Evolve task name
execution_name	Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.
execution_desc	Description of the execution (maximum 256 characters)

Return Values

Name of the new execution

167.6.11 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK  (
   task_name       IN  VARCHAR2,
   task_owner      IN  VARCHAR2  := NULL,
   execution_name  IN  VARCHAR2  := NULL,
   force           IN BOOLEAN    := FALSE)
 RETURN NUMBER;
```

Parameters

Table 167-16 IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.

Table 167-16 (Cont.) IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
force	Accept all plans even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

Return Values

The number of plans accepted

167.6.12 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK  (
   task_name        IN  VARCHAR2);
```

Parameters

Table 167-17 INTERRUPT_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to interrupt

167.6.13 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
   begin_snap      IN  NUMBER,
   end_snap        IN  NUMBER,
   basic_filter    IN  VARCHAR2 := NULL,
   fixed           IN  VARCHAR2 := 'NO',
   enabled         IN  VARCHAR2 := 'YES',
   commit_rows     IN  NUMBER := 1000)
 RETURN PLS_INTEGER;
```

Parameters

Table 167-18 LOAD_PLANS_FROM_AWR Function Parameters

Parameter	Description
begin_snap	Begin snapshot

Table 167-18 (Cont.) LOAD_PLANS_FROM_AWR Function Parameters

Parameter	Description
end_snap	End snapshot
basic_filter	SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.
fixed	Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.
enabled	Default 'YES' means the loaded plans will be considered by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit.
dbid	The DBID that is used for imported or PDB-level AWR data.

Usage Notes

Requires the Administer SQL Management Object privilege

> **See Also:**
>
> For information on the SQLSET_ROW objects, see SQLSET_ROW Object Type.

167.6.14 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_text          IN  CLOB,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_handle        IN  VARCHAR2,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   attribute_name   IN VARCHAR2,
   attribute_value  IN VARCHAR2,
   fixed            IN VARCHAR2 := 'NO',
   enabled          IN VARCHAR2 := 'YES')
  RETURN PLS_INTEGER;
```

Parameters

Table 167-19 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: • SQL_TEXT" • 'PARSING_SCHEMA_NAME' • 'MODULE' • 'ACTION'

Table 167-19 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

167.6.15 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sqlset_owner     IN  VARCHAR2 := NULL,
   basic_filter     IN  VARCHAR2 := NULL,
   fixed            IN  VARCHAR2 := 'NO',
   enabled          IN  VARCHAR2 := 'YES'
   commit_rows      IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 167-20 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.

Table 167-20 (Cont.) LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example basic_filter => 'sql_text like ''select /*LOAD_STS*/%''' or basic_filter => 'sql_id=''b62q7nc33gzwx'''.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

167.6.16 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
   attribute_name     IN  VARCHAR2,
   attribute_value    IN  CLOB,
   fixed              IN  VARCHAR2 := 'NO')
 RETURN CLOB;

DBMS_SPM.MIGRATE_STORED_OUTLINE (
   outln_list         IN  DBMS_SPM.NAME_LIST,
   fixed              IN  VARCHAR2 := 'NO')
 RETURN CLOB;
```

Parameters

Table 167-21 MIGRATE_STORED_OUTLINE Function Parameters

Parameter	Description
attribute_name	Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values: • outline_name • sql_text • category • all
attribute_value	Based on attribute_name, this can be: • Name of stored outline to be migrated • SQL text of stored outlines to be migrated • Category of stored outlines to be migrated • NULL if attribute_name is all
fixed	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
outln_list	List of outline names to be migrated

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to DEFAULT. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate all, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

167.6.17 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 167-22 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
table_owner	Name of staging table owner.Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

167.6.18 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK  (
   task_name        IN  VARCHAR2);
```

Parameters

Table 167-23 RESET_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to reset

167.6.19 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK  (
   task_name        IN  VARCHAR2);
```

Parameters

Table 167-24 RESUME_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to resume

167.6.20 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK  (
   type            IN  VARCHAR2  := TYPE_TEXT,
   level           IN  VARCHAR2  := LEVEL_TYPICAL,
   section         IN  VARCHAR2  := SECTION_ALL,
   object_id       IN  NUMBER    := NULL,
   execution_name  IN  VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 167-25 REPORT_AUTO_EVOLVE_TASK Function Parameters

Parameter	Description
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

167.6.21 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK  (
   task_name       IN  VARCHAR2,
   type            IN  VARCHAR2  := TYPE_TEXT,
   level           IN  VARCHAR2  := LEVEL_TYPICAL,
   section         IN  VARCHAR2  := SECTION_ALL,
   object_id       IN  NUMBER    := NULL,
   task_owner      IN  VARCHAR2  := NULL,
   execution_name  IN  VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 167-26 REPORT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

167.6.22 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a `VARCHAR2` or a `NUMBER`.

Syntax

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER  (
   task_name     IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  NUMBER);

DBMS_SPM.SET_EVOLVE_TASK_PARAMETER  (
   task_name     IN  VARCHAR2  := NULL,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2);
```

Parameters

Table 167-27 SET_EVOLVE_TASK_PARAMETER Procedure Parameters

Parameter	Description
`task_name`	Evolve task name
`parameter`	Name of the parameter to set (see following table)
`value`	Value of the parameter (see following table)

The following table describes parameters for the `SET_EVOLVE_TASK_PARAMETER` procedure.

Table 167-28 DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
`alternate_plan_source`	Determines which sources to search for additional plans: • `AUTO` (the database selects the source automatically) • `AUTOMATIC_WORKLOAD_REPOSITORY` • `CURSOR_CACHE` • `SQL_TUNING_SET` You can combine multiple values with the plus sign (+).	The default depends on whether the SPM Evolve Advisor task is automated or manual: • If automated, the default is `AUTO`. • If manual, the default is `CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY`.

Table 167-28 (Cont.) DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
`alternate_plan_baseline`	Determines which alternative plans should be loaded: • `AUTO` lets Autonomous Database choose whether to load plans for statements with or without baselines. • `EXISTING` loads alternate plans with for statements with existing baselines. • `NEW` loads alternative plans for statements without a baseline, in which case a new baseline is created. You can combine multiple values with the plus sign (+), as in `EXISTING+NEW`.	`EXISTING`
`alternate_plan_limit`	Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement).	The default depends on whether the SPM Evolve Advisor task is automated or manual: • If automated, the default is `UNLIMITED`. • If manual, the default is `10`.
`accept_plans`	Specifies whether to accept recommended plans automatically. When `ACCEPT_PLANS` is `true`, SQL plan management automatically accepts all plans recommended by the task. When `ACCEPT_PLANS` is `false`, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.	`true` (regardless of whether the advisor is run automatically or manually)
`time_limit`	Global time limit in seconds. This is the total time allowed for the task.	The default depends on whether the SPM Evolve Advisor task is automated or manual: • If automated, the default is `3600`. • If manual, the default is `2147483646`.

167.6.23 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 167-29 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner.Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive,% wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE','MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

168
DBMS_SQL

The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE Procedures supplied with the DBMS_SQL package.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes
- Examples
- Data Structures
- Summary of DBMS_SQL Subprograms

> **See Also:**
>
> For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference.*

168.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using DBMS_SQL. For tasks that require DBMS_SQL, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

> **See Also:**
>
> *Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

168.2 DBMS_SQL Security Model

`DBMS_SQL` is a `SYS`-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

> **See Also:**
>
> *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the IS_OPEN Function denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.

- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an `ORA-29470` error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, `1` and `2`.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

168.3 DBMS_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE Procedures`.

These constants are described in the following table.

Table 168-1 DBMS_SQL Constants

Name	Type	Value	Description
`V6`	`INTEGER`	`0`	Specifies Oracle database version 6 behavior
`NATIVE`	`INTEGER`	`1`	Specifies normal behavior for the database to which the program is connected
`V7`	`INTEGER`	`2`	Specifies Oracle database version 7 behavior
`FOREIGN_SYNTAX`	`INTEGER`	`4294967295`	Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set.

Related Topics

- PARSE Procedures
  This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

168.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the DEFINE_COLUMN Procedures, the DEFINE_COLUMN_LONG Procedure, or the DEFINE_ARRAY Procedure.
2. Run your `SELECT` statement by calling the EXECUTE Function.
3. Call the FETCH_ROWS Function (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call COLUMN_VALUE Procedure or COLUMN_VALUE_LONG Procedure to determine the value of a column retrieved by the FETCH_ROWS Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the EXECUTE Function.
2. If statements have the `returning` clause, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables.

Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the LAST_ERROR_POSITION Function immediately after calling one of the PARSE Procedures.

168.5 DBMS_SQL Execution Flow

These functions comprise the DBMS_SQL execution flow.

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY
4. DEFINE_COLUMN_ DEFINE_COLUMN_LONG_ or DEFINE_ARRAY
5. EXECUTE

6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, VARIABLE_PKG, COLUMN_VALUE or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

168.5.1 OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Functions, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

Related Topics

- OPEN_CURSOR Functions
  This function opens a new cursor.

168.5.2 PARSE

Every SQL statement must be parsed by calling the PARSE procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of `DBMS_SQL` is shown in Figure 168-1.

Figure 168-1 DBMS_SQL Execution Flow

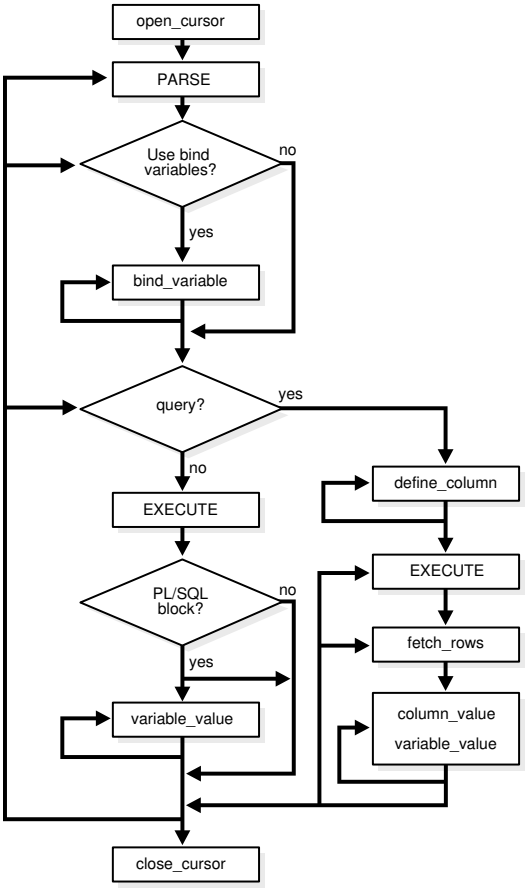

illustration: arpls008
release: 9
caption: DBMS_SQL Execution Flow
date: 7/31/01
platform: pc
ref: ADG8013

Related Topics

- PARSE Procedures
  This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

168.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the BIND_ARRAY Procedures, or BIND_VARIABLE Procedures, or the BIND_VARIABLE_PKG Procedure to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

168.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The DEFINE_COLUMN, DEFINE_COLUMN_LONG, and DEFINE_ARRAY procedures specify the variables that receive SELECT values on a query.

The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, or DEFINE_ARRAY Procedure) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG Procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

168.5.5 EXECUTE

Call the EXECUTE Function to run your SQL statement.

Related Topics

- EXECUTE Function
  This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

168.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The FETCH_ROWS Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling EXECUTE Function and then `FETCH_ROWS`, you may find it more efficient to call EXECUTE_AND_FETCH Function if you are calling `EXECUTE` for a single execution.

Related Topics

- FETCH_ROWS Function
  This function fetches a row from a given cursor.
- EXECUTE Function
  This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- EXECUTE_AND_FETCH Function
  This function executes the given cursor and fetches rows.

168.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the COLUMN_VALUE Procedure to determine the value of a column retrieved by the FETCH_ROWS Function.

For anonymous blocks containing calls to `PL/SQL` procedures or DML statements with `returning` clause, call the VARIABLE_VALUE Procedures or the VARIABLE_VALUE_PKG Procedure to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the DEFINE_COLUMN_LONG Procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

168.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the CLOSE_CURSOR Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

Related Topics

- CLOSE_CURSOR Procedure
  This procedure closes a given cursor.

168.6 DBMS_SQL Exceptions

This exception is raised by the `COLUMN_VALUE Procedure` or the `VARIABLE_VALUE Procedures` when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;
  pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- COLUMN_VALUE Procedure
  This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.
- VARIABLE_VALUE Procedures
  This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

168.7 DBMS_SQL Examples

These example procedures use the `DBMS_SQL` package.

Example : Using DBMS_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                   DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
```

```
   cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
   DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
   ret := DBMS_SQL.EXECUTE(cursor_name);
   DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id        of type NUMBER
name      of type VARCHAR2(30)
birthdate of type DATE
```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
     source      IN VARCHAR2,
     destination IN VARCHAR2) IS
     id_var              NUMBER;
     name_var            VARCHAR2(30);
     birthdate_var       DATE;
     source_cursor       INTEGER;
     destination_cursor INTEGER;
     ignore              INTEGER;
  BEGIN

  -- Prepare a cursor to select from the source table:
     source_cursor := dbms_sql.open_cursor;
     DBMS_SQL.PARSE(source_cursor,
         'SELECT id, name, birthdate FROM ' || source,
          DBMS_SQL.NATIVE);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
     ignore := DBMS_SQL.EXECUTE(source_cursor);

  -- Prepare a cursor to insert into the destination table:
```

```
    destination_cursor := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(destination_cursor,
                   'INSERT INTO ' || destination ||
                   ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
                    DBMS_SQL.NATIVE);

  -- Fetch a row from the source table and insert it into the destination table:
    LOOP
      IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
        -- get column values of the row
        DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
        DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
        DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

  -- Bind the row into the cursor that inserts into the destination table. You
  -- could alter this example to require the use of dynamic SQL by inserting an
  -- if condition before the bind.
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                                                                  birthdate_var);
       ignore := DBMS_SQL.EXECUTE(destination_cursor);
     ELSE

  -- No more rows to copy:
       EXIT;
     END IF;
   END LOOP;

  -- Commit and close all cursors:
    COMMIT;
    DBMS_SQL.CLOSE_CURSOR(source_cursor);
    DBMS_SQL.CLOSE_CURSOR(destination_cursor);
  EXCEPTION
    WHEN OTHERS THEN
      IF DBMS_SQL.IS_OPEN(source_cursor) THEN
        DBMS_SQL.CLOSE_CURSOR(source_cursor);
      END IF;
      IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
        DBMS_SQL.CLOSE_CURSOR(destination_cursor);
      END IF;
      RAISE;
  END;
/
```

Example 4: RETURNING clause

With this clause, `INSERT`, `UPDATE`, and `DELETE` statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use `DBMS_SQL.BIND_VARIABLE` to bind these outbinds. To get the values in these bind variables, call `DBMS_SQL.VARIABLE_VALUE`

> **Note:**
>
> This process is similar to `DBMS_SQL.VARIABLE_VALUE`, which must be called after running a PL/SQL block with an outbind inside `DBMS_SQL`.

i) Single-row insert

```
CREATE OR REPLACE PROCEDURE single_Row_insert
     (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
c NUMBER;
n NUMBER;
begin
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

ii) Single-row update

```
CREATE OR REPLACE PROCEDURE single_Row_update
     (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
                    'WHERE rownum < 2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

iii) Single-row delete

```
CREATE OR REPLACE PROCEDURE single_Row_Delete
     (c1 NUMBER, r OUT NUMBER) is
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
                'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

iv) Multiple-row insert

```
CREATE OR REPLACE PROCEDURE multi_Row_insert
     (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

v) Multiple-row update.

```
CREATE OR REPLACE PROCEDURE multi_Row_update
     (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

> **Note:**
>
> bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
     (c1 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
                    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
```

```
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

vii) outbind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
   (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

> **Note:**
>
> DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

```
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia',
dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
   some_dnames dnames_var;
   c      NUMBER;
   r      NUMBER;
   sql_stmt VARCHAR2(32767) :=
    'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
INTO :b3';

BEGIN

   c := DBMS_SQL.OPEN_CURSOR;

   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
```

```
   DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
   DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

   r := DBMS_SQL.EXECUTE(c);

   -- Get value of outbind variable
   DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

   -- select dept_names
   sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

   DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

   r := DBMS_SQL.EXECUTE_AND_FETCH(c);

   DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST  LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;
END;
/

DECLARE
  new_dnames dnames_var;
BEGIN
  new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                           'Executive', 'Marketing');
  update_depts(new_dnames, 'Asia');
END;
/
```

168.8 DBMS_SQL Data Structures

The DBMS_SQL package defines RECORD type and TABLE type data structures.

RECORD Types

- DBMS_SQL DESC_REC Record Type (deprecated)
- DBMS_SQL DESC_REC2 Record Type
- DBMS_SQL DESC_REC3 Record Type
- DBMS_SQL DESC_REC4 Record Type

TABLE Types for DESCRIBE_COLUMNS Procedures

- DBMS_SQL DESC_TAB Table Type

- DBMS_SQL DESC_TAB2 Table Type
- DBMS_SQL DESC_TAB3 Table Type
- DBMS_SQL DESC_TAB4 Table Type

TABLE Types For Scalar and LOB Collections

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

- DBMS_SQL BFILE_TABLE Table Type
- DBMS_SQL BINARY_DOUBLE_TABLE Table Type
- DBMS_SQL BINARY_FLOAT_TABLE Table Type
- DBMS_SQL BLOB_TABLE Table Type
- DBMS_SQL CLOB_TABLE Table Type
- DBMS_SQL DATE_TABLE Table Type
- DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type
- DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- DBMS_SQL JSON_TABLE Table Type
- DBMS_SQL NUMBER_TABLE Table Type
- DBMS_SQL TIME_TABLE Table Type
- DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type
- DBMS_SQL TIMESTAMP_TABLE Table Type
- DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type
- DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- DBMS_SQL UROWID_TABLE Table Type
- DBMS_SQL VARCHAR2_TABLE Table Type
- DBMS_SQL VARCHAR2A Table Type
- DBMS_SQL VARCHAR2S Table Type

168.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

> **Note:**
>
> This type has been deprecated in favor of the DESC_REC2 Record Type.

It is the element type of the `DESC_TAB` table type and the DESCRIBE_COLUMNS Procedure.

Syntax

```
TYPE desc_rec IS RECORD (
      col_type            BINARY_INTEGER := 0,
      col_max_len         BINARY_INTEGER := 0,
      col_name            VARCHAR2(32)   := '',
      col_name_len        BINARY_INTEGER := 0,
      col_schema_name     VARCHAR2(32)   := '',
      col_schema_name_len BINARY_INTEGER := 0,
      col_precision       BINARY_INTEGER := 0,
      col_scale           BINARY_INTEGER := 0,
      col_charsetid       BINARY_INTEGER := 0,
      col_charsetform     BINARY_INTEGER := 0,
      col_null_ok         BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

Table 168-2 DESC_REC Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

168.8.2 DBMS_SQL DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (
   col_type            binary_integer := 0,
   col_max_len         binary_integer := 0,
   col_name            varchar2(32767) := '',
   col_name_len        binary_integer := 0,
   col_schema_name     varchar2(32)   := '',
   col_schema_name_len binary_integer := 0,
```

```
   col_precision       binary_integer := 0,
   col_scale           binary_integer := 0,
   col_charsetid       binary_integer := 0,
   col_charsetform     binary_integer := 0,
   col_null_ok         boolean        := TRUE);
```

Fields

Table 168-3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

Related Topics

- DESCRIBE_COLUMNS2 Procedure
  This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

168.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD (
   col_type              binary_integer := 0,
   col_max_len           binary_integer := 0,
   col_name              varchar2(32767) := '',
   col_name_len          binary_integer := 0,
   col_schema_name       varchar2(32) := '',
   col_schema_name_len   binary_integer := 0,
   col_precision         binary_integer := 0,
   col_scale             binary_integer := 0,
```

```
   col_charsetid          binary_integer := 0,
   col_charsetform        binary_integer := 0,
   col_null_ok            boolean := TRUE,
   col_type_name          varchar2(32767)   := '',
   col_type_name_len      binary_integer := 0);
```

Fields

Table 168-4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

Related Topics

- DESCRIBE_COLUMNS3 Procedure
  This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

168.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

Syntax

```
TYPE desc_rec4 IS RECORD (
   col_type               binary_integer := 0,
   col_max_len            binary_integer := 0,
   col_name               varchar2(32767) := '',
   col_name_len           binary_integer := 0,
   col_schema_name        DBMS_ID := '',
   col_schema_name_len    binary_integer := 0,
   col_precision          binary_integer := 0,
```

```
col_scale             binary_integer := 0,
col_charsetid         binary_integer := 0,
col_charsetform       binary_integer := 0,
col_null_ok           boolean := TRUE,
col_type_name         DBMS_ID   := '',
col_type_name_len     binary_integer := 0);
```

> **See Also:**
>
> *Oracle Database PL/SQL Language Reference* for more information about the predefined subtype DBMS_ID.

Fields

Table 168-5 DESC_REC4 Fields

Field	Description
`col_type`	Type of column
`col_max_len`	Maximum column length
`col_name`	Name of column
`col_name_len`	Length of column name
`col_schema_name`	Column schema name
`col_schema_name_len`	Length of column schema name
`col_precision`	Precision of column
`col_scale`	Scale of column
`col_charsetid`	Column character set ID
`col_charsetform`	Column character set form
`col_null_ok`	`NULL` column flag; `TRUE`, if `NULL` possible
`col_type_name`	User-define type column type name, this field is valid when `col_type` is 109
`col_type_name_len`	Length of user-define type column type name, this field is valid when `col_type` is 109

Related Topics

- DESCRIBE_COLUMNS3 Procedure
  This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

168.8.5 DBMS_SQL BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

168.8.6 DBMS_SQL BINARY_DOUBLE_TABLE Table Type

This is a table of `BINARY_DOUBLE`.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

168.8.7 DBMS_SQL BINARY_FLOAT_TABLE Table Type

This is a table of `BINARY_FLOAT`.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

168.8.8 DBMS_SQL BLOB_TABLE Table Type

This is a table of `BLOB`.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

168.8.9 DBMS_SQL CLOB_TABLE Table Type

This is a table of `CLOB`.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

168.8.10 DBMS_SQL DATE_TABLE Table Type

This is a table of `DATE`.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

168.8.11 DBMS_SQL DESC_TAB Table Type

This is a table of `DESC_REC Record Type`.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Related Topics

- DBMS_SQL DESC_REC Record Type
  This record type holds the describe information for a single column in a dynamic query.

168.8.12 DBMS_SQL DESC_TAB2 Table Type

This is a table of `DESC_REC2 Record Type`.

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

Related Topics

- DBMS_SQL DESC_REC2 Record Type
  `DESC_REC2` is the element type of the `DESC_TAB2` table type and the `DESCRIBE_COLUMNS2` Procedure.

168.8.13 DBMS_SQL DESC_TAB3 Table Type

This is a table of `DESC_REC3` Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

Related Topics

- DBMS_SQL DESC_REC3 Record Type
  `DESC_REC3` is the element type of the `DESC_TAB3` table type and the `DESCRIBE_COLUMNS3 Procedure`.

168.8.14 DBMS_SQL DESC_TAB4 Table Type

This is a table of DBMS_SQL DESC_REC4 Record Type.

Syntax

```
TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;
```

Related Topics

- DBMS_SQL DESC_REC4 Record Type
  `DESC_REC4` is the element type of the `DESC_TAB4` table type and the DESCRIBE_COLUMNS3 Procedure.

168.8.15 DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of `DSINTERVAL_UNCONSTRAINED`.

Syntax

```
 TYPE interval_day_to_second_Table IS TABLE OF
    DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

168.8.16 DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of YMINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;
```

168.8.17 DBMS_SQL JSON_TABLE Table Type

This is a table of JSON.

Syntax

```
TYPE JSON_TABLE IS TABLE OF JSON INDEX BY BINARY_INTEGER;
```

Related Topics

- BIND_ARRAY Procedures
- COLUMN_VALUE Procedure

168.8.18 DBMS_SQL NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

168.8.19 DBMS_SQL TIME_TABLE Table Type

This is a table of TIME_UNCONSTRAINED.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

168.8.20 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIME_TZ_UNCONSTRAINED.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;;
```

168.8.21 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

168.8.22 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

168.8.23 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

168.8.24 DBMS_SQL UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

168.8.25 DBMS_SQL VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

168.8.26 DBMS_SQL VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

168.8.27 DBMS_SQL VARCHAR2S Table Type

This is table of `VARCHAR2(256)`.

> **Note:**
>
> This type has been superseded by the VARCHAR2A Table Type. Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

168.9 Summary of DBMS_SQL Subprograms

This table lists the `DBMS_SQL` subprograms and briefly describes them.

Table 168-6 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures	Binds a given value to a given collection.
BIND_VARIABLE Procedures	Binds a given value to a given variable.
BIND_VARIABLE_PKG Procedure	Binds a given value to a given package variable.
CLOSE_CURSOR Procedure	Closes given cursor and frees memory.
COLUMN_VALUE Procedure	Returns value of the cursor element for a given position in a cursor.
COLUMN_VALUE_LONG Procedure	Returns a selected part of a `LONG` column, that has been defined using `DEFINE_COLUMN_LONG`.
DEFINE_ARRAY Procedure	Defines a collection to be selected from the given cursor, used only with `SELECT` statements.
DEFINE_COLUMN Procedures	Defines a column to be selected from the given cursor, used only with `SELECT` statements.
DEFINE_COLUMN_CHAR Procedure	Defines a column of type `CHAR` to be selected from the given cursor, used only with `SELECT` statements.
DEFINE_COLUMN_LONG Procedure	Defines a `LONG` column to be selected from the given cursor, used only with `SELECT` statements.
DEFINE_COLUMN_RAW Procedure	Defines a column of type `RAW` to be selected from the given cursor, used only with `SELECT` statements.
DEFINE_COLUMN_ROWID Procedure	Defines a column of type `ROWID` to be selected from the given cursor, used only with `SELECT` statements.
DESCRIBE_COLUMNS Procedure	Describes the columns for a cursor opened and parsed through `DBMS_SQL`.
DESCRIBE_COLUMNS2 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure.

Table 168-6 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
DESCRIBE_COLUMNS3 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure.
EXECUTE Function	Executes a given cursor.
EXECUTE_AND_FETCH Function	Executes a given cursor and fetch rows.
FETCH_ROWS Function	Fetches a row from a given cursor.
GET_NEXT_RESULT Procedures	Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.
IS_OPEN Function	Returns TRUE if given cursor is open.
LAST_ERROR_POSITION Function	Returns byte offset in the SQL statement text where the error occurred.
LAST_ROW_COUNT Function	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function	Returns ROWID of last row processed.
LAST_SQL_FUNCTION_CODE Function	Returns SQL function code for statement.
OPEN_CURSOR Functions	Returns cursor ID number of new cursor.
PARSE Procedures	Parses given statement.
RETURN_RESULT Procedures	Returns the result of an executed statement to the client application.
TO_CURSOR_NUMBER Function	Takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.
TO_REFCURSOR Function	Takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.
VARIABLE_VALUE Procedures	Returns value of named variable for given cursor.
VARIABLE_VALUE_PKG Procedure	Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification.

168.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
   c                  IN INTEGER,
   name               IN VARCHAR2,
   <table_variable>   IN <datatype>
 [,index1             IN INTEGER,
   index2             IN INTEGER)] );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
clob_tab     Clob_Table
bflt_tab     Binary_Float_Table
bdbl_tab     Binary_Double_Table
blob_tab     Blob_Table
bfile_tab    Bfile_Table
date_tab     Date_Table
j_tab        Json_Table
num_tab      Number_Table
urowid_tab   Urowid_Table
vchr2_tab    Varchar2_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_ltz_Table
tstz_tab     Timestamp_With_Time_Zone_Table
ids_tab      Interval_Day_To_Second_Table
iym_tab      Interval_Year_To_Month_Table
```

Notice that the BIND_ARRAY procedure is overloaded to accept different datatype.

Parameters

Table 168-7 BIND_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
table_variable	Local variable that has been declared as <datatype>.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

Usage Notes

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS_SQL package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local `DBMS_SQL` buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in `DBMS_SQL`.

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE json_table     IS TABLE OF JSON           INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                    IS TABLE OF timestamp_ltz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                    IS TABLE OF timestamp_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

Example 168-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements `INSERT`, `UPDATE` and `DELETE`.

Here is an example of a bulk `INSERT` statement that demonstrates adding seven new employees to the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array      DBMS_SQL.NUMBER_TABLE;
  empname_array    DBMS_SQL.VARCHAR2_TABLE;
  jobs_array       DBMS_SQL.VARCHAR2_TABLE;
  mgr_array        DBMS_SQL.NUMBER_TABLE;
  hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
  sal_array        DBMS_SQL.NUMBER_TABLE;
  comm_array       DBMS_SQL.NUMBER_TABLE;
  deptno_array     DBMS_SQL.NUMBER_TABLE;
  c                NUMBER;
  dummy            NUMBER;
BEGIN
  empno_array(1):= 9001;
  empno_array(2):= 9002;
  empno_array(3):= 9003;
  empno_array(4):= 9004;
  empno_array(5):= 9005;
  empno_array(6):= 9006;
  empno_array(7):= 9007;

  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';

  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
  jobs_array(5) := 'Miner';
  jobs_array(6) := 'Miner';
  jobs_array(7) := 'Miner';

  mgr_array(1) := 9003;
  mgr_array(2) := 9003;
  mgr_array(3) := 9003;
  mgr_array(4) := 9003;
  mgr_array(5) := 9003;
  mgr_array(6) := 9003;
  mgr_array(7) := 9003;

  hiredate_array(1) := '06-DEC-2006';
  hiredate_array(2) := '06-DEC-2006';
  hiredate_array(3) := '06-DEC-2006';
  hiredate_array(4) := '06-DEC-2006';
  hiredate_array(5) := '06-DEC-2006';
  hiredate_array(6) := '06-DEC-2006';
  hiredate_array(7) := '06-DEC-2006';

  sal_array(1):= 1000;
  sal_array(2):= 1000;
  sal_array(3):= 1000;
  sal_array(4):= 1000;
  sal_array(5):= 1000;
```

```
  sal_array(6):= 1000;
  sal_array(7):= 1000;

  comm_array(1):= 0;
  comm_array(2):= 0;
  comm_array(3):= 0;
  comm_array(4):= 0;
  comm_array(5):= 0;
  comm_array(6):= 0;
  comm_array(7):= 0;

  deptno_array(1):= 11;
  deptno_array(2):= 11;
  deptno_array(3):= 11;
  deptno_array(4):= 11;
  deptno_array(5):= 11;
  deptno_array(6):= 11;
  deptno_array(7):= 11;

  stmt := 'INSERT INTO emp VALUES(
     :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
     :sal_array, :comm_array, :deptno_array)';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
  DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
  DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
  DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
  DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
  DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
  DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);
  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```

Here is an example of a bulk `UPDATE` statement that demonstrates updating salaries for four existing employees in the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array     DBMS_SQL.NUMBER_TABLE;
  salary_array    DBMS_SQL.NUMBER_TABLE;
  c               NUMBER;
  dummy           NUMBER;
BEGIN

  empno_array(1):= 7369;
  empno_array(2):= 7876;
  empno_array(3):= 7900;
  empno_array(4):= 7934;

  salary_array(1) := 10000;
```

```
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;

  stmt := 'update emp set sal = :salary_array
    WHERE empno = :num_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In a `DELETE` statement, for example, you could bind an array in the `WHERE` clause and have the statement be run for each element in the array:

```
DECLARE
  stmt VARCHAR2(200);
  dept_no_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
begin
  dept_no_array(1) := 10; dept_no_array(2) := 20;
  dept_no_array(3) := 30; dept_no_array(4) := 40;
  dept_no_array(5) := 30; dept_no_array(6) := 40;
  stmt := 'delete from emp where deptno = :dept_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

168.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED
```

Notice that `BIND_VARIABLE` is overloaded to accept different datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets [] indicate an optional parameter for the `BIND_VARIABLE` procedure.

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_RAW (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN RAW [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_ROWID (
```

```
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN ROWID);
```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 168-8 BIND_VARIABLE Procedures Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the variable in the statement. The length of the bind variable name must be <=30 bytes.
value	Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);

or

BIND_VARIABLE (cursor_name, 'X', 3500);
```

168.9.3 BIND_VARIABLE_PKG Procedure

This procedures binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN <datatype>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Table 168-9 BIND_VARIABLE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable in the statement for which you are retrieving the value.
value	• Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE_PKG. • Array option: Local variable that has been declared <table_type>

Example 168-2 Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The BIND_VARIABLE_PKG is used to bind the variable v1 in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
   TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
   TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
   TYPE trect IS TABLE OF NUMBER;
   TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
  dummy NUMBER;
  cur   NUMBER;
  v1 ty_pkg.trec;
  str VARCHAR2(3000);
  n1 NUMBER;
  n2 NUMBER;
BEGIN
  FOR i in 1..3 LOOP
     v1(i).n1 := i*10;
     v1(i).n2 := i*20;
  END LOOP;
  str := 'SELECT * FROM TABLE(:v1)' ;
  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
```

```
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
  dummy := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
  DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

  LOOP
    IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
      -- get column values of the row
       DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
       DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
       DBMS_OUTPUT.PUT_LINE('n1 = '||n1||' n2 = '||n2);
    ELSE
      -- No more rows
       EXIT;
    END IF;
  END LOOP;
  DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60
```

168.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
   c    IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 168-10 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

168.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
   c                IN  INTEGER,
   position         IN  INTEGER,
   value            OUT <datatype>
 [,column_error     OUT NUMBER]
 [,actual_length    OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and `<datatype>` can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT CHAR CHARACTER SET ANY_CS
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_RAW (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT RAW
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_ROWID (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT ROWID
```

```
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
   c                IN             INTEGER,
   position         IN             INTEGER,
   <param_name>     IN OUT NOCOPY  <table_type>);
```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```
bdbl_tab     Binary_Double_Table
bflt_tab     Binary_Float_Table
bf_tab       Bfile_Table
bl_tab       Blob_Table
cl_tab       Clob_Table
d_tab        Date_Table
ids_tab      Interval_Day_To_Second_Table
iym_tab      Interval_Year_To_Month_Table
j_tab        Json_table
n_tab        Number_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_ltz_Table
tstz_tab     Timestamp_With_Time_Zone_Table
ur_tab       Urowid_Table
c_tab        Varchar2_Table
```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 168-11 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to DEFINE_COLUMN.
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 168-12 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.

Table 168-12 (Cont.) COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

168.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
   c            IN  INTEGER,
   position     IN  INTEGER,
   length       IN  INTEGER,
   offset       IN  INTEGER,
   value        OUT VARCHAR2,
   value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

Table 168-13 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

168.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE json_table     IS TABLE OF JSON           INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                    IS TABLE OF timestamp_ltz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                    IS TABLE OF timestamp_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

Syntax

```
DBMS_SQL.DEFINE_ARRAY (
   c           IN INTEGER,
   position    IN INTEGER,
   <table_variable>    IN <datatype>
   cnt         IN INTEGER,
   lower_bnd   IN INTEGER);
```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

```
clob_tab     Clob_Table
bflt_tab     Binary_Float_Table
bdbl_tab     Binary_Double_Table
blob_tab     Blob_Table
bfile_tab    Bfile_Table
date_tab     Date_Table
j_tab        Json_Table
num_tab      Number_Table
urowid_tab   Urowid_Table
vchr2_tab    Varchar2_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_ltz_Table
tstz_tab     Timestamp_With_Time_Zone_Table
ids_tab      Interval_Day_To_Second_Table
iym_tab      Interval_Year_To_Month_Table
```

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions lower_bnd, lower_bnd+1, lower_bnd+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/ COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

Table 168-14 DEFINE_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind an array.
position	Relative position of the column in the array being defined. The first column in a statement has position 1.
table_variable	Local variable that has been declared as <datatype>.
cnt	Number of rows that must be fetched.
lower_bnd	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bnd can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
    TYPE sallist IS TABLE OF employees.salary%TYPE;
```

```
    names    namelist;
    sals     sallist;
    c        NUMBER;
    r        NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

    r := DBMS_SQL.EXECUTE(c);

    LOOP
      r := DBMS_SQL.FETCH_ROWS(c);
      DBMS_SQL.COLUMN_VALUE(c, 1, names);
      DBMS_SQL.COLUMN_VALUE(c, 2, sals);
      EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST  LOOP
      DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/
```

Example 168-3 Example: Defining an Array

The following examples show how to use the DEFINE_ARRAY procedure:

```
declare
  c       NUMBER;
  d       NUMBER;
  n_tab   DBMS_SQL.NUMBER_TABLE;
  indx    NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
```

```
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

Each time the preceding example calls FETCH_ROWS Function, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure is called, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE time and is updated every time COLUMN_VALUE is called. If you reexecute at any point, then the current index for each DEFINE is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
DECLARE
  c       NUMBER;
  d       NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  d_tab1 DBMS_SQL.DATE_TABLE;
  v_tab  DBMS_SQL.VARCHAR2_TABLE;
  d_tab2 DBMS_SQL.DATE_TABLE;
  indx NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  LOOP
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);
```

```
    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

/*
```

The four tables can be used for anything. One usage might be to use `BIND_ARRAY` to move the rows to another table by using a statement such as 'INSERT into SOME_T values (:a, :b, :c, :d);

```
*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

168.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
```

```
REFs
Opaque types
```

Note that DEFINE_COLUMN is overloaded to accept different datatypes.

The following syntax is also supported for the DEFINE_COLUMN procedure:

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN VARCHAR2 CHARACTER SET ANY_CS,
   column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-15 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of type VARCHAR2.

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: column_size * maximum character byte size for the current character set. For example, specifying the column_size as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

168.9.9 DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
   c              IN INTEGER,
   position       IN INTEGER,
```

```
   column         IN CHAR CHARACTER SET ANY_CS,
   column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-16 DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

168.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
   c              IN INTEGER,
   position       IN INTEGER);
```

Parameters

Table 168-17 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

168.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor.

This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN RAW,
   column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-18 DEFINE_COLUMN_RAW Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of RAW type.

168.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_RAW Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 168-19 DEFINE_COLUMN_ROWID Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

168.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
   c             IN  INTEGER,
   col_cnt       OUT INTEGER,
   desc_t        OUT DESC_TAB);
```

Parameters

Table 168-20 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

Example 168-4 Describe Columns

This code can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt     INTEGER;
  f           BOOLEAN;
  rec_tab     DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type            =    ' || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen          =    ' || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name            =    ' || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len        =    ' || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name     =    ' || rec.col_schema_name);
```

```
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len =    ' ||
rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision       =    ' ||
rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale           =    ' || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok         =    ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

  d := DBMS_SQL.EXECUTE(c);

  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
    END LOOP;
  END IF;

  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

168.9.14 DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (
   c             IN  INTEGER,
   col_cnt       OUT INTEGER,
   desc_t        OUT DESC_TAB2);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 168-21 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Related Topics

- DESCRIBE_COLUMNS Procedure
  This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

168.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB3);

BMS_SQL.DESCRIBE_COLUMNS3 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB4);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 168-22 DESCRIBE_COLUMNS3 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENed and PARSEd, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
      ( projname          VARCHAR2(20),
        mgr               VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab    DBMS_SQL.DESC_TAB3;
  colcnt     NUMBER;
  sql_stmt   VARCHAR2(200) := 'select * from projecttab';
BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
      IF desctab(i).col_type = 109 THEN
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                             desctab(i).col_type_name);
      END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T
```

Related Topics

- DESCRIBE_COLUMNS Procedure
  This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

168.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

The return value is only valid for `INSERT`, `UPDATE`, and `DELETE` statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```
DBMS_SQL.EXECUTE (
   c   IN INTEGER)
  RETURN INTEGER;
```

Parameters

Table 168-23 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

Return Values

Returns number of rows processed

Usage Notes

The DBMS_SQL cursor that is returned by the TO_CURSOR_NUMBER Function performs in the same way as a DBMS_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.

168.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
   c              IN INTEGER,
   exact          IN BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

Table 168-24 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
c	ID number of the cursor to execute and fetch.
exact	Set to TRUE to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch TRUE option with LONG columns. Even if an exception is raised, the rows are still fetched and available.

Return Values

Returns designated rows

168.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
   c              IN INTEGER)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 168-25 FETCH_ROWS Function Parameters

Parameter	Description
c	ID number.

Return Values

Returns a row from a given cursor

168.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the RETURN_RESULT Procedures.

Syntax

```
DBMS_SQL.GET_NEXT_RESULT(
   c            IN          INTEGER,
   rc           OUT         SYS_REFCURSOR);

DBMS_SQL.GET_NEXT_RESULT(
   c            IN          INTEGER,
   rc           OUT         INTEGER);
```

Parameters

Table 168-26 GET_NEXT_RESULT Procedure Parameters

Parameter	Description
c	Recursive statement cursor
rc	Cursor or ref cursor of the statement of the next returned result

Exceptions

`ORA-01403 no_data_found`: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

```
DECLARE
  c  INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c                  => c,
                 statement          => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
    LOOP
      FETCH rc INTO ...
      ...
    END LOOP;
  END LOOP;
END;
```

168.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```
DBMS_SQL.IS_OPEN (
   c              IN INTEGER)
  RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 168-27 IS_OPEN Function Parameters

Parameter	Description
C	Cursor ID number of the cursor to check.

Return Values

Returns TRUE for any cursor number that has been opened but not closed, and FALSE for a NULL cursor number. Note that the CLOSE_CURSOR Procedure Procedure NULLs out the cursor variable passed to it.

Exceptions

ORA-29471 DBMS_SQL access denied: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.

168.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.

168.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

168.9.23 LAST_ROW_ID Function

This function returns the `ROWID` of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID
   RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the `ROWID` of the last row processed

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

168.9.24 LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide.*

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

168.9.25 OPEN_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (
   treat_as_client_for_results    IN     BOOLEAN    DEFAULT FALSE)
  RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
   security_level                 IN     INTEGER,
   treat_as_client_for_results    IN     BOOLEAN    DEFAULT FALSE)
  RETURN INTEGER;
```

Parameters

Table 168-28 OPEN_CURSOR Function Parameters

Parameter	Description
`security_level`	Specifies the level of security protection to enforce on the opened cursor. Valid security level values are `0`, `1`, and `2`. When a `NULL` argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the `security_level` parameter, the default security level value `1` will be enforced on the opened cursor. • `Level 0` - allows all `DBMS_SQL` operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. • `Level 1` - requires that the referenced container, effective userid, and roles of the caller to `DBMS_SQL` for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. • `Level 2` - requires that the referenced container, effective userid, and roles of the caller to `DBMS_SQL` for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.
`treat_as_client_for results`	Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the CLOSE_CURSOR Procedure.
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

168.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the `PARSE` procedure:

- Taking a `VARCHAR2` statement as an argument
- Taking a segmented string, one taking `VARCHAR2A`, a `TABLE OF VARCHAR2(32767)`, and another, taking `VARCHAR2S`, a `TABLE OF VARCHAR2(256)`, as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single `VARCHAR2` variable by splitting up the statement.
- Taking a `CLOB` statement as an argument. You can use the `CLOB` overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
   c                            IN   INTEGER,
   statement                    IN   VARCHAR2,
   language_flag                IN   INTEGER[
 [,edition                      IN   VARCHAR2 DEFAULT NULL],
   apply_crossedition_trigger   IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger           IN   BOOLEAN DEFAULT TRUE]
 [,schema                       IN   VARCHAR2 DEFAULT NULL]
 [,container                    IN   VARCHAR2)];

DBMS_SQL.PARSE (
   c                            IN   INTEGER,
   statement                    IN   CLOB,
   language_flag                IN   INTEGER[
 [,edition                      IN   VARCHAR2 DEFAULT NULL],
   apply_crossedition_trigger   IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger           IN   BOOLEAN DEFAULT TRUE]
 [,schema                       IN   VARCHAR2 DEFAULT NULL]
 [,container                    IN   VARCHAR2)];

DBMS_SQL.PARSE (
   c                            IN   INTEGER,
   statement                    IN   VARCHAR2A,
```

```
   lb                          IN   INTEGER,
   ub                          IN   INTEGER,
   lfflg                       IN   BOOLEAN,
   language_flag               IN   INTEGER[
 [,edition                     IN   VARCHAR2 DEFAULT NULL],
   apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]
 [,schema                      IN   VARCHAR2 DEFAULT NULL]
 [,container                   IN   VARCHAR2)];

DBMS_SQL.PARSE (
   c                           IN   INTEGER,
   statement                   IN   VARCHAR2s,
   lb                          IN   INTEGER,
   ub                          IN   INTEGER,
   lfflg                       IN   BOOLEAN,
   language_flag               IN   INTEGER[
 [,edition                     IN   VARCHAR2 DEFAULT NULL],
   apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]
 [,schema                      IN   VARCHAR2 DEFAULT NULL]
 [,container                   IN   VARCHAR2)];
```

Parameters

Table 168-29 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example: DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants
edition	Specifies the edition in which to run the statement under the following conditions: • If NULL and container is NULL, the statement will be run in the current edition. • If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition. • Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition. The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.

Table 168-29 (Cont.) PARSE Procedure Parameters

Parameter	Description
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement.If a non-NULL value is specified, the specified crossedition trigger will be executed assuming fire_apply_trigger is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's dml_event_clause, any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed.The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the apply_crossedition_trigger would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The apply_crossedition_trigger and fire_apply_trigger parameters are ignored if the statement is not a DML.
schema	Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.
container	Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

  For example, the following code does *not* compile on the client:

  ```
  DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
  DBMS_SQL.NATIVE
  ```

  The following code works on the client, because the argument is explicitly provided:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```

- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload.
- If the container parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the PL/SQL unit is still created.

168.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
   rc           IN OUT      SYS_REFCURSOR,
   to_client    IN          BOOLEAN           DEFAULT TRUE);

DBMS_SQL.RETURN_RESULT(
   rc           IN OUT      INTEGER,
   to_client    IN          BOOLEAN           DEFAULT TRUE);
```

Parameters

Table 168-30 RETURN_RESULT Procedure Parameters

Parameter	Description
rc	Statement cursor or ref cursor
to_client	Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because `EXECUTE IMMEDIATE` statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the `EXECUTE IMMEDIATE` statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use `DBMS_SQL` to execute the recursive statement.

Examples

```
CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

168.9.28 TO_CURSOR_NUMBER Function

This function takes an `OPEN`ed strongly or weakly-typed ref cursor and transforms it into a `DBMS_SQL` cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
   rc IN OUT SYS_REFCURSOR)
  RETURN INTEGER;
```

Parameters

Table 168-31 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
`rc`	`REF CURSOR` to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a `REF CURSOR`

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  desctab         DBMS_SQL.DESC_TAB;
  colcnt          NUMBER;
  namevar         VARCHAR2(50);
  numvar          NUMBER;
  datevar         DATE;
  empno           NUMBER := 100;
BEGIN

    -- sql_stmt := 'select ..... from employees where employee_id = :b1';
    OPEN src_cur FOR sql_stmt USING empno;

    -- Switch from native dynamic SQL to DBMS_SQL
    curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

    DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

    -- Define columns
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 2 THEN
           DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
        ELSIF desctab(i).col_type = 12 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
.......
         ELSE
            DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
         END IF;
    END LOOP;

  -- Fetch Rows
    WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
        FOR i IN 1 .. colcnt LOOP
          IF (desctab(i).col_type = 1) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
         ELSIF (desctab(i).col_type = 2) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
          ELSIF (desctab(i).col_type = 12) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
....
          END IF;
        END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
```

```
END;
/
```

168.9.29 TO_REFCURSOR Function

This function takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
   cursor_number IN OUT INTEGER)
  RETURN SYS_REFCURSOR;
```

Parameters

Table 168-32 TO_REFCURSOR Function Parameters

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number

Usage Notes

- The cursor passed in by the cursor_number has to be OPENed, PARSEd, and EXECUTEd; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a REF CURSOR.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  sql_stmt        VARCHAR2(200);
  ret             INTEGER;
  empnos          DBMS_SQL.Number_Table;
  depts           DBMS_SQL.Number_Table;
BEGIN

  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt :=    'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID
```

```
= :b1';

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
  ret := DBMS_SQL.EXECUTE(curid);

  -- Switch from DBMS_SQL to native dynamic SQL
  src_cur := DBMS_SQL.TO_REFCURSOR(curid);

  -- Fetch with native dynamic SQL
  FETCH src_cur BULK COLLECT INTO empnos, depts;

  IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
      DBMS_OUTPUT.PUT_LINE(empnos(i) || '   ' || depts(i));
    END LOOP;
  END IF;
   -- Close cursor
  CLOSE src_cur;
END;
/
```

168.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

Syntax

```
DBMS_SQL.VARIABLE_VALUE (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the following types:

```
ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
```

```
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT CHAR CHARACTER SET ANY_CS);

DBMS_SQL.VARIABLE_VALUE_RAW (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT RAW);

DBMS_SQL.VARIABLE_VALUE_ROWID (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
   c                IN   INTEGER,
   name             IN   VARCHAR2,
   value            OUT NOCOPY <table_type>);
```

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See DBMS_SQL Data Structures

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 168-33 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	• Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE. • Array option: Local variable that has been declared <table_type>. For bulk operations, value is an OUT NOCOPY parameter.

168.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (
   c                IN   INTEGER,
   name             IN   VARCHAR2,
   value            OUT NOCOPY <table_type>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Parameters

Table 168-34 VARIABLE_VALUE_PKG Parameters

Parameter	Description
`c`	ID number of the cursor from which to get the values.
`name`	Name of the variable for which you are retrieving the value.
`value`	• Single row option: Returns the value of the variable for the specified position. Oracle raises the exception `ORA-06562`, `inconsistent_type`, if the type of this output parameter differs from the actual type of the value, as defined by the call to `BIND_VARIABLE_PKG`. • Array option: Local variable that has been declared <`table_type`>.

Example 168-5 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable v2 in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
   ( n1 NUMBER,
```

```
    n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt  AS
  dummy NUMBER;
  cur   NUMBER;
  v1 ty_pkg.trect;
  v2 ty_pkg.trect;
  str VARCHAR2(3000);
BEGIN
  v1 := ty_pkg.trect(1000);
  str := 'declare v1 ty_pkg.trect;  begin v1:=:v1;  v1(1) := 2000; :v2 :=
v1; end;' ;
  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
  dummy := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
  DBMS_OUTPUT.PUT_LINE('n =  '
  || V2(1));
  DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_nt;
/
EXEC dyn_sql_nt;

n =  2000
```

169
DBMS_SQL_MONITOR

The DBMS_SQL_MONITOR package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- DBMS_SQL_MONITOR Overview
- DBMS_SQL_MONITOR Security Model
- DBMS_SQL_MONITOR Constants
- Summary of DBMS_SQL_MONITOR Subprograms

> **See Also:**
>
> DBMS_SQLTUNE

169.1 DBMS_SQL_MONITOR Overview

The DBMS_SQL_MONITOR package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the V$SQL_MONITOR and V$SQL_PLAN_MONITOR views.

The following subprograms begin and end monitoring of a composite database operation:

- BEGIN_OPERATION Function
- END_OPERATION Procedure

The following subprograms report on monitoring data collected in V$SQL_MONITOR and V$SQL_PLAN_MONITOR:

- REPORT_SQL_MONITOR Function
- REPORT_SQL_MONITOR_XML Function
- REPORT_SQL_MONITOR_LIST Function
- REPORT_SQL_MONITOR_LIST_XML Function

169.2 DBMS_SQL_MONITOR Security Model

This package is available to PUBLIC and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role SELECT_CATALOG_ROLE.

169.3 DBMS_SQL_MONITOR Constants

The DBMS_SQL_MONITOR package uses the constants shown in the following table.

Table 169-1 DBMS_SQL_MONITOR Constants

Constant	Type	Value	Description
FORCE_TRACKING	VARCHAR2(30)	'Y'	Force track the composite database operation when the operation starts
NO_FORCE_TRACKING	VARCHAR2(30)	'N'	Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.

169.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the DBMS_SQL_MONITOR package subprograms.

Table 169-2 DBMS_SQL_MONITOR Package Subprograms

Subprogram	Description
BEGIN_OPERATION Function	This function starts a database operation in the current session.
END_OPERATION Procedure	This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.
REPORT_SQL_MONITOR Function	This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.
REPORT_SQL_MONITOR_XML Function	This function is identical to the REPORT_SQL_MONITOR function, except that the return type is XMLType.
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.
REPORT_SQL_MONITOR_LIST_XML Function	This function is identical to the REPORT_SQL_MONITOR_LIST function, except that it returns XMLType.

169.4.1 BEGIN_OPERATION Function

This function starts a database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (
   dbop_name       IN VARCHAR2,
   dbop_eid        IN NUMBER   := NULL,
   forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,
   attribute_list  IN VARCHAR2 := NULL,
   session_id      IN NUMBER   := NULL,
   session_serial  IN NUMBER   := NULL)
  iRETURN NUMBER;
```

Parameters

Table 169-3 *BEGIN_OPERATION Procedure Parameters*

Parameter	Description
`dbop_name`	Name for the composite database operation.
`dbop_eid`	Unique identifier for the current execution of the composite database operation.
`forced_tracking`	Whether tracking is forced. Possible values are: • `FORCE_TRACKING` - forces the composite database operation to be tracked when the operation starts. You can also use the string variable `Y`. • `NO_FORCE_TRACKING` - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable `N`. See "DBMS_SQL_MONITOR Constants".
`attribute_list`	List of user-created attributes. It is a comma-separated list of name-value pairs (for example, `'table_name=emp, operation=load'`).
`session_id`	Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.
`session_serial`	Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.

Return Values

This function returns the database operation execution ID. If the value is null for `dbop_eid`, then the database generates a unique value.

169.4.2 END_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION(
   dbop_name       IN VARCHAR2,
   dbop_eid        IN NUMBER);
```

Parameters

Table 169-4 END_OPERATION Procedure Parameters

Parameter	Description
dbop_name	Name of a composite database operation
dbop_eid	Unique identifier for the current execution of the composite database operation

169.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (`-1` is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
   sql_id                   IN VARCHAR2 DEFAULT  NULL,
   dbop_name                IN VARCHAR2 DEFAULT  NULL,
   dbop_exec_id             IN NUMBER   DEFAULT  NULL,
   session_id               IN NUMBER   DEFAULT  NULL,
   session_serial           IN NUMBER   DEFAULT  NULL,
```

```
  sql_exec_start            IN DATE     DEFAULT  NULL,
  sql_exec_id               IN NUMBER   DEFAULT  NULL,
  inst_id                   IN NUMBER   DEFAULT  NULL,
  start_time_filter         IN DATE     DEFAULT  NULL,
  end_time_filter           IN DATE     DEFAULT  NULL,
  instance_id_filter        IN NUMBER   DEFAULT  NULL,
  parallel_filter           IN VARCHAR2 DEFAULT  NULL,
  plan_line_filter          IN NUMBER   DEFAULT  NULL,
  event_detail              IN VARCHAR2 DEFAULT  'YES',
  bucket_max_count          IN NUMBER   DEFAULT  128,
  bucket_interval           IN NUMBER   DEFAULT  NULL,
  base_path                 IN VARCHAR2 DEFAULT  NULL,
  last_refresh_time         IN DATE     DEFAULT  NULL,
  report_level              IN VARCHAR2 DEFAULT 'TYPICAL',
  type                      IN VARCHAR2 DEFAULT 'TEXT',
  sql_plan_hash_value       IN NUMBER   DEFAULT  NULL,
  con_name                  IN VARCHAR2 DEFAULT  NULL)
RETURN CLOB;
```

Parameters

Table 169-5 *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed
session_id	Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
sql_exec_start	Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
sql_exec_id	A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
inst_id	Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.
start_time_filter	If not NULL, the report shows activity from V$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.

Table 169-5 (Cont.) *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
`end_time_filter`	If not `NULL`, the report shows activity from `V$ACTIVE_SESSION_HISTORY` started before this date. If `NULL`, the reported activity ends when the targeted database operation has ended or `SYSDATE` if the operation is still executing.
`instance_id_filter`	Only looks at activity for the specified instance. Use `NULL` (the default) to target all instances. Only relevant if the query runs in parallel.
`parallel_filter`	Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string `parallel_filter` can be: • `NULL` - target all parallel execution servers as wells as the query coordinator • `['qc'][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]` where any `NULL` value is interpreted as `ALL`
`plan_line_filter`	Selects activity and execution statistics for the specified line number in the plan of a SQL.
`event_detail`	When set to `NO`, the activity is aggregated by `wait_class` only. Use `YES` (default) to aggregate by `wait_class`, `event_name`.
`bucket_max_count`	Specifies the maximum number of buckets to create in the report
`bucket_interval`	Represents the exact time interval, in seconds, of all histogram buckets. If specified, `bucket_max_count` is ignored.
`base_path`	URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash `swf` file).
`last_refresh_time`	If not `NULL` (default), the time when the report was last retrieved (`SYSDATE` attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized: • SQL text will not be returned when this option is specified • Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if `last_refresh_time` is after the start of that bucket

Table 169-5 (Cont.) *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
report_level	Level of detail for the report. Of the following, only one can be specified: • NONE: Minimum possible • BASIC: This is equivalent to sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics where the token "-" implies that report section will not be included in the report. • TYPICAL: Everything but plan_histogram • ALL: Everything In addition, individual report sections can also be enabled or disabled by using a ±*section_name*. Several sections are defined: • XPLAN: Shows explain plan. ON by default. • PLAN: Shows plan monitoring statistics. ON by default. • SESSIONS: Show session details. Applies only to parallel queries. ON by default. • INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default. • PARALLEL: An umbrella parameter for specifying sessions as well as instance details • ACTIVITY: Shows activity summary at global level, plan line level and session • INSTANCE LEVEL: (If applicable). ON by default. • BINDS: Shows bind information when available. ON by default. • METRICS: Shows metric data (such as CPU and IOs) over time. ON by default • ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default. • PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default. • OTHER: Other information. ON by default. In addition, SQL text can be specified at different levels: • -SQL_TEXT: No SQL text in report • +SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in GV$SQL_MONITOR • SQL_FULLTEXT: No full SQL text, that is, +sql_text • +SQL_FULLTEXT: Show full SQL text (default)
type	Report type: • TEXT: text report (default) • HTML: simple HTML report • ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics and plan_histogram) is only shown when this type is selected • XML: raw data for the report
sql_plan_hash_value	Targets only those with the specified plan hash value. Default is NULL.
con_name	Container name in a multitenant database.

Return Values

SQL monitor report, an XML document.

Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV$SQL_MONITOR
- GV$SQL_PLAN_MONITOR
- GV$ACTIVE_SESSION_HISTORY
- GV$SESSION_LONGOPS
- GV$SQL if SQL full text is requested and its length is greater than 2 KB

169.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the REPORT_SQL_MONITOR function, except that the return type is XMLType.

Related Topics

- REPORT_SQL_MONITOR Function
  This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

169.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
   sql_id                    IN VARCHAR2 DEFAULT  NULL,
   dbop_name                 IN VARCHAR2 DEFAULT  NULL,
   monitor_type              IN NUMBER   DEFAULT  MONITOR_TYPE_ALL,
   session_id                IN NUMBER   DEFAULT  NULL,
   session_serial            IN NUMBER   DEFAULT  NULL,
   inst_id                   IN NUMBER   DEFAULT  NULL,
   active_since_date         IN DATE     DEFAULT  NULL,
   active_since_sec          IN NUMBER   DEFAULT  NULL,
   last_refresh_time         IN DATE     DEFAULT  NULL,
   report_level              IN VARCHAR2 DEFAULT 'TYPICAL',
   auto_refresh              IN NUMBER   DEFAULT  NULL,
   base_path                 IN VARCHAR2 DEFAULT  NULL,
   type                      IN VARCHAR2 DEFAULT 'TEXT',
   con_name                  IN VARCHAR2 DEFAULT  NULL)
  RETURN CLOB;
```

Parameters

Table 169-6 ***REPORT_SQL_MONITOR_LIST Procedure Parameters***

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
monitor_type	Monitor type: • MONITOR_TYPE_SQL returns only simple database operations • MONITOR_TYPE_DBOP returns composite database operations • MONITOR_TYPE_ALL returns all types
session_id	Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition tosession_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
inst_id	Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).
active_since_date	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.
active_since_sec	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.
last_refresh_time	If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.
auto_refresh	Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.

Table 169-6 (Cont.) *REPORT_SQL_MONITOR_LIST Procedure Parameters*

Parameter	Description
`base_path`	URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash `swf` file).
`type`	Report type: • `TEXT`: text report (default) • `HTML`: simple HTML report • `ACTIVE`: database active report. Some information (explain plan, `activity_histogram`, metrics, and `plan_histogram`) is only shown when this type is selected. • `XML`: raw data for the report
`con_name`	Container name in a multitenant database.

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the REPORT_SQL_MONITOR Function to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views `GV$SQL_MONITOR` and `GV$SQL`.

169.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the `REPORT_SQL_MONITOR_LIST` function, except that it returns `XMLType`.

Related Topics

- REPORT_SQL_MONITOR_LIST Function
  This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

170
DBMS_SQL_TRANSLATOR

The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples
- Summary of DBMS_SQL_TRANSLATOR Subprograms

> **See Also:**
>
> SQL Translation Framework Architecture and Overview in*Oracle Database Migration Guide*

170.1 DBMS_SQL_TRANSLATOR Security Model

DBMS_SQL_TRANSLATOR is a invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the TRANSLATE SQL user privilege on the current user.

Additionally, the current user must be granted the EXECUTE privilege on the translator package.

170.2 DBMS_SQL_TRANSLATOR Constants

DBMS_SQL_TRANSLATOR defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 170-1 DBMS_SQL_TRANSLATOR Constants

Constant	Value	Type	Description
ATTR_EDITIONABLE	'EDITIONABLE'	VARCHAR2(30)	Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes)
ATTR_FOREIGN_SQL_SYNTAX	'FOREIGN_SQL_SYNTAX'	VARCHAR2(30)	Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes)
ATTR_LOG_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes)
ATTR_RAISE_TRANSLATION_ERROR	'TRANSLATION_ERROR '	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes)
ATTR_TRANSLATE_NEW_SQL	'TRANSLATE_NEW_SQL'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes)
ATTR_TRACE_TRANSLATION	'TRACE_TRANSLATION'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls tracing (see Operational Notes)
ATTR_TRANSLATOR	'TRANSLATOR'	VARCHAR2(30)	Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes)
ATTR_VALUE_TRUE	'TRUE'	VARCHAR2(30)	Value to set a SQL translation profile attribute to true (see Operational Notes)
ATTR_VALUE_FALSE	'FALSE'	VARCHAR2(30)	Value to set a SQL translation profile attribute to false (see Operational Notes)

170.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant

Editionable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant

Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

ATTR_RAISE_TRANSLATION_ERROR Constant

Raise translation error is false by default.

ATTR_TRANSLATE_NEW_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

ATTR_TRACE_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

ATTR_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The TRANSLATE_SQL Procedure and the TRANSLATE_ERROR Procedure are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(
   sql_text        IN  CLOB,
   translated_text OUT CLOB);

PROCEDURE TRANSLATE_ERROR(
   error_code          IN  BINARY_INTEGER,
   translated_code     OUT BINARY_INTEGER,
   translated_sqlstate OUT VARCHAR2);

Parameters:
  profile_name        - profile name
  sql_text            - SQL statement to be translated
  translated_text     - translated SQL statement
  error_code          - Oracle error code
  translated_code     - translated error code
  translated_sqlstate - translated SQLSTATE
```

- When `NULL` is returned in `translated_text`, `translated_code`, or `translated_sqlstate`, it means that no translation is required and the original SQL statement, error code, or `SQLSTATE` is used instead.
- The name of the translator package follows the naming rules for database packages of the form `[schema.]package_name`. When the schema and package names are used, they

are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsql_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQL_TRANSLATOR'`, but not the same as `translator => '"dbms_tsql_translator"'`. The default schema name is the profile owner.

- The translator attribute is not set by default.

ATTR_VALUE_TRUE Constant

The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant

The value to set a SQL translation profile attribute to false.

170.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

Table 170-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

Exception	Error Code	Description
BAD_ARGUMENT	29261	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	1031	User has insufficient privilege for the operation
NO_SUCH_PROFILE	24252	Profile does not exist
NO_SUCH_USER	1918	Profile owner does not exist
NO_TRANSLATION_FOUND	24253	No translation of the SQL statement or error code found
PROFILE_EXISTS	955	Profile already exists

170.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

Basic SQL Translation

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name     => ' tsql_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name     =>  'tsql_application',
    attribute_name   =>  DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value  =>  'migration_repo.sybase_tsql_translator');
END;
```

170.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 170-3 DBMS_SQL_TRANSLATOR Package Subprograms

Subprogram	Description
CREATE_PROFILE Procedure	Creates a SQL translation profile
DEREGISTER_SQL_TRANSLATION Procedure	Deregisters the custom translation of a SQL statement in a SQL translation profile
DEREGISTER_ERROR_TRANSLATION Procedure	Deregisters the translation of an Oracle error code and SQLSTATE in a SQL translation profile
DROP_PROFILE Procedure	Drops a SQL translation profile and its contents
ENABLE_ERROR_TRANSLATION Procedure	Enables or disables a custom translation of an Oracle error code in a SQL translation profile
ENABLE_SQL_TRANSLATION Procedure	Enables or disables a custom translation of a SQL statement in a SQL translation profile
EXPORT_PROFILE Procedure	Exports the content of a SQL translation profile
IMPORT_PROFILE Procedure	Imports the content of a SQL translation profile
REGISTER_ERROR_TRANSLATION Procedure	Registers a custom translation of an Oracle error code and SQLSTATE in a SQL translation profile
REGISTER_SQL_TRANSLATION Procedure	Registers a custom translation of a SQL statement in a SQL translation profile
SET_ATTRIBUTE Procedure	Sets an attribute of a SQL translation profile
SQL_HASH Function	Computes the hash value of a SQL statement in a SQL translation profile
SQL_ID Function	Computes the SQL identifier of a SQL statement in a SQL translation profile
TRANSLATE_ERROR Procedure	Translates an Oracle error code and an ANSI SQLSTATE using a SQL translation profile
TRANSLATE_SQL Procedure	Translates a SQL statement using a SQL translation profile

170.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
   profile_name    IN  VARCHAR2);
```

Parameters

Table 170-4 *CREATE_PROFILE Procedure Parameters*

Parameter	Description
`profile_name`	Name of profile

Exceptions

Table 170-5 CREATE_PROFILE Procedure Exceptions

Exception	Description
`BAD_ARGUMENT`	Bad argument is passed to the PL/SQL interface
`INSUFFICIENT_PRIVILEGE`	User has insufficient privilege for the operation
`NO_SUCH_USER`	Profile owner does not exist
`PROFILE_EXISTS`	Profile already exists

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form `[schema.]name`. When the schema and profile names are used in the `DBMS_SQL_TRANSLATOR` package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile `profile_name => 'tsql_application'` is the same as `profile_name => 'Tsql_Application'` and `profile_name => 'TSQL_APPLICATION'`, but not the same as `profile_name => '"tsql_application"'`.
- A SQL translation profile is an editionable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the DROP_PROFILE Procedure.

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

170.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
   profile_name      IN  VARCHAR2,
   sql_text          IN  CLOB);
```

Parameters

Table 170-6 *DEREGISTER_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement

Exceptions

Table 170-7 DEREGISTER_SQL_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION(
      profile_name => 'tsql_application',
      sql_text     => 'select top 5 * from emp');
END;
```

170.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and SQLSTATE in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
   profile_name          IN   VARCHAR2,
   error_code            IN   PLS_INTEGER);
```

Parameters

Table 170-8 *DEREGISTER_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
error_code	Oracle error code

Exceptions

Table 170-9 DEREGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
   DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
      profile_name    => 'tsql_application',
      error_code      => 1);
END;
```

170.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
   profile_name     IN    VARCHAR2);
```

Parameters

Table 170-10 *DROP_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile

Exceptions

Table 170-11 DROP_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.DROP_PROFILE(
      profile_name    =>  'tsql_application');
END;
```

170.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
   profile_name      IN  VARCHAR2,
   sql_text          IN CLOB,
   enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-12 *ENABLE_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 170-13 ENABLE_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
      profile_name => 'tsql_application',
      sql_text     => 'SELECT TOP 5 * FROM emp'
      enable       => TRUE);
END;
```

170.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
   profile_name      IN    VARCHAR2,
   sql_text          IN    CLOB,
   enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-14 *ENABLE_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 170-15 ENABLE_SQL_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
      profile_name => 'tsql_application',
      sql_text     => 'select top 5 * from emp',
      enable       => TRUE);
END;
```

170.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (
   profile_name     IN          VARCHAR2,
   content          OUT NOCOPY  CLOB);
```

Parameters

Table 170-16 *EXPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 170-17 EXPORT_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
                      ForeignSQLSyntax="TRUE|FALSE"
                      TranslateNewSQL="TRUE|FALSE"
                      RaiseTranslationError="TRUE|FALSE"
                      LogTranslationError="TRUE|FALSE"
                      TraceTranslation="TRUE|FALSE"
                      Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">
      <SQLText>original SQL text</SQLText>
      <TranslatedText>translated SQL text</TranslatedText>
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">
      <ErrorCode>Oracle error code</ErrorCode>
      <TranslatedCode>translated error code</TranslatedCode>
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the IMPORT_PROFILE Procedure.

Examples

```
DECLARE
  content CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
      profile_name    =>  'tsql_application',
      content         =>  content);
END;
```

170.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
   profile_name       IN   VARCHAR2,
   content            IN   CLOB);
```

Parameters

Table 170-18 *IMPORT_PROFILE Procedure Parameters*

Parameter	Description
`profile_name`	Name of profile
`content`	Content of profile

Exceptions

Table 170-19 IMPORT_PROFILE Procedure Exceptions

Exception	Description
`BAD_ARGUMENT`	Bad argument is passed to the PL/SQL interface
`INSUFFICIENT_PRIVILEGE`	User has insufficient privilege for the operation
`NO_SUCH_USER`	Profile owner does not exist

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the EXPORT_PROFILE Procedure. All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the EXPORT_PROFILE Procedure.

Examples

```
DECLARE
  content CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
      profile_name    =>  'tsql_application',
      content         =>  content);
END;
```

170.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and SQLSTATE in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
   profile_name          IN   VARCHAR2,
   error_code            IN   PLS_INTEGER,
   translated_code       IN   PLS_INTEGER DEFAULT NULL,
   translated_sqlstate   IN   VARCHAR2 DEFAULT NULL,
   enable                IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-20 *REGISTER_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
error_code	Oracle error code
translated_code	Translated error code
translated_sqlstate	Translated SQLSTATE
enable	Enable or disable the translation

Exceptions

Table 170-21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and SQLSTATE, if present, is replaced with the new translation.
- To deregister a translation, use the DEREGISTER_ERROR_TRANSLATION Procedure.

Examples

```
BEGIN
      DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
      profile_name    => 'tsql_application',
      error_code      => 1,
      translated_code => 2601);
END;
```

170.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
   profile_name      IN VARCHAR2,
   sql_text          IN CLOB,
   translated_text   IN CLOB DEFAULT NULL,
   enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 170-22 *REGISTER_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
`profile_name`	Name of profile
`sql_text`	SQL statement
`translated_text`	Translated SQL statement
`enable`	Enable or disable the translation

Exceptions

Table 170-23 REGISTER_SQL_TRANSLATION Procedure Exceptions

Exception	Description
`BAD_ARGUMENT`	Bad argument is passed to the PL/SQL interface
`INSUFFICIENT_PRIVILEGE`	User has insufficient privilege for the operation
`NO_SUCH_USER`	Profile owner does not exist
`NO_SUCH_PROFILE`	Profile does not exist

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.

- When `translated_text` is `NULL`, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the DEREGISTER_SQL_TRANSLATION Procedure.

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
      profile_name    => 'tsql_application',
      sql_text        => 'select top 5 * from emp',
      translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

170.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
   profile_name      IN  VARCHAR2,
   attribute_name    IN  VARCHAR2,
   attribute_value   IN  VARCHAR2;)
```

Parameters

Table 170-24 *SET_ATTRIBUTE Procedure Parameters*

Parameter	Description
`profile_name`	Name of profile
`attribute_name`	Name of attribute
`attribute_value`	Value of attribute

Exceptions

Table 170-25 SET_ATTRIBUTE Procedure Exceptions

Exception	Description
`BAD_ARGUMENT`	Bad argument is passed to the PL/SQL interface
`INSUFFICIENT_PRIVILEGE`	User has insufficient privilege for the operation
`NO_SUCH_USER`	Profile owner does not exist
`NO_SUCH_PROFILE`	Profile does not exist

Usage Notes

See Constants

170.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (
   sql_text         IN    CLOB)
RETURN NUMBER DETERMINISTIC;
```

Parameters

Table 170-26 *SQL_HASH Function Parameters*

Parameter	Description
sql_text	SQL statement

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

Table 170-27 SQL_HASH Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```
DECLARE
  sqltext CLOB;
  txltext CLOB;
  sqlhash NUMBER;
BEGIN
  sqltext  :=  'SELECT TOP 1 * FROM emp';
  sqlhash  :=  DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
  SELECT translated_text INTO txltext
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```

170.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (
   sql_text         IN    CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 170-28 *SQL_ID Function Parameters*

Parameter	Description
sql_text	SQL statement

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 170-29 SQL_ID Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```
DECLARE
  sqltext CLOB;
  sqlid   VARCHAR2(13);
BEGIN
  sqltext :=  'SELECT TOP 1 * FROM emp';
  sqlid   :=  DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;
```

170.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

```
DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
   error_code           IN           PLS_INTEGER,
   translated_code      OUT          PLS_INTEGER,
   translated_sqlstate  OUT NOCOPY   VARCHAR2);
```

Parameters

Table 170-30 *TRANSLATE_ERROR Procedure Parameters*

Parameter	Description
error_code	Oracle error code
translated_code	Translated error code
translated_sqlstate	Translated SQLSTATE

Exceptions

Table 170-31 TRANSLATE_ERROR Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist
NO_TRANSLATION_FOUND	No translation of the SQL statement or error code is found

Examples

```
DECLARE
  translated_code      BINARY_INTEGER;
  translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
      error_code           => 1,
      translated_code      => translated_code,
      translated_sqlstate  => translated_sqlstate);
END;
```

170.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
   sql_text          IN           CLOB,
   translated_text   OUT  NOCOPY  CLOB);
```

Parameters

Table 170-32 *TRANSLATE_SQL Procedure Parameters*

Parameter	Description
sql_text	SQL statement
translated_text	Translated SQL statement

Exceptions

Table 170-33 TRANSLATE_SQL Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Table 170-33 (Cont.) TRANSLATE_SQL Procedure Exceptions

Exception	Description
NO_SUCH_PROFILE	Profile does not exist

Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE =  tsql_application;

DECLARE
  translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
      sql_text         => 'select top 5 * from emp',
      translated_text  => translated_text);
END;
```

171
DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- DBMS_SQLDIAG Overview
- DBMS_SQLDIAG Security Model
- DBMS_SQLDIAG Constants
- Summary of DBMS_SQLDIAG Subprograms

> **See Also:**
>
> *Oracle Database Administrator's Guide* for more information about "Managing Diagnostic Data"

171.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the `DBMS_SQLDIAG` package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

> **See Also:**
>
> *Oracle Database Administrator's Guide* for more information about how to run the SQL Repair Advisor using the `DBMS_SQLDIAG` package subprograms.

171.2 DBMS_SQLDIAG Security Model

You must have the `ADVISOR` role to execute the `DBMS_SQLDIAG` package.

171.3 DBMS_SQLDIAG Constants

`DBMS_SQLDIAG` defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- Table 171-1 describes the name of SQL repair advisor as seen by the advisor framework

- Table 171-2 describes SQLDIAG advisor task scope parameter values
- Table 171-3 describes SQLDIAG advisor `time_limit` constants
- Table 171-4 describes possible formats for a report
- Table 171-5 describes possible levels of detail in the report
- Table 171-6 describes possible report sections (comma delimited)
- Table 171-7 describes possible values for the `problem_type` parameter of the CREATE_DIAGNOSIS_TASK Functions
- Table 171-8 describes possible values for the `_sql_findings_mode` parameter

Table 171-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2(18)	SQL Repair Advisor	Name of SQL repair advisor as seen by the advisor framework

Table 171-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2(13)	COMPREHENSIVE	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2(7)	LIMITED	Brief analysis of the problem

Table 171-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

Table 171-4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	HTML	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2(4)	TEXT	Report from the REPORT_DIAGNOSIS_TASK Function in text form

Table 171-4 (Cont.) DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_XML	VARCHAR2(3)	XML	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 171-5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	ALL	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	BASIC	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	TYPICAL	Simple report shows only information about the actions taken by the advisor.

Table 171-6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	ALL	All statements
SECTION_ERRORS	VARCHAR2(6)	ERRORS	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	FINDINGS	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	INFORMATION	General information
SECTION_PLANS	VARCHAR2(5)	PLANS	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	SUMMARY	Summary information

Table 171-7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation

Table 171-7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GEN	NUMBER	5	User to explore all alternative plans

Table 171-8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VARIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJ_FEATURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_INFO	NUMBER	8	Show the alternative plans generated by the advisor

171.4 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 171-9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure	Cancels a diagnostic task
CREATE_DIAGNOSIS_TASK Functions	Creates a diagnostic task in order to diagnose a single SQL statement

Table 171-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
CREATE_SQL_PATCH Function	Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text.
CREATE_STGTAB_SQLPATCH Procedure	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure	Drops a diagnostic task
DROP_SQL_PATCH Procedure	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_DIR_BY_INC Function	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_FIX_CONTROL Function	Returns the value of fix control for a given bug number
GET_SQL Function	Imports a SQL test case
IMPORT_SQL_TESTCASE Procedures	Imports a SQL test case into a schema
INCIDENTID_2_SQL Procedure	Initializes a `sql_setrow` from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure	Interrupts a diagnostic task
LOAD_SQLSET_FROM_TCB Function	Loads a SQLSET from Test Case Builder (TCB) file
PACK_STGTAB_SQLPATCH Procedure	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPLAY_SQL_TESTCASE Function	Reports on a diagnostic task
REPORT_DIAGNOSIS_TASK Function	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_PARAMETER Procedure	Sets a diagnosis task parameter
SQL_DIAGNOSE_AND_REPAIR Function	Diagnoses a given SQL statement for a given SQL ID for the given problem type.
UNPACK_STGTAB_SQLPATCH Procedure	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure, using the patch data stored in the staging table to create patches on this system

171.4.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE)
 RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 171-10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

Table 171-10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
replace	If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege

171.4.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
   name            IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   value           IN  VARCHAR2);
```

Parameters

Table 171-11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
name	Name of SQL patch to alter.
attribute_name	Name of SQL patch to alter. Possible values: • STATUS -> can be set to ENABLED or DISABLED • NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). • DESCRIPTION -> can be set to any string of size no more than 500 • CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.

Table 171-11 (Cont.) ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege

171.4.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text           IN   CLOB,
    bind_list          IN   sql_binds := NULL,
    user_name          IN   VARCHAR2  := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id             IN   VARCHAR2,
    plan_hash_value    IN   NUMBER    := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
```

```
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 :=  NULL,
    object_filter     IN VARCHAR2 :=  NULL,
    rank1             IN VARCHAR2 :=  NULL,
    rank2             IN VARCHAR2 :=  NULL,
    rank3             IN VARCHAR2 :=  NULL,
    result_percentage IN NUMBER   :=  NULL,
    result_limit      IN NUMBER   :=  NULL,
    scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
    time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 :=  NULL,
    description       IN VARCHAR2 :=  NULL,
    plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
    sqlset_owner      IN VARCHAR2 :=  NULL,
    problem_type      IN NUMBER   :=  PROBLEM_TYPE_PERFORMANCE)  RETURN VARCHAR2;
```

Parameters

Table 171-13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: • PROBLEM_TYPE_WRONG_RESULTS • PROBLEM_TYPE_COMPILATION_ERROR • PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL

Table 171-13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: • LAST_GENERATED: plan with most recent timestamp • FIRST_GENERATED: opposite to LAST_GENERATED • LAST_LOADED: plan with most recent first_load_time stat info • FIRST_LOADED: opposite to LAST_LOADED • MAX_ELAPSED_TIME: plan with maximum elapsed time • MAX_BUFFER_GETS: plan with maximum buffer gets • MAX_DISK_READS: plan with maximum disk reads • MAX_DIRECT_WRITES: plan with maximum direct writes • MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

171.4.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_text        IN   CLOB,
    hint_text       IN   CLOB,
    name            IN   VARCHAR2   := NULL,
    description     IN   VARCHAR2   := NULL,
    category        IN   VARCHAR2   := NULL,
    validate        IN   BOOLEAN    := TRUE)
RETURN VARCHAR2;

DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_id          IN   VARCHAR2,
    hint_text       IN   CLOB,
    name            IN   VARCHAR2   := NULL,
    description     IN   VARCHAR2   := NULL,
    category        IN   VARCHAR2   := NULL,
    validate        IN   BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

Parameters

Table 171-14 CREATE_SQL_PATCH Function Parameters

Parameter	Description
sql_text	Text of the SQL statement

Table 171-14 (Cont.) CREATE_SQL_PATCH Function Parameters

Parameter	Description
sql_id	The SQL identifier for the SQL statement
hint_text	Hints to include in the SQL patch
name	Optional SQL patch name
description	Description of the SQL patch
category	Category name
validate	Whether to validate the provided hints

Return Values

Both functions return the SQL patch name.

171.4.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
   table_name       IN  VARCHAR2,
   schema_name      IN  VARCHAR2 := NULL,
   tablespace_name  IN  VARCHAR2 := NULL);
```

Parameters

Table 171-15 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

171.4.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-16 DROP_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
   name     IN  VARCHAR2,   ignore   IN  BOOLEAN := FALSE);
```

Parameters

Table 171-17 DROP_SQL_PATCH Function & Procedure Parameters

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires `DROP ANY SQL PATCH` privilege

171.4.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-18 EXECUTE_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase        IN   CLOB)
  RETURN CLOB;
```

Parameters

Table 171-19 EXPLAIN_SQL_TESTCASE Function Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

171.4.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory               IN              VARCHAR2,
    sql_text                IN              CLOB,
    user_name               IN              VARCHAR2  :=  NULL,
    bind_list               IN              sql_binds :=  NULL,
    exportEnvironment       IN              BOOLEAN   :=  TRUE,
    exportMetadata          IN              BOOLEAN   :=  TRUE,
    exportData              IN              BOOLEAN   :=  FALSE,
    exportPkgbody           IN              BOOLEAN   :=  FALSE,
    samplingPercent         IN              NUMBER    :=  100,
    ctrlOptions             IN              VARCHAR2  :=  NULL,
    timeLimit               IN              NUMBER    :=  0,
    testcase_name           IN              VARCHAR2  :=  NULL,
    testcase                IN OUT NOCOPY   CLOB,
    preserveSchemaMapping   IN              BOOLEAN   :=  FALSE,
    version                 IN              VARCHAR2  :=  'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory               IN              VARCHAR2,
    incident_id             IN              VARCHAR2,
    exportEnvironment       IN              BOOLEAN   :=  TRUE,
    exportMetadata          IN              BOOLEAN   :=  TRUE,
    exportData              IN              BOOLEAN   :=  FALSE,
    exportPkgbody           IN              BOOLEAN   :=  FALSE,
    samplingPercent         IN              NUMBER    :=  100,
    ctrlOptions             IN              VARCHAR2  :=  NULL,
    timeLimit               IN              NUMBER    :=
                                               DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name           IN              VARCHAR2  :=  NULL,
```

```
    testcase                IN OUT NOCOPY   CLOB,
    preserveSchemaMapping   IN              BOOLEAN   :=  FALSE)
    version                 IN              VARCHAR2  :=  'COMPATIBLE');
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V$SQL to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory               IN              VARCHAR2,
    sql_id                  IN              VARCHAR2,
    plan_hash_value         IN              NUMBER    := NULL,
    exportEnvironment       IN              BOOLEAN   :=  TRUE,
    exportMetadata          IN              BOOLEAN   :=  TRUE,
    exportData              IN              BOOLEAN   :=  FALSE,
    exportPkgbody           IN              BOOLEAN   :=  FALSE,
    samplingPercent         IN              NUMBER    :=  100,
    ctrlOptions             IN              VARCHAR2  :=  NULL,
    timeLimit               IN              NUMBER    :=
                                               DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name           IN              VARCHAR2  :=  NULL,
    testcase                IN OUT NOCOPY   CLOB,
    preserveSchemaMapping   IN              BOOLEAN   :=  FALSE)
    version                 IN              VARCHAR2  :=  'COMPATIBLE');
```

Parameters

Table 171-20 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 171-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
ctrlOptions	Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'. • name="capture" - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. BASIC: runs as Oracle release 11*g* TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures. • name="mexec_count"–Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. • name="stat_history_since"–Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. • name="compress"–This option is used to compress the SQL Test Case Builder output files into a zip file. The possible values are: – YES – NO The default value is NO. • name="diag_event"–This option is used to specify the level of trace information to include in the SQL Test Case Builder output. The possible values are: – ADS – COMPILER – SQLEXEC_LOW – SQLEXEC_MEDIUM – SQLEXEC_HIGH – SQLEXEC_HIGHEST The default value is ADS + COMPILER. • name="problem_type"–This option is used to assign an issue type for a SQL Test Case Builder test case. For example, if a test case is related to performance regression issue, then you can assign the value of PERFORMANCE to the problem_type option. The possible values are : – PERFORMANCE – WRONG_RESULTS – COMPILATION_ERROR – EXECUTION_ERROR The default value is PERFORMANCE.

Table 171-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
`timeLimit`	How much time should we spend exporting the SQL test case
`testcaseName`	An optional name for the SQL test case. This is used to prefix all the generated scripts
`testcase`	Resulting testcase
`preserveSchemaMapping`	`TRUE` if the schema (or schemas) are not re-mapped from the original environment to the test environment
`version`	Version of database objects to be extracted. This option is only valid for `EXPORT`. Database objects or attributes incompatible with the version will not be extracted. • `COMPATIBLE` - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the `V$COMPATIBILITY` view). Database compatibility must be set to 9.2 or higher. • `LATEST` - the version of the metadata that specifies the current database version. • A specific database version. For example, if `'10.0.0'`, this cannot be lower than Oracle Database release 10.0.0.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (`.dmp`)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (`xxxxmain.xml`)
  - a `README.txt` file that explain the usage of the TCB
  - the outlines used by the statement (`ol.xml`)
  - a list of parameters set in the exporting db/env (`prmimp.sql`)
  - a SQL monitor report, if any (`smrpt.html`)
  - an AWR report, if any (`awrrpt.html`)
  - a list of binds used in this statement (`bndlst.xml`)
- You should not run Test Case Builder (TCB) under user `SYS`. Instead, use another user who can be granted the `DBA` role.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal.

To export data, call EXPORT_SQL_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the ctrlOptions encapsulated either by using the <parameters> parent tag or without the parent tag.

Using the <parameters> tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>
```

Without the <parameters> tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>'
```

The compress option that you can specify in the ctrlOptions parameter:

```
  opt := '<parameters>
              <parameter name="capture">with_runtime_info</parameter>
              <parameter name="compress">yes</parameter>
          </parameters>';
```

The diag_event option that you can specify in the ctrlOptions parameter:

```
  opt := '<parameters>
              <parameter name="capture">with_runtime_info</parameter>
              <parameter name="compress">yes</parameter>
          </parameters>';
```

The problem_type option that you can specify in the ctrlOptions parameter:

```
  opt := '<parameters>
              <parameter name="capture">with_runtime_info</parameter>
              <parameter name="compress">yes</parameter>
          </parameters>';
```

171.4.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL
    version            IN   VARCHAR2 := 'COMPATIBLE')
 RETURN BOOLEAN;
```

Parameters

Table 171-21 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
`incident_id`	Incident ID containing the offending SQL. For more information about Incidents, see *Oracle Database Performance Tuning Guide*.
`directory`	Directory path to the generated files
`exportEnvironment`	TRUE if the compilation environment should be exported
`exportMetadata`	TRUE if the definition of the objects referenced in the SQL should be exported
`exportData`	TRUE if the data of the objects referenced in the SQL should be exported
`samplingPercent`	If is TRUE, specify the sampling percentage to use to create the dump file

Table 171-21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
ctrlOptions	Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'. • capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. BASIC: runs as Oracle release 11*g* TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. • name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. • name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. • COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. • LATEST - the version of the metadata that specifies the current database version. • A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

171.4.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    sql_text           IN   CLOB,
    user_name          IN   VARCHAR2 := 'SYS',
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL
    version            IN   VARCHAR2 := 'COMPATIBLE')
  RETURN BOOLEAN;
```

Parameters

Table 171-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
`incident_id`	Incident ID containing the offending SQL
`directory`	Directory to store the various generated files
`sql_text`	Text of the SQL statement to explain
`username`	Name of the user schema to use to parse the SQL, defaults to `SYS`
`exportEnvironment`	`TRUE` if the compilation environment should be exported
`exportMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be exported
`exportData`	`TRUE` if the data of the objects referenced in the SQL should be exported
`samplingPercent`	If is `TRUE`, specify the sampling percentage to use to create the dump file
`ctrlOptions`	Opaque control parameters. For example, to execute three times, set `ctrlOptions` with the following string: `'<parameter name="mexec_count">3</parameter>'`. • `capture` - `BASIC` (default) or `WITH_RUNTIME_INFO`. This parameter defines the mode of TCB capture. `BASIC`: runs as Oracle Release 11*g* TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. `WITH_RUNTIME_INFO`: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under `BASIC` mode. • `name=mexec_count` - Value is any positive number (`N`). This parameter tells TCB to execute the statement for `N` time and capture runtime info at end of each execution. • `name=stat_history_since` - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
`version`	Version of database objects to be extracted. This option is only valid for `EXPORT`. Database objects or attributes incompatible with the version will not be extracted. • `COMPATIBLE` - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the `V$COMPATIBILITY` view). Database compatibility must be set to 9.2 or higher. • `LATEST` - the version of the metadata that specifies the current database version. • A specific database version. For example, if `'10.0.0'`, this cannot be lower than Oracle Database Release 10.0.0.

171.4.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number   IN    NUMBER)
  RETURN NUMBER;
```

Parameters

Table 171-23 GET_FIX_CONTROL Function Parameters

Parameter	Description
bug_number	Bug number

171.4.15 GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id  IN     VARCHAR2)
  RETURN SQLSET_ROW;
```

Parameters

Table 171-24 GET_SQL Function Parameters

Parameter	Description
incident_id	Identifier of the incident

171.4.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory               IN   VARCHAR2,
    sqlTestCase             IN   CLOB,
    importEnvironment       IN   BOOLEAN   :=  TRUE,
    importMetadata          IN   BOOLEAN   :=  TRUE,
    importData              IN   BOOLEAN   :=  TRUE,
    importPkgbody           IN   BOOLEAN   :=  FALSE,
    importDiagnosis         IN   BOOLEAN   :=  TRUE,
    ignoreStorage           IN   BOOLEAN   :=  TRUE,
    ctrlOptions             IN   VARCHAR2  :=  NULL,
    preserveSchemaMapping   IN   BOOLEAN   :=  FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory                IN   VARCHAR2,
    filename                 IN   VARCHAR2,
    importEnvironment        IN   BOOLEAN   :=  TRUE,
    importMetadata           IN   BOOLEAN   :=  TRUE,
    importData               IN   BOOLEAN   :=  TRUE,
    importPkgbody            IN   BOOLEAN   :=  FALSE,
    importDiagnosis          IN   BOOLEAN   :=  TRUE,
    ignoreStorage            IN   BOOLEAN   :=  TRUE,
    ctrlOptions              IN   VARCHAR2  :=  NULL,
    preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

Parameters

Table 171-25 IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
`directory`	Directory containing test case files
`filename`	Name of a file containing an XML document describing the SQL test case
`importEnvironment`	`TRUE` if the compilation environment should be imported
`importMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be imported
`importData`	`TRUE` if the data of the objects referenced in the SQL should be imported
`importPkgbody`	`TRUE` if the body of the packages referenced in the SQL are imported
`importDiagnosis`	`TRUE` if the diagnostic information associated to the task should be imported
`ignoreStorage`	`TRUE` if the storage attributes should be ignored
`ctrlOptions`	Opaque control parameters, of which only `capture` is valid for this subprogam. • `capture` - `BASIC` (default) or `WITH_RUNTIME_INFO`. This parameter defines the mode of TCB capture. `BASIC`: runs as Oracle Release 11*g* TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. `WITH_RUNTIME_INFO`: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under `BASIC` mode.
`preserveSchemaMapping`	`TRUE` if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with `preservesSchemaMapping` set to `TRUE`, if the objects in the schemas exists then the import will overwrite the existing objects.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (`.dmp`)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (`xxxxmain.xml`)
  - a `README.txt` file that explain the usage of the TCB
  - the outlines used by the statement (`ol.xml`)
  - a list of parameters set in the exporting db/env (`prmimp.sql`)
  - a SQL monitor report, if any (`smrpt.html`)
  - an AWR report, if any (`awrrpt.html`)
  - a list of binds used in this statement (`bndlst.xml`)
- You should not run Test Case Builder (TCB) under user `SYS`. Instead, use another user who can be granted the `SYSDBA` privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE Procedures with `exportData=>TRUE` and the data will be imported by default, unless turned `OFF` by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE Procedures with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call `IMPORT_SQL_TESTCASE` Procedures with `importPkgbody=>TRUE`.
- The `capture` value used when invoking the EXPORT_SQL_TESTCASE Procedures must be used when calling this procedure.

171.4.17 INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id   IN     VARCHAR2,
    sql_stmt      OUT    SQLSET_ROW,
    problem_type  OUT    NUMBER,
    err_code      OUT    BINARY_INTEGER,
    err_mesg      OUT    VARCHAR2);
```

Parameters

Table 171-26 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
incident_id	Identifier of the incident
sql_stmt	Resulting SQL
problem_type	Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)
err_code	Error code if any otherwise it is set to NULL
err_msg	Error message if any otherwise it is set to NULL

171.4.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.19 LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory        IN     VARCHAR2,
    filename         IN     VARCHAR2,
    sqlset_name      IN     VARCHAR2 DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 171-28 LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
directory	Name of directory
filename	Name of file
sqlset_name	Name of SQLSET

171.4.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := 'DEFAULT',
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 171-29 PACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`patch_name`	Name of patch to pack (% wildcards acceptable, case-sensitive)
`patch_category`	Category to which to pack patches (% wildcards acceptable, case-insensitive)
`staging_table_name`	(Mandatory) Name of the table to use (case-sensitive)
`staging_schema_owner`	Schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

- Requires: `ADMINISTER SQL PLAN MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table
- By default, we move all SQL patches in category `DEFAULT`. Note that the subprogram issues a `COMMIT` after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- CREATE_STGTAB_SQLPATCH Procedure
  This procedure creates the staging table used for transporting SQL patches from one system to another.

171.4.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
   directory       IN   VARCHAR2,
   filename        IN   VARCHAR2,
   ctrlOptions     IN   VARCHAR2  := NULL,
   format          IN   VARCHAR2  := 'TEXT')
   RETURN CLOB;

DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
   directory       IN   VARCHAR2,
```

```
   sqlTestCase     IN   CLOB,
   ctrlOptions     IN   VARCHAR2  := NULL,
   format          IN   VARCHAR2  := 'TEXT')
   RETURN CLOB;
```

Parameters

Table 171-30 REPLAY_SQL_TESTCASE Function Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
ctrlOptions	Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'. • replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. EXPLAIN: Replay explains the statement without using outlines OUTLINE: Replay uses outlines mode and explains the statement using outlines EXECUTION: Replay executes the statement without using outlines OUTLINE EXECUTION: Replay executes the statement using outlines Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown. • name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.
sqlTestCase	SQL test case
format	Format of the replay report. Possible formats are: TEXT, XML and HTML..

Examples

```
TCB Replay Mode: Execute
 SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp
where emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal >
1000 /* tcbdynpl_1 */

Explain Plan
 Plan Hash Value  : 2219294842

-------------------------------------------------------------------
| Id  | Operation                     | Name           | Rows |
-------------------------------------------------------------------
|   0 | SELECT STATEMENT              |                |   13 |
| * 1 |   HASH JOIN                   |                |   13 |

REPLAY Note:
-----------
- Replay used dynamic sampling
- Replay forced Dynamic plan
```

171.4.22 REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a `CLOB` containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
    taskname           IN   VARCHAR2,
    type               IN   VARCHAR2  := TYPE_TEXT,
    level              IN   VARCHAR2  := LEVEL_TYPICAL,
    section            IN   VARCHAR2  := SECTION_ALL,
    object_id          IN   NUMBER    := NULL,
    result_limit       IN   NUMBER    := NULL,
    owner_name         IN   VARCHAR2  := NULL)
  RETURN CLOB;
```

Parameters

Table 171-31 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
`taskname`	Name of task to report
`type`	Type of the report. Possible values are: TEXT, HTML, XML (see Table 171-4).

Table 171-31 (Cont.) REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 171-5).
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 171-6).
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

171.4.23 RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-32 RESET_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.24 RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 171-33 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

171.4.25 SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE: diag scope (comprehensive, limited)
- _SQLDIAG_FINDING_MODE: findings in the report (see "Table 171-8" for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname           IN   VARCHAR2,
    parameter          IN   VARCHAR2,    value              IN   NUMBER);
```

Parameters

Table 171-34 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

171.4.26 SQL_DIAGNOSE_AND_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_text           IN   CLOB,
    bind_list          IN   sql_binds := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch   IN   VARCHAR2  := YES)
  RETURN NUMBER;

DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_id             IN   VARCHAR2,
    plan_hash_value    IN   NUMBER   := NULL,
    scope              IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER   := TIME_LIMIT_DEFAULT,
    problem_type       IN   NUMBER   := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch   IN   VARCHAR2 := YES)
  RETURN NUMBER;

DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
```

```
   incident_id        IN   VARCHAR2,
   scope              IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
   time_limit         IN   NUMBER   := TIME_LIMIT_DEFAULT,
   problem_type       IN   NUMBER   := PROBLEM_TYPE_PERFORMANCE,
   auto_apply_patch   IN   VARCHAR2 := YES)
 RETURN NUMBER;
```

Parameters

Table 171-35 SQL_DIAGNOSE_AND_REPAIR Function Parameters

Parameter	Description
sql_text	Text of the SQL statement.
sql_id	SQL ID of the SQL query.
plan_hash_value	The plan to be used for diagnosis. The default value is NULL.
bind_list	Binds to be used for diagnosis. The default value is NULL.
scope	The scope of diagnostic advisor. Possible values are: • SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL. • SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement. The default value is SCOPE_COMPREHENSIVE.
time_limit	Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT.
problem_type	Problem type that is being diagnosed. The following problem type are supported: • PROBLEM_TYPE_PERFORMANCE—performance problem. • PROBLEM_TYPE_WRONG_RESULTS—incorrect results. • PROBLEM_TYPE_COMPILATION_ERROR—crash during compilation of the statement. • PROBLEM_TYPE_EXECUTION_ERROR—crash during execution of the statement. The default value is PROBLEM_TYPE_PERFORMANCE.
auto_apply_patch	A value that decides if the recommended SQL patch needs to be accepted. Possible values are: • YES—accepts the recommended SQL patch. • NO—does not accepts recommended SQL patch automatically. User need to manually accept the SQL patch. The default value is YES.

171.4.27 UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := '%',
   replace               IN  BOOLEAN,
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 171-36 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`patch_name`	Name of patch to unpack (% wildcards acceptable, case-sensitive)
`patch_category`	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
`replace`	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
`staging_table_name`	(Mandatory) Name of the table to use (case-sensitive)
`staging_schema_owner`	Schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

- Requires: `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `SELECT` or `READ` privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

Related Topics

- PACK_STGTAB_SQLPATCH Procedure
  This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.
- ACCEPT_SQL_PATCH Function & Procedure
  This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

172
DBMS_SQLPA

The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_SQLPA Subprograms

172.1 DBMS_SQLPA Overview

The `DBMS_SQLPA` package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.s
2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.
3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.

172.2 DBMS_SQLPA Security Model

This package is available to `PUBLIC` and performs its own security checking. All analysis task interfaces (`XXX_ANALYSIS_TASK`) require privilege `ADVISOR`.

172.3 Summary of DBMS_SQLPA Subprograms

This table lists the `DBMS_SQLPA` subprograms and briefly describes them.

Table 172-1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure	Drops a SQL analysis task

Table 172-1 (Cont.) DBMS_SQLPA Package Subprograms

Subprogram	Description
EXECUTE_ANALYSIS_TASK Function & Procedure	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_PARAMETER Procedures	Sets the SQL analysis task parameter default value

172.3.1 CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 172-2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

172.3.2 CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text         IN CLOB,
  bind_list        IN sql_binds := NULL,
  parsing_schema   IN VARCHAR2  := NULL,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER    := NULL,
  task_name        IN VARCHAR2  := NULL,
  con_name         IN VARCHAR2     DEFAULT,
  description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  dbid             IN NUMBER       DEFAULT,
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
```

```
  plan_hash_value  IN NUMBER    := NULL,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL)
  con_name         IN VARCHAR2     DEFAULT,
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name       IN VARCHAR2,
  basic_filter      IN VARCHAR2 :=  NULL,
  con_name          IN VARCHAR2     DEFAULT,
  order_by          IN VARCHAR2 :=  NULL,
  top_sql           IN VARCHAR2 :=  NULL,
  task_name         IN VARCHAR2 :=  NULL,
  description       IN VARCHAR2 :=  NULL
  sqlset_owner      IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

Parameters

Table 172-3 *CREATE_ANALYSIS_TASK Function Parameters*

Parameter	Description
`sql_text`	Text of a SQL statement
`bind_list`	A set of bind values
`parsing_schema`	Name of the schema where the statement can be compiled
`task_name`	Optional analysis task name
`dbid`	The `DBID` for imported or `PDB-level AWR` data. If `NULL`, then the current database `DBID` is used
`con_name`	Container for the SPA task. The semantics depend on the function format: For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. The following statements are true of all function formats: • In a non-CDB, this parameter is ignored. • In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs. • In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs.
`description`	Description of the SQL analysis task to a maximum of 256 characters
`sql_id`	Identifier of a SQL statement
`plan_hash_value`	Hash value of the SQL execution plan
`begin_snap`	Begin snapshot identifier

Table 172-3 (Cont.) *CREATE_ANALYSIS_TASK Function Parameters*

Parameter	Description
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
     sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id       => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap  => 1,
    end_snap    => 2,
    sql_id      => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
  sqlset_name    =>   'my_workload', -
  order_by       =>   'BUFFER_GETS', -
  description    =>   'process workload ordered by buffer gets');
```

172.3.3 DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task.The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 172-4 DROP_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	The name of the analysis task to drop

172.3.4 EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 172-5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 172-5 (Cont.) EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are: • [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. • EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. • COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task • CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name     => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name       => :tname,
    execution_type  => 'test execute',
    execution_name  => 'before_change');
```

3. Make change

```
...
```

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name          => :tname, -
   execution_type     => 'test execute',
   execution_name     => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
   :tname,'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         => :tname, -
   execution_type    => 'compare performance', -
   execution_name    => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name        => :tname, -
   execution_type   => 'compare performance',
   execution_params => dbms_advisor.arglist(
      'execution_name1',
      'before_change',
      'execution_name2',
      'after_change',
      'comparison_metric',
      'buffer_gets'));
```

172.3.5 INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
   task_name         IN VARCHAR2);
```

Parameters

Table 172-6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

172.3.6 REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
   task_name       IN   VARCHAR2,
   type            IN   VARCHAR2   := 'TEXT',
   level           IN   VARCHAR2   := 'TYPICAL',
   section         IN   VARCHAR2   := 'SUMMARY',
   object_id       IN   NUMBER     := NULL,
   top_sql         IN   NUMBER     := 100,
   execution_name  IN   VARCHAR2   := NULL,
   task_owner      IN   VARCHAR2   := NULL,
   order_by        IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 172-7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).
level	Level of detail in the report: • ALL - details of all SQL • BASIC - currently the same as typical • CHANGED - only SQL with changed performance • CHANGED_PLANS - only SQL with plan changes • ERRORS - SQL with errors only • IMPROVED - only improved SQL • REGRESSED - only regressed SQL • TIMEOUT - only SQL which timed-out during execution • TYPICAL (default) - show information about every statement analyzed, including changing and errors • UNCHANGED - only SQL with unchanged performance • UNCHANGED_PLANS - only SQL with unchanged plans • UNSUPPORTED - only SQL not supported by SPAs

Table 172-7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
section	Optionally limit the report to a single section (ALL for all sections): • SUMMARY (default) - workload summary only • ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
order_by	How to sort SQL statements in the report (summary and body). Possible values: • CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric • NULL (default) - order SQL statement by impact on workload • SQL_IMPACT - order SQL statement by change impact on SQL • WORKLOAD_IMPACT - same as NULL • METRIC_DELTA - same as CHANGE_DIFF

Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

172.3.7 RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 172-8 RESET_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

172.3.8 RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 172-9 RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the CREATE_ANALYSIS_TASK Functions.

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.
```

```
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

172.3.9 SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN VARCHAR2,
  test_execute_dop  IN NUMBER DEFAULT 0,
  compare_resultset IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN NUMBER
  test_execute_dop  IN NUMBER DEFAULT 0,
  compare_resultset IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 172-10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: • APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • CELL_SIMULATION_ENABLED: for more details, see the helper script tcellsim.sql in the ADMIN directory. • COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) • DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure.

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	• DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to TRUE to disable this capability. In this case, each SQL in the SQL tuning set is executed only once. • EXECUTE_TRIGGERS: Set this parameter to TRUE to execute all statement-level triggers in the FULLDML mode. If the parameter is set to FALSE, then the triggers will not be executed even in FULLDML mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is FALSE. • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) • EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds) • METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero. • NUM_ROWS_TO_FETCH: specifies the number of rows to be fetched for an SQL query. You can use one of the following values: – ALL_ROWS: Fetches all the rows for an SQL query – AVERAGE: Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS – AUTO: Number of result rows is determined using the value of optimizer_mode parameter of the optimizer environment captured in the STS. If the value of optimizer_mode is ALL_ROWS, then all result rows will be fetched. If its value is FIRST_ROWS_n, then n result rows will be fetched by the SPA. – A valid number: Fetches the exact number of rows specified by in the SQL query The default value is ALL_ROWS. • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • PLAN_LINES_COMPARISON: - ALWAYS --line by line comparison of plans in all scenarios.- AUTO -Line by Line comparison of plans only if phv2 is not available and phv1 is different- NONE (default) - line by line comparison of plans only if phv is unknown

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
	• RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: – CURRENT_SYSDATE: SYSDATE calls return the current date. – SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS The default value is CURRENT_SYSDATE. • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. • SQL_LIMIT: maximum number of SQL statements to process • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA. • SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME. • TIME_LIMIT: global time out (seconds)
parameter (contd.)	• WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression. • CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.
value	New value of the specified parameter
test_execute_dop	Specifies the requested level of concurrency with which a SPA task should be executed. Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.

Table 172-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
compare_resultset	Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement. • If set to TRUE the result set comparison will be performed • If set to FALSE result set comparison will not be performed.

Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the test_execute_dop parameter. This parameter applies only to test-execute or explain plan type of trials that process a SQL Tuning set.

Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

172.3.10 SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 172-11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
`parameter`	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: • `APPLY_CAPTURED_COMPILENV`: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, `NO`). • `BASIC_FILTER`: basic filter for SQL tuning set • `COMPARISON_METRIC`: specify an expression of execution statistics to use in performance comparison (Example: `buffer_gets`, `cpu_time` + `buffer_gets` * 10) • `DATABASE_LINK`: can be set to the global name of a `PUBLIC` database link. When it is set, SQL Performance Analyzer will use the database link for all `TEST EXECUTE` and `EXPLAIN PLAN` operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. • `DAYS_TO_EXPIRE`: number of days until the task is deleted • `DEFAULT_EXECUTION_TYPE`: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. • `EXECUTE_FULLDML`: `TRUE` to execute DML statement fully, including acquiring row locks and modifying rows; `FALSE` (default) to execute only the query part of the DML without modifying data. When `TRUE`, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • `EXECUTION_DAYS_TO_EXPIRE`: number of days until the tasks's executions will be deleted (without deleting the task) • `EXECUTION_NAME1`: name of the first task execution to analyze • `EXECUTION_NAME2`: name of the second task execution to analyze • `LOCAL_TIME_LIMIT`: per-statement time out (seconds)

Table 172-11 (Cont.) SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
`parameter` (contd.)	• `PLAN_FILTER`: plan filter for SQL tuning set (see `SELECT_SQLSET` for possible values) • `RANK_MEASURE1`: first ranking measure for SQL tuning set • `RANK_MEASURE2`: second possible ranking measure for SQL tuning set • `RANK_MEASURE3`: third possible ranking measure for SQL tuning set • `RESUME_FILTER`: a extra filter for SQL tuning sets besides `BASIC_FILTER` • `SQL_IMPACT_THRESHOLD`: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. • `SQL_LIMIT`: maximum number of SQL statements to process • `SQL_PERCENTAGE`: percentage filter of SQL tuning set statements • `TIME_LIMIT`: global time out (seconds) • `WORKLOAD_IMPACT_THRESHOLD`: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
`value`	New value of the specified parameter

173
DBMS_SQLQ

The DBMS_SQLQ package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- DBMS_SQLQ Overview
- Summary of DBMS_SQLQ Subprograms

173.1 DBMS_SQLQ Overview

The DBMS_SQLQ package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the DBMS_SQLQ package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

173.2 Summary of DBMS_SQLQ Subprograms

This table lists the DBMS_SQLQ subprograms and briefly describes them.

Table 173-1 DBMS_SQLQ Package Subprograms

Procedure	Description
ALTER_QUARANTINE Procedure	Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement
CREATE_QUARANTINE_BY_SQL_ID Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL ID
CREATE_QUARANTINE_BY_SQL_TEXT Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL text
CREATE_STGTAB_QUARANTINE Procedure	Creates a staging table to store quarantine configurations
DROP_QUARANTINE Procedure	Deletes a quarantine configuration

Table 173-1 (Cont.) DBMS_SQLQ Package Subprograms

Procedure	Description
GET_PARAM_VALUE_QUARANTINE Function	Returns the value for a quarantine threshold specified in a quarantine configuration
PACK_STGTAB_QUARANTINE Function	Adds one or more quarantine configurations to a staging table
UNPACK_STGTAB_QUARANTINE Function	Creates quarantine configurations in a database from a staging table

173.2.1 ALTER_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
   quarantine_name   IN VARCHAR2,
   parameter_name    IN VARCHAR2,
   parameter_value   IN VARCHAR2);
```

Parameters

Table 173-2 ALTER_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values: • CPU_TIME: CPU time • ELAPSED_TIME: Elapsed time • IO_MEGABYTES: I/O in megabytes • IO_REQUESTS: Number of physical I/O requests • IO_LOGICAL: Number of logical I/O requests • ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES. • AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES.

Table 173-2 (Cont.) ALTER_QUARANTINE Procedure Parameters

Parameter	Description
parameter_value	Quarantine threshold for the resource specified in parameter_name.

Examples

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

  DBMS_SQLQ.ALTER_QUARANTINE(
   QUARANTINE_NAME  =>  'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
   PARAMETER_NAME   =>  'CPU_TIME',
   PARAMETER_VALUE  =>  '5');

  DBMS_SQLQ.ALTER_QUARANTINE(
   QUARANTINE_NAME  =>  'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
   PARAMETER_NAME   =>  'ELAPSED_TIME',
   PARAMETER_VALUE  =>  '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

173.2.2 CREATE_QUARANTINE_BY_SQL_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
   sql_id           IN VARCHAR2,
   plan_hash_value  IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 173-3 CREATE_QUARANTINE_BY_SQL_ID Function Parameters

Parameter	Description
sql_id	SQL ID of the SQL statement.

Table 173-3 (Cont.) CREATE_QUARANTINE_BY_SQL_ID Function Parameters

Parameter	Description
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr', PLAN_HASH_VALUE => '3488063716');
END;
/
```

173.2.3 CREATE_QUARANTINE_BY_SQL_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
   sql_text         IN CLOB,
   plan_hash_value  IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 173-4 CREATE_QUARANTINE_BY_SQL_TEXT Function Parameters

Parameter	Description
sql_text	SQL statement.
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(*) from emp'.

```
DECLARE
  quarantine_config VARCHAR2(30);
BEGIN
  quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

173.2.4 CREATE_STGTAB_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
   staging_table_name   IN VARCHAR2,
   staging_table_owner  IN VARCHAR2 DEFAULT NULL,
   tablespace_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-5 CREATE_STGTAB_QUARANTINE Procedure Parameters

Parameter	Description
staging_table_name	Name of the staging table.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
tablespace_name	Name of the tablespace in which the staging table needs to be created. Default value is NULL, which means the staging table is created in the default tablespace of the database.

Examples

The following example creates the staging table TBL_STG_QUARANTINE in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
  DBMS_SQLQ.CREATE_STGTAB_QUARANTINE(STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

173.2.5 DROP_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

Syntax

```
DBMS_SQLQ.DROP_QUARANTINE(quarantine_name IN VARCHAR2);
```

Parameters

Table 173-6 DROP_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration to delete.

Examples

The following example deletes the quarantine configuration having the name SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN
  DBMS_SQLQ.DROP_QUARANTINE('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

173.2.6 GET_PARAM_VALUE_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
   quarantine_name   IN VARCHAR2,
   parameter_name    IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 173-7 GET_PARAM_VALUE_QUARANTINE Function Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Resource for which the quarantine threshold needs to be retrieved.

Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
DECLARE
  quarantine_config_setting_value VARCHAR2(30);
BEGIN
  quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE(
                                       QUARANTINE_NAME  =>
'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
                                       PARAMETER_NAME   =>  'CPU_TIME');
END;
/
```

173.2.7 PACK_STGTAB_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
   staging_table_name    IN VARCHAR2,
   staging_table_owner   IN VARCHAR2 DEFAULT NULL,
   name                  IN VARCHAR2 DEFAULT '%',
   sql_text              IN VARCHAR2 DEFAULT '%',
```

```
   enabled               IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 173-8 PACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table in which the quarantine configurations need to be added.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations added to the staging table.

Examples

The following example adds all the quarantine configurations having the names starting with SQL_QUARANTINE_ into the staging table TBL_STG_QUARANTINE.

```
DECLARE
  quarantine_configs NUMBER;
BEGIN
  quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE(
                          STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
                          NAME => 'SQL_QUARANTINE_%');
END;
/
```

173.2.8 UNPACK_STGTAB_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

Syntax

```
DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
   staging_table_name    IN VARCHAR2,
   staging_table_owner   IN VARCHAR2 DEFAULT NULL,
   name                  IN VARCHAR2 DEFAULT '%',
```

```
   sql_text              IN VARCHAR2 DEFAULT '%',
   enabled               IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 173-9 UNPACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table from which the quarantine configurations need to be created in the database.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations created in the database from the staging table.

Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table TBL_STG_QUARANTINE.

```
DECLARE
  quarantine_configs NUMBER;
BEGIN
  quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE(
                                      STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

174
DBMS_SQLSET

The DBMS_SQLSET package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in DBMS_SQLTUNE. The difference is that DBMS_SQLSET does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- DBMS_SQLSET Overview
- DBMS_SQLSET Security Model
- DBMS_SQLSET Data Structures
- Summary of DBMS_SQLSET Subprograms

174.1 DBMS_SQLSET Overview

Use this package to manage SQL tuning sets.

> **Note:**
>
> All DBMS_SQLSET subprograms have equivalents in the DBMS_SQLTUNE package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the SELECT_CURSOR_CACHE Function
- Top SQL statements from the Automatic Workload Repository using the SELECT_WORKLOAD_REPOSITORY Function
- Other SQL tuning sets using the SELECT_SQLSET Function
- SQL Performance Analyzer task comparison results using the SELECT_SQLPA_TASK Function
- SQL Trace files using the SELECT_SQL_TRACE Function
- A user-defined workload

The complete group of subprograms listed in Summary of DBMS_SQLSET Subprograms facilitates this functionality. As examples:

- The CREATE_SQLSET Procedure and Function creates a SQL tuning set object in the database.
- The LOAD_SQLSET Procedure populates the SQL tuning set with a set of selected SQL.
- The CAPTURE_CURSOR_CACHE Procedure collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

174.2 DBMS_SQLSET Security Model

This package is available to `PUBLIC` and performs its own security checking.

SQL tuning set subprograms require either the `ADMINISTER SQL TUNING SET` or the `ADMINISTER ANY SQL TUNING SET` privilege. Users having the `ADMINISTER SQL TUNING SET` privilege can only create and modify a SQL tuning set that they own. The `ADMINISTER ANY SQL TUNING SET` privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use CREATE_SQLSET Procedure and Function to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the `ADMINISTER SQL TUNING SET` privilege to manipulate the SQL tuning set.

174.3 DBMS_SQLSET Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- SQLSET_ROW Object Type

174.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                  VARCHAR(13),
```

```
force_matching_signature NUMBER,
sql_text                 CLOB,
object_list              sql_objects,
bind_data                RAW(2000),
parsing_schema_name      VARCHAR2(30),
module                   VARCHAR2(48),
action                   VARCHAR2(32),
elapsed_time             NUMBER,
cpu_time                 NUMBER,
buffer_gets              NUMBER,
disk_reads               NUMBER,
direct_writes            NUMBER,
rows_processed           NUMBER,
fetches                  NUMBER,
executions               NUMBER,
end_of_fetch_count       NUMBER,
optimizer_cost           NUMBER,
optimizer_env            RAW(2000),
priority                 NUMBER,
command_type             NUMBER,
first_load_time          VARCHAR2(19),
stat_period              NUMBER,
active_stat_period       NUMBER,
other                    CLOB,
plan_hash_value          NUMBER,
sql_plan                 sql_plan_table_type,
bind_list                sql_binds,
con_dbid                 NUMBER,
last_exec_start_time     VARCHAR2(19))
```

Attributes

Table 174-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.

Table 174-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.
bind_list	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.
con_dbid	DBID of the PDB or CDB root.
last_exec_start_time	Most recent execution start time of this SQL statement.

174.4 Summary of DBMS_SQLSET Subprograms

This table lists the DBMS_SQLSET subprograms and briefly describes them.

Table 174-2 DBMS_SQLSET Package Subprograms

Subprogram	Description
ADD_REFERENCE Function	This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.
CAPTURE_CURSOR_CACHE Procedure	This procedure captures a workload from the shared SQL area into a SQL tuning set.
CREATE_SQLSET Procedure and Function	This procedure or function creates a SQL tuning set object in the database.

Table 174-2 (Cont.) DBMS_SQLSET Package Subprograms

Subprogram	Description
CREATE_STGTAB Procedure	This procedure creates a staging table through which SQL tuning sets are imported and exported.
DELETE_SQLSET Procedure	This procedure deletes a set of SQL statements from a SQL tuning set.
DROP_SQLSET Procedure	This procedure drops a SQL tuning set if it is not active.
LOAD_SQLSET Procedure	This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.
PACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the `CREATE_STGTAB` procedure.
REMAP_STGTAB Procedure	This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.
REMOVE_REFERENCE Procedure	This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.
SELECT_CURSOR_CACHE Function	This function collects SQL statements from the workload repository.
SELECT_SQL_TRACE Function	This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.
SELECT_SQLPA_TASK Function	This function collects SQL statements from a SQL Performance Analyzer comparison task.
SELECT_SQLSET Function	This is a table function that reads the contents of a SQL tuning set.
SELECT_WORKLOAD_REPOSITORY Function	This function collects SQL statements from the workload repository.
UNPACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.
UPDATE_SQLSET Procedures	This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

174.4.1 ADD_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

Syntax

```
DBMS_SQLSET.ADD_REFERENCE (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL,
   sqlset_owner IN  VARCHAR2 :=NULL)
 RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 174-3 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set.
`description`	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
`sqlset_owner`	Specifies the owner of the SQL tuning set, or `NULL` for the current schema owner.

Return Values

The identifier of the added reference.

Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',
description => 'my sts ref');
```

174.4.2 CAPTURE_CURSOR_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (
    sqlset_name         IN VARCHAR2,
    time_limit          IN POSITIVE := 1800,
    repeat_interval     IN POSITIVE := 300,
    capture_option      IN VARCHAR2 := 'MERGE',
    capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,
    basic_filter        IN VARCHAR2 := NULL,
    sqlset_owner        IN VARCHAR2 := NULL,
    recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 174-4 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the SQL tuning set name
`time_limit`	Defines the total amount of time, in seconds, to execute.
`repeat_interval`	Defines the amount of time, in seconds, to pause between sampling.
`capture_option`	Specifies whether to insert new statements, update existing statements, or both. Values are `INSERT`, `UPDATE`, or `MERGE`. The values are the same as for `load_option` in `load_sqlset`.
`capture_mode`	Specifies the capture mode (`UPDATE` and `MERGE` capture options). Possible values: • `MODE_REPLACE_OLD_STATS` — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set • `MODE_ACCUMULATE_STATS` — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
`basic_filter`	Defines a filter to apply to the shared SQL area for each sample. If `basic_filter` is not set by the caller, then the subprogram captures only statements of type `CREATE TABLE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, and `MERGE`.
`sqlset_owner`	Specifies the owner of the SQL tuning set or `NULL` for current schema owner

Table 174-4 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
recursive_sql	Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                        sqlset_name     =>
'my_workload', -
                                        time_limit      =>  30, -
                                        repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                         sqlset_name     => 'my_workload', -
                         time_limit      => 30, -
                         repeat_interval => 5, -
                         capture_mode    =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                    sqlset_name     => 'my_workload', -
                                    time_limit      => 30, -
                                    repeat_interval => 5, -
                                    capture_option  => 'INSERT');
```

174.4.3 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLSET.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL
   sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLSET.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   sqlset_owner IN  VARCHAR2 := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 174-5 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

174.4.4 CREATE_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
   table_name        IN VARCHAR2,
   schema_name       IN VARCHAR2 := NULL,
   tablespace_name   IN VARCHAR2 := NULL,
   db_version        IN NUMBER   := NULL);
```

Parameters

Table 174-6 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
`table_name`	Specifies the of the table to create. The name is case sensitive.
`schema_name`	Defines the schema in which to create the table, or `NULL` for the current schema. The name is case sensitive.
`tablespace_name`	Specifies the tablespace in which to store the staging table, or `NULL` for the default tablespace of the current user. The name is case sensitive.
`db_version`	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: • `NULL` (default) — Specifies the current database version. • `STS_STGTAB_10_2_VERSION` — Specifies the 10.2 database version. • `STS_STGTAB_11_1_VERSION` — Specifies the 11.1 database version. • `STS_STGTAB_11_2_VERSION` — Specifies the 11.2 database version. • `STS_STGTAB_12_1_VERSION` — Specifies the 12.1 database version. • `STS_STGTAB_12_2_VERSION` — Specifies the 12.2 database version.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12*c* Release 1 (12.1.0.2) format:

```
BEGIN
  DBMS_SQLSET.CREATE_STGTAB(
      table_name => 'STGTAB_SQLSET_121'
  ,   db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION );
END;
```

174.4.5 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
   sqlset_name   IN  VARCHAR2,
   basic_filter  IN  VARCHAR2 := NULL,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 174-7 DELETE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name   => 'my_workload', -
                               basic_filter  => 'elapsed_time < 1000000');
```

174.4.6 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

Syntax

```
DBMS_SQLSET.DROP_SQLSET (
   sqlset_name   IN  VARCHAR2,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 174-8 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.

Table 174-8 (Cont.) DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

174.4.7 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

Syntax

```
DBMS_SQLSET.LOAD_SQLSET (
   sqlset_name       IN  VARCHAR2,
   populate_cursor   IN  sqlset_cursor,
   load_option       IN VARCHAR2 := 'INSERT',
   update_option     IN VARCHAR2 := 'REPLACE',
   update_condition  IN VARCHAR2 :=  NULL,
   update_attributes IN VARCHAR2 :=  NULL,
   ignore_null       IN BOOLEAN  :=  TRUE,
   commit_rows       IN POSITIVE :=  NULL,
   sqlset_owner      IN VARCHAR2 := NULL);
```

Parameters

Table 174-9 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: • INSERT (default) — Adds only new statements. • UPDATE — Updates existing the SQL statements and ignores any new statements. • MERGE — Inserts new statements and updates the information of the existing ones.

Table 174-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_option	Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: • REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on. • ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.
update_condition	Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: • OLD — Refers to statement attributes from the SQL tuning set (destination). • NEW — Refers to statement attributes from the input statements (source).
update_attributes	Specifies the list of SQL statement attributes to update during a merge or update. The possible values are: • NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action. • BASIC — Specifies statistics and binds only. • TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list. • ALL — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: – EXECUTION_CONTEXT – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN – SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)
ignore_null	Specifies whether to update attributes when the new value is NULL. If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.

Table 174-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
commit_rows	Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.
sqlset_owner	Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in sqlset_row), or because they violate the user's privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to SYS schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
 cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
   SELECT VALUE(P)
     FROM table(
       DBMS_SQLSET.SELECT_CURSOR_CACHE(
         'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
         'ALL')) P;

DBMS_SQLSET.LOAD_SQLSET(sqlset_name     => 'my_workload',
                        populate_cursor => cur);
```

```
END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with `'ACCUMULATE'` as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
                                               'parsing_schema_name <>
''SYS''',
                                               NULL, NULL,NULL,NULL,
                                               1,
                                               NULL,
                                               'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name     => 'my_workload',
                          populate_cursor => cur,
                          load_option     => 'MERGE',
                          update_option   => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that `'INSERT'` is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
```

```
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name     => 'my_workload',
                          populate_cursor => cur,
                          load_option     => 'UPDATE');
END;
/
```

174.4.8 PACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.

Syntax

```
DBMS_SQLSET.PACK_STGTAB (
   sqlset_name          IN VARCHAR2,
   sqlset_owner         IN VARCHAR2 := NULL,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL,
   db_version           IN NUMBER   := NULL);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.PACK_STGTAB_SQLSET and DBMS_SQLSET.PACK_STGTAB procedures.

Table 174-10 PACK_STGTAB_SQLSET and PACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.
sqlset_owner	Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted.
staging_table_name	Specifies the name of the table to use. The value is case sensitive.
staging_schema_owner	Specifies the schema where the table resides, or NULL for the current schema. The value is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: • NULL (default) — Specifies the current database version. • STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. • STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. • STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.

Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a `COMMIT` after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
      sqlset_name        => '%'
  ,   sqlset_owner       => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
      sqlset_name        => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
      sqlset_name         => 'my_workload'
  ,   staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
      sqlset_name         => 'workload_subset'
  ,   staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11*g* Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
      sqlset_name          => 'workload_subset'
  ,   staging_table_name   => 'STGTAB_SQLSET'
```

```
  ,   db_version           => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

174.4.9 REMAP_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
   old_sqlset_name        IN VARCHAR2,
   old_sqlset_owner       IN VARCHAR2 := NULL,
   new_sqlset_name        IN VARCHAR2 := NULL,
   new_sqlset_owner       IN VARCHAR2 := NULL,
   staging_table_name     IN VARCHAR2,
   staging_schema_owner   IN VARCHAR2 := NULL
   old_con_dbid           IN NUMBER   := NULL,
   new_con_dbid           IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 174-11 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
      old_sqlset_name    =>
'my_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_name    =>
'imp_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLSET.REMAP_STGTAB(
      old_sqlset_name    => 'imp_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_owner   => 'SYS'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

174.4.10 REMOVE_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

Syntax

```
DBMS_SQLSET.REMOVE_REFERENCE (
   sqlset_name   IN  VARCHAR2,
   reference_id  IN  NUMBER,
   sqlset_owner  IN  VARCHAR2 := NULL,
   force_remove  IN  NUMBER   := 0);
```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 174-12 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set.
`reference_id`	Specifies the identifier of the reference to remove.
`sqlset_owner`	Specifies the owner of the SQL tuning set (or `NULL` for the current schema owner).

Table 174-12 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
force_remove	Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to my_workload:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name   => 'my_workload', -
                                  reference_id  => :rid);
```

Use the DBA_SQLSET_REFERENCES view to find all references to a given SQL tuning set.

174.4.11 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL,
  attribute_list      IN   VARCHAR2 := 'TYPICAL',
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-13 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
basic_filter	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
object_filter	Currently not supported.

Table 174-13 (Cont.) SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
ranking_measure(n)	Defines an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top *n*% according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
result_limit	Defines the top limit SQL from the filtered source ranked by the ranking measure.
attribute_list	Specifies the list of SQL statement attributes to return in the result. Possible values are: • TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default). • BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • ALL — Specifies all attributes. • Comma-separated list of attribute names. This values returns only a subset of SQL attributes: – EXECUTION_STATISTICS – BIND_LIST – OBJECT_LIST – SQL_PLAN – SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics
recursive_sql	Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Example 174-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM   TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

Example 174-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID `4rm4183czbs7j`:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j'''));
```

Example 174-3 Multiple Plans for a SQL Statement

A data source may store multiple plans for each SQL statement. The output of the `SELECT_CURSOR_CACHE` function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID `ay1m3ssvtrh24`:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id =
''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;
```

Example 174-4 Processing All Statements in the Shared SQL Area

This example processes all statements in the shared SQL area:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

  -- Process each statement in cursor (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

Example 174-5 Process Statements Not Parsed by SYS

This example processes all statements not parsed in the `SYS` schema:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(p)
    FROM TABLE(
     DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS'''))
p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
```

```
end;
/
```

Example 174-6 All Statements from an Application Module and Action

This example processes all statements from a specified application module and action:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE(
         'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) p;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/
```

Example 174-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

Example 174-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the `APPS` schema and had more than 100 buffer gets:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = ''APPS'''))p;

  -- Process each statement (or pass cursor to load_sqlset)
```

```
  CLOSE cur;
END;
/
```

Example 174-9 Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The `SQL_PLAN` attribute of `sqlset_row` is `NULL`.

```
-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of
sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => 'elapsed_time > 5000000',
      object_filter     => NULL,
      ranking_measure1  => NULL,
      ranking_measure2  => NULL,
      ranking_measure3  => NULL,
      result_percentage => 1,
      result_limit      => NULL,
      attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
      recursive_sql     => HAS_RECURSIVE_SQL)) p;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/
```

Example 174-10 Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'ELAPSED_TIME',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => 1,
      result_limit      => 100,
```

```
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

Example 174-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'BUFFER_GETS',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

174.4.12 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

Syntax

```
DBMS_SQLSET.SELECT_SQL_TRACE (
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
```

```
  result_limit           IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-14 SELECT_SQL_TRACE Function Parameters

Parameter	Description
directory	Defines the directory object containing the trace files. This field is mandatory.
file_name	Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.
mapping_table_name	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.
mapping_table_owner	Specifies the mapping table owner. If it is NULL, then the function uses the current user.
select_mode	Specifies the mode for selecting SQL from the trace. Possible values are: • SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. • ALL_EXECUTIONS — Returns all executions.
options	Specifies which types of SQL statements are returned. • LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. • ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with SELECT privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the PATH_PREFIX clause of the CREATE PLUGGABLE DATABASE statement to ensure that all

directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
     FROM TABLE(
        DBMS_SQLSET.SELECT_SQL_TRACE(
           directory=>'SQL_TRACE_DIR',
           file_name=>'%trc',
           mapping_table_name=>'mapping')) p;
   DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
END;
/
```

174.4.13 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

> **See Also:**
>
> *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-15 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
`task_name`	Specifies the name of the SQL Performance Analyzer task.
`task_owner`	Specifies the owner of the SQL Performance Analyzer task. If `NULL`, then assume the current user.
`execution_name`	Specifies the name of the SQL Performance Analyzer task execution (type `COMPARE PERFORMANCE`) from which the provided filters will be applied. If `NULL`, then assume the most recent `COMPARE PERFORMANCE` execution.

Table 174-15 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
level_filter	Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed. • IMPROVED includes only improved SQL. • REGRESSED includes only regressed SQL (default). • CHANGED includes only SQL with changed performance. • UNCHANGED includes only SQL with unchanged performance. • CHANGED_PLANS includes only SQL with plan changes. • UNCHANGED_PLANS includes only SQL with unchanged plans. • ERRORS includes only SQL with errors only. • MISSING_SQL includes only missing SQL statements (across STS). • NEW_SQL includes only new SQL statements (across STS).
basic filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	Defines the SQL statement attributes to return in the result. Possible values are: • TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • ALL — Returns all attributes. • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

174.4.14 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
  sqlset_name         IN   VARCHAR2,
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
```

```
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL)
  attribute_list      IN   VARCHAR2 := 'TYPICAL',
  plan_filter         IN   VARCHAR2 := NULL,
  sqlset_owner        IN   VARCHAR2 := NULL,
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-16 SELECT_SQLSET Function Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set to query.
`basic_filter`	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the `SQLSET_ROW`.
`object_filter`	Currently not supported.
`ranking_measure(n)`	Specifies an `ORDER BY` clause on the selected SQL.
`result_percentage`	Specifies a filter that picks the top *n*% according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
`result_limit`	The top limit SQL from the filtered source, ranked by the ranking measure.
`attribute_list`	Defines the SQL statement attributes to return in the result. The possible values are: • `BASIC` — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • `TYPICAL` — Returns `BASIC` plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • `ALL` — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: – `EXECUTION_STATISTICS` – `SQL_BINDS` – `SQL_PLAN_STATISTICS` (similar to `SQL_PLAN` plus row source statistics)

Table 174-16 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
plan_filter	Specifies the plan filter. This parameter enables you to select a single plan when a statement has multiple plans. Possible values are: • LAST_GENERATED — Returns the plan with the most recent timestamp. • FIRST_GENERATED — Returns the plan with the least recent timestamp. • LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information. • FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information. • MAX_ELAPSED TIME — Returns the plan with the maximum elapsed time. • MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets. • MAX_DISK_READS — Returns the plan with the maximum disk reads. • MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes. • MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.
recursive_sql	Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
```

```
  CLOSE cur;
END;
/
```

174.4.15 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```
DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := 'TYPICAL',
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid              IN NUMBER   := NULL)
 RETURN sys.sqlset PIPELINED;

DBMS_SQLSET.SELECT_WORKLOAD REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := 'TYPICAL',
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid              IN NUMBER   := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 174-17 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
`begin_snap`	Defines the beginning AWR snapshot (non-inclusive).
`end_snap`	Defines the ending AWR snapshot (inclusive).

Table 174-17 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
baseline_name	Specifies the name of the AWR baseline period.
basic_filter	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
object_filter	Currently not supported.
ranking_measure(n)	Defines an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top *n*% according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
result_limit	Specifies the top limit SQL from the source according to the supplied ranking measure.
attribute_list	Specifies the SQL statement attributes to return in the result. The possible values are: • TYPICAL — Returns BASIC plus SQL plan (without row source statistics) and without object reference list. This is the default. • BASIC — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. • ALL — Returns all attributes • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics).
recursive_sql	Specifies the filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).
dbid	Specifies the DBID for imported or PDB-level AWR data. If NULL, then the function uses the current database DBID.

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
```

```
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

174.4.16 UNPACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

Syntax

```
DBMS_SQLSET.UNPACK_STGTAB (
   sqlset_name          IN VARCHAR2 := '%',
   sqlset_owner         IN VARCHAR2 := NULL,
   replace              IN BOOLEAN,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

Table 174-18 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
`sqlset_owner`	Specifies the name of tuning set owner, or `NULL` for the current schema owner. Wildcard characters (%) are supported.
`replace`	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
`staging_table_name`	Specifies the name of the staging table, moved after a call to the `DBMS_SQLTUNE.PACK_STGTAB_SQLSET` or `DBMS_SQLSET.PACK_STGTAB` procedure (case-sensitive).
`staging_schema_owner`	Specifies the name of staging table owner, or `NULL` for the current schema owner (case-sensitive).

Examples

```
 -- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name         => '%', -
                               sqlset_owner        => '%', -
                               replace             => FALSE, -
                               staging_table_name  => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system.  In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name         => '%', -
                               sqlset_owner        => '%', -
                               replace             => TRUE, -
                               staging_table_name  => 'STGTAB_SQLSET');
```

174.4.17 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

Syntax

```
DBMS_SQLSET.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN  NUMBER := NULL,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  VARCHAR2 := NULL,
   sqlset_owner     IN  VARCHAR2 := NULL);

DBMS_SQLSET.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN  NUMBER := NULL,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  NUMBER := NULL,
   sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

Table 174-19 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.

Table 174-19 (Cont.) UPDATE_SQLSET Procedure Parameters

Parameter	Description
`attribute_name`	Specifies the name of the attribute to be modified. You can update the text field for `MODULE`, `ACTION`, `PARSING_SCHEMA_NAME`, and `OTHER`. The only numerical field that you can update is `PRIORITY`. If a statement has multiple plans, then the procedure changes the attribute value for all plans.
`attribute_value`	Specifies the new value of the attribute.

175
DBMS_SQLTUNE

The DBMS_SQLTUNE package is the interface for tuning SQL on demand. The related package DBMS_AUTO_SQLTUNE package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- DBMS_SQLTUNE Overview
- DBMS_SQLTUNE Security Model
- DBMS_SQLTUNE Data Structures
- DBMS_SQLTUNE Subprogram Groups
- Summary of DBMS_SQLTUNE Subprograms

> **See Also:**
>
> "DBMS_AUTO_SQLTUNE Overview"

175.1 DBMS_SQLTUNE Overview

The DBMS_SQLTUNE package provides a number of interrelated areas of functionality.

This section contains the following topics:

- DBMS_SQLTUNE SQL Tuning Advisor Subprograms
- DBMS_SQLTUNE SQL Profile Subprograms
- DBMS_SQLTUNE SQL Tuning Set Subprograms

SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of DBMS_SQLTUNE SQL Tuning Advisor Subprograms provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. CREATE_TUNING_TASK Functions creates a tuning task for tuning one or more SQL statements.
2. The EXECUTE_TUNING_TASK Function and Procedure executes a previously created tuning task.

3. The REPORT_TUNING_TASK Function displays the results of a tuning task.
4. You use the SCRIPT_TUNING_TASK Function to create a SQL*Plus script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of DBMS_SQLTUNE SQL Profile Subprograms provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the ACCEPT_SQL_PROFILE Procedure and Function to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the ALTER_SQL_PROFILE Procedure.
- You can drop a SQL profile with the DROP_SQL_PROFILE Procedure.

SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the SELECT_CURSOR_CACHE Function
- Top SQL statements from the Automatic Workload Repository using the SELECT_WORKLOAD_REPOSITORY Function
- Other SQL tuning sets using the SELECT_SQLSET Function
- SQL Performance Analyzer task comparison results using the SELECT_SQLPA_TASK Function
- SQL Trace files using the SELECT_SQL_TRACE Function
- A user-defined workload

The complete group of DBMS_SQLTUNE SQL Tuning Set Subprograms facilitates this functionality. As examples:

- The CREATE_SQLSET Procedure and Function creates a SQL tuning set object in the database.

- The LOAD_SQLSET Procedure populates the SQL tuning set with a set of selected SQL.
- The CAPTURE_CURSOR_CACHE_SQLSET Procedure collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

> **Note:**
>
> When manipulating SQL tuning sets, you can use DBMS_SQLSET as an alternative to `DBMS_SQLTUNE`.

Import and Export of SQL Tuning Sets and SQL Profiles

Use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the CREATE_STGTAB_SQLPROF Procedure or the CREATE_STGTAB_SQLSET Procedure.
2. To populate the staging table with information from the source system, call the PACK_STGTAB_SQLPROF Procedure or PACK_STGTAB_SQLSET Procedure.
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the UNPACK_STGTAB_SQLPROF Procedure or the UNPACK_STGTAB_SQLSET Procedure.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* for more information about programmatic flow

Automatic Tuning Task Functions

The automated system task `SYS_AUTO_SQL_TUNING_TASK` is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK` API.

> **See Also:**
>
> DBMS_AUTO_SQLTUNE for the list of subprograms that you can use to manage the automated SQL tuning task.

Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

> **Note:**
>
> `DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

175.2 DBMS_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
  - `ADMINISTER SQL TUNING SET`

    You can only create and modify a SQL tuning set that you own.
  - `ADMINISTER ANY SQL TUNING SET`

    You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
  - `CREATE ANY SQL PROFILE`
  - `ALTER ANY SQL PROFILE`
  - `DROP ANY SQL PROFILE`

  The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT` .

175.3 DBMS_SQLTUNE Data Structures

The SELECT_* subprograms in the DBMS_SQLTUNE package return objects of the SQLSET_ROW type.

Object Types

- SQLSET_ROW Object Type

175.3.1 SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of SQLSET_ROW objects. Each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT_* subprograms each model a data source as a collection of SQLSET_ROW objects, with each object uniquely identified by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                    VARCHAR(13),
  force_matching_signature  NUMBER,
  sql_text                  CLOB,
  object_list               sql_objects,
  bind_data                 RAW(2000),
  parsing_schema_name       VARCHAR2(30),
  module                    VARCHAR2(48),
  action                    VARCHAR2(32),
  elapsed_time              NUMBER,
  cpu_time                  NUMBER,
  buffer_gets               NUMBER,
  disk_reads                NUMBER,
  direct_writes             NUMBER,
  rows_processed            NUMBER,
  fetches                   NUMBER,
  executions                NUMBER,
  end_of_fetch_count        NUMBER,
  optimizer_cost            NUMBER,
  optimizer_env             RAW(2000),
  priority                  NUMBER,
  command_type              NUMBER,
  first_load_time           VARCHAR2(19),
  stat_period               NUMBER,
  active_stat_period        NUMBER,
  other                     CLOB,
  plan_hash_value           NUMBER,
```

```
  sql_plan                sql_plan_table_type,
  bind_list               sql_binds,
  con_dbid                NUMBER,
  last_exec_start_time    VARCHAR2(19))
```

Attributes

Table 175-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.

Table 175-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
bind_list	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.
con_dbid	DBID of the PDB or CDB root.
last_exec_start_time	Most recent execution start time of this SQL statement.

175.4 DBMS_SQLTUNE Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function.

- DBMS_SQLTUNE SQL Tuning Advisor Subprograms
- DBMS_SQLTUNE SQL Profile Subprograms
- DBMS_SQLTUNE SQL Tuning Set Subprograms
- DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
- DBMS_SQLTUNE SQL Performance Reporting Subprograms

175.4.1 DBMS_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 175-2 SQL Tuning Task Subprograms

Subprogram	Description
"CANCEL_TUNING_TASK Procedure"	Cancels the currently executing tuning task
"CREATE_SQL_PLAN_BASELINE Procedure"	Creates a SQL plan baseline for an existing plan
"CREATE_TUNING_TASK Functions"	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor
"DROP_TUNING_TASK Procedure"	Drops a SQL tuning task
"EXECUTE_TUNING_TASK Function and Procedure"	Executes a previously created tuning task
"IMPLEMENT_TUNING_TASK Procedure"	Implements a set of SQL profile recommendations made by SQL Tuning Advisor
"INTERRUPT_TUNING_TASK Procedure"	Interrupts the currently executing tuning task
"REPORT_AUTO_TUNING_TASK Function"	Displays a report from the automatic tuning task, reporting on a range of executions
"REPORT_TUNING_TASK Function"	Displays the results of a tuning task
"RESET_TUNING_TASK Procedure"	Resets the currently executing tuning task to its initial state
"RESUME_TUNING_TASK Procedure"	Resumes a previously interrupted task that was created to process a SQL tuning set

Table 175-2 (Cont.) SQL Tuning Task Subprograms

Subprogram	Description
"SCHEDULE_TUNING_TASK Function"	Creates a tuning task and schedules its execution as a scheduler job
"SCRIPT_TUNING_TASK Function"	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations
"SET_TUNING_TASK_PARAMETER Procedures"	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER

"Summary of DBMS_SQLTUNE Subprograms" contains a complete listing of all subprograms in the package.

175.4.2 DBMS_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

Table 175-3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a specific execution of a tuning task
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure	Uses the profile data stored in the staging table to create profiles on this system

"Summary of DBMS_SQLTUNE Subprograms" contains a complete listing of all subprograms in the package.

175.4.3 DBMS_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 175-4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFERENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQLSET Procedure	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQLSET Procedure	Copies tuning sets out of the SYS schema into the staging table
REMAP_STGTAB_SQLSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system
REMOVE_SQLSET_REFERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CACHE Function	Collects SQL statements from the shared SQL area
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL performance analyzer comparison task
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_REPOSITORY Function	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQLSET Procedure	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

175.4.4 DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 175-5 Real-Time SQL Monitoring Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function	Reports on Real-Time SQL Monitoring
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database
REPORT_SQL_MONITOR_LIST_XML Function	Builds an XML report for all or a subset of statements monitored by Oracle Database

175.4.5 DBMS_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

Table 175-6 SQL Performance Reporting Subprograms

Subprogram	Description
REPORT_SQL_DETAIL Function	This function reports on a specific SQL ID.
REPORT_SQL_MONITOR Function	This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.
REPORT_TUNING_TASK Function	This function displays the results of a tuning task.
REPORT_TUNING_TASK_XML Function	This function displays an XML report of a tuning task.

175.5 Summary of DBMS_SQLTUNE Subprograms

This table lists the `DBMS_SQLTUNE` subprograms and briefly describes them.

Table 175-7 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a particular execution of a particular tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ADD_SQLSET_REFERENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client	DBMS_SQLTUNE SQL Tuning Set Subprograms
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object	DBMS_SQLTUNE SQL Profile Subprograms

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
CANCEL_TUNING_TASK Procedure	Cancels the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CAPTURE_CURSOR_CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_SQL_PLAN_BASELINE Procedure	Creates a SQL plan baseline for an existing plan	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another	DBMS_SQLTUNE SQL Profile Subprograms
CREATE_STGTAB_SQLSET Procedure	Creates a staging table through which SQL tuning sets are imported and exported	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_TUNING_TASK Functions	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database	DBMS_SQLTUNE SQL Profile Subprograms
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_TUNING_TASK Procedure	Drops a SQL tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
EXECUTE_TUNING_TASK Function and Procedure	Executes a previously created tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
IMPLEMENT_TUNING_TASK Procedure	implements a set of SQL profile recommendations made by SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
INTERRUPT_TUNING_TASK Procedure	Interrupts the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL	DBMS_SQLTUNE SQL Tuning Set Subprograms
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Profile Subprograms
PACK_STGTAB_SQLSET Procedure	Moves tuning sets out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation	DBMS_SQLTUNE SQL Profile Subprograms
REMAP_STGTAB_SQLSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system	DBMS_SQLTUNE SQL Tuning Set Subprograms
REMOVE_SQLSET_REFERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_AUTO_TUNING_TASK Function	Displays a report from the automatic tuning task, reporting on a range of subtasks	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_SQL_DETAIL Function	Reports on a specific SQL ID	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_SQL_MONITOR Function	Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST_XML Function	Equivalent to the `REPORT_SQL_MONITOR_LIST` function, except that it returns `XMLType`	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_TUNING_TASK Function	Displays the results of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_TUNING_TASK_XML Function	Displays an XML report of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
RESET_TUNING_TASK Procedure	Resets the currently executing tuning task to its initial state	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
RESUME_TUNING_TASK Procedure	Resumes a previously interrupted task that was created to process a SQL tuning set	DBMS_SQLTUNE SQL Tuning Advisor Subprograms

Table 175-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
SCHEDULE_TUNING_TASK Function	Creates a SQL tuning task and schedule its execution as a scheduler job	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SCRIPT_TUNING_TASK Function	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SELECT_CURSOR_CACHE Function	Collects SQL statements from the shared SQL area	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL Performance Analyzer comparison task	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_WORKLOAD_REPOSITORY Function	Collects SQL statements from the workload repository	DBMS_SQLTUNE SQL Tuning Set Subprograms
SET_TUNING_TASK_PARAMETER Procedures	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLPROF Procedure	Uses the profile data stored in the staging table to create profiles on this system	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLSET Procedure	Moves one or more SQL tuning sets from the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms
UPDATE_SQLSET Procedures	Updates selected fields for a SQL statement in a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms

175.5.1 ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
   task_name         IN VARCHAR2,
   category          IN VARCHAR2 := NULL,
   replace           IN BOOLEAN  := FALSE,
   force_match       IN BOOLEAN  := FALSE,
   profile_type      IN VARCHAR2 := REGULAR_PROFILE,
   autotune_period   IN NUMBER   := NULL,
   execution_name    IN VARCHAR2 := NULL,
   task_owner        IN VARCHAR2 := NULL,
   description       IN VARCHAR2 := NULL,
   database_link_to  IN VARCHAR2 := NULL);
```

Parameters

Table 175-8 ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
category	This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.
replace	If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.
profile_type	Options: • REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. • PX_PROFILE - regular profile with a change to parallel execution

Table 175-8 (Cont.) ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
autotune_period	The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: • null or negative value (default) - all or full. The result includes all task executions. • 0 - result of the current or most recent task execution. • 1 - result for the most recent 24-hour period. • 7 - result for the most recent 7-day period. The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.
execution_name	Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.
task_owner	Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
description	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: `CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';`

Security Model

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

175.5.2 ACCEPT_SQL_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL

Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name    IN  VARCHAR2,
   object_id    IN  NUMBER   := NULL,
   name         IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   category     IN  VARCHAR2 := NULL);
   task_owner   IN VARCHAR2  := NULL,
   replace      IN BOOLEAN   := FALSE,
   force_match  IN BOOLEAN   := FALSE,
   profile_type IN VARCHAR2  := REGULAR_PROFILE);

DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name         IN  VARCHAR2,
   object_id         IN  NUMBER    := NULL,
   name              IN  VARCHAR2  := NULL,
   description       IN  VARCHAR2  := NULL,
   category          IN  VARCHAR2  := NULL;
   task_owner        IN  VARCHAR2  := NULL,
   replace           IN  BOOLEAN   := FALSE,
   force_match       IN  BOOLEAN   := FALSE,
   profile_type      IN  VARCHAR2  := REGULAR_PROFILE,
   database_link_to  IN  VARCHAR2  := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 175-9 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.
description	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.

Table 175-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
category	The category name. This name must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.
profile_type	Options: • REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. • PX_PROFILE - regular profile with a change to parallel execution

Table 175-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';

Return Values

The name of the SQL profile.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement form the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   begin_snap  => 1, -
   end_snap    => 2, -
   sql_id      => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :stmt_task, -
   category   =>  'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name   =>  :stmt_task, -
                                      force_match =>  TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to `5`. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
  sqlset_name   => 'my_workload',  -
  rank1         => 'ELAPSED_TIME', -
  time_limit    => 3600,           -
  description   => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

 -- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :sts_task, -
   object_id  =>  5);
```

175.5.3 ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL)
 RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 175-10 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set.
`description`	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
`sqlset_owner`	Specifies the owner of the SQL tuning set, or `NULL` for the current schema owner.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
```

```
                                    sqlset_name => 'my_workload', -
                                    description => 'my sts reference');
```

You can use the DBA_SQLSET_REFERENCES view to find all references on a given SQL tuning set.

175.5.4 ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- STATUS can be set to ENABLED or DISABLED.
- NAME can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- DESCRIPTION can be set to any string of size no more than 500 characters.
- CATEGORY can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
   name                 IN  VARCHAR2,
   attribute_name       IN  VARCHAR2,
   value                IN  VARCHAR2);
```

Parameters

Table 175-11 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of the existing SQL profile to alter
attribute_name	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
value	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the ALTER ANY SQL PROFILE privilege.

Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
```

```
                                        attribute_name  =>  'STATUS', -
                                        value           =>  'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>   :pname,   -
                                        attribute_name  =>   'STATUS', -
                                        value           =>   'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this
profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                        attribute_name  =>  'CATEGORY', -
                                        value           =>  'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                        attribute_name  =>  'CATEGORY', -
                                        value           =>  'DEFAULT');
```

175.5.5 CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
 task_name         IN VARCHAR2);
```

Parameters

Table 175-12 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Specifies the name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

175.5.6 CAPTURE_CURSOR_CACHE_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
    sqlset_name         IN VARCHAR2,
    time_limit          IN POSITIVE := 1800,
    repeat_interval     IN POSITIVE := 300,
    capture_option      IN VARCHAR2 := 'MERGE',
    capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,
    basic_filter        IN VARCHAR2 := NULL,
    sqlset_owner        IN VARCHAR2 := NULL,
    recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 175-13 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the SQL tuning set name
`time_limit`	Defines the total amount of time, in seconds, to execute.
`repeat_interval`	Defines the amount of time, in seconds, to pause between sampling.
`capture_option`	Specifies whether to insert new statements, update existing statements, or both. Values are `INSERT`, `UPDATE`, or `MERGE`. The values are the same as for `load_option` in `load_sqlset`.

Table 175-13 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
capture_mode	Specifies the capture mode (UPDATE and MERGE capture options). Possible values: • MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set • MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
basic_filter	Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
sqlset_owner	Specifies the owner of the SQL tuning set or NULL for current schema owner
recursive_sql	Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                        sqlset_name     =>
'my_workload', -
                                        time_limit      =>  30, -
                                        repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                          sqlset_name     => 'my_workload', -
                          time_limit      => 30, -
                          repeat_interval => 5, -
                          capture_mode    =>
dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                    sqlset_name     => 'my_workload', -
                                    time_limit      => 30, -
                                    repeat_interval => 5, -
                                    capture_option  => 'INSERT');
```

175.5.7 CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
   task_name            IN VARCHAR2,
   object_id            IN NUMBER   := NULL,
   plan_hash_value      IN NUMBER,
   owner_name           IN VARCHAR2 := NULL,
   database_link_to     IN VARCHAR2 := NULL);
```

Parameters

Table 175-14 CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Name of the task for which to get a script
object_id	Object ID to which the SQL corresponds
plan_hash_value	Plan to create plan baseline
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.

Table 175-14 (Cont.) CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';

175.5.8 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL
   sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   sqlset_owner IN  VARCHAR2 := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 175-15 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

175.5.9 CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
   table_name            IN VARCHAR2,
   schema_name           IN VARCHAR2 := NULL,
   tablespace_name       IN VARCHAR2 := NULL);
```

Parameters

Table 175-16 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`table_name`	The name of the table to create (case-insensitive unless double quoted).
`schema_name`	The schema to create the table in, or `NULL` for the current schema (case-insensitive unless double quoted).
`tablespace_name`	The tablespace to store the staging table within, or `NULL` for the default tablespace of the current user (case-insensitive unless double quoted).

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name  => 'PROFILE_STGTAB');
```

175.5.10 CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
   table_name           IN VARCHAR2,
   schema_name          IN VARCHAR2 := NULL,
   tablespace_name      IN VARCHAR2 := NULL,
   db_version           IN NUMBER   := NULL);
```

Parameters

Table 175-17 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
table_name	Specifies the of the table to create. The name is case sensitive.
schema_name	Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.
tablespace_name	Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: • NULL (default) — Specifies the current database version. • STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. • STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. • STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. • STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. • STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.

Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

Usage Notes

- Call this procedure once before packing the SQL set.

- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11*g* Release 2 (11.2) format

```
BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
      table_name => 'STGTAB_SQLSET'
  ,   db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;
```

175.5.11 CREATE_TUNING_TASK Functions

This function creates a SQL Tuning Advisor task.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_text         IN CLOB,
  bind_list        IN sql_binds := NULL,
  user_name        IN VARCHAR2  := NULL,
  scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL,
  con_name         IN VARCHAR2  := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER    := NULL,
  scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL,
  con_name         IN VARCHAR2  := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

AWR format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER    := NULL,
  scope            IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL,
  con_name         IN VARCHAR2  := NULL,
  dbid             IN NUMBER    := NULL,
  database_link_to IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL tuning set format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sqlset_name       IN VARCHAR2,
  basic_filter      IN VARCHAR2 :=  NULL,
  object_filter     IN VARCHAR2 :=  NULL,
  rank1             IN VARCHAR2 :=  NULL,
  rank2             IN VARCHAR2 :=  NULL,
  rank3             IN VARCHAR2 :=  NULL,
  result_percentage IN NUMBER   :=  NULL,
  result_limit      IN NUMBER   :=  NULL,
  scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 :=  NULL,
  description       IN VARCHAR2 :=  NULL
  plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
  sqlset_owner      IN VARCHAR2 :=  NULL,
  database_link_to IN VARCHAR2  :=  NULL)
RETURN VARCHAR2;
```

SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
   spa_task_name     IN VARCHAR2,
   spa_task_owner    IN VARCHAR2 :=  NULL,
   spa_compare_exec  IN VARCHAR2 :=  NULL,
   basic_filter      IN VARCHAR2 :=  NULL,
   time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
   task_name         IN VARCHAR2 :=  NULL,
   description       IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

Parameters

Table 175-18 *CREATE_TUNING_TASK Function Parameters*

Parameter	Description
sql_text	Specifies the text of a SQL statement.
begin_snap	Specifies the begin snapshot identifier.
end_snap	Specifies the end snapshot identifier.
sql_id	Specifies the identifier of a SQL statement.
bind_list	Defines an ordered list of bind values in ANYDATA type. **NOTE:** This parameter is not supported on a standby database.
plan_hash_value	Specifies the hash value of the SQL execution plan.
sqlset_name	Specifies the SQL tuning set name.
basic_filter	Specifies the predicate used to filter the SQL from the SQL tuning set.
object_filter	Specifies the object filter.
rank(i)	Specifies an ORDER BY clause on the selected SQL statement.
result_percentage	Specifies the percentage on the sum of a ranking measure.

Table 175-18 (Cont.) *CREATE_TUNING_TASK Function Parameters*

Parameter	Description
result_limit	Specifies the top L(imit) SQL from the filtered or ranked SQL.
user_name	Specifies the user name for whom the statement is to be tuned.
scope	Specifies the tuning scope: • LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated. • COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.
time_limit	Specifies the maximum duration in seconds for the tuning session.
task_name	Specifies an optional tuning task name.
description	Provides a description of the SQL tuning session, up to a maximum of 256 characters.
plan_filter	Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: • LAST_GENERATED: most recent timestamp • FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED • LAST_LOADED: most recent first_load_time statistics information • FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED • MAX_ELAPSED_TIME: maximum elapsed time • MAX_BUFFER_GETS: maximum buffer gets • MAX_DISK_READS: maximum disk reads • MAX_DIRECT_WRITES: maximum direct writes • MAX_OPTIMIZER_COST: maximum optimizer cost
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.
spa_task_name	Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.
spa_task_owner	Specifies the owner of specified SQL Performance Analyzer task or NULL for current user.
spa_compare_exec	Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE.
dbid	Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Table 175-18 (Cont.) *CREATE_TUNING_TASK Function Parameters*

Parameter	Description
`con_name`	Specifies the container for the tuning task. The semantics depend on the function format: • For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container. • For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container. • For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container. The following statements are true of all function formats: • In a non-CDB, this parameter is ignored. • In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs. • In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.
`database_link_to`	The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use `DBMS_SQLTUNE` to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute `REPORT_TUNING_TASK` locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The `database_link_to` parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user `SYS$UMF`. The following sample statement creates a link named `lnk_to_pri`: `CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY` *`password`* `USING 'inst1';`

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed

with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Example 175-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task     VARCHAR2(64);
VARIABLE sts_task      VARCHAR2(64);
VARIABLE spa_tune_task VARCHAR2(64);
```

Example 175-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
  sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE
s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

Example 175-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24', -
   scope => 'LIMITED');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24', -
   time_limit => 600);
```

Example 175-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
   end_snap => 2, sql_id => 'ay1m3ssvtrh24');
```

Example 175-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
  sqlset_name  => 'my_workload', -
  rank1        => 'BUFFER_GETS', -
  time_limit   => 3600, -
  description  => 'tune my workload ordered by buffer gets');
```

Example 175-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named `task_123`.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   spa_task_name     => 'task_123',
   spa_task_owner    => 'SCOTT',
   spa_compare_exec  => 'exec1');
```

Example 175-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task uses the `lnk_to_primary` database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ col1 FROM table1 t WHERE col1=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
                 task_name => :tname, database_link_to => 'lnk_to_primary');
```

175.5.12 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
   sqlset_name   IN  VARCHAR2,
   basic_filter  IN  VARCHAR2 := NULL,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 175-19 DELETE_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set.
`basic_filter`	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
`sqlset_owner`	Specifies the owner of the SQL tuning set, or `NULL` for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');
```

```
-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', -
                                basic_filter  => 'elapsed_time <
1000000');
```

175.5.13 DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
   name          IN  VARCHAR2,
   ignore        IN  BOOLEAN  := FALSE);
```

Parameters

Table 175-20 DROP_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of SQL profile to be dropped. The name is case sensitive.
ignore	Ignores errors due to object not existing

Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

175.5.14 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (
   sqlset_name   IN  VARCHAR2,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 175-21 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

175.5.15 DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (
 task_name         IN VARCHAR2);
```

Parameters

Table 175-22 DROP_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Specifies name of the tuning task to drop.

175.5.16 EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL,
   database_link_to  IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL,
   database_link_to  IN VARCHAR2               := NULL);
```

Parameters

Table 175-23 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to execute.

Table 175-23 (Cont.) EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
execution_name	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: `CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';`

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

175.5.17 IMPLEMENT_TUNING_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing IMPLEMENT_TUNING_TASK is equivalent to executing the SCRIPT_TUNING_TASK Function and then running the script.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name          IN  VARCHAR2,
    rec_type           IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name         IN  VARCHAR2 := NULL,
    execution_name     IN  VARCHAR2 := NULL,
    database_link_to   IN  VARCHAR2 := NULL);
```

Parameters

Table 175-24 IMPLEMENT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task for which to implement recommendations.
rec_type	Filter the types of recommendations to implement. Only 'PROFILES' is supported.
owner_name	Owner of the relevant tuning task or NULL for the current user.
execution_name	Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';

175.5.18 INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (
 task_name         IN VARCHAR2);
```

Parameters

Table 175-25 INTERRUPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

175.5.19 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
   sqlset_name       IN  VARCHAR2,
   populate_cursor   IN  sqlset_cursor,
   load_option       IN VARCHAR2 := 'INSERT',
   update_option     IN VARCHAR2 := 'REPLACE',
   update_condition  IN VARCHAR2 :=  NULL,
```

```
   update_attributes IN VARCHAR2 :=  NULL,
   ignore_null       IN BOOLEAN  :=  TRUE,
   commit_rows       IN POSITIVE :=  NULL,
   sqlset_owner      IN VARCHAR2 := NULL);
```

Parameters

Table 175-26 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: • INSERT (default) — Adds only new statements. • UPDATE — Updates existing the SQL statements and ignores any new statements. • MERGE — Inserts new statements and updates the information of the existing ones.
update_option	Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: • REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on. • ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.
update_condition	Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: • OLD — Refers to statement attributes from the SQL tuning set (destination). • NEW — Refers to statement attributes from the input statements (source).

Table 175-26 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_attributes	Specifies the list of SQL statement attributes to update during a merge or update. The possible values are: • NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action. • BASIC — Specifies statistics and binds only. • TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list. • ALL — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: – EXECUTION_CONTEXT – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN – SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)
ignore_null	Specifies whether to update attributes when the new value is NULL. If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.
commit_rows	Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.
sqlset_owner	Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in sqlset_row), or because they violate the user's privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to

SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
           NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update_option because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the elapsed_time filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>
''SYS''',
                                                NULL, NULL,NULL,NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name     => 'my_workload',
                           populate_cursor => cur,
                           Using DBMS_SQLTUNE
                           load_option => 'MERGE',
                           update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that `'INSERT'` is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name     => 'my_workload',
                           populate_cursor => cur,
                           load_option     => 'UPDATE');
END;
/
```

175.5.20 PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the `SYS.` schema into the staging table.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 175-27 PACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Security Model

This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.

Usage Notes

This function issues a COMMIT after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
                                       staging_table_name =>
'PROFILE_STGTAB');
```

175.5.21 PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET procedure.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2,
   sqlset_owner         IN VARCHAR2 := NULL,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL,
   db_version           IN NUMBER   := NULL);
```

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
      sqlset_name        => '%'
  ,   sqlset_owner       => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
      sqlset_name        => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
      sqlset_name         => 'my_workload'
  ,   staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
      sqlset_name         => 'workload_subset'
  ,   staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11*g* Release 1 (11.2):

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
      sqlset_name          => 'workload_subset'
  ,   staging_table_name   => 'STGTAB_SQLSET'
```

```
  ,   db_version           => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

175.5.22 REMAP_STGTAB_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 175-28 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`old_profile_name`	The name of the profile to target for a remap operation (case-sensitive)
`new_profile_name`	The new name of the profile, or `NULL` to remain the same (case-sensitive)
`new_profile_category`	The new category for the profile, or `NULL` to remain the same (case-sensitive)
`staging_table_name`	The name of the table on which to perform the remap operation (case-sensitive). Required.
`staging_schema_owner`	The schema where the table resides, or `NULL` for current schema (case-sensitive)

Security Model

This procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
      old_profile_name    => :pname
  ,   new_profile_name    => 'IMP' || :pname
  ,   staging_table_name  => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be `'TEST'` category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
      old_profile_name     => :pname
  ,   new_profile_category => 'TEST'
  ,   staging_table_name   => 'PROFILE_STGTAB');
END;
```

175.5.23 REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
   old_sqlset_name        IN VARCHAR2,
   old_sqlset_owner       IN VARCHAR2 := NULL,
   new_sqlset_name        IN VARCHAR2 := NULL,
   new_sqlset_owner       IN VARCHAR2 := NULL,
   staging_table_name     IN VARCHAR2,
   staging_schema_owner   IN VARCHAR2 := NULL
   old_con_dbid           IN NUMBER   := NULL,
   new_con_dbid           IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 175-29 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
      old_sqlset_name    =>
'my_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_name    =>
'imp_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
      old_sqlset_name    => 'imp_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_owner   => 'SYS'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

175.5.24 REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
   sqlset_name   IN  VARCHAR2,
   reference_id  IN  NUMBER,
   sqlset_owner  IN  VARCHAR2 := NULL,
   force_remove  IN  NUMBER   := 0);
```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 175-30 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set.
`reference_id`	Specifies the identifier of the reference to remove.
`sqlset_owner`	Specifies the owner of the SQL tuning set (or `NULL` for the current schema owner).
`force_remove`	Specifies whether references can be removed for other users (`1`) or whether they cannot be removed (`0`). Setting this parameter to 1 only takes effect when the user has the `ADMINISTER ANY SQL TUNING SET` privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
                                  sqlset_name   => 'my_workload', -
                                  reference_id  => :rid,
                                  sqlset_owner  => NULL,
                                  force_remove  => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

175.5.25 REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the REPORT_TUNING_TASK Function reports on a single execution. Note that this function is deprecated with Oracle Database 11*g* Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

> **See Also:**
>
> - DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group
> - REPORT_AUTO_TUNING_TASK Function

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec     IN VARCHAR2  := NULL,
    end_exec       IN VARCHAR2  := NULL,
    type           IN VARCHAR2  := TYPE_TEXT,
    level          IN VARCHAR2  := LEVEL_TYPICAL,
    section        IN VARCHAR2  := SECTION_ALL,
    object_id      IN NUMBER    := NULL,
    result_limit   IN NUMBER    := NULL)
  RETURN CLOB;
```

Parameters

Table 175-31 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
`begin_exec`	Specifies the name of the execution from which to begin the report. `NULL` retrieves a report on the most recent run.
`end_exec`	Specifies the name of the execution at which to end the report. `NULL` retrieves a report on the most recent run.
`type`	Specifies the type of the report to produce. Possible values are `TYPE_TEXT` which produces a text report
`level`	Specifies the level of detail in the report: • `LEVEL_BASIC`: simple version of the report. Just show info about the actions taken by the advisor. • `LEVEL_TYPICAL`: show information about every statement analyzed, including requests not implemented. • `LEVEL_ALL`: highly detailed report level, also provides annotations about statements skipped over.

Table 175-31 (Cont.) REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
section	Limits the report to a single section (ALL for all sections): • SECTION_SUMMARY - summary information • SECTION_FINDINGS - tuning findings • SECTION_PLAN - explain plans • SECTION_INFORMATION - general information • SECTION_ERROR - statements with errors • SECTION_ALL - all statements
object_id	Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution.
result_limit	Specifies the maximum number of SQL statements to show in the report.

Return Values

A CLOB containing the desired report.

175.5.26 REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the V$ views and AWR.

> **See Also:**
>
> DBMS_SQLTUNE SQL Performance Reporting Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
   sql_id                   IN  VARCHAR2   DEFAULT NULL,
   sql_plan_hash_value      IN  NUMBER     DEFAULT NULL,
   start_time               IN  DATE       DEFAULT NULL,
   duration                 IN  NUMBER     DEFAULT NULL,
   inst_id                  IN  NUMBER     DEFAULT NULL,
   dbid                     IN  NUMBER     DEFAULT NULL,
   event_detail             IN  VARCHAR2   DEFAULT 'YES',
   bucket_max_count         IN  NUMBER     DEFAULT 128,
   bucket_interval          IN  NUMBER     DEFAULT NULL,
   top_n                    IN  NUMBER     DEFAULT 10,
   report_level             IN  VARCHAR2   DEFAULT 'TYPICAL',
   type                     IN  VARCHAR2   DEFAULT 'ACTIVE',
   data_source              IN  VARCHAR2   DEFAULT 'AUTO',
   end_time                 IN  DATE       DEFAULT NULL,
   duration_stats           IN  NUMBER     DEFAULT NULL,
```

```
   con_name                 IN  VARCHAR2   DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 175-32 REPORT_SQL_DETAIL Function Parameters

Parameter	Description
sql_id	SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.
sql_plan_hash_value	Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.
start_time	If specified, shows SQL activity (from GV$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.
duration	Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.
inst_id	Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.
dbid	DBID from which to get SQL details. If NULL, uses current DBID.
event_detail	When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
top_n	Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.

Table 175-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
report_level	Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- *section_name*. Several sections are defined: • 'TOP'- Show top values for the ASH dimensions for a SQL statement; ON by default • 'SPM'- Show existing plan baselines for a SQL statement; OFF by default • 'MISMATCH'- Show reasons for creating new child cursors (sharing criteria violations); OFF by default. • 'STATS'- Show SQL execution statistics per plan from GV$SQLAREA_PLAN_HASH; ON by default • 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default • 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default • 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default • 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default • 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default • 'XPLAN' - Show execution plans; ON by default • 'BINDS' - show captured bind data; ON by default In addition, SQL text can be specified at different levels: • -SQL_TEXT - No SQL text in report • +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR • -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) • +SQL_FULLTEXT - Show full SQL text (default value) The meanings of the three top-level report levels are: • NONE - minimum possible • BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM • TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR • ALL - everything Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string
type	Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).
data_source	Determines the data source of SQL data based on one of the following values: • MEMORY: The data source is GV$ view • DISK: The data source is DBA_HIST_* view • AUTO: Automatically determines the data source based on the time frame (default)

Table 175-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
end_time	If specified, shows SQL activity from start_time to end_time. If NULL (default), shows SQL activity for systimestamp.
duration_stats	Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered.
con_name	Name of the multitenant container database (CDB).

Security Model

The invoker needs the EXECUTE privilege on the DBMS_XPLAN package.

Return Values

A CLOB containing the desired report.

Usage Notes

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT or READ privilege on the following views:
  - V$SESSION
  - DBA_ADVISOR_FINDINGS
  - V$DATABASE
  - GV$ASH_INFO
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SQLAREA_PLAN_HASH
  - GV$SQL
  - DBA_HIST_SNAPSHOT
  - DBA_HIST_WR_CONTROL
  - DBA_HIST_ACTIVE_SESS_HISTORY
  - DBA_HIST_SQLSTAT
  - DBA_HIST_SQL_BIND_METADATA
  - DBA_HIST_SQLTEXT
  - DBA_SQL_PLAN_BASELINES
  - DBA_SQL_PROFILES
  - DBA_ADVISOR_TASKS
  - DBA_SERVICES

- DBA_USERS
- DBA_OBJECTS
- DBA_PROCEDURES

175.5.27 REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

> **See Also:**
>
> Real-Time SQL Monitoring for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR(
   sql_id                    IN VARCHAR2  DEFAULT  NULL,
   dbop_name                 IN VARCHAR2  DEFAULT  NULL,
   dbop_exec_id              IN NUMBER    DEFAULT  NULL,
   session_id                IN NUMBER    DEFAULT  NULL,
   session_serial            IN NUMBER    DEFAULT  NULL,
   sql_exec_start            IN DATE      DEFAULT  NULL,
   sql_exec_id               IN NUMBER    DEFAULT  NULL,
   inst_id                   IN NUMBER    DEFAULT  NULL,
   start_time_filter         IN DATE      DEFAULT  NULL,
   end_time_filter           IN DATE      DEFAULT  NULL,
   instance_id_filter        IN NUMBER    DEFAULT  NULL,
   parallel_filter           IN VARCHAR2  DEFAULT  NULL,
   plan_line_filter          IN NUMBER    DEFAULT  NULL,
   event_detail              IN VARCHAR2  DEFAULT  'YES',
   bucket_max_count          IN NUMBER    DEFAULT  128,
   bucket_interval           IN NUMBER    DEFAULT  NULL,
   base_path                 IN VARCHAR2  DEFAULT  NULL,
   last_refresh_time         IN DATE      DEFAULT  NULL,
   report_level              IN VARCHAR2  DEFAULT 'TYPICAL',
   type                      IN VARCHAR2  DEFAULT 'TEXT',
   sql_plan_hash_value       IN NUMBER    DEFAULT  NULL,
   con_name                  IN VARCHAR2  DEFAULT  NULL,
   report_id                 IN NUMBER    DEFAULT  NULL)
 RETURN CLOB;
```

Parameters

Table 175-33 REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
start_time_filter	If not NULL, the report considers only the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.
end_time_filter	If not NULL, the report shows only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
instance_id_filter	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
parallel_filter	Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be: • NULL to target all processes • [qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider. The following examples show how to target a subset of the parallel processes: • qc: targets only the query coordinator • servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. • servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) • servers(1,1): consider only group 1, set 1 • servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process • qc servers(1,2,4): same as above by also including the query coordinator
event_detail	When value is 'YES' (the default), reported activity from GV$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)
last_refresh_time	If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized: • SQL text is not returned when this option is specified • activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

Table 175-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
report_level	Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. In addition, individual report sections can also be enabled or disabled by using a +/- *section_name*. Several sections are defined: • 'XPLAN'- Show explain plan; ON by default • 'PLAN'- Show plan monitoring statistics; ON by default • 'SESSIONS'- Show session details. Applies only to parallel queries; ON by default • 'INSTANCE'- Show instance details. Applies only to parallel and cross instance; ON by default • 'PARALLEL'- An umbrella parameter for specifying sessions+instance details • 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default • 'BINDS' - Show bind information when available; ON by default • 'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default • 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default • 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default • 'OTHER' - Other info; ON by default In addition, SQL text can be specified at different levels: • SQL_TEXT - No SQL text in report • +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR • -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) • +SQL_FULLTEXT - Show full SQL text (default value)
report_level (contd.)	The meanings of the three top-level report levels are: • NONE - minimum possible • +BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS • TYPICAL - everything but PLAN_HISTOGRAM • ALL - everything Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).
sql_plan_hash_value	Target only those SQL executions with the specified plan_hash_value. Default is NULL.
con_name	Name of the multitenant container database (CDB).
report_id	ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
  - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
  - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally it serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
  - The most recent execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key (`sql_id`, `sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram.

  By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because 600/8 = 74, which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.
- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

  The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

> *Oracle Database SQL Tuning Guide* for more information about SQL real-time monitoring.

175.5.28 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the REPORT_SQL_MONITOR Function to get detailed monitoring information for a single SQL statement.

> **See Also:**
>
> Real-Time SQL Monitoring for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
   sql_id                    IN VARCHAR2  DEFAULT  NULL,
   session_id                IN NUMBER    DEFAULT  NULL,
   session_serial            IN NUMBER    DEFAULT  NULL,
   inst_id                   IN NUMBER    DEFAULT  NULL,
   active_since_date         IN DATE      DEFAULT  NULL,
   active_since_sec          IN NUMBER    DEFAULT  NULL,
   active_before_date        IN DATE      DEFAULT  NULL,
   last_refresh_time         IN DATE      DEFAULT  NULL,
   dbop_name                 IN VARCHAR2  DEFAULT  NULL,
   monitor_type              IN NUMBER    DEFAULT  MONITOR_TYPE_ALL,
   max_sqltext_length        IN NUMBER    DEFAULT  NULL,
   top_n_count               IN NUMBER    DEFAULT  NULL,
   top_n_rankby              IN VARCHAR2  DEFAULT  'LAST_ACTIVE_TIME',
   report_level              IN VARCHAR2  DEFAULT  'TYPICAL',
   auto_refresh              IN NUMBER    DEFAULT  NULL,
   base_path                 IN VARCHAR2  DEFAULT  NULL,
   type                      IN VARCHAR2  DEFAULT 'TEXT',
   con_name                  IN VARCHAR2  DEFAULT  NULL,
   top_n_detail_count        IN NUMBER    DEFAULT  NULL)
 RETURN CLOB;
```

Parameters

Table 175-34 REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.

Table 175-34 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
session_serial	In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
active_since_date	If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.
active_since_sec	Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.
active_before_date	If not NULL (default), returns only monitored statements that have been active before the specified date and time.
last_refresh_time	If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics.
dbop_name	DB operation name. Specify NULL to display all the monitored DB operations.
monitor_type	Type of the SQL Monitor operation. Specify one of the following values: • MONITOR_TYPE_SQL - Returns only SQL statements • MONITOR_TYPE_DBOP - Returns only database operations • MONITOR_TYPE_ALL - Returns SQL statements as well as database operations
max_sqltext_length	Maximum length of the SQL text. Default is NULL (no limit).
top_n_count	Limits the number of top-N SQL statements that need to be included in the report.
top_n_rankby	Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values: • LAST_ACTIVE_TIME - Last active date and time (top N most recent) • DURATION - Total duration of execution • DB_TIME - DB time used • CPU_TIME - CPU time used • IO_REQUESTS - Number of I/O requests • IO_BYTES - Number of I/O bytes

Table 175-34 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
report_level	Level of detail for the report. The level is one of the following: • BASIC - SQL text up to 200 characters • TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters • ALL - currently the same as TYPICAL
auto_refresh	Currently non-operational, reserved for future use.
base_path	URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).
type	Report format: TEXT (default), HTML, or XML.
con_name	Name of the multitenant container database (CDB)
top_n_detail_count	Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report.

Return Values

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

Usage Notes

You must have the privilege to access the following fixed views: GV$SQL_MONITOR and GV$SQL.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* for more information about SQL real-time monitoring.

175.5.29 REPORT_TUNING_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

> **See Also:**
>
> DBMS_SQLTUNE SQL Performance Reporting Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
   task_name        IN   VARCHAR2,
   type             IN   VARCHAR2   := 'TEXT',
   level            IN   VARCHAR2   := 'TYPICAL',
   section          IN   VARCHAR2   := ALL,
   object_id        IN   NUMBER     := NULL,
   result_limit     IN   NUMBER     := NULL,
   owner_name       IN   VARCHAR2   := NULL,
   execution_name   IN   VARCHAR2   := NULL,
   database_link_to IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 175-35 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task.
type	Type of the report to produce. Possible values are TEXT which produces a text report.
level	Level of detail in the report: • BASIC: simple version of the report. Just show info about the actions taken by the advisor. • TYPICAL: show information about every statement analyzed, including requests not implemented. • ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): • SUMMARY - Summary information • FINDINGS - Tuning findings • PLAN - Explain plans • INFORMATION - General information • ERROR - Statements with errors • ALL - All statements
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report.
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If NULL, then the function generates the report for the last task execution.

Table 175-35 (Cont.) REPORT_TUNING_TASK Function Parameters

Parameter	Description
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';

Return Values

A CLOB containing the desired report.

Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM   DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM   DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL','FINDINGS', 5)
FROM   DUAL;
```

175.5.30 REPORT_TUNING_TASK_XML Function

This function displays an XML report of a tuning task.

> **See Also:**
>
> DBMS_SQLTUNE SQL Performance Reporting Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK_LIST_XML(
   task_name        IN   VARCHAR2   := NULL,
   level            IN   VARCHAR2   := LEVEL_TYPICAL,
   section          IN   VARCHAR2   := SECTION_ALL,
   object_id        IN   NUMBER     := NULL,
   result_limit     IN   NUMBER     := 160,
   owner_name       IN   VARCHAR2   := NULL,
   execution_name   IN   VARCHAR2   := NULL,
   autotune_period  IN   NUMBER     := NULL,
   report_tag       IN   VARCHAR2   := NULL)
RETURN XMLTYPE;
```

Parameters

Table 175-36 REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
task_name	Name of the tuning task.
level	Level of detail in the report: • BASIC: simple version of the report. Just show info about the actions taken by the advisor. • TYPICAL: show information about every statement analyzed, including requests not implemented. • ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): • SUMMARY - Summary information • ALL - All statements
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows: • Profile • Index • Restructure SQL • Alternate plan • Statistics • Errors • Information • No findings
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution.

Table 175-36 (Cont.) REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
`autotune_period`	The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: • Null or negative value (default) — All or full. The result includes all task executions. • `0` — Result of the current or most recent task execution. • `1` — Result for the most recent 24-hour period. • `7` — Result for the most recent 7-day period. The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.
`report_tag`	The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.

Return Values

A `CLOB` containing the desired report.

175.5.31 RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 175-37 RESET_TUNING_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);
```

```
-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

175.5.32 RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 175-38 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to resume.
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter basic_filteri when calling CREATE_TUNING_TASK Functions.

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

175.5.33 SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information

about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                    := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE  := NULL,
  scope           IN VARCHAR2                  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                  := NULL,
  description     IN VARCHAR2                  := NULL,
  con_name        IN VARCHAR2                  := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER                    := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE  := NULL,
  scope           IN VARCHAR2                  := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER                    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2                  := NULL,
  description     IN VARCHAR2                  := NULL,
  con_name        IN VARCHAR2                  := NULL,
  dbid            IN NUMBER                    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 175-39 SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
begin_snap	The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.
end_snap	The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.
sql_id	The SQL ID of the statement to be tuned.

Table 175-39 (Cont.) SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
plan_hash_value	The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.
start_date	The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.
scope	The scope of the tuning job: limited, or comprehensive.
time_limit	The maximum duration in seconds for the SQL tuning session.
task_name	Optional SQL tuning task name.
description	Description of the SQL tuning session. The description can contain a maximum of 256 characters.
con_name	The container from which SQL Tuning Advisor accesses the SQL statement information.
dbid	DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Security Model

The caller must possess the CREATE JOB privilege for the job.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows: sqltune_job_*taskid_orahash*(*systimestamp*).

175.5.34 SCRIPT_TUNING_TASK Function

This function creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name         IN VARCHAR2,
  rec_type          IN VARCHAR2  := REC_TYPE_ALL,
  object_id         IN NUMBER    := NULL,
```

```
  result_limit      IN NUMBER    := NULL,
  owner_name        IN VARCHAR2  := NULL,
  execution_name    IN VARCHAR2  := NULL,
  database_link_to  IN VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 175-40 SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script.
rec_type	Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL:''PROFILES' ''STATISTICS' ''INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES,STATISTICS'.
object_id	Optionally filters by a single object ID.
result_limit	Optionally shows commands for only top *n* SQL (ordered by object_id and ignored if an object_id is also specified).
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
excution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: `CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';`

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we
have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

175.5.35 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL,
  attribute_list      IN   VARCHAR2 := NULL,
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-41 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
basic_filter	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
object_filter	Currently not supported.
ranking_measure(n)	Defines an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top *n*% according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
result_limit	Defines the top limit SQL from the filtered source ranked by the ranking measure.
attribute_list	Specifies the list of SQL statement attributes to return in the result. Possible values are: • TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default). • BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • ALL — Specifies all attributes. • Comma-separated list of attribute names. This values returns only a subset of SQL attributes: – EXECUTION_STATISTICS – BIND_LIST – OBJECT_LIST – SQL_PLAN – SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics
recursive_sql	Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));

-- Notice that some statements can have multiple plans.  The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value).  This
is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
     DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;/

-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
```

```
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time >
5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = ''APPS'''))P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of
sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
```

```
    FROM table(dbms_sqltune.select_cursor_cache(
      'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
      'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;/

-- Select the top 100 statements in the shared SQL area ordering by
elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'ELAPSED_TIME', NULL, NULL,
                                                1,
                                                100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the shared SQL area.  This means that the buffer gets of
all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'BUFFER_GETS', NULL, NULL,
                                                .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

175.5.36 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
  result_limit           IN POSITIVE := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-42 SELECT_SQL_TRACE Function Parameters

Parameter	Description
`directory`	Defines the directory object containing the trace files. This field is mandatory.
`file_name`	Specifies all or part of the name of the trace files. If `NULL`, then the function uses the current or most recent file in the specified location or path. `'%'` wildcards are supported for matching trace file names.
`mapping_table_name`	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is `NULL`, then the function uses the mappings in the current database.
`mapping_table_owner`	Specifies the mapping table owner. If it is `NULL`, then the function uses the current user.
`select_mode`	Specifies the mode for selecting SQL from the trace. Possible values are: • `SINGLE_EXECUTION` — Returns one execution of a SQL. This is the default. • `ALL_EXECUTIONS` — Returns all executions.

Table 175-42 (Cont.) SELECT_SQL_TRACE Function Parameters

Parameter	Description
options	Specifies which types of SQL statements are returned. • LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. • ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with SELECT privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the PATH_PREFIX clause of the CREATE PLUGGABLE DATABASE statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
```

```
                              'LOB', 'OPERATOR', 'PACKAGE',
                              'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                              'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                              'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
     FROM TABLE(
        DBMS_SQLTUNE.SELECT_SQL_TRACE(
           directory=>'SQL_TRACE_DIR',
           file_name=>'%trc',
           mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
END;
/
```

175.5.37 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

See Also:

- DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-43 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
task_name	Specifies the name of the SQL Performance Analyzer task.
task_owner	Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user.
execution_name	Specifies the name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.
level_filter	Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed. • IMPROVED includes only improved SQL. • REGRESSED includes only regressed SQL (default). • CHANGED includes only SQL with changed performance. • UNCHANGED includes only SQL with unchanged performance. • CHANGED_PLANS includes only SQL with plan changes. • UNCHANGED_PLANS includes only SQL with unchanged plans. • ERRORS includes only SQL with errors only. • MISSING_SQL includes only missing SQL statements (across STS). • NEW_SQL includes only new SQL statements (across STS).
basic filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	Defines the SQL statement attributes to return in the result. Possible values are: • TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • ALL — Returns all attributes. • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

175.5.38 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name         IN   VARCHAR2,
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL)
  attribute_list      IN   VARCHAR2 := NULL,
  plan_filter         IN   VARCHAR2 := NULL,
  sqlset_owner        IN   VARCHAR2 := NULL,
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-44 SELECT_SQLSET Function Parameters

Parameter	Description
`sqlset_name`	Specifies the name of the SQL tuning set to query.
`basic_filter`	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the `SQLSET_ROW`.
`object_filter`	Currently not supported.
`ranking_measure(n)`	Specifies an `ORDER BY` clause on the selected SQL.

Table 175-44 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
result_percentage	Specifies a filter that picks the top *n*% according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
result_limit	The top limit SQL from the filtered source, ranked by the ranking measure.
attribute_list	Defines the SQL statement attributes to return in the result. The possible values are: • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • ALL — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics)
plan_filter	Specifies the plan filter. This parameter enables you to select a single plan when a statement has multiple plans. Possible values are: • LAST_GENERATED — Returns the plan with the most recent timestamp. • FIRST_GENERATED — Returns the plan with the least recent timestamp. • LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information. • FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information. • MAX_ELAPSED TIME — Returns the plan with the maximum elapsed time. • MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets. • MAX_DISK_READS — Returns the plan with the maximum disk reads. • MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes. • MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.
recursive_sql	Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

175.5.39 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between begin_snap and end_snap
- A workload repository baseline

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid              IN NUMBER   := NULL)
 RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL,
  attribute_list    IN VARCHAR2 := NULL,
  recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid              IN NUMBER   := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 175-45 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
`begin_snap`	Defines the beginning AWR snapshot (non-inclusive).
`end_snap`	Defines the ending AWR snapshot (inclusive).
`baseline_name`	Specifies the name of the AWR baseline period.
`basic_filter`	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the `SQLSET_ROW`. If `basic_filter` is not set by the caller, then the subprogram captures only statements of type `CREATE TABLE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, and `MERGE`.
`object_filter`	Currently not supported.
`ranking_measure(n)`	Defines an `ORDER BY` clause on the selected SQL.
`result_percentage`	Specifies a filter that picks the top *n*% according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
`result_limit`	Specifies the top limit SQL from the source according to the supplied ranking measure.
`attribute_list`	Specifies the SQL statement attributes to return in the result. The possible values are: • `TYPICAL` — Returns `BASIC` plus SQL plan (without row source statistics) and without object reference list. This is the default. • `BASIC` — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. • `ALL` — Returns all attributes • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: `EXECUTION_STATISTICS`, `SQL_BINDS`, `SQL_PLAN_STATISTICS` (similar to `SQL_PLAN` plus row source statistics).
`recursive_sql`	Specifies the filter that includes recursive SQL in the SQL tuning set (`HAS_RECURSIVE_SQL`) or excludes it (`NO_RECURSIVE_SQL`).
`dbid`	Specifies the DBID for imported or PDB-level AWR data. If `NULL`, then the function uses the current database DBID.

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

175.5.40 SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
   task_name        IN  VARCHAR2,
   parameter        IN  VARCHAR2,
   value            IN  VARCHAR2,
   database_link_to IN  VARCHAR2);

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
   task_name        IN  VARCHAR2,
   parameter        IN  VARCHAR2,
   value            IN  NUMBER,
```

```
   database_link_to IN  VARCHAR2);
);
```

Parameters

Table 175-46 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: • APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function and Procedure • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) • LOCAL_TIME_LIMIT: per-statement time out (seconds) • MODE: tuning scope (comprehensive, limited) • OBJECT_FILTER: object filter for SQL tuning set • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_LIMIT: maximum number of SQL statements to tune • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute • TIME_LIMIT: global time out (seconds) • USERNAME: username under which the statement is parsed
value	New value of the specified parameter

Table 175-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY *password* USING 'inst1';

Usage Notes

When setting automatic tuning task parameters, use the SET_AUTO_TUNING_TASK_PARAMETER Procedures in the DBMS_AUTO_SQLTUNE package.

175.5.41 SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba_sql_profiles.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text    IN CLOB,
  force_match IN BOOLEAN  := FALSE)
RETURN NUMBER;
```

Parameters

Table 175-47 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
sql_text	SQL text whose signature is required. Required.
force_match	If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

175.5.42 UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

> **See Also:**
>
> DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   replace               IN BOOLEAN,
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 175-48 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
      replace            => FALSE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the
profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
targeting it.
-- You can resume the unpack operation by setting replace to TRUE so
that
-- the profiles that were already created are replaced.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
      replace            => TRUE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

175.5.43 UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2 := '%',
   sqlset_owner         IN VARCHAR2 := NULL,
   replace              IN BOOLEAN,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

Table 175-49 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
sqlset_owner	Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.
replace	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
staging_table_name	Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).

Examples

```
 -- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => FALSE, -
                                       staging_table_name  =>
'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system.  In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => TRUE, -
                                       staging_table_name  =>
'STGTAB_SQLSET');
```

175.5.44 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

> **See Also:**
>
> DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value IN NUMBER := NULL);
```

Parameters

Table 175-50 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.
attribute_name	Specifies the name of the attribute to be modified. You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY. If a statement has multiple plans, then the procedure changes the attribute value for all plans.
attribute_value	Specifies the new value of the attribute.

176
DBMS_STAT_FUNCS

The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms

176.1 Summary of DBMS_STAT_FUNCS Subprograms

This table lists and briefly describes the DBMS_STAT_FUNCS subprograms.

Table 176-1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure	Tests how well a sample of values fits a Weibull distribution

176.1.1 EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   mu           IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 176-2 *EXPONENTIAL_DIST_FIT Procedure Parameters*

Parameter	Description
ownername	The schema where the table resides.

Table 176-2 (Cont.) *EXPONENTIAL_DIST_FIT Procedure Parameters*

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

176.1.2 NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
   mean         IN    NUMBER,
   stdev        IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 176-3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

176.1.3 POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 176-4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
`ownername`	The schema where the table resides.
`tablename`	The table where the column resides.
`columnname`	The column of the table against which to run the test.
`test_type`	The type of test to use: `'KOLMOGOROV_SMIRNOV'` or `'ANDERSON_DARLING'`.
`lambda`	The lambda parameter is the shape parameter.
`sig`	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

176.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   sigma_value  IN    NUMBER DEFAULT 3,
   s           OUT    SummaryType);
```

Parameters

Table 176-5 SUMMARY Procedure Parameters

Parameter	Description
`ownername`	The schema where the table resides.

Table 176-5 (Cont.) SUMMARY Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table to be summarized.
sigma_value	The number of sigmas for the set of extreme values, defaults to 3.
s	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
   count             NUMBER,
   min               NUMBER,
   max               NUMBER,
   range             NUMBER,
   mean              NUMBER,
   cmode             num_table,
   variance          NUMBER,
   stddev            NUMBER,
   quantile_5        NUMBER,
   quantile_25       NUMBER,
   median            NUMBER,
   quantile_75       NUMBER,
   quantile_95       NUMBER,
   plus_x_sigma      NUMBER,
   minus_x_sigma     NUMBER,
   extreme_values    num_table,
   top_5_values      n_arr,
   bottom_5_values   n_arr);
```

176.1.5 UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   paramA       IN    NUMBER,
   paramB       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 176-6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.

Table 176-6 (Cont.) UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

176.1.6 WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   alpha        IN    NUMBER,
   mu           IN    NUMBER,
   beta         IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 176-7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

177
DBMS_STATS

With the DBMS_STATS package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the DBMS_STATS package. However, DBMS_STATS cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- DBMS_STATS Overview
- DBMS_STATS Deprecated Subprograms
- DBMS_STATS Types
- DBMS_STATS Constants
- DBMS_STATS Operational Notes
- DBMS_STATS Data Structures
- Summary of DBMS_STATS Subprograms

> **See Also:**
>
> - *Oracle Database SQL Tuning Guide*
> - *Oracle Database Administrator's Guide*

177.1 DBMS_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

> **Note:**
>
> By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the DELETE_COLUMN_STATS procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use DBMS_STATS to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics

177.2 DBMS_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11*g* Release 2 (11.2), the following subprograms are obsolete:

- GET_PARAM Function

  Instead, use GET_PREFS Function
- SET_PARAM Procedure

  Instead, use SET_GLOBAL_PREFS Procedure
- RESET_PARAM_DEFAULTS Procedure

  Instead use RESET_GLOBAL_PREF_DEFAULTS Procedure

The following subprogram is deprecated with Oracle Database 12*c* and later:

- `GENERATE_STATS`

  This procedure is replaced by the `GATHER_INDEX_STAT` procedure.

> **See Also:**
>
> "GATHER_INDEX_STATS Procedure"

177.3 DBMS_STATS Types

Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray  IS VARRAY(2050) OF NUMBER;
TYPE datearray IS VARRAY(2050) OF DATE;
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(2050) OF RAW(2000);
TYPE fltarray  IS VARRAY(2050) OF BINARY_FLOAT;
TYPE dblarray  IS VARRAY(2050) OF BINARY_DOUBLE;
```

Stale Tables

Types for listing stale tables include the following:

```
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;
```

Statistics Difference Reports

Use the following type to displays a statistics difference report:

```
TYPE DiffRepElem IS RECORD (
  report      CLOB,            -- stats difference report
  maxdiffpct  NUMBER);         -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;
```

Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```
TYPE ObjectElem IS RECORD (
  ownname     dbms_quoted_id, -- owner
  objtype     VARCHAR2(6), -- 'TABLE' or 'INDEX'
  objname     dbms_quoted_id, -- table/index
  partname    dbms_quoted_id, -- partition
  subpartname dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;
```

> **Note:**
>
> Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```
TYPE StatsAdvOpr IS RECORD (
  name  VARCHAR2(64), -- name of the operation
  param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;
```

The following type represents a filter list:

```
TYPE StatsAdvFilter IS RECORD (
  rulename VARCHAR2(64),    -- rule name
  objlist  ObjectTab,       -- object filter list
  oprlist  StatsAdvOprTab, -- operation filter list
```

```
  include  BOOLEAN);       -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```

177.4 DBMS_STATS Constants

The DBMS_STATS package defines several constants to use specifying parameter values.

Table 177-1 DBMS_STATS Constants

Name	Type	Description
ADD_GLOBAL_PREFS	NUMBER	Copies global preferences
AUTO_CASCADE	BOOLEAN	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
AUTO_INVALIDATE	BOOLEAN	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_SIZE	NUMBER	Indicates that auto-sample size algorithms should be used
PURGE_ALL	TIMESTAMP WITH TIME ZONE	A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses TRUNCATE statements on the various dictionary statistics tables holding the history of statistics.
RECLAIM_SYNOPSIS	TIMESTAMP WITH TIME ZONE	A constant used for reclaiming synopsis table space.

177.5 DBMS_STATS Operational Notes

Observe these operational notes when using the DBMS_STATS package.

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics

- Extended Statistics
- Optimizer Statistics Advisor

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a force parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

GATHER_DATABASE_STATS Procedures
GATHER_DICTIONARY_STATS Procedure
GATHER_FIXED_OBJECTS_STATS Procedure
GATHER_INDEX_STATS Procedure
GATHER_SCHEMA_STATS Procedures
GATHER_SYSTEM_STATS Procedure
GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SEED_COL_USAGE Procedure
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure
DELETE_DICTIONARY_STATS Procedure
DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure
DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are `'OBJECT_STATS'` (table statistics, column statistics and index statistics) and `'SYNOPSES'` (auxiliary statistics created when statistics are incrementally maintained). The default is `'OBJECT_STATS, SYNOPSES'`.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (`EXPORT_*`)
- from a user statistics table to the dictionary (`IMPORT_*`)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

> **Note:**
>
> Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_PARTITION_STATS Procedure
LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure

UNLOCK_PARTITION_STATS Procedure
UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched.When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESET_GLOBAL_PREF_DEFAULTS Procedure
RESTORE_DATABASE_STATS Procedure
RESTORE_DICTIONARY_STATS Procedure
RESTORE_FIXED_OBJECTS_STATS Procedure
RESTORE_SCHEMA_STATS Procedure
RESTORE_SYSTEM_STATS Procedure
RESTORE_TABLE_STATS Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION Procedure.

The other `DBMS_STATS` procedures related to restoring statistics are:

- PURGE_STATS Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- GET_STATS_HISTORY_RETENTION Function: This function gets the current statistics history retention value.
- GET_STATS_HISTORY_AVAILABILITY Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the GET_INDEX_STATS Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`.The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to `TRUE`. The default value of this parameter is `FALSE` and this boolean parameter can be set at the

session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the PUBLISH_PENDING_STATS Procedure if the performance is acceptable, or delete the pending statistics using DELETE_PENDING_STATS Procedure if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- DELETE_PENDING_STATS Procedure
- EXPORT_PENDING_STATS Procedure
- PUBLISH_PENDING_STATS Procedure

Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates c1=1 and c2=1 and if there are statistics on column group (c1, c2), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

- CREATE_EXTENDED_STATS Function
- DROP_EXTENDED_STATS Procedure
- SHOW_EXTENDED_STATS_NAME Function
- REPORT_COL_USAGE Function
- SEED_COL_USAGE Procedure
- RESET_COL_USAGE Procedure

Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- System

  This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

- Operation

  This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

- Object

  This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- CANCEL_ADVISOR_TASK Procedure
- CONFIGURE_ADVISOR_FILTER Function
- CONFIGURE_ADVISOR_OBJ_FILTER Function
- CONFIGURE_ADVISOR_OPR_FILTER Functions
- CONFIGURE_ADVISOR_RULE_FILTER Function
- CREATE_ADVISOR_TASK Function
- DROP_ADVISOR_TASK Procedure

- EXECUTE_ADVISOR_TASK Function
- GET_ADVISOR_OPR_FILTER Procedure
- GET_ADVISOR_RECS Function
- IMPLEMENT_ADVISOR_TASK Function
- INTERRUPT_ADVISOR_TASK Procedure
- REPORT_ADVISOR_TASK Function
- RESET_ADVISOR_TASK Procedure
- RESUME_ADVISOR_TASK Procedure
- SCRIPT_ADVISOR_TASK Function
- SET_ADVISOR_TASK_PARAMETER Procedure

177.6 DBMS_STATS Data Structures

The `DBMS_STATS` package defines a `RECORD` type.

RECORD Types

- STAT_REC Record Type

177.6.1 DBMS_STATS STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY,
  chvals CHARARRAY,
  eavals RAWARRAY,
  rpcnts NUMARRAY,
  eavs   NUMBER);
```

Fields of the Record type COMPARISON_TYPE (STAT_REC Attributes)

Table 177-2 STAT_REC Attributes

Field	Description
epc	Number of buckets in histogram
minval	Minimum value
maxval	Maximum value
bkvals	Array of bucket numbers
novals	Array of normalized end point values
chvals	Array of dumped end point values
eavals	Array of end point actual values
rpcnts	Array of end point value frequencies
eavs	A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures, this field will be automatically filled.

177.7 Summary of DBMS_STATS Subprograms

This table lists the DBMS_STATS subprograms and briefly describes them.

Table 177-3 *DBMS_STATS Package Subprograms*

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure	Changes the statistics history retention value
CANCEL_ADVISOR_TASK Procedure	Cancels an Optimizer Statistics Advisor execution
CONFIGURE_ADVISOR_FILTER Function	Configures the filter list for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OBJ_FILTER Function	Configures an object filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OPR_FILTER Functions	Configures an operation filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_RULE_FILTER Function	Configures a rule filter for an Optimizer Statistics Advisor task
CREATE_ADVISOR_TASK Function	Creates an advisor task for the Optimizer Statistics Advisor
CONVERT_RAW_VALUE Procedures	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
COPY_TABLE_STATS Procedure	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure	Creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure	Deletes the statistics preferences of all the tables
DELETE_DATABASE_STATS Procedure	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure	Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure	Deletes index-related statistics
DELETE_PENDING_STATS Procedure	Deletes the private statistics that have been collected but have not been published
DELETE_PROCESSING_RATE Procedure	Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources
DELETE_SCHEMA_PREFS Procedure	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure	Deletes system statistics
DELETE_TABLE_PREFS Procedure	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps
DIFF_TABLE_STATS_IN_PENDING Function	Compares pending statistics and statistics as of a timestamp or statistics from dictionary
DIFF_TABLE_STATS_IN_STATTAB Function	Compares statistics for a table from two different sources
DROP_ADVISOR_TASK Procedure	Drops the specified Optimizer Statistics Advisor task
DROP_EXTENDED_STATS Procedure	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure	Drops a user statistics table created by `CREATE_STAT_TABLE`
EXECUTE_ADVISOR_TASK Function	Executes a previously created Optimizer Statistics Advisor task

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
EXPORT_COLUMN_STATS Procedure	Retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`
EXPORT_DATABASE_PREFS Procedure	Exports the statistics preferences of all the tables
EXPORT_DATABASE_STATS Procedure	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by `statown.stattab`
EXPORT_DICTIONARY_STATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`
EXPORT_FIXED_OBJECTS_STATS Procedure	Retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`
EXPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`
EXPORT_PENDING_STATS Procedure	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREFS Procedure	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STATS Procedure	Retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics table identified by `stattab`
EXPORT_SYSTEM_STATS Procedure	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONITORING_INFO Procedure	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_STATS Procedures	Gathers statistics for all objects in the database
GATHER_DICTIONARY_STATS Procedure	Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components
GATHER_FIXED_OBJECTS_STATS Procedure	Gathers statistics of fixed objects
GATHER_INDEX_STATS Procedure	Gathers index statistics
GATHER_PROCESSING_RATE Procedure	Starts the job of gathering the processing rates which end after `interval` defined in minutes
GATHER_SCHEMA_STATS Procedures	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STATS Procedure	Gathers system statistics
GATHER_TABLE_STATS Procedure	Gathers table and column (and index) statistics

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
GENERATE_STATS Procedure	Generates object statistics from previously collected statistics of related objects
GET_ADVISOR_OPR_FILTER Procedure	Creates an operation filter for an Optimizer Statistics Advisor operation
GET_ADVISOR_RECS Function	Generates a recommendation report for the specified item
GET_COLUMN_STATS Procedures	Gets all column-related information
GET_INDEX_STATS Procedures	Gets all index-related information
GET_PARAM Function	Gets the default value of parameters of `DBMS_STATS` procedures (see DBMS_STATS Deprecated Subprograms)
GET_PREFS Function	Gets the default value of the specified preference
GET_STATS_HISTORY_AVAILABILITY Function	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function	Returns the current statistics history retention value
GET_SYSTEM_STATS Procedure	Gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`
GET_TABLE_STATS Procedure	Gets all table-related information
IMPLEMENT_ADVISOR_TASK Function	Implements the recommendations made by Optimizer Statistics Advisor
IMPORT_COLUMN_STATS Procedure	Retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure	Imports the statistics preferences of all the tables
IMPORT_DATABASE_STATS Procedure	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure	Retrieves statistics for fixed tables from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure	Retrieves statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure	Retrieves system statistics from the user statistics table and stores them in the dictionary
IMPORT_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
IMPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary
INTERRUPT_ADVISOR_TASK Procedure	Interrupts a currently executing Optimizer Statistics Advisor task.
LOCK_PARTITION_STATS Procedure	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure	Locks the statistics on the table
MERGE_COL_USAGE Procedure	Merges column usage information from a source database, by means of a `dblink`, into the local database
PREPARE_COLUMN_VALUES Procedures	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_NVARCHAR Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PUBLISH_PENDING_STATS Procedure	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure	Purges old versions of statistics saved in the dictionary
REMAP_STAT_TABLE Procedure	Remaps the names of objects in the user statistics table
REPORT_ADVISOR_TASK Function	Reports the results of an Optimizer Advisor Task.
REPORT_COL_USAGE Function	Reports the recorded column (group) usage information
REPORT_GATHER_AUTO_STATS Function	Runs the auto statistics gathering job in reporting mode
REPORT_GATHER_DATABASE_STATS Functions	Runs the GATHER_DATABASE_STATS Procedures in reporting mode.
REPORT_GATHER_DICTIONARY_STATS Functions	Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode
REPORT_GATHER_FIXED_OBJ_STATS Function	Runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode
REPORT_GATHER_SCHEMA_STATS Functions	Runs the GATHER_SCHEMA_STATS Procedures in reporting mode
REPORT_GATHER_TABLE_STATS Function	Runs the GATHER_TABLE_STATS Procedure in reporting mode

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
REPORT_STATS_OPERATIONS Function	Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided
RESET_ADVISOR_TASK Procedure	Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing
RESET_COL_USAGE Procedure	Resets the recorded column (group) usage information
RESET_GLOBAL_PREF_DEFAULTS Procedure	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure	Resets global preferences to default values (see DBMS_STATS Deprecated Subprograms)
RESTORE_DICTIONARY_STATS Procedure	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_STATS Procedure	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure	Restores statistics of a table as of a specified timestamp (`as_of_timestamp`), as well as statistics of associated indexes and columns
RESUME_ADVISOR_TASK Procedure	Resumes an interrupted task. It only resumes the execution that was most recently interrupted
SCRIPT_ADVISOR_TASK Function	Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor
SEED_COL_USAGE Procedure	Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements
SET_ADVISOR_TASK_PARAMETER Procedure	Updates the value of an Optimizer Statistics Advisor task parameter
SET_COLUMN_STATS Procedures	Sets column-related information
SET_DATABASE_PREFS Procedure	Sets the statistics preferences of all the tables
SET_GLOBAL_PREFS Procedure	Sets the global statistics preferences
SET_INDEX_STATS Procedures	Sets index-related information
SET_PARAM Procedure	Sets default values for parameters of `DBMS_STATS` procedures (see DBMS_STATS Deprecated Subprograms)
SET_PROCESSING_RATE Procedure	Sets the value of rate of processing for a given operation
SET_SCHEMA_PREFS Procedure	Sets the statistics preferences of all the tables owned by the specified owner name

Table 177-3 (Cont.) *DBMS_STATS Package Subprograms*

Subprogram	Description
SET_SYSTEM_STATS Procedure	Sets system statistics
SET_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure	Sets table-related information
SHOW_EXTENDED_STATS_NAME Function	Returns the name of the virtual column that is created for the user-specified extension
TRANSFER_STATS Procedure	Transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database
UNLOCK_PARTITION_STATS Procedure	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure	Unlocks the statistics on all the tables in schema
UNLOCK_TABLE_STATS Procedure	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure	Upgrades user statistics on an older table

177.7.1 ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
   retention       IN     NUMBER);
```

Parameters

Table 177-4 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
`retention`	The retention time in days. The statistics history will be retained for at least these many number of days.The valid range is [1,365000]. Also you can use the following values for special purposes: • -1: Statistics history is never purged by automatic purge • 0: Old statistics are never saved. The automatic purge will delete all statistics history • `NULL`: Change statistics history retention to default value

Usage Notes

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

`ORA-20000`: Insufficient privileges

177.7.2 CANCEL_ADVISOR_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 177-5 CANCEL_ADVISOR_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

Example 177-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
  v_ename   VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an `ORA-13632` to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

177.7.3 CONFIGURE_ADVISOR_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name           IN   VARCHAR2,
  stats_adv_opr_type  IN   VARCHAR2,
  configuration_type  IN   VARCHAR2,
  filter              IN   StatsAdvFilterTab   := NULL)
RETURN CLOB;
```

Parameters

Table 177-6 CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.
`stats_adv_opr_type`	The type of operation to configure. Possible values are `EXECUTE`, `REPORT`, `SCRIPT`, and `IMPLEMENT`. The function permits you to specify a combination of operation types by using the plus (+) operator, for example, `EXECUTE +REPORT`. If this parameter is null, then the filter applies to all types of advisor operations.

Table 177-6 (Cont.) CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
`configuration_type`	The type of configuration. Possible values are as follows: • `SET`: Sets the specified filter list values. The submitted filter overrides existing filter values. • `CLEAR`: Clears the existing values for the specified filter. • `SHOW`: Shows the current values of the specified filter.
`filter`	The list of filter items for the script.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- Inclusion list

  Only include these objects in the check.
- Exclusion list

  Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- Rule filter

  This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.
- Operation filter

This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the DBA_OPTSTAT_OPERATIONS view. To obtain the filter for an operation, use DBMS_STATS.GET_ADVISOR_OPR_FILTER.

- Object filter

  This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

Example 177-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```
DECLARE
  v_task_name    VARCHAR2(128)                := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter    := null;
  filterTab      DBMS_STATS.StatsAdvFilterTab := null;
  v_counter      NUMBER                       := 0;
  v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize the filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- First filter: set filters to be FALSE by default
  filter.include := FALSE;

  -- Add this filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  -- Second filter: turn on filter for one rule
  filter.include := TRUE;
  filter.rulename := 'TurnOnSQLPlanDirective';

  -- Add the SQL plan directive filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
                      task_name          => v_task_name,
                      stats_adv_opr_type => NULL,
                      configuration_type => 'SET',
```

```
                    filter            => filterTab);
  -- Drop the task
  DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

Example 177-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```
DECLARE
  v_task_name    VARCHAR2(128)               := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter    := null;
  filterTab      DBMS_STATS.StatsAdvFilterTab := null;
  opr            DBMS_STATS.StatsAdvOpr;
  oprTab         DBMS_STATS.StatsAdvOprTab;
  v_oprCnt       NUMBER                       := 0;
  TYPE numTab IS TABLE OF NUMBER;
  opr_tab        numTab;
  v_filterReport CLOB;

BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- Initialize operations filter
  oprTab := DBMS_STATS.StatsAdvOprTab();

  SELECT ID
    BULK COLLECT INTO opr_tab
  FROM   WRI$_OPTSTAT_OPR
  WHERE  OPERATION = 'set_table_stats'
  AND    TARGET = 'HR.EMPLOYEES';

  -- Populate the operations table
  FOR i IN 1..opr_tab.count LOOP

    -- Use the procedure GET_ADVISOR_OPR_FILTER to construct
    -- an operation filter
    DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);

    v_oprCnt := v_oprCnt + 1;
    oprTab.extend;
    oprTab(v_oprCnt) := opr;

  END LOOP;

  filter.include := FALSE;
  filter.oprlist := oprTab;
```

```
  -- Add to filter table
  filterTab.extend;
  filterTab(1) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
                      task_name          => v_task_name,
                      stats_adv_opr_type => NULL,
                      configuration_type => 'SET',
                      filter             => filterTab);

  -- Drop the task
  DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

Example 177-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the sh schema. Also, you want to skip the sh.products table. You create an object filter as follows:

```
DECLARE
  v_task_name     VARCHAR2(128)                := 'my_task';
  v_ret           VARCHAR2(128);
  filter          DBMS_STATS.StatsAdvFilter    := null;
  filterTab       DBMS_STATS.StatsAdvFilterTab := null;
  v_filterReport  CLOB;
  v_counter       NUMBER                       := 0;
  obj             DBMS_STATS.ObjectElem;
  objTab          DBMS_STATS.ObjectTab;
  v_objCnt        NUMBER                       := 0;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- Set object filter to be off by default
  filter.include := FALSE;

  objTab := DBMS_STATS.ObjectTab();

  obj.ownname := NULL;
  obj.objname := NULL;

  -- Add to the object table

  v_objCnt := v_objCnt + 1;
  objTab.extend;
  objTab(v_objCnt) := obj;

  filter.objlist := objTab;

  -- Add the object filter to the filter table
  v_counter := v_counter + 1;
```

```
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH

filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products

filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
  task_name          => v_task_name,
  stats_adv_opr_type => NULL,
  configuration_type => 'SET',
```

```
    filter             => filterTab);

  -- Drop the task
  DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

177.7.4 CONFIGURE_ADVISOR_OBJ_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
  task_name             IN VARCHAR2,
  stats_adv_opr_type    IN VARCHAR2,
  rule_name             IN VARCHAR2,
  ownname               IN VARCHAR2,
  tabname               IN VARCHAR2,
  action                IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-7 CONFIGURE_ADVISOR_OBJ_FILTER Function Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.
`stats_adv_opr_type`	The type of operation to configure. Possible values are `EXECUTE`, `REPORT`, `SCRIPT`, and `IMPLEMENT`. See"CONFIGURE_ADVISOR_RULE_FILTER Function".
`rule_name`	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
`ownname`	The owner name of the operation target. If null, the function applies the filter to all owner names.
`tabname`	The table name of the operation target.
`action`	The configuration action to take for the specified rule. See"CONFIGURE_ADVISOR_RULE_FILTER Function".

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

177.7.5 CONFIGURE_ADVISOR_OPR_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name             IN VARCHAR2,
  stats_adv_opr_type    IN VARCHAR2,
  rule_name             IN VARCHAR2,
  operation_name        IN VARCHAR2,
  action                IN VARCHAR2)
RETURN CLOB;

DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name             IN VARCHAR2,
  stats_adv_opr_type    IN VARCHAR2,
  rule_name             IN VARCHAR2,
  operation_name        IN VARCHAR2,
  ownname               IN VARCHAR2,
  tabname               IN VARCHAR2,
  action                IN VARCHAR2)
RETURN CLOB;

DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
  task_name             IN VARCHAR2,
  stats_adv_opr_type    IN VARCHAR2,
  rule_name             IN VARCHAR2,
  operation_id          IN NUMBER,
  action                IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-8 CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.
`stats_adv_opr_type`	The type of operation to configure. Possible values are `EXECUTE`, `REPORT`, `SCRIPT`, and `IMPLEMENT`. See"CONFIGURE_ADVISOR_RULE_FILTER Function".

Table 177-8 (Cont.) CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
rule_name	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
operation_name	The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.
operation_id	The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPSTAT_OPERATIONS.ID. This value cannot be null.
ownname	The owner name of the operation target. This value cannot be null.
tabname	The table name of the operation target.
action	The configuration action to take for the specified rule. See"CONFIGURE_ADVISOR_RULE_FILTER Function".

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-5 Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the hr schema. User account stats has been granted the DBA role, ADVISOR privilege, and SELECT ON DBA_OPTSTAT_OPERATIONS privilege. You perform the following steps:

1. Log in to the database as stats.
2. Drop any existing task named opt_adv_task1.

```
DECLARE
  v_tname VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
  DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
END;
/
```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations *except* those that gather statistics for tables in the `hr` schema.

```
CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
   v_retc CLOB;
BEGIN
   -- For all rules, prevent the advisor from operating
   -- on the operations selected in the following query
   FOR rec IN
     (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =
'gather_table_stats' AND TARGET LIKE 'HR.%')
   LOOP
     v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
                 task_name          => p_tname
               , stats_adv_opr_type => NULL
               , rule_name          => NULL
               , operation_id       => rec.id
               , action             => 'DISABLE');
   END LOOP;
END;
/
SHOW ERRORS
```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```
DECLARE
  v_tname VARCHAR2(32767);
  v_ret VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
  v_ret   := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  opr_filter(v_tname);
END;
/
```

5. Execute the task `opt_adv_task1`.

```
DECLARE
  v_tname VARCHAR2(32767);
  v_ret   VARCHAR2(32767);
begin
  v_tname := 'opt_adv_task1';
  v_ret   := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

6. Print the report.

```
SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000
```

```
SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
         task_name      => 'opt_adv_task1'
       , execution_name => NULL
       , type           => 'TEXT'
       , section        => 'ALL'
       ) AS report
FROM   DUAL;
SPOOL OFF
```

177.7.6 CONFIGURE_ADVISOR_RULE_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
  task_name            IN   VARCHAR2,
  stats_adv_opr_Type   IN   VARCHAR2,
  rule_name            IN   VARCHAR2,
  action               IN   VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-9 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.
`stats_adv_opr_type`	The type of operation to configure. Possible values are `EXECUTE`, `REPORT`, `SCRIPT`, and `IMPLEMENT`. You can specify a combination of operation types, for example, `EXECUTE +REPORT`. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations.
`rule_name`	The name of the rule to configure. If null, the function applies the filter to all rules.
`action`	The configuration action to take for the specified rule. Possible values are: • `ENABLE`: Enables the filter • `DISABLE`: Disables the filter • `DELETE`: Deletes the filter • `SHOW`: Shows the current filter value

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

177.7.7 CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT VARCHAR2);
```

Parameters

Table 177-10 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
rawval	Raw representation of a column minimum, maximum, histogram end point actual value
resval	Converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.8 CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The minval, maxval and eavals fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
   rawval     RAW,
   resval OUT NVARCHAR2);
```

Parameters

Table 177-11 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.9 CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The minval, maxval and eavals fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
   rawval     RAW,
   resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 177-12 CONVERT_RAW_VALUE_ROWID Procedure Parameters

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.10 COPY_TABLE_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given scale_factor.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   srcpartname      VARCHAR2,
   dstpartname      VARCHAR2,
   scale_factor     VARCHAR2 DEFAULT 1,
   flags            NUMBER DEFAULT NULL,
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-13 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the table of source and destination [sub] partitions
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dtspartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname
flags	For internal Oracle use (should be left as NULL)
force	When value of this argument is TRUE copy statistics even if the destination [sub]partition is locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

`ORA-20000`: Invalid [sub]partition name

`ORA-20001`: Bad input value

Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
  - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
    - The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
    - The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
  - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
    - The minimum value of the destination partition is set to the minimum value of the source partition.
    - The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
  - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
  - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is `MAXVALUE`, in which case the maximum value of the destination partition is set to the high bound of the previous partition.
  - If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

    If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum

value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is `D` and its preceding partition is `D-1` and the key column to be adjusted is `Cn`, the maximum value for `Cn` is set to the upper bound of `D` (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column `Cn-1` are the same in partitions `D` and `D-1`.

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

177.7.11 CREATE_ADVISOR_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (
   task_name    IN   VARCHAR2   := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 177-14 CREATE_ADVISOR_TASK Function Parameters

Parameter	Description
`task_name`	Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

Exceptions

`ORA-20000`: Insufficient privileges / creating extension is not supported

`ORA-20001`: Error when processing extension

`ORA-20012`: Optimizer Statistics Advisor errors

Example 177-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

> **Note:**
>
> *Oracle Database SQL Tuning Guide* to learn how manage Optimizer Statistics Advisor

177.7.12 CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.
This second form of this function creates statistics extensions based on the column group usage recorded by the SEED_COL_USAGE Procedure. This function returns a report of extensions created.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;

DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 177-15 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table

Table 177-15 (Cont.) CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
`tabname`	Name of the table
`extension`	Can be either a column group or an expression. Suppose the specified table has columns `c1`, `c2`. An example column group is "(`c1`, `c2`)". An example expression is "(`c1` + `c2`)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

`ORA-20000`: Insufficient privileges / creating extension is not supported

`ORA-20001`: Error when processing extension

`ORA-20007`: Extension already exists

`ORA-20008`: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

177.7.13 CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
   ownname             VARCHAR2,
   stattab             VARCHAR2,
   tblspace            VARCHAR2 DEFAULT NULL,
   global_temporary    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-16 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	Name of the table to create. This value should be passed as the `stattab` parameter to other procedures when the user does not want to modify the dictionary statistics directly.
`tblspace`	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.
`global_temporary`	Whether or not the table should be created as a global temporary table

Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

Exceptions

`ORA-20000`: Table already exists or insufficient privileges

`ORA-20001`: Tablespace does not exist

177.7.14 DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
   ownname        VARCHAR2,
   tabname        VARCHAR2,
   colname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   cascade_parts  BOOLEAN  DEFAULT TRUE,
```

```
statown         VARCHAR2 DEFAULT NULL,
no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                  get_param('NO_INVALIDATE')),
force           BOOLEAN  DEFAULT FALSE,
col_stat_type   VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 177-17 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes column statistics even if locked
col_stat_type	Type of column statistics to be deleted.This argument takes the following values: • HISTOGRAM - delete column histogram only • ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.15 DELETE_DATABASE_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-18 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS
add_sys	Determines whether SYS tables will be included.

Table 177-19 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
GRANULARITY	Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.
INCREMENTAL	Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE.

Table 177-19 (Cont.) Statistics Preferences

Preference	Description

INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.
	
	The parameter accepts the following values:
	• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.
	For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.
	Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.
	• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.
	For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.
	• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.
	• NULL—A partition or subpartition is considered stale when it has any DML changes.
	For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.
	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.

Table 177-19 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed.
NO_INVALIDATE	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS Procedure.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default) • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 177-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics preferences

177.7.16 DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                       get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-20 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 177-20 (Cont.) DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.17 DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   stattype       VARCHAR2 DEFAULT 'ALL',
   force          BOOLEAN  DEFAULT FALSE,
   stat_category  VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-21 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.

Table 177-21 (Cont.) DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
stattype	Statistics type
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.18 DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                       get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 177-22 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	Ignores the statistics lock on objects and deletes the statistics if set to TRUE

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.19 DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'ALL',
   force            BOOLEAN  DEFAULT FALSE);
   stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-23 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type
force	When value of this argument is TRUE, deletes index statistics even if locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

177.7.20 DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2);
```

Parameters

Table 177-24 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
`ownname`	Owner name
`tabname`	Table name

Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

Exceptions

`ORA-20000`: Insufficient privileges

Usage Notes

If the parameter `tabname` is `NULL` delete applies to all tables of the specified schema.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

177.7.21 DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (
   stat_source      IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-25 DELETE_PROCESSING_RATE Procedure Parameters

Parameter	Description
stat_source	Source of processing rates: • 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure • 'CALIBRATION' : values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user • 'FEEDBACK': values obtained by time feedback

Usage Notes

You require the OPTIMIZER_PROCESSING_RATE role to run this procedure since AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.22 DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2);
```

Parameters

Table 177-26 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 177-26 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS

Table 177-27 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values. You can set the following values: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses.

Table 177-27 (Cont.) Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
COORDINATOR_TRIGGER_SHARD	User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards. While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator. You can set the following values: • TRUE—Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale. • FALSE—Ignores the statistics gathering command triggered from the shard coordinator. The default value is FALSE.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	The value determines the percentage of rows to estimate.
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, onlyFOR ALL syntax is allowed.
NO_INVALIDATE	The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
GRANULARITY	The value determines granularity of statistics to collect (only pertinent if the table is partitioned)
PUBLISH	This value determines whether or not newly gathered statistics will be published once the gather job has completed.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 177-27 (Cont.) Statistics Preferences

Preference	Description

INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.
	The parameter accepts the following values:
	• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.
	For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.
	Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.
	• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.
	For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.
	• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.
	• NULL—A partition or subpartition is considered stale when it has any DML changes.
	For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.
	Note that the following two executions are different:
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.

Table 177-27 (Cont.) Statistics Preferences

Preference	Description
ROOT_TRIGGER_PDB	The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB. During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root. You can set the following values: • TRUE—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale. • FALSE—Ignores the statistics gathering command triggered from application root. The default value is FALSE. **Note:** CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.
STALE_PERCENT	This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
GLOBAL_TEMP_TABLE_STATS	This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
TABLE_CACHED_BLOCKS	The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.
OPTIONS	Determines the `options` parameter used in the GATHER_TABLE_STATS Procedure.

Security Model

To run this procedure, you must be the object owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics preferences

177.7.23 DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-28 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the table where statistics are stored. If stattab is NULL, then the procedure deletes statistics directly from the data dictionary.
statid	Specifies the identifier (optional) associated with these statistics within stattab. This parameter is only relevant if stattab is not NULL.
statown	Specifies the schema containing stattab (if different than ownname).

Table 177-28 (Cont.) DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
no_invalidate	Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. • SYNOPSES — Specifies metadata for incremental statistics. • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

177.7.24 DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option), if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-29 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.25 DELETE_TABLE_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 177-30 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name

Table 177-30 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be deleted and default preference values will be used: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • GLOBAL_TEMP_STATS • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS

Table 177-31 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GRANULARITY	Determines granularity of statistics to collect. This value is only relevant for partitioned tables.

Table 177-31 (Cont.) Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 177-31 (Cont.) Statistics Preferences

Preference	Description

INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.
	The parameter accepts the following values:
	• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.
	For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.
	Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.
	• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.
	For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.
	• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.
	• NULL—A partition or subpartition is considered stale when it has any DML changes.
	For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.
	Note that the following two executions are different:
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.

Table 177-31 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only 'FOR ALL' syntax is allowed.
NO_INVALIDATE	The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS Procedure.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether newly gathered statistics will be published after the statistics gathering job has completed.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default) • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be in the buffer cache when calculating the index clustering factor.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics preferences

177.7.26 DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   cascade_columns  BOOLEAN  DEFAULT TRUE,
   cascade_indexes  BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 177-32 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tabname	Specifies the name of the table to which this column belongs.
partname	Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	Identifies the user statistics table where statistics will be retrieved. If stattab is NULL, then the procedure retrieves statistics directly from the dictionary.
statid	Specifies the identifier (optional) associated with these statistics within stattab. This parameter is only relevant if stattab is not NULL.

Table 177-32 (Cont.) DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
cascade_parts	Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if partname is NULL, then specifying TRUE deletes statistics for underlying partitions.
cascade_columns	Indicates whether to invoke the DELETE_COLUMN_STATS procedure. If TRUE, then this procedure calls DELETE_COLUMN_STATS for all underlying columns.
cascade_indexes	Indicates whether to invoke the DELETE_INDEX_STATS procedure. If TRUE, then this procedure calls DELETE_INDEX_STATS for all underlying columns.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — specifies table statistics, column statistics, and index statistics. • SYNOPSES — specifies metadata for incremental statistics. • REALTIME_STATS — specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

177.7.27 DIFF_TABLE_STATS_IN_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
   ownname        IN  VARCHAR2,
   tabname        IN  VARCHAR2,
   time1          IN  TIMESTAMP WITH TIME ZONE,
   time2          IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   pctthreshold   IN  NUMBER                   DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 177-33 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify NULL for current schema.
tabname	Specifies the table for which statistics are to be compared.
time1	Specifies the first timestamp for comparison.
time2	Specifies the second timestamp for comparison.
pctthreshold	Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Usage Notes

If the second timestamp is NULL, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

177.7.28 DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      timestamp      IN  TIMESTAMP WITH TIME ZONE,
      pctthreshold   IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 177-34 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for the current schema.
tabname	Table for which statistics are to be compared.
timestamp	Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is NULL, then this function compares the current statistics in the dictionary with the pending statistics (default).
pctthreshold	Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table, or you must have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or you must have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.29 DIFF_TABLE_STATS_IN_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using statids
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (stattab1 or time1) as the basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
   ownname        IN  VARCHAR2,
   tabname        IN  VARCHAR2,
   stattab1       IN  VARCHAR2,
   stattab2       IN  VARCHAR2 DEFAULT NULL,
   pctthreshold   IN  NUMBER   DEFAULT 10,
   statid1        IN  VARCHAR2 DEFAULT NULL,
   statid2        IN  VARCHAR2 DEFAULT NULL,
   stattab1own    IN  VARCHAR2 DEFAULT NULL,
   stattab2own    IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;
```

Parameters

Table 177-35 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify NULL for current schema.
tabname	Specifies the table for which statistics are to be compared.
stattab1	Specifies the user statistics table 1.
stattab2	Specifies the user statistics table 2. If NULL, the function compares statistics in stattab1 with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as stattab1 (see statid below).
pctthreshold	Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10.
stadid1	(optional) Identifies statistics set within stattab1.
stadid2	(optional) Identifies statistics set within stattab2.
stattab1own	Specifies the schema containing stattab1 (if other than ownname).
stattab2own	Specifies the schema containing stattab2 (if other than ownname).

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.30 DROP_ADVISOR_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.DROP_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 177-36 DROP_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named my_task:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

177.7.31 DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2);
```

Parameters

Table 177-37 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If no extended statistics set is created for the extension, this function throws an error.

177.7.32 DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2);
```

Parameters

Table 177-38 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

177.7.33 EXECUTE_ADVISOR_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (
   task_name        IN   VARCHAR2,
   execution_name   IN   VARCHAR2 := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 177-39 EXECUTE_ADVISOR_TASK Parameters

Parameter	Description
task_name	Name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

  Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- Operation level

  The results depend on the following privileges:

  - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
  - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
  - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
  - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level

  Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Returns

This function returns the name of the new execution.

Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System

  To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- Operation

  If you have the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges, then you can execute this function for all operations. If you have only the ANALYZE ANY privilege, then you can execute this function for operations related to any schemas except SYS. If you have only the ANALYZE ANY DICTIONARY privilege, then you can execute this function for operations related to any schemas, including SYS. If you have neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege, then you can execute this function only for operations in your own schema.

- Object

  If you have the privilege to collect statistics for an object, then you can execute this function for the object.

Example 177-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named my_task, and then executes it.

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

177.7.34 EXPORT_COLUMN_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-40 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs

Table 177-40 (Cont.) EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.35 EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-41 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

177.7.36 EXPORT_DATABASE_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by statown.stattab.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-42 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default). • SYNOPSES — information to support incremental statistics. • REALTIME_STATS — specifies only real-time statistics. If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.37 EXPORT_DICTIONARY_STATS Procedure

This procedure exports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-43 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default) • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.38 EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-44 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20002`: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.39 EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
   ownname  VARCHAR2,
   indname  VARCHAR2,
```

```
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-45 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

177.7.40 EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT USER);
```

Parameters

Table 177-46 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 177-46 (Cont.) EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
tabname	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter tabname is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

177.7.41 EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-47 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

177.7.42 EXPORT_SCHEMA_STATS Procedure

This procedure exports statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-48 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the user statistics table in which to store the exported statistics.
statid	Specifies the identifier (optional) associated with these statistics within stattab.
statown	Specifies the schema containing stattab (if different than ownname).

Table 177-48 (Cont.) EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — specifies table statistics, column statistics, and index statistics • SYNOPSES — specifies metadata for incremental statistics • REALTIME_STATS — specifies only real-time statistics You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.43 EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-49 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table that describes where the statistics will be stored
statid	Optional identifier associated with the statistics stored from the stattab
statown	Schema containing stattab (if different from current schema)

Security Model

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

177.7.44 EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-50 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.

- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

177.7.45 EXPORT_TABLE_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2,
   statid           VARCHAR2 DEFAULT NULL,
   cascade          BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-51 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Specifies the name of the schema.
`tabname`	Specifies the name of the table.
`partname`	Specifies the name of the table partition. If the table is partitioned, and if `partname` is `NULL`, then the procedure exports global and partition statistics.
`stattab`	Specifies the identifier (optional) associated with these statistics within `stattab`.
`statid`	Specifies the identifier (optional) associated with these statistics within `stattab`.
`cascade`	Indicates whether to export column and index statistics. If `TRUE`, then the procedure exports column and index statistics for the specified table. This is the default.
`statown`	Specifies the schema containing `stattab` (if different than `ownname`).

Table 177-51 (Cont.) EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — specifies table statistics, column statistics, and index statistics • SYNOPSES — specifies metadata for incremental statistics • REALTIME_STATS — specifies only real-time statistics You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.46 FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Security Model

The ANALYZE_ANY system privilege is required to run this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call FLUSH_DATABASE_MONITORING_INFO to view the latest information in *_TAB_STATISTICS and *_IND_STATISTICS because these views show statistics cached in the SGA and

stored on disk. Because the GATHER_*_STATS procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

177.7.47 GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);
```

Parameters

Table 177-52 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.
method_opt	When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed.: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 177-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
degree	Determines the degree of parallelism used for gathering statistics. The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=>NULL, DEGREE=>*n*, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics
cascade	Determines whether to collect index statistics as part of gathering table statistics. Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.

Table 177-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
statid	Identifier (optional) to associate with these statistics within stattab.
options	Specifies which objects require statistics to be gathered. Valid values are as follows: • GATHER — Gathers statistics on all objects in the database. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. • LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the SYS user.
no_invalidate	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) or (o.a2 like s2) or ... is true.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM .....

  This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

177.7.48 GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id          VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER AUTO',
   objlist    OUT   ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id           VARCHAR2 DEFAULT NULL,
   estimate_percent  NUMBER DEFAULT
                          to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample      BOOLEAN DEFAULT FALSE,
   method_opt        VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
   degree            NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
   granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade           BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
   stattab           VARCHAR2 DEFAULT NULL,
   statid            VARCHAR2 DEFAULT NULL,
   options           VARCHAR2 DEFAULT 'GATHER AUTO',
   statown           VARCHAR2 DEFAULT NULL,
   no_invalidate     BOOLEAN DEFAULT
                             to_no_invalidate_type(get_param('NO_INVALIDATE')),
   obj_filter_list   ObjectTab DEFAULT NULL);
```

Parameters

Table 177-53 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	The method options. This parameter accepts the following values: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 177-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics
cascade	Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab

Table 177-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
options	Specifies which objects require statistics to be gathered. Valid values are as follows: • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER — Gathers statistics on all objects in the relevant schema. • GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. • LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	The list of objects found to be stale or empty.
statown	Schema containing stattab, if different from the current schema.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM .....

  This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.49 GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 177-54 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.50 GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The granularity and no_invalidate arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (GET_PARAM('ESTIMATE_PERCENT')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                       (GET_PARAM('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-55 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Schema of index to analyze
indname	Name of index
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics

Table 177-55 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.51 GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an interval defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
   gathering_mode      IN    VARCHAR2  DEFAULT 'START',
   interval            IN    NUMBER    DEFAULT  NULL);
```

Parameters

Table 177-56 GATHER_PROCESSING_RATE Procedure Parameters

Parameter	Description
gathering_mode	Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes.
interval	Time interval (number of minutes) for which the processing must be gathered

Usage Notes

- You require the OPTIMIZER_PROCESSING_RATE role to run this procedure.
- AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.52 GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
  force             BOOLEAN DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE'),
   force            BOOLEAN DEFAULT FALSE,
   obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 177-57 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)

Table 177-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
estimate_percent	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 177-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab

Table 177-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
options	Specifies which objects require statistics to be gathered. Valid values are as follows: • GATHER — Gathers statistics on all objects in the schema. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. • LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM .....

  This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that the tables SH.SALES and SH.COSTS, if stale, will have statistics gathered upon them.

```
DECLARE
   filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
   filter_lst.extend(2);
   filter_lst(1).ownname := 'SH';
   filter_lst(1).objname := 'SALES';
   filter_lst(2).ownname := 'SH';
   filter_lst(2).objname := 'COSTS';
   DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
 END;
```

177.7.53 GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
   gathering_mode   VARCHAR2 DEFAULT 'NOWORKLOAD',
   interval         INTEGER  DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-58 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	Specifies the mode in which the database gathers system statistics. Possible values are: • NOWORKLOAD The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. To fine tune system statistics for the workload, use START and STOP or the INTERVAL option. If you gather both NOWORKLOAD and workload-specific statistics (statistics collected using INTERVAL or START and STOP), the optimizer uses the workload statistics. Collected components include cpuspeednw, ioseektim, and iotfrspeed. • INTERVAL The database captures system activity during a specified interval in minutes. This parameter works in combination with the interval parameter. The database creates or updates system statistics in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • START | STOP The database captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. The database ignores the INTERVAL value. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • EXADATA In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.
interval	Specifies the number of minutes in which to gather system statistics. This parameter applies only when gathering_mode='INTERVAL'.
stattab	Specifies the table in which the database stores the statistics.
statid	Specifies an optional identifier associated with the statistics saved in stattab.
statown	Specifies the schema containing stattab, if different from the current schema.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE   jobno   number;
BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'',''OLTP'');'
   sysdate, 'sysdate + 1');
   COMMIT;
END;

BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'',''OLAP'');'
   sysdate + 0.5, 'sysdate + 1');
   COMMIT;
END;
```

177.7.54 GATHER_TABLE_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type

(get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (

get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE,
   context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
   options          VARCHAR2 DEFAULT get_param('OPTIONS'));
```

Parameters

Table 177-59 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema containing the table.
tabname	Name of the table.
partname	Name of the partition.
estimate_percent	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	METHOD_OPT - When setting preference on global, schema, database or dictionary level, only'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column_clause is defined as column_clause := column_name | extension name | extension - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Determines the degree of parallelism used for gathering statistics. The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=>NULL, DEGREE=>*n*, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Determines whether to collect index statistics as part of gathering table statistics. Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.

Table 177-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked
context	Not used.
options	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parellelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM .....

  This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

177.7.55 GENERATE_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

> **Note:**
>
> This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the `GATHER_INDEX_STAT` procedure. See "GATHER_INDEX_STATS Procedure".

Syntax

```
DBMS_STATS.GENERATE_STATS (
   ownname    VARCHAR2,
   objname    VARCHAR2,
   organized  NUMBER DEFAULT 7,
   force      BOOLEAN default FALSE);
```

Parameters

Table 177-60 GENERATE_STATS Procedure Parameters

Parameter	Description
`ownname`	Schema of object
`objname`	Name of object
`organized`	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
`force`	If `TRUE`, generates statistics for the target object even if it is locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

177.7.56 GET_ADVISOR_OPR_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (
  opr_id        IN             NUMBER,
  opr_filter    IN OUT NOCOPY  StatsAdvOpr);
```

Parameters

Table 177-61 GET_ADVISOR_OPR_FILTER Procedure Parameters

Parameter	Description
opr_id	The ID of the statistics operation stored in the DBA_OPTSTAT_OPERATIONS view.
opr_filter	The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

177.7.57 GET_ADVISOR_RECS Function

This function generates a recommendation report for the specified item.

Syntax

```
DBMS_STATS.GET_ADVISOR_RECS(
  ownname    IN   VARCHAR2,
  tabname    IN   VARCHAR2,
  rec        IN   VARCHAR2,
  type       IN   VARCHAR2   := 'TEXT')
RETURN CLOB;
```

Parameters

Table 177-62 GET_ADVISOR_RECS Function Parameters

Parameter	Description
ownname	The owner of the table.
tabname	The name of the table.
rec	The Optimizer Statistics Advisor recommendation. • INCREMENTAL When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off. • CONCURRENT The report recommends either setting the CONCURRENT preference, or specifying AUTO_DEGREE for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting CONCURRENT first. The advisor only recommends AUTO_DEGREE when statistics gathering on an individual table take a long time and the CONCURRENT preference is already set.
type	Type of the report: TEXT, HTML, or XML.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

177.7.58 GET_COLUMN_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname        VARCHAR2,
   tabname        VARCHAR2,
   colname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   distcnt OUT    NUMBER,
   density OUT    NUMBER,
   nullcnt OUT    NUMBER,
   srec    OUT    StatRec,
   avgclen OUT    NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   realtime_stats BOOLEAN iDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   colname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-63 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Specifies the name of the table to which this column belongs.
colname	Specifies the name of the column or extension.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if partname is NULL, then the procedure retrieves statistics at the global table level.
stattab	Specifies the statistics table ID describing where to retrieve the statistics. If stattab is NULL, then the procedure retrieves statistics directly from the data dictionary.
statid	Specifies an optional identifier associated with these statistics within stattab. This parameter is only relevant when stattab is not NULL.
ext_stats	Specifies the user-defined statistics.
stattypown	Specifies the schema of the statistics type.
stattypname	Specifies the name of the statistics type.
distcnt	Specifies the number of distinct values.
density	Specifies the column density.
nullcnt	Specifies the number of NULL values.
srec	Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values.
avgclen	Specifies the average length of the column (in bytes).
statown	Specifies the schema containing stattab (if different than ownname).
realtime_stats	Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be the owner of the table, or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Before invoking this procedure, ensure that the table exists.

177.7.59 GET_INDEX_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL);

DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   guessq     OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-64 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing stattab (if different than ownname)
guessq	Guess quality for the index (partition)

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values

>
> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics

177.7.60 GET_PARAM Function

This function returns the default value of parameters of `DBMS_STATS` procedures.

> **Note:**
>
> This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.
>
> See also DBMS_STATS Deprecated Subprograms.

Syntax

```
DBMS_STATS.GET_PARAM (
   pname     IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 177-65 GET_PARAM Function Parameters

Parameter	Description
pname	Parameter name

Exceptions

ORA-20001: Invalid input values

177.7.61 GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (
   pname     IN   VARCHAR2,
   ownname   IN   VARCHAR2 DEFAULT NULL,
   tabname   IN   VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 177-66 GET_PREFS Function Parameters

Parameter	Description
pname	Preference name. The possible values are: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATUS
ownname	Owner name
tabname	Table name

Table 177-67 Preference Descriptions

Preference Name	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
AUTO_TASK_STATUS	Enables or disables the high-frequency automatic optimizer statistics collection. Values are: • ON — Enables high-frequency automatic optimizer statistics collection. • OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
AUTO_TASK_MAX_RUN_TIME	Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
CONCURRENT	Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: • MANUAL — Concurrency is enabled only for manual statistics gathering. • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. • ALL — Concurrency is enabled for both manual and automatic statistics gathering. • OFF — Concurrency is disabled for both manual and automatic statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table: • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values: • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description

	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value `NULL`, whereas the second sets the preference to the default, which is `ALLOW_MIXED_FORMAT`.

`METHOD_OPT`	Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only `FOR ALL` syntax is allowed: • `FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]` The `size_clause` is defined as `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}` `integer` — Specifies the number of histogram buckets. The number must be between 1 and 2048. `REPEAT` — Collects histograms only on the columns that already have histograms. `AUTO` — Determines the columns on which to collect histograms based on data distribution and the workload of the columns. `SKEWONLY` — Determines the columns on which to collect histograms based on the data distribution of the columns. The default is `FOR ALL COLUMNS SIZE AUTO`. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
`NO_INVALIDATE`	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is `DBMS_STATS.AUTO_INVALIDATE`, which means the database decides when to invalidate dependent cursors. If set to `TRUE`, then the database not invalidate dependent cursors. If set to `FALSE`, then the procedure invalidates dependent cursors immediately.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
OPTIONS	Determines the `options` parameter used in the `GATHER_TABLE_STATS` procedure. The preference takes the following values: • `GATHER` — Gathers statistics for all objects in the table. This is the default. • `GATHER AUTO` — Gathers all necessary statistics automatically. Oracle recommends setting `GATHER AUTO` on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have `INCREMENTAL` enabled. Running `GATHER_TABLE_STATS` procedure on these tables with the `GATHER AUTO` option skips regathering the already fresh statistics.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • `TRUE` — Ignores input parameter values, and uses the value of the corresponding preference. • `FALSE` — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for `stale_percent` is non-negative numbers. The default value is `10`, which means that a table having more than 10% of changes is considered stale.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • `OBJECT_STATS` - table statistics, column statistics and index statistics (default) • `SYNOPSES` - information to support incremental statistics • `REALTIME_STATS` — specifies only real-time statistics. The value `'OBJECT_STATS, SYNOPSES'` specifies table statistics, column statistics, index statistics, and synopses.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.

Table 177-67 (Cont.) Preference Descriptions

Preference Name	Description
WAIT_TIME_TO_UPDATE_STATS	Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.

Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, and MANAGE ANY QUEUE.

Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

Usage Notes

Note the following guidelines:

- The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER_*_STATS procedures. DBMS_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

  To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB_QUEUE_PROCESSES initialization parameter must be at least 4.
- If the ownname and tabname are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

177.7.62 GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
 RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.63 GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
 RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.64 GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
   status    OUT  VARCHAR2,
   dstart    OUT  DATE,
   dstop     OUT  DATE,
   pname     IN   VARCHAR2,
   pvalue    OUT  NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-68 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
`status`	Output is one of the following: • `COMPLETED:` • `AUTOGATHERING:` • `MANUALGATHERING:` • `BADSTATS:`

Table 177-68 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
dstart	Date when statistics gathering started. If status = MANUALGATHERING, the start date is returned.
dstop	Date when statistics gathering stopped. • If status = COMPLETE, the finish date is returned. • If status = AUTOGATHERING, the future finish date is returned. • If status = BADSTATS, the must-finished-by date is returned.
pname	The parameter name to get, which can have one of the following values: • iotfrspeed - I/O transfer speed in bytes for each millisecond • ioseektim - seek time + latency time + operating system overhead time, in milliseconds • sreadtim - average time to read single block (random read), in milliseconds • mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds • cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) • cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. • mbrc - average multiblock read count for sequential read, in blocks • maxthr - maximum I/O system throughput, in bytes/second • slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.65 GET_TABLE_STATS Procedure

This overloaded procedure gets all table-related statistics.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
   ownname            VARCHAR2,
   tabname            VARCHAR2,
   partname           VARCHAR2 DEFAULT NULL,
   stattab            VARCHAR2 DEFAULT NULL,
   statid             VARCHAR2 DEFAULT NULL,
   numrows        OUT NUMBER,
   numblks        OUT NUMBER,
   avgrlen        OUT NUMBER,
   statown            VARCHAR2 DEFAULT NULL,
   realtime_stats     BOOLEAN DEFAULT TRUE);

DBMS_STATS.GET_TABLE_STATS (
   ownname            VARCHAR2,
   tabname            VARCHAR2,
   partname           VARCHAR2 DEFAULT NULL,
   stattab            VARCHAR2 DEFAULT NULL,
   statid             VARCHAR2 DEFAULT NULL,
   numrows        OUT NUMBER,
   numblks        OUT NUMBER,
   avgrlen        OUT NUMBER,
   statown            VARCHAR2 DEFAULT NULL,
   im_imcu_count  OUT NUMBER,
   im_block_count OUT NUMBER,
   scanrate       OUT NUMBER,
   realtime_stats     BOOLEAN DEFAULT TRUE);

DBMS_STATS.GET_TABLE_STATS (
   ownname           VARCHAR2,
   tabname           VARCHAR2,
   partname          VARCHAR2 DEFAULT NULL,
   stattab           VARCHAR2 DEFAULT NULL,
   statid            VARCHAR2 DEFAULT NULL,
   numrows       OUT NUMBER,
   numblks       OUT NUMBER,
   avgrlen       OUT NUMBER,
   cachedblk     OUT NUMBER,
   cachehit      OUT NUMBER,
   realtime_stats     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 177-69 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tabname	Specifies the name of the table to which this column belongs.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If stattab is NULL, then the procedure gathers statistics directly from the data dictionary.
statid	Specifies the optional ID associates with these statistics within stattab. This ID is only relevant when stattab is not NULL.
numrows	Specifies the number of rows in the table or partition.
numblks	Specifies the number of blocks in the table or partition.
avgrlen	Specifies the average row length for the table or partition.
statown	Specifies the schema containing stattab (if different from ownname).
im_imcu_count	Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	Specifies the number of In-Memory blocks in the table or partition. An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks.
scanrate	Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.
realtime_stats	Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.
cachedblk	For internal use only.
cachehit	For internal use only.

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or have the ANALYZE ANY DICTIONARY or SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains cachedblk and cachehit at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the DBMS_STATS.GATHER_*_STATS procedure for automatic mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each cachehit and a cachedblk for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

> *Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics preferences

177.7.66 IMPLEMENT_ADVISOR_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2    := NULL,
  level              IN   VARCHAR2    := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-70 IMPLEMENT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
level	The level of the implementation. Possible values are • ALL: Ignores the filters and implements all recommendations. • TYPICAL: Implements the recommendations according to the filters in place.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level

  Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.

- Operation level

  The results depend on the following privileges:

  – Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.

  – Users with the ANALYZE ANY privilege but *not* the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.

  – Users with the ANALYZE ANY DICTIONARY privilege but *not* the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.

  – Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

  Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 177-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```
DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
  v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
  DBMS_OUTPUT.PUT_LINE(v_report);

  -- implement all recommendations
  v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

177.7.67 IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
```

```
                                    get_param('NO_INVALIDATE')),
  force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-71 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If set to TRUE, imports statistics even if statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

177.7.68 IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-72 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
`stattab`	Statistics table name where to import the statistics
`statid`	Optional identifier to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)
`add_sys`	Value `TRUE` will include the Oracle-owned tables

Exceptions

`ORA-20000`: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

177.7.69 IMPORT_DATABASE_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
```

```
   force           BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-73 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	Specifies the statistics table that contains the statistics to be imported.
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics locked at the object (table) level: • TRUE - Ignores the statistics lock and imports the statistics • FALSE - The statistics will be imported only if they are not locked
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. The default value is 'OBJECT_STATS, SYNOPSES, MODELS'.

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.70 IMPORT_DICTIONARY_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force           BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-74 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock at the object (table) level: • TRUE - Ignores the statistics lock and imports the statistics. • FALSE - The statistics will be imported only if there is no lock.
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS'.

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.71 IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 177-75 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock: • TRUE - Ignores the statistics lock and imports the statistics • FALSE - The statistics will be imported only if there is no lock

Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.72 IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-76 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Imports statistics even if index statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Oracle does not support export or import of statistics across databases of different character sets.

177.7.73 IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-77 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

177.7.74 IMPORT_SCHEMA_STATS Procedure

This procedure imports statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
   ownname         VARCHAR2,
   stattab         VARCHAR2,
   statid          VARCHAR2 DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force           BOOLEAN DEFAULT FALSE,
   stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-78 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
`ownname`	Specifies the name of the schema.
`stattab`	Identifies the user table that stores the statistics to be imported.
`statid`	Specifies the ID associated with these statistics within `stattab`.
`statown`	Specifies the schema containing `stattab` (if different than `ownname`).
`no_invalidate`	Indicates whether to invalidate dependent cursors. If this parameter is set to `TRUE`, then the procedure does not invalidate dependent cursors. If set to `FALSE`, then the procedure invalidates the dependent cursors immediately. Use `DBMS_STATS.AUTO_INVALIDATE` to let Oracle Database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
`force`	Specifies whether to override statistics locked at the object level. The possible values are as follows: • `TRUE` — Ignores the statistics lock and imports the statistics. • `FALSE` — Imports the statistics only if there is no lock. This is the default.

Table 177-78 (Cont.) IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — specifies table statistics, column statistics, and index statistics • SYNOPSES — specifies metadata for incremental statistics • REALTIME_STATS — specifies only real-time statistics You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS '.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.75 IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by stattab, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-79 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be retrieved
statid	Optional identifier associated with the statistics retrieved from the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

Oracle does not support export or import of statistics across databases of different character sets.

177.7.76 IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-80 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

177.7.77 IMPORT_TABLE_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by `stattab` and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2,
   statid           VARCHAR2 DEFAULT NULL,
   cascade          BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(
                                       get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE,
   stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 177-81 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Specifies the name of the schema.
`tabname`	Specifies the name of the table.
`partname`	Name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition table statistics are imported.
`stattab`	Identifies the user statistics table that describes where to retrieve the statistics.
`statid`	Specifies the ID associated with these statistics within `stattab`.
`cascade`	Indicates whether to import column and index statistics for this table. The default is `TRUE`.
`statown`	Specifies the schema containing `stattab` (if different than `ownname`).
`no_invalidate`	Indicates whether to invalidate dependent cursors. If this parameter is set to `TRUE`, then the procedure does not invalidate dependent cursors. If set to `FALSE`, then the procedure invalidates the dependent cursors immediately. Use `DBMS_STATS.AUTO_INVALIDATE` to let Oracle Database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure

Table 177-81 (Cont.) IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
force	Specifies whether to override statistics locked at the object level. The possible values are as follows: • TRUE — Ignores the statistics lock and imports the statistics. • FALSE — Imports the statistics only if there is no lock. This is the default.
stat_category	Specifies which statistics to process. The following values are supported: • OBJECT_STATS — specifies table statistics, column statistics, and index statistics • SYNOPSES — specifies metadata for incremental statistics • REALTIME_STATS — specifies only real-time statistics You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

177.7.78 INTERRUPT_ADVISOR_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the "RESUME_ADVISOR_TASK Procedure".

Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 177-82 INTERRUPT_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named my_task:

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
  v_ename   VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

177.7.79 LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 177-83 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.80 LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
   ownname    VARCHAR2);
```

Parameters

Table 177-84 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

177.7.81 LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 177-85 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

177.7.82 MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
   dblink    IN    VARCHAR2);
```

Parameters

Table 177-86 MERGE_COL_USAGE Procedure Parameters

Parameter	Description
`dblink`	Name of `dblink`

Usage Notes

User must be `SYS` to execute this procedure. addition the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

Exceptions

`ORA-20000`: Insufficient privileges

`ORA-20001`: Parameter `dblink` cannot be `NULL`

`ORA-20002`: Unable to create a `TEMP` table

177.7.83 PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   charvals        CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec      IN OUT StatRec,
   datevals          DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   dblvals          DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   fltvals          FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   numvals          NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   rawvals          RAWARRAY);
```

Parameters

Table 177-87 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
`srec.epc`	Number of values specified in `charvals`, `datevals`, `dblvals`, `fltvals`, `numvals`, or `rawvals`. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (`nvarchar` and `rowid`). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to `SET_COLUMN_STATS`.
`srec.bkvals`	If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in `charvals`, `datevals`, `dblvals`, `fltvals`, `numvals`, or `rawvals`. Otherwise, it is merely an output parameter, and it must be set to `NULL` when this procedure is called.
`srec.rpcnts`	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in `charvals`, `datevals`, `numvals`, or `rawvals`. Otherwise, it is merely an output argument and must be set to `NULL` when this procedure is called. As an example, for a given array `numvals` with `numvals(i)=4, rpcnts(i)=13` means that there are 13 rows in the column which are less than or equal to 4. Note: • Whenever `srec.rpcnts` is populated, `srec.bkvals` must be populated as described above. • Whenever `bkvals` and/or `rpcnts` are populated, there should not be any duplicates in `charvals`, `datevals`, `numvals`, or `rawvals`.

Datatype-specific input parameters (use one) are shown in Table 177-88.

Table 177-88 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	Array of values when the column type is date-based
dblvals	Array of values when the column type is double-based
fltvals	Array of values when the column type is float-based
numvals	Array of values when the column type is numeric-based
rawvals	Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.
nvmin, nvmax	Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 177-89 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.84 PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
   srec     IN OUT StatRec,
   nvmin           NVARCHAR2,
   nvmax           NVARCHAR2);
```

Parameters

Table 177-90 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

Parameter	Description
`srec.epc`	Number of values specified in `charvals`, `datevals`, `dblvals`, `fltvals`, `numvals`, or `rawvals`. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (`nvarchar` and `rowid`). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to `SET_COLUMN_STATS`.
`srec.bkvals`	If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in `charvals`, `datevals`, `dblvals`, `fltvals`, `numvals`, or `rawvals`. Otherwise, it is merely an output parameter, and it must be set to `NULL` when this procedure is called.
`srec.rpcnts`	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in `charvals`, `datevals`, `numvals`, or `rawvals`. Otherwise, it is merely an output argument and must be set to `NULL` when this procedure is called. As an example, for a given array `numvals` with `numvals(i)=4`, `rpcnts(i)=13` means that there are 13 rows in the column which are less than or equal to 4. Note: • Whenever `srec.rpcnts` is populated, `srec.bkvals` must be populated as described above. • Whenever `bkvals` and/or `rpcnts` are populated, there should not be any duplicates in `charvals`, `datevals`, `numvals`, or `rawvals`.

Datatype-specific input parameters (use one) are shown in Table 177-88.

Table 177-91 PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 177-92 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

Related Topics

- SET_COLUMN_STATS Procedures
  This procedure sets column-related information.

177.7.85 PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
   srec  IN OUT StatRec,
   rwmin        ROWID,
   rwmax        ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 177-93 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec	Values (IN): • epc • bkvals • rpcnts Values (OUT): • minval • maxval • bkvals • novals • eavals • rpcnts
rwmin	Minimum value when the column type is rowid. No histogram information is provided for a column of this type.
rwmax	Maximum value when the column type is rowid. No histogram information is provided for a column of this type.

Table 177-94 StatRec Record Type Fields

Field	Description
epc (IN)	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
bkvals (IN)	If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Table 177-94 (Cont.) StatRec Record Type Fields

Field	Description
rpcnts (IN)	If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called. As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4. Note: • Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.
minval (OUT)	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.
maxval (OUT)	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
bkvals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
novals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
eavals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS
rpcnts (OUT)	Array suitable for use in a call to SET_COLUMN_STATS

Usage Notes

No special privilege or role is needed to invoke this procedure.

177.7.86 PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate        BOOLEAN DEFAULT
       TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    force            IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-95 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 177-95 (Cont.) PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If TRUE, will override the lock

Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

177.7.87 PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp       TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 177-96 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure.The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

177.7.88 REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
   ownname    IN    VARCHAR2,
   stattab    IN    VARCHAR2,
   src_own    IN    VARCHAR2,
   src_tab    IN    VARCHAR2,
   tgt_own    IN    VARCHAR2,
   tgt_tab    IN    VARCHAR2);
```

Parameters

Table 177-97 REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Owner of the statistics table. NULL means the current schema.
stattab	User statistics table identifier
src_own	Owner of the table to be renamed. This argument cannot be NULL.
src_tab	Name of the table to be renamed. If NULL, all tables are owned by src_own.

Table 177-97 (Cont.) REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
tgt_own	New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed.This argument cannot be NULL.
tgt_tab	New name of the table. This argument is valid only if src_tab is not NULL.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers','shsave',
'customers_sav');
```

177.7.89 REPORT_ADVISOR_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2   := NULL,
  type               IN   VARCHAR2   := 'TEXT',
  section            IN   VARCHAR2   := 'ALL',
  level              IN   VARCHAR2   := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-98 REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Table 177-98 (Cont.) REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
execution_name	A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.
type	The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.
section	A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'.
level	The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level

  Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.
- Operation level

  The results depend on the following privileges:

  – Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.

  – Users with the ANALYZE ANY privilege but *not* the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.

  – Users with the ANALYZE ANY DICTIONARY privilege but *not* the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.

  – Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.
- Object level

  Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: User input errors
- `ORA-20012`: Optimizer Statistics Advisor errors

Returns

This function returns a CLOB that contains the report.

Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

Example 177-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2,
which VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_ftype  VARCHAR2(400) := p_ftype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10) := 10000;
  v_pn     NUMBER(10) := 1;
  v_ret    VARCHAR2(32767);
BEGIN
   IF which = 'REPORT'
   THEN
      -- generate a report
      v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
                    task_name => v_tname,
                    type      => v_ftype,
                    section   => 'ALL',
                    level     => 'ALL');
      v_len := DBMS_LOB.getlength(v_report);
      WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
```

```
   ELSE
      -- generate a script
      v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
      v_len := DBMS_LOB.getlength(v_script);
      WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR( v_script, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
   END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','HTML','REPORT');
SPOOL OFF
```

Example 177-13 Generating a Textual Report for AUTO_STATS_ADVISOR_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');
```

The following sample output shows part of the report:

```
GENERAL INFORMATION
-------------------------------------------------------------------------------
--

 Task Name       : AUTO_STATS_ADVISOR_TASK
 Execution Name  : EXEC_97
 Created         : 07-08-16 10:18:10
 Last Modified   : 07-11-16 03:02:30

-------------------------------------------------------------------------------
--
SUMMARY
-------------------------------------------------------------------------------
--
 For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics
Advisor
 has 10 finding(s). The findings are related to the following rules:
 COMPLETEAUTOJOB, MAINTAINSTATSHISTORY, USEDEFAULTPREFERENCE,
 AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMASTATS, AVOIDSTALESTATS,
 UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please refer to
the
 finding section for detailed information.
-------------------------------------------------------------------------------
--
FINDINGS
-------------------------------------------------------------------------------
```

```
--
 Rule Name:         MaintainStatsHistory
 Rule Description:  Maintain Statistics History

 Finding:  Statistics history tables are too big.

 Recommendation:  Check the other findings of this rule, as well as
the
                  findings for the rules
AvoidFrequentStatsCollection,
                  UseDefaultPreference, UseDefaultParams for possible
causes
                  and
recommendations.
 Rationale:  The size of the statistics history table could be big
because of
             violations of other rules.

-------------------------------------------------
 Rule Name:         UseDefaultPreference
 Rule Description:  Use Default Preference for Stats Collection
 Finding:  Global preference SYS_FLAGS is set to a non-default value
'1'.

Recommendation:  Set the value of preference SYS_FLAGS to '0'.
 Example:
 -- Setting preference cascade to default value:
 dbms_stats.set_global_prefs('CASCADE', NULL);

 Rationale:  Preference SYS_FLAGS is for Oracle internal use only,
setting it
             to nondefault value '1' could cause unforeseen
consequences.
.
.
.
```

177.7.90 REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```
DBMS_STATS.REPORT_COL_USAGE (
   ownname    IN    VARCHAR2,
   tabname    IN    VARCHAR2)
RETURN CLOB;
```

Parameters

Table 177-99 REPORT_COL_USAGE Function Parameters

Parameter	Description
ownname	Owner name. If NULL it reports column usage information for tables in all schemas in the database.
tabname	Table name. If NULL it reports column usage information for all tables of ownname.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.91 REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (
   detail_level      VARCHAR2  DEFAULT 'TYPICAL',
   format            VARCHAR2  DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 177-100 REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 177-100 (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
format	Report format: • XML • HTML • TEXT (Default)

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

177.7.92 REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER_DATABASE_STATS. The input set of parameters is the same as in GATHER_DATABASE_STATS, with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
   estimate_percent     IN    NUMBER     DEFAULT to_estimate_percent_type (
                                             GET_PARAM('ESTIMATE_PERCENT')),
   block_sample         IN    BOOLEAN    DEFAULT FALSE,
   method_opt           IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree               IN    NUMBER     DEFAULT TO_DEGREE_TYPE(
                                             GET_PARAM('DEGREE')),
   granularity          IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade              IN    BOOLEAN    DEFAULT to_cascade_type (
                                             GET_PARAM('CASCADE')),
   stattab              IN    VARCHAR2   DEFAULT NULL,
   statid               IN    VARCHAR2   DEFAULT NULL,
   options              IN    VARCHAR2   DEFAULT 'GATHER',
   statown              IN    VARCHAR2   DEFAULT NULL,
   gather_sys           IN    BOOLEAN    DEFAULT TRUE,
   no_invalidate        IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE (
                                             GET_PARAM('NO_INVALIDATE')),
   gather_temp          IN    BOOLEAN    DEFAULT FALSE,
   gather_fixed         IN    BOOLEAN    DEFAULT FALSE,
   stattype             IN    VARCHAR2   DEFAULT DATA,
   obj_filter_list      IN    ObjectTab  DEFAULT NULL,
   detail_level         IN    VARCHAR2   DEFAULT 'TYPICAL',
   format               IN    VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 177-101 REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
estimate_percent	The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.
method_opt	Method options. This parameter accepts the following values: FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]. size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
granularity	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics. The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.
statid	Identifier (optional) to associate with these statistics within stattab.

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views LIST EMPTY: Returns a list of objects which currently have no statistics
statown	Schema containing stattab, if different from current schema.
gather_sys	Gathers statistics on the objects owned by the SYS user.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
gather_temp	Gathers statistics on global temporary tables when TRUE. The default is FALSE. The temporary table must be created with the ON COMMIT PRESERVE ROWS clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.
gather_fixed	Gather statistics on fixed tables when TRUE. The default is FALSE. Only user SYS can collect statistics for fixed tables. The ownname must be SYS or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments: • estimate_percent • block_sample • stattab • statid • statown The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
stattype	The type of statistics: • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
obj_filter_list	A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values. When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
detail_level	The level of detail for the content of the report. Valid values are as follows: • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 177-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
format	The format of the report. Valid values are: • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

177.7.93 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in REPORT_GATHER_DICTIONARY_STATS Functions. For all other input parameters, see GATHER_DICTIONARY_STATS Procedure.

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
   comp_id               IN    VARCHAR2   DEFAULT NULL,
   estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE

(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample          IN    BOOLEAN    DEFAULT FALSE,
   method_opt            IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree                IN    NUMBER     DEFAULT TO_DEGREE_TYPE
                                               (GET_PARAM('DEGREE')),
   granularity           IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade               IN    BOOLEAN    DEFAULT TO_CASCADE_TYPE
                                               (GET_PARAM('CASCADE')),
   stattab               IN    VARCHAR2   DEFAULT NULL,
   options               IN    VARCHAR2   DEFAULT 'GATHER AUTO',
   no_invalidate         IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
                                               (GET_PARAM('NO_INVALIDATE')),
   stattype              IN    VARCHAR2   DEFAULT 'DATA',
```

```
  obj_filter_list       IN    ObjectTab  DEFAULT NULL,
  detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
  format                IN    VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

Table 177-102 REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
comp_id	Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	The method options. This parameter accepts the following values: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 177-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics.

Table 177-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
options	Further specification of objects for which to gather statistics: • 'GATHER' - Gathers statistics on all objects in the schema • 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. • 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. • 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. • 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' • 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views • 'LIST EMPTY' - Returns list of objects which currently have no statistics
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	The type of statistics: • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.
detail_level	See the description in REPORT_GATHER_DICTIONARY_STATS Functions.
format	See the description in REPORT_GATHER_DICTIONARY_STATS Functions.

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

177.7.94 REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
   stattab          IN  VARCHAR2 DEFAULT NULL,
   statid           IN  VARCHAR2 DEFAULT NULL,
   statown          IN  VARCHAR2 DEFAULT NULL,
   no_invalidate    IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                     GET_PARAM('NO_INVALIDATE')),
   detail_level     IN  VARCHAR2   DEFAULT 'TYPICAL',
   format           IN  VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 177-103 REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within stattab (optional)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 177-103 (Cont.) REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
format	Report format: • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

Related Topics

- GATHER_FIXED_OBJECTS_STATS Procedure
  This procedure gathers statistics for all fixed objects (dynamic performance tables).

177.7.95 REPORT_GATHER_SCHEMA_STATS Functions

This function runs the GATHER_SCHEMA_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER_SCHEMA_STATS. The input set of parameters is exactly the same as in GATHER_SCHEMA_STATS, with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
   ownname           IN   VARCHAR2,
   estimate_percent  IN   NUMBER      DEFAULT TO_ESTIMATE_PERCENT_TYPE (
                                        GET_PARAM ('ESTIMATE_PERCENT')),
   block_sample      IN   BOOLEAN     DEFAULT FALSE,
   method_opt        IN   VARCHAR2    DEFAULT GET_PARAM ('METHOD_OPT'),
   degree            IN   NUMBER      DEFAULT TO_DEGREE_TYPE (
                                        GET_PARAM('DEGREE')),
   granularity       IN   VARCHAR2    DEFAULT GET_PARAM('GRANULARITY'),
   cascade           IN   BOOLEAN     DEFAULT TO_CASCADE_TYPE (
                                        GET_PARAM ('CASCADE')),
   stattab           IN   VARCHAR2    DEFAULT NULL,
   statid            IN   VARCHAR2    DEFAULT NULL,
   options           IN   VARCHAR2    DEFAULT 'GATHER',
   statown           IN   VARCHAR2    DEFAULT NULL,
   no_invalidate     IN   BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE (
                                        GET_PARAM ('NO_INVALIDATE')),
   force             IN   BOOLEAN     DEFAULT FALSE,
   obj_filter_list   IN   ObjectTab   DEFAULT NULL,
   detail_level      IN   VARCHAR2    DEFAULT 'TYPICAL',
   format            IN   VARCHAR2    DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 177-104 REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 177-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
format	Report format: • XML • HTML • TEXT (Default)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema or any table in the HR schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'GATHER STALE');
END;
```

177.7.96 REPORT_GATHER_TABLE_STATS Function

This procedure runs the GATHER_TABLE_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_TABLE_STATS is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
```

```
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                      get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE)
   detail_level     VARCHAR2 DEFAULT 'TYPICAL',   format           VARCHAR2 DEFAULT
'TEXT')
 RETURN CLOB;
```

Parameters

Table 177-105 REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 177-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
method_opt	Accepts either of the following options, or both in combination: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column_clause is defined as column_clause := column_name | extension name | extension - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 177-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked

Table 177-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
format	Report format: • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Related Topics

- GATHER_TABLE_STATS Procedure
  This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

177.7.97 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
   opid              NUMBER,
   detail_level      VARCHAR2  DEFAULT 'TYPICAL',
   format            VARCHAR2  DEFAULT 'TEXT'
   container_id      NUMBER    DEFAULT NULL)
 RETURN CLOB;
```

Parameters

Table 177-106 REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
opid	Operation ID

Table 177-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 177-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
format	Report format: • XML • HTML • TEXT (Default)
container_id	ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

177.7.98 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
   detail_level       VARCHAR2 DEFAULT 'TYPICAL',
   format             VARCHAR2 DEFAULT 'TEXT',
   latestN            NUMBER DEFAULT NULL,
   since              TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   until              TIMESTAMP WITH TIME ZONE DEFAULT NULl,
   auto_only          BOOLEAN DEFAULT FALSE,
   container_ids      DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
 RETURN CLOB;
```

Parameters

Table 177-107 REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report • `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed -out objects (applies to only auto statistics gathering) • `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name (if the operation was run in a job) - session ID - parameter values - additional error details if the operation has failed
`format`	Report format: • XML • HTML • TEXT (Default)
`latestN`	Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is `NULL`, meaning that all qualifying operations will be reported.
`since`	The report will include only statistics operations that started after this timestamp.
`until`	The report will include only statistics operations that before after this timestamp.
`auto_only`	When `TRUE`, the report will contain only auto statistics gathering job runs.
`container_ids`	A multitenant environment contains one or more pluggable databases (PDBs). `container_ids` represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `harvals` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab  DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

177.7.99 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 177-108 RESET_ADVISOR_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values

- ORA-20012: Optimizer Statistics Advisor errors

177.7.100 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
   ownname    IN    VARCHAR2,
   tabname    IN    VARCHAR2);
```

Parameters

Table 177-109 RESET_COL_USAGE Procedure Parameters

Parameter	Description
ownname	Owner name. If NULL it deletes column usage information for tables in all schemas in the database.
tabname	Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tabname is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

177.7.101 RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedures sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

177.7.102 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

> **Note:**
>
> This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the RESET_GLOBAL_PREF_DEFAULTS Procedure.
>
> See also . DBMS_STATS Deprecated Subprograms

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

177.7.103 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABSE_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-110 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.104 RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-111 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	Timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.105 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
```

```
                                                    (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-112 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

177.7.106 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   ownname               VARCHAR2,
   as_of_timestamp       TIMESTAMP WITH TIME ZONE,
   force                 BOOLEAN DEFAULT FALSE,
   no_invalidate         BOOLEAN DEFAULT to_no_invalidate_type
                                                 (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-113 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked

Table 177-113 (Cont.) RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.107 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 177-114 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.108 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
   ownname                  VARCHAR2,
   tabname                  VARCHAR2,
   as_of_timestamp          TIMESTAMP WITH TIME ZONE,
   restore_cluster_index    BOOLEAN DEFAULT FALSE,
   force                    BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 177-115 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tabname	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.109 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 177-116 RESUME_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 177-14 Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named my_task:

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
  v_ename   VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

177.7.110 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2    := NULL,
  dir_name           IN   VARCHAR2    := NULL,
  level              IN   VARCHAR2    := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 177-117 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
dir_name	Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory.
level	The level of the script to generate. Possible values are • ALL: Ignores the filter and generates a script for all findings • TYPICAL: Generates a script according to the filters in place

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

  Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level

  The results depend on the following privileges:

  - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
  - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
  - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
  - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

  Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns a CLOB that contains the script.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 177-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
```

```
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_ftype  VARCHAR2(400) := p_ftype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
   IF which = 'REPORT'
   THEN
      -- generate a report
      v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
                    task_name => v_tname,
                    type      => v_ftype,
                    section   => 'ALL',
                    level     => 'ALL');
      v_len := DBMS_LOB.getlength(v_report);
      WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
   ELSE
      -- generate a script
      v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
      v_len := DBMS_LOB.getlength(v_script);
      WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
   END IF;
END;
/

177.7.111 SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```
DBMS_STATS.SEED_COL_USAGE (
   sqlset_name    IN    VARCHAR2,
   owner_name     IN    VARCHAR2,
   time_limit     IN    POSITIVE DEFAULT NULL);
```

Parameters

Table 177-118 SEED_COL_USAGE Procedure Parameters

Parameter	Description
`sqlset_name`	Name of the SQL tuning set that contains the statements to be monitored. If this parameter and `owner_name` are both null, then the procedure monitors all statements in the database for the specified time limit.
`owner_name`	Owner of the SQL tuning set that contains the statements to be monitored. If this parameter and `sqlset_name` are both null, then the procedure monitors all statements in the database for the specified time limit.
`time_limit`	Time limit (in seconds).

Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Exceptions

`ORA-20000`: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the CREATE_EXTENDED_STATS Function procedure. If `sqlset_name` and `owner_name` are `NULL`, then the procedure records the

column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
   DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

177.7.112 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name     IN   VARCHAR2,
  parameter     IN   VARCHAR2,
  value         IN   VARCHAR2);
```

Parameters

Table 177-119 SET_ADVISOR_TASK_PARAMETER Procedure Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.
`parameter`	The name of the parameter to set. The function returns an error if the specified parameter does not exist.
`value`	The new value of the parameter.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to manage Optimizer Statistics Advisor

177.7.113 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   distcnt       NUMBER DEFAULT NULL,
   density       NUMBER DEFAULT NULL,
   nullcnt       NUMBER DEFAULT NULL,
   srec          StatRec DEFAULT NULL,
   avgclen       NUMBER DEFAULT NULL,
   flags         NUMBER DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-120 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.114 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname           IN   VARCHAR2,
    pvalue          IN   VARCHAR2,
    add_sys         IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 177-121 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The existing value for following preferences can be set and default preference values will be used: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default values
add_sys	Value TRUE will include the Oracle-owned tables

Table 177-122 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.

Table 177-122 (Cont.) Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table: • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.

Table 177-122 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values: • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 177-122 (Cont.) Statistics Preferences

Preference	Description

INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.
	The parameter accepts the following values:
	• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.
	For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.
	Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.
	• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.
	For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.
	• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.
	• NULL—A partition or subpartition is considered stale when it has any DML changes.
	For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.
	Note that the following two executions are different:
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.

Table 177-122 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] The size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} integer — Specifies the number of histogram buckets. The number must be between 1 and 2048. REPEAT — Collects histograms only on the columns that already have histograms. AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns. SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
NO_INVALIDATE	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.
OPTIONS	Specifies which objects require statistics to be gathered. Valid values are as follows: • GATHER — Gathers statistics on all objects in the database. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.

Table 177-122 (Cont.) Statistics Preferences

Preference	Description
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for `stale_percent` is non-negative numbers. The default value is `10`, which means that a table having more than 10% of changes is considered stale.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • `OBJECT_STATS` — table statistics, column statistics and index statistics (default) • `SYNOPSES` — information to support incremental statistics • `REALTIME_STATS` — specifies only real-time statistics. The value '`OBJECT_STATS, SYNOPSES`' specifies table statistics, column statistics, index statistics, and synopses.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.

Security Model

To run this procedure, you must have the `SYSDBA` role or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

Exceptions

`ORA-20000`: Insufficient privileges

`ORA-20001`: Invalid or illegal input values

Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');
```

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

177.7.115 SET_GLOBAL_PREFS Procedure

This procedure sets statistics preferences at the global level.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 177-123 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for the following preferences can be set: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • AUTOSTATS_TARGET • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS
pvalue	Preference value. If NULL is specified, it will set the Oracle default values

Table 177-124 Global Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
AUTO_TASK_STATUS	Enables or disables the high-frequency automatic optimizer statistics collection. Values are: • ON — Enables high-frequency automatic optimizer statistics collection. • OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.
AUTO_TASK_MAX_RUN_TIME	Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).
AUTOSTATS_TARGET	Controls the objects considered for statistics collection. It takes the following values: • 'ALL' - Statistics collected for all objects in system • 'ORACLE' - Statistics collected for all Oracle owned objects • 'AUTO' - Oracle decides on which objects to collect statistics This preference is applicable only for automatic statistics collection.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.
CONCURRENT	Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: • MANUAL — Concurrency is enabled only for manual statistics gathering. • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. • ALL — Concurrency is enabled for both manual and automatic statistics gathering. • OFF — Concurrency is disabled for both manual and automatic statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL	Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table: • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values: • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description

	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value `NULL`, whereas the second sets the preference to the default, which is `ALLOW_MIXED_FORMAT`.

`METHOD_OPT`	Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • `FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]` `size_clause` is defined as `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}` - `integer`: Number of histogram buckets. Must be in the range [1,2048]. - `REPEAT` : Collects histograms only on the columns that already have histograms - `AUTO` : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - `SKEWONLY` : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - `column_name` : name of a column - `extension` : can be either a column group in the format of `(column_name, colume_name [, ...])` or an expression The default is `FOR ALL COLUMNS SIZE AUTO`.
`NO_INVALIDATE`	Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is `DBMS_STATS.AUTO_INVALIDATE`, which means the database decides when to invalidate dependent cursors. If set to `TRUE`, then the database not invalidate dependent cursors. If set to `FALSE`, then the procedure invalidates dependent cursors immediately.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
OPTIONS	Determines the `options` parameter used in the `GATHER_TABLE_STATS` procedure. The preference takes the following values: • `GATHER` — Gathers statistics for all objects in the table. This is the default. • `GATHER AUTO` — Gathers all necessary statistics automatically. Oracle recommends setting `GATHER AUTO` on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have `INCREMENTAL` enabled. Running `GATHER_TABLE_STATS` procedure on these tables with the `GATHER AUTO` option skips regathering the already fresh statistics.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • `TRUE` — Ignores input parameter values, and uses the value of the corresponding preference. • `FALSE` — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for `stale_percent` is non-negative numbers. The default value is `10`, which means that a table having more than 10% of changes is considered stale.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • `OBJECT_STATS` — table statistics, column statistics and index statistics (default) • `SYNOPSES` — information to support incremental statistics • `REALTIME_STATS` — specifies only real-time statistics. The value '`OBJECT_STATS, SYNOPSES`' specifies table statistics, column statistics, index statistics, and synopses.

Table 177-124 (Cont.) Global Statistics Preferences

Preference	Description
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.
WAIT_TIME_TO_UPDATE_STATS	Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.

Security Model

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 177-16 Overriding Statistics Preferences at the Global Level

You use the SET_GLOBAL_PREFS procedure to set the ESTIMATE_PERCENT preference to 5 for every table in the database that does not have a table preference set. Because sh.costs does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');

PL/SQL procedure successfully completed.
```

You use SET_TABLE_PREFS to set the PREFERENCE_OVERRIDES_PARAMETER preference to true for the sh.sales table only.

```
SQL> EXEC
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRU
E');

PL/SQL procedure successfully completed.
```

A script attempts to set ESTIMATE_PERCENT to 10 when gathering statistics for sh.sales. However, because PREFERENCE_OVERRIDES_PARAMETER is TRUE for this table, and because a

global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs',
ESTIMATE_PERCENT=>10);

PL/SQL procedure successfully completed.
```

Example 177-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

177.7.116 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts ext_stats sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   numrows       NUMBER    DEFAULT NULL,
   numlblks      NUMBER    DEFAULT NULL,
   numdist       NUMBER    DEFAULT NULL,
   avglblk       NUMBER    DEFAULT NULL,
   avgdblk       NUMBER    DEFAULT NULL,
```

```
   clstfct       NUMBER    DEFAULT NULL,
   indlevel      NUMBER    DEFAULT NULL,
   flags         NUMBER    DEFAULT NULL,
   statown       VARCHAR2  DEFAULT NULL,
   no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   guessq        NUMBER    DEFAULT NULL,
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Use the following syntax for user-defined domain index statistics:

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                   get_param('NO_INVALIDATE')),
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 177-125 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)

Table 177-125 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	Internal use only. Do not set.
cachehit	Internal use only. Do not set.
force	Sets the values even if statistics of the index are locked

Security Model

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode.

In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

> *Oracle Database SQL Tuning Guide* to learn how to set artificial statistics

177.7.117 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of `DBMS_STATS` procedures.

> **Note:**
>
> This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.
>
> See also DBMS_STATS Deprecated Subprograms.

You can use the `GET_PARAM Function` to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
   pname      IN    VARCHAR2,
   pval       IN    VARCHAR2);
```

Parameters

Table 177-126 SET_PARAM Procedure Parameters

Parameter	Description
pname	The parameter name The default value for following parameters can be set. • CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. • DEGREE • ESTIMATE_PERCENT • METHOD_OPT • NO_INVALIDATE • GRANULARITY • AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values: • 'ALL' - Statistics are collected for all objects in the system • 'ORACLE' - Statistics are collected for all Oracle owned objects • 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
  - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

177.7.118 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
   opname      IN    VARCHAR2,
   procrate    IN    NUMBER);
```

Parameters

Table 177-127 SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
opname	Name of the operation.
procrate	Processing rate. Valid values are as follows: • AGGR • ALL • CPU • CPU_ACCESS • CPU_AGGR • CPU_BYTES_PER_SEC • CPU_FILTER • CPU_GBY • CPU_HASH_JOIN • CPU_JOIN • CPU_NL_JOIN • CPU_RANDOM_ACCESS • CPU_SEQUENTIAL_ACCESS • CPU_SM_JOIN • CPU_SORT • HASH • IO • IO_ACCESS • IO_BYTES_PER_SEC • IO_RANDOM_ACCESS • IO_SEQUENTIAL_ACCESS • MEMCMP • MEMCPY

Security Model

You must have the OPTIMIZER_PROCESSING_RATE role to run this procedure.

Usage Notes

AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

177.7.119 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname   IN   VARCHAR2,
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 177-128 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. You can set the default value for the following preferences: • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it sets the database default value.

Table 177-129 Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values. You can set the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	This preference takes the following values: • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 177-129 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are: 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
INCREMENTAL	Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: • INCREMENTAL value for the partitioned table is set to TRUE • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 177-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: • TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. • PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

Table 177-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. Note that the following two executions are different: `EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS`

Table 177-129 (Cont.) Statistics Preferences

Preference	Description
	('sh', 'sales', 'INCREMENTAL_STALENESS', null); The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.
METHOD_OPT	Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
NO_INVALIDATE	Controls the invalidation of dependent cursors of the tables for which statistics are gathered. If set to TRUE, then this parameter does not invalidate the dependent cursors. If set to FALSE, then this procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default.

Table 177-129 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11*g* Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks cached in the buffer cache for any table when calculating the index clustering factor.

Security Model

To run this procedure, you must be the schema owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

177.7.120 SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
   pname          VARCHAR2,
   pvalue         NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 177-130 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: • iotfrspeed—I/O transfer speed in bytes for each millisecond • ioseektim - Seek time + latency time + operating system overhead time, in milliseconds • sreadtim - Average time to read single block (random read), in milliseconds • mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds • cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) • cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. • mbrc - Average multiblock read count for sequential read, in blocks • maxthr - Maximum I/O system throughput, in bytes/second • slavethr - Average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

177.7.121 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

Parameters

Table 177-131 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. You can set the default value for following preferences: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Table 177-132 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description
CONCURRENT	This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time: • 'MANUAL' - Concurrency will be turned on only for manual statistics gathering. • 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering. • 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering. • 'OFF': Concurrency will be turned off for both manual and automatic statistics
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values: • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	Determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
INCREMENTAL	Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: • INCREMENTAL value for the partitioned table is set to TRUE; • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: • TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. • PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description

	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value `NULL`, whereas the second sets the preference to the default, which is `ALLOW_MIXED_FORMAT`.

`METHOD_OPT`	The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • `FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]` `size_clause` is defined as `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}` - `integer`: Number of histogram buckets. Must be in the range [1,2048]. - `REPEAT` : Collects histograms only on the columns that already have histograms - `AUTO` : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - `SKEWONLY` : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - `column_name` : name of a column - `extension :` can be either a column group in the format of `(column_name, colume_name [, ...])` or an expression The default is `FOR ALL COLUMNS SIZE AUTO`.
`NO_INVALIDATE`	The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE` to have Oracle decide when to invalidate dependent cursors. This is the default.

Table 177-132 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you must connect as owner of the table or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

Example 177-18 Overriding Statistics Preferences

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;

STAT_PREFS
----------
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to `100` when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs', ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of `100`.

>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

177.7.122 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
   ownname        VARCHAR2,
   tabname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows        NUMBER   DEFAULT NULL,
   numblks        NUMBER   DEFAULT NULL,
   avgrlen        NUMBER   DEFAULT NULL,
   flags          NUMBER   DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                 get_param('NO_INVALIDATE')),
   cachedblk      NUMBER   DEFAULT NULL,
   cachehit       NUMBER   DEFAULT NULL,
   force          BOOLEAN  DEFAULT FALSE,
   im_imcu_count  NUMBER   DEFAULT NULL,
   im_block_count NUMBER   DEFAULT NULL,
   scanrate       NUMBER   DEFAULT NULL);
```

Parameters

Table 177-133 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table.
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	Table in which to store the statistics. If stattab is NULL, then the database stores the statistics in the data dictionary.
statid	Identifier (optional) to associate with these statistics within stattab. This identifier is only relevant if stattab is not NULL.
numrows	Number of rows in the table or partition.
numblks	Number of blocks that the table or partition occupies.
avgrlen	Average row length for the table or partition.
flags	For internal use only. Do not set.
statown	Schema containing stattab (if different than ownname).

Table 177-133 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
no_invalidate	The validation setting for dependent cursors. If set to TRUE, then the procedure does not invalidate the dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
cachedblk	For internal use only. Do not set.
cachehit	For internal use only. Do not set.
force	A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.
im_imcu_count	The number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	The number of In-Memory blocks in the table or partition.
scanrate	The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.

Security Model

To invoke this procedure you must be owner of the table, or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or have the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the DBMS_STATS.SET_*_STATS procedures. These procedures insert the artificial statistics into the data dictionary directly (when stattab is null) or into a user-created table.

> **Note:**
>
> The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the "real" statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a "confidence factor" for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the database does not have one major workload, resulting in averages that do not correspond to real values

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to set artificial statistics

177.7.123 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 177-134 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.124 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by dblink to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
   ownname     IN     VARCHAR2,
   tabname     IN     VARCHAR2,
   dblink      IN     VARCHAR2,   options     IN     NUMBER DEFAULT NULL);
```

Parameters

Table 177-135 TRANSFER_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.
tabname	Name of the table. If NULL, all tables in OWNNAME.
dblink	Database link name
options	By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.125 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 177-136 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

177.7.126 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 177-137 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

177.7.127 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
   ownname     VARCHAR2,
   tabname     VARCHAR2);
```

Parameters

Table 177-138 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

177.7.128 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
   ownname    VARCHAR2,
   stattab    VARCHAR2);
```

Parameters

Table 177-139 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

`ORA-20000`: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

178
DBMS_STORAGE_MAP

With the DBMS_STORAGE_MAP package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of DBMS_STORAGE_MAP Subprograms

178.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the DBMS_STORAGE_MAP API.

- Mapping libraries

  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- Mapping files

  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

> **See Also:**
>
> – *Oracle Database Administrator's Guide*for more information
>
> – *Oracle Database Reference*for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT

178.2 DBMS_STORAGE_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

> **See Also:**
>
> *Oracle Database Administrator's Guide*for a discussion of the configuration ID, an attribute of the element or file that is changed.

178.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

Table 178-1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function	Drops the mapping information for the element defined by `elemname`
DROP_FILE Function	Drops the file mapping information defined by `filename`
LOCK_MAP Procedure	Locks the mapping information in the shared memory of the instance
MAP_ALL Function	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function	Builds mapping information for the element identified by `elemname`
MAP_FILE Function	Builds mapping information for the file identified by `filename`
MAP_OBJECT Function	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure	Unlocks the mapping information in the shared memory of the instance.

178.3.1 DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
      dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-2 DROP_ALL Function Parameters

Parameter	Description
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

178.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-3 DROP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is dropped.
`cascade`	If `TRUE`, then `DROP_ELEMENT` is invoked recursively on all elements of the DAG defined by `elemname`, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

178.3.3 DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
   filename          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-4 DROP_FILE Function Parameters

Parameter	Description
`filename`	The file for which file mapping information is dropped.
`cascade`	If `TRUE`, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

178.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, `V$MAP_ELEMENT` and `V$MAP_SUBELEMENT`, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

178.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
   max_num_fileext   IN NUMBER DEFAULT 100,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-5 MAP_ALL Function Parameters

Parameter	Description
`max_num_fileext`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

178.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-6 MAP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is built.
`cascade`	If `TRUE`, all elements within the elemname I/O stack DAG are mapped.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

178.3.7 MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
   filename           IN VARCHAR2,
   filetype           IN VARCHAR2,
   cascade            IN BOOLEAN,
   max_num_fileextent IN NUMBER DEFAULT 100,
   dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 178-7 MAP_FILE Function Parameters

Parameter	Description
`filename`	The file for which mapping information is built.
`filetype`	Defines the type of the file to be mapped. It can be `"DATAFILE"`, `"SPFILE"`, `"TEMPFILE"`, `"CONTROLFILE"`, `"LOGFILE"`, or `"ARCHIVEFILE"`.

Table 178-7 (Cont.) MAP_FILE Function Parameters

Parameter	Description
cascade	Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.
max_num_fileextent	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

178.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
   objname  IN  VARCHAR2,
   owner    IN  VARCHAR2,
   objtype  IN  VARCHAR2);
```

Parameters

Table 178-8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

178.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

178.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

178.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

179
DBMS_SYNC_REFRESH

The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.

> **See Also:**
>
> *Oracle Database Data Warehousing Guide* for more information on using DBMS_SYNC_REFRESH

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_SYNC_REFRESH Subprograms

179.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12*c*, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

> **See Also:**
>
> *Oracle Database Data Warehousing Guide* for more information about using synchronous refresh

179.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to PUBLIC, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the DBA privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that it, the user must have the SELECT or READ, INSERT, UPDATE, and DELETE privileges on that table or materialized view. A couple of exceptions are:

- PURGE_REFRESH_STATS and ALTER_REFRESH_STATS_RETENTION Functions

  These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function

  This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

179.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

Table 179-1 DBMS_SYNC_REFRESH Package Subprograms

Subprogram	Description
ABORT_REFRESH Procedure	Aborts a refresh.
ALTER_REFRESH_STATS_RETENTION Procedure	Alters the refresh history retention value, specified in days.
CAN_SYNCREF_TABLE Procedure	Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.
EXECUTE_REFRESH Procedure	Executes synchronous refresh on the synchronous refresh groups.
GET_ALL_GROUP_IDS Function	Returns the group IDs of all the synchronous refresh groups in the database.
GET_GROUP_ID Function	Returns the group ID of a table or materialized view.
GET_GROUP_ID_LIST Function	Returns the group IDs of the tables in a given list of objects (tables or materialized views).
PREPARE_REFRESH Procedure	Prepares the sync refresh groups for refresh.
PREPARE_STAGING_LOG Procedure	Validates and collects statistics on the data in the staging log.
PURGE_REFRESH_STATS Procedure	Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter.
REGISTER_MVIEWS	Registers materialized views for synchronous refresh.
REGISTER_PARTITION_OPERATION Procedure	Registers a partition maintenance operation on a partition of a base table.
UNREGISTER_MVIEWS	Unregisters materialized views from synchronous refresh.
UNREGISTER_PARTITION_OPERATION Procedure	Unregisters a partition maintenance operation on a partition of a base table.

179.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 179-2 ABORT_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be aborted for sync refresh.

Usage Notes

If called after PREPARE_REFRESH, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after EXECUTE_REFRESH fails, this procedure restores the state of tables to before EXECUTE_REFRESH by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks.

ABORT_REFRESH will work only if a PREPARE_REFRESH or EXECUTE_REFRESH statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

179.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with PURGE_REFRESH_HISTORY. It also requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
   retention   IN NUMBER);
```

Parameters

Table 179-3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

Parameter	Description
retention	The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000. You can use the following values for special purposes: • -1 - Refresh history is never purged by PREPARE_REFRESH. • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. • NULL - Change refresh history retention to default value.

179.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide.*

You can invoke CAN_SYNCREF_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of statement_id or output_array need be provided to CAN_SYNCREF_TABLE.

Parameters

Table 179-4 CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
table_name	The name of the base table.

Table 179-4 (Cont.) CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
statement_id	A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.
output_array	The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
   statement_id    VARCHAR2(30),
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
   mv_name         VARCHAR2(30),
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
   mv_name         VARCHAR2(30),
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.

179.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by DBMS_SYNC_REFRESH.PREPARE_REFRESH. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id   IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 179-5 EXECUTE_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be executed for sync refresh.

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after DBMS_SYNC_REFRESH.EXECUTE_REFRESH.

179.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
           RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-6 GET_ALL_GROUP_IDS Function Parameter

Parameter	Description
get_all_group_ids	Returns the group IDs of all the sync refresh groups in the database.

179.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
   object_name_list   IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-7 GET_GROUP_ID Function Parameter

Parameter	Description
object_name_list	The name of the materialized view. The name can be schema-qualified.

179.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
   object_name_list   IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-8 GET_GROUP_ID_LIST Function Parameter

Parameter	Description
object_name_list	A comma-separated list of object names (materialized views). Each name can be schema-qualified.

179.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
   group_id   IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 179-9 PREPARE_REFRESH Procedure Parameters

Parameter	Description
`group_id`	The group ID of the sync refresh group to be prepared for sync refresh.

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

179.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide.*

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is `'D'`), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is `'UO'` or `'UN'`), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is `'UO'`), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is `'UN'`), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is `'UN'`), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows `'UO'` and `'UN'`;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE$$ is 'I') by choosing the psl_mode of DBMS_SYNC_REFRESH.INSERT_TRUSTED
- trust all the delete rows (DMLTYPE$$ is 'D') by choosing the psl_mode of DBMS_SYNC_REFRESH.DELETE_TRUSTED
- trust all the update rows (DMLTYPE$$ is 'UO' or 'UN') by choosing the psl_mode of DBMS_SYNC_REFRESH.UPDATE_TRUSTED
- trust all three types of DMLs by choosing the psl_mode of DBMS_SYNC_REFRESH.TRUSTED.

In addition, you can specify the psl_mode as a bitmask of the flags described above. For example, DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH_DELETE_TRUSTED will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   psl_mode         IN NUMBER DEFAULT
   DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 179-10 PREPARE_STAGING_LOG Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
psl_mode	The mode in which staging log preparation should be done. The possible values are: • DBMS_SYNC_REFRESH.ENFORCED (the default) • DBMS_SYNC_REFRESH.INSERT_TRUSTED • DBMS_SYNC_REFRESH.DELETE_TRUSTED • DBMS_SYNC_REFRESH.UPDATE_TRUSTED • DBMS_SYNC_REFRESH.TRUSTED

179.3.10 PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the BEFORE_TIMESTAMP parameter.

This procedure requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
   before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 179-11 PURGE_REFRESH_STATS Procedure Parameter

Parameter	Description
`before_timestamp`	Records of sync refreshes saved before this timestamp are purged. If `NULL`, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using `ALTER_REFRESH_STATS_RETENTION`. The default is 31 days.

179.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide.* The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
   mv_list   IN VARCHAR2);
```

Parameter

Table 179-12 REGISTER_MVIEWS Procedure Parameter

Parameter	Description
`mv_list`	A comma-delimited list of materialized views to register. These names are optionally schema-qualified.

179.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
   partition_op                IN VARCHAR2,
   schema_name                 IN VARCHAR2,
   base_table_name             IN VARCHAR2,
   partition_name              IN VARCHAR2,
   outside_partn_table_schema  IN VARCHAR2,
   outside_partn_table_name    IN VARCHAR2);
```

Parameters

Table 179-13 REGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.
outside_partn_table_schema	The name of the schema of the outside partition table (required for EXCHANGE only).
outside_partn_table_name	The name of the outside partition table (required for EXCHANGE only).

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

179.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
   mv_list   IN VARCHAR20;
```

Parameter

Table 179-14 UNREGISTER_MVIEWS Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.

179.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
   partition_op     IN VARCHAR2,
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   partition_name   IN VARCHAR2);
```

Parameters

Table 179-15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.

180
DBMS_TABLE_DATA

The DBMS_TABLE_DATA package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- DBMS_TABLE_DATA Overview
- DBMS_TABLE_DATA Security Model
- Summary of DBMS_TABLE_DATA Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Concepts*
> - *Oracle Database SQL Language Reference*
> - *Oracle Database Reference*

180.1 DBMS_TABLE_DATA Overview

The DBMS_TABLE_DATA package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

180.2 DBMS_TABLE_DATA Security Model

The DBMS_TABLE_DATA package is owned by SYS and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs SELECT privileges on the table to extract column data.

180.3 Summary of DBMS_TABLE_DATA Subprograms

The DBMS_TABLE_DATA package uses GET_BYTES_FOR_COLUMN, GET_BYTES_FOR_COLUMNS, and GET_BYTES_FOR_ROW subprograms to perform various functions.

Table 180-1 DBMS_TABLE_DATA Package Subprograms

Subprogram	Description
GET_BYTES_FOR_COLUMN Procedure	Returns the column_data in bytes for the particular column with name column_name for row_id row in the particular table identified by schema_name.table_name.
GET_BYTES_FOR_COLUMNS Procedure	Returns a concatenated array of column byte values in column_data in the order of columns specified in the column_names array.
GET_BYTES_FOR_ROW Procedure	Returns a concatenated array of column byte values in column_data in the order of column positions for the particular row identified by row_id.

180.3.1 GET_BYTES_FOR_COLUMN Procedure

This procedure returns the column_data in bytes for the particular column with name column_name for row_id row in the particular table identified by schema_name.table_name.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_name             IN VARCHAR2,
   column_data             IN OUT BLOB);
```

Parameters

Table 180-2 GET_BYTES_FOR_COLUMN Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the table.
row_id	The row id.
column_name	The column name.
column_data	The data in the column.

Usage Notes

All arguments are required.

180.3.2 GET_BYTES_FOR_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_names            IN VARCHAR2,
   column_data             IN OUT BLOB);
```

Parameters

Table 180-3 GET_BYTES_FOR_COLUMNS Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table.
`row_id`	The row id.
`column_names`	The names of the columns.
`column_data`	The data in the columns.

Usage Notes

All arguments are required.

180.3.3 GET_BYTES_FOR_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_data             IN OUT BLOB);
```

Parameters

Table 180-4 GET_BYTES_FOR_ROW Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table.
`row_id`	The row id.
`column_data`	The data in the row.

Usage Notes

All arguments are required.

181
DBMS_TDB

The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

> **See Also:**
>
> *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

- Overview
- DBMS_TDB Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_TDB Subprograms

181.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The DBMS_TDB package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager CONVERT DATABASE command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the DBMS_TDB subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

181.2 DBMS_TDB Security Model

Use of this package requires the DBA privilege.

181.3 DBMS_TDB Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 181-1.

Table 181-1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in read-only tablespaces when checking whether a database is ready for transport.

181.4 DBMS_TDB Views

The DBMS_TDB package uses the V$DB_TRANSPORTABLE_PLATFORM view.

This view is described in *Oracle Database Reference*.

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

181.5 DBMS_TDB Operational Notes

The following notes apply to DBMS_TDB.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple TRUE or FALSE results to indicate whether database transport is possible. Use the subprograms with SERVEROUTPUT ON for informative messages about why transport is not possible.

181.6 Summary of DBMS_TDB Subprograms

This table lists the DBMS_TDB subprograms and briefly describes them.

Table 181-2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function	Checks whether a database has external tables, directory or BFILEs

181.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2,
     skip_option            IN  NUMBER)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
   RETURN BOOLEAN;
```

Parameters

Table 181-3 CHECK_DB Function Parameters

Parameter	Description
`target_platform_name`	The name of the destination platform, as it appears in `V$DB_TRANSPORTABLE_PLATFORM`.
`skip_option`	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 181-1.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 181-4.

Table 181-4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of CHECK_DB with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
     BEGIN
       db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
     END;
     /

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```

181.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
   RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
        external BOOLEAN;
     BEGIN
       external := DBMS_TDB.CHECK_EXTERNAL;
     END;
     /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

182
DBMS_TF

The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

> **See Also:**
>
> - *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
> - *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- DBMS_TF Overview
- DBMS_TF Security Model
- DBMS_TF Constants
- DBMS_TF Operational Notes
- DBMS_TF Execution Flow
- DBMS_TF Restrictions
- DBMS_TF Examples
- DBMS_TF Data Structures
- Summary of DBMS_TF Subprograms

182.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.

182.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker's rights privileges.

182.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The `DBMS_TF` package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, `DBMS_TF.TYPE_DATE`.

Table 182-1 DBMS_TF Supported Types

Name	Description
TYPE_BINARY_DOUBLE	Type code for BINARY_DOUBLE
TYPE_BINARY_FLOAT	Type code for BINARY_FLOAT
TYPE_BLOB	Type code for BLOB
TYPE_CHAR	Type code for CHAR
TYPE_CLOB	Type code for CLOB
TYPE_DATE	Type code for DATE
TYPE_INTERVAL_DS	Type code for INTERVAL_DS
TYPE_INTERVAL_YM	Type code for INTERVAL_YM
TYPE_NUMBER	Type code for NUMBER
TYPE_ROWID	Type code for ROWID
TYPE_RAW	Type code for RAW
TYPE_TIMESTAMP	Type code for TIMESTAMP
TYPE_TIMESTAMP_TZ	Type code for TIMESTAMP_TZ
TYPE_VARCHAR2	Type code for VARCHAR2

Additional constants are defined for use with specific subprograms.

See Also:

- Table 182-3 for more information about CSTORE related constants
- Table 182-4 for more information about predefined PTF method names
- Table 182-6 for more information about XSTORE related constants
- Supported Types Collections for more information about predefined collections of supported types

182.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

182.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as NULL values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

FETCH_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 182-1 Noop Polymorphic Table Function Example

This example creates a PTF called noop. This PTF returns the input rows as the output rows without any modification or filtering. Noop is one of the smallest PTF you can write.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Noop Polymorphic Table Function

To implement the noop PTF, you first create the implementation package noop_package.

```
CREATE PACKAGE noop_package AS
   FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
     RETURN DBMS_TF.DESCRIBE_T;

   PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
   FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
     RETURN DBMS_TF.DESCRIBE_T AS
     BEGIN
       RETURN NULL;
     END;

   PROCEDURE fetch_rows AS
```

```
   BEGIN
     RETURN;
   END;
END noop_package;
```

The noop PTF is defined to execute the noop_package when it is invoked.

```
CREATE FUNCTION noop (t TABLE)
  RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;
```

The PTF can be invoked in queries. For example:

```
SELECT *
FROM   NOOP(emp)
WHERE deptno = 10;

      7782 CLARK      MANAGER         7839 09-JUN-81       2450        10
      7839 KING       PRESIDENT            17-NOV-81       5000        10
      7934 MILLER     CLERK           7782 23-JAN-82       1300        10

WITH e
     AS (SELECT *
         FROM   emp
                NATURAL JOIN dept
         WHERE dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

  30       7499 ALLEN      SALESMAN        7698 20-FEB-81       1600       300
SALES          CHICAGO
  30       7521 WARD       SALESMAN        7698 22-FEB-81       1250       500
SALES          CHICAGO
  30       7654 MARTIN     SALESMAN        7698 28-SEP-81       1250      1400
SALES          CHICAGO
  30       7698 BLAKE      MANAGER         7839 01-MAY-81       2850
SALES          CHICAGO
  30       7844 TURNER     SALESMAN        7698 08-SEP-81       1500         0
SALES          CHICAGO
  30       7900 JAMES      CLERK           7698 03-DEC-81        950
SALES          CHICAGO
```

182.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

182.4.2 PTF Server Side Interface

The `DBMS_TF` package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

Table 182-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

NAME	DESCRIPTION
COLUMN_METADATA_T	Column metadata record
COLUMN_T	Column descriptor record
TABLE_T	Table descriptor record
COLUMNS_T	Collection containing column names
COLUMNS_NEW_T	Collection for new columns
TAB_<typ>_T	Collection for each supported types, where <typ> is described in "Supported Types Collections "
ROW_SET_T	Data for a rowset record
GET_COL Procedure	Fetches data for a specified (input) column
PUT_COL Procedure	Returns data for a specified (new) column
GET_ROW_SET Procedure	Fetches the input rowset of column values
PUT_ROW_SET Procedure	Returns data for ALL (new) columns
SUPPORTED_TYPE Function	Verifies if a type is supported by DBMS_TF subprograms
GET_XID Function	Returns a unique execution ID to index PTF state in a session

See Also:

- DBMS_TF Data Structures for the complete list of types
- Summary of DBMS_TF Subprograms for the complete list of subprograms

182.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the FETCH_ROWS procedure.

The PTF indicates the read columns inside DESCRIBE by annotating them in the input table descriptor, TABLE_T. Only the indicated read columns will be fetched and thus available for processing during FETCH_ROWS.

The PTF invocation in a query will typically use the COLUMNS operator to indicate which columns the query wants the PTF to read, and this information is passed to the DESCRIBE function which then in turn sets the COLUMN_T.FOR_READ boolean flag.

Only scalar SQL data types are allowed for the read columns.

The Echo Polymorphic Table Function Example takes a table and a list of columns and produces new columns with the same values.

182.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to false. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the DESCRIBE function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

182.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. Compilation State : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. Execution State: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

182.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

Name	Description
`CSTORE_GET` procedure	Fetches item of specified type. If not found, the OUT value remains unchanged.
`CSTORE_EXISTS` function	If an item with the given key exists in the CSTORE, this function returns TRUE.

CSTORE Supported Types

The `DBMS_TF.DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

Table 182-3 DBMS_TF CSTORE Scalar Supported Types

Name	Description
`CSTORE_TYPE_VARCHAR2`	CSTORE `VARCHAR2` type code
`CSTORE_TYPE_NUMBER`	CSTORE `NUMBER` type code
`CSTORE_TYPE_DATE`	CSTORE `DATE` type code
`CSTORE_TYPE_BOOLEAN`	CSTORE `BOOLEAN` type code

Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767)  INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER           INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN          INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE             INDEX BY VARCHAR2(32767);
```

DBMS_TF Method Names

The method names are also stored in the `DBMS_TF.DESCRIBE_T` record. These predefined values for the method names can be customized by the PTF author.

See Method Name Overrides for more information about changing the default method names

Table 182-4 DBMS_TF Method Names Constants

Name	Type	Value	Description
`CLOSE`	`DBMS_QUOTED_ID`	‘CLOSE’	Predefined index value for the method named CLOSE

Table 182-4 (Cont.) DBMS_TF Method Names Constants

Name	Type	Value	Description
FETCH_ROWS	DBMS_QUOTED_ID	'FETCH_ROWS'	Predefined index value for the method named FETCH_ROWS
OPEN	DBMS_QUOTED_ID	'OPEN'	Predefined index value for the method named OPEN

182.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 182-5 DBMS_TF XSTORE Subprograms

Name	Description
XSTORE_CLEAR procedure	Removes all key-value pairs from the XSTORE execution state
XSTORE_EXISTS function	Returns TRUE if an item with a given key exists in the XSTORE
XSTORE_GET procedure	Gets the associated value for a given key stored in the XSTORE
XSTORE_REMOVE procedure	Removes an item associated with the given key and key_type
XSTORE_SET procedure	Sets the value for the given key for PTF Execution State Management

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

Table 182-6 DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_VARCHAR2	XSTORE VARCHAR2 type code
XSTORE_TYPE_NUMBER	XSTORE NUMBER type code

Table 182-6 (Cont.) DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_DATE	XSTORE DATE type code
XSTORE_TYPE_BOOLEAN	XSTORE BOOLEAN type code

182.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (OPEN, FETCH_ROWS, and CLOSE) with your PTF specific names.

To override a method name, the application can specify the new method names using DBMS_TF METHOD_NAMES collection (see DESCRIBE_T Record Type).

> **See Also:**
>
> Table 182-4

Example 182-2 DBMS_TF Method Name Overrides

This example shows how to change the default method name of the noop_p PTF fetch_rows method to noop_fetch.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at DBMS_TF Method Name Overrides

Create the PTF implementation package noop_p.

```
CREATE PACKAGE noop_p AS
   FUNCTION describe(tab IN OUT DBMS_TF.table_t)
               RETURN DBMS_TF.describe_t;
   PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using DBMS_TF.Method_Names collection. The FETCH_ROWS method name is changed to 'Noop_Fetch'. The procedure noop_fetch to implement this method is defined in the package.

```
 CREATE OR replace PACKAGE BODY noop_p
AS
   FUNCTION describe(tab IN OUT DBMS_TF.table_t)
               RETURN DBMS_TF.describe_t AS
```

```
     methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
     BEGIN
          RETURN DBMS_TF.describe_t(method_names => methods);
   END;
   PROCEDURE noop_fetch AS
     BEGIN
         RETURN;
   END;
END noop_p;
```

The noop PTF is defined to execute the noop_p when it is invoked.

```
CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;
```

The PTF is invoked in the FROM clause of a query block.

```
SELECT *
FROM noop(scott.emp)
WHERE deptno =10;
```

182.4.7 Using the COLUMNS Pseudo-Operator

The `COLUMNS` pseudo-operator is an addition to the SQL expression language.

Use the `COLUMNS` pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the `FROM` clause. The `COLUMNS` pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

> **See Also:**
>
> *Oracle Database PL/SQL Language Reference* for more information about the COLUMNS pseudo-operator syntax and semantics

182.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a `Row Semantics` PTF, and the `PARTITION BY` key columns of a `Table Semantics` PTF can be used for projection and predicate pushdown.

Example 182-3 Query Transformations

This example illustrates the predicate and projection pushdown for a `Row Semantics` PTF.

This query calls the echo PTF created in Echo Polymorphic Table Function Example.

```
SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))
```

```
WHERE deptno = 30
  AND echo_sal > 1000;

     EMPNO ENAME             SAL       COMM   ECHO_SAL
---------- ---------- ---------- ---------- ----------
      7499 ALLEN            1600        300       1600
      7521 WARD             1250        500       1250
      7654 MARTIN           1250       1400       1250
      7698 BLAKE            2850                  2850
      7844 TURNER           1500          0       1500
```

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

182.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table emp has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
------------------------------------------------
| Id | Operation                      | Name     |
------------------------------------------------
| 0 | SELECT STATEMENT                |          |

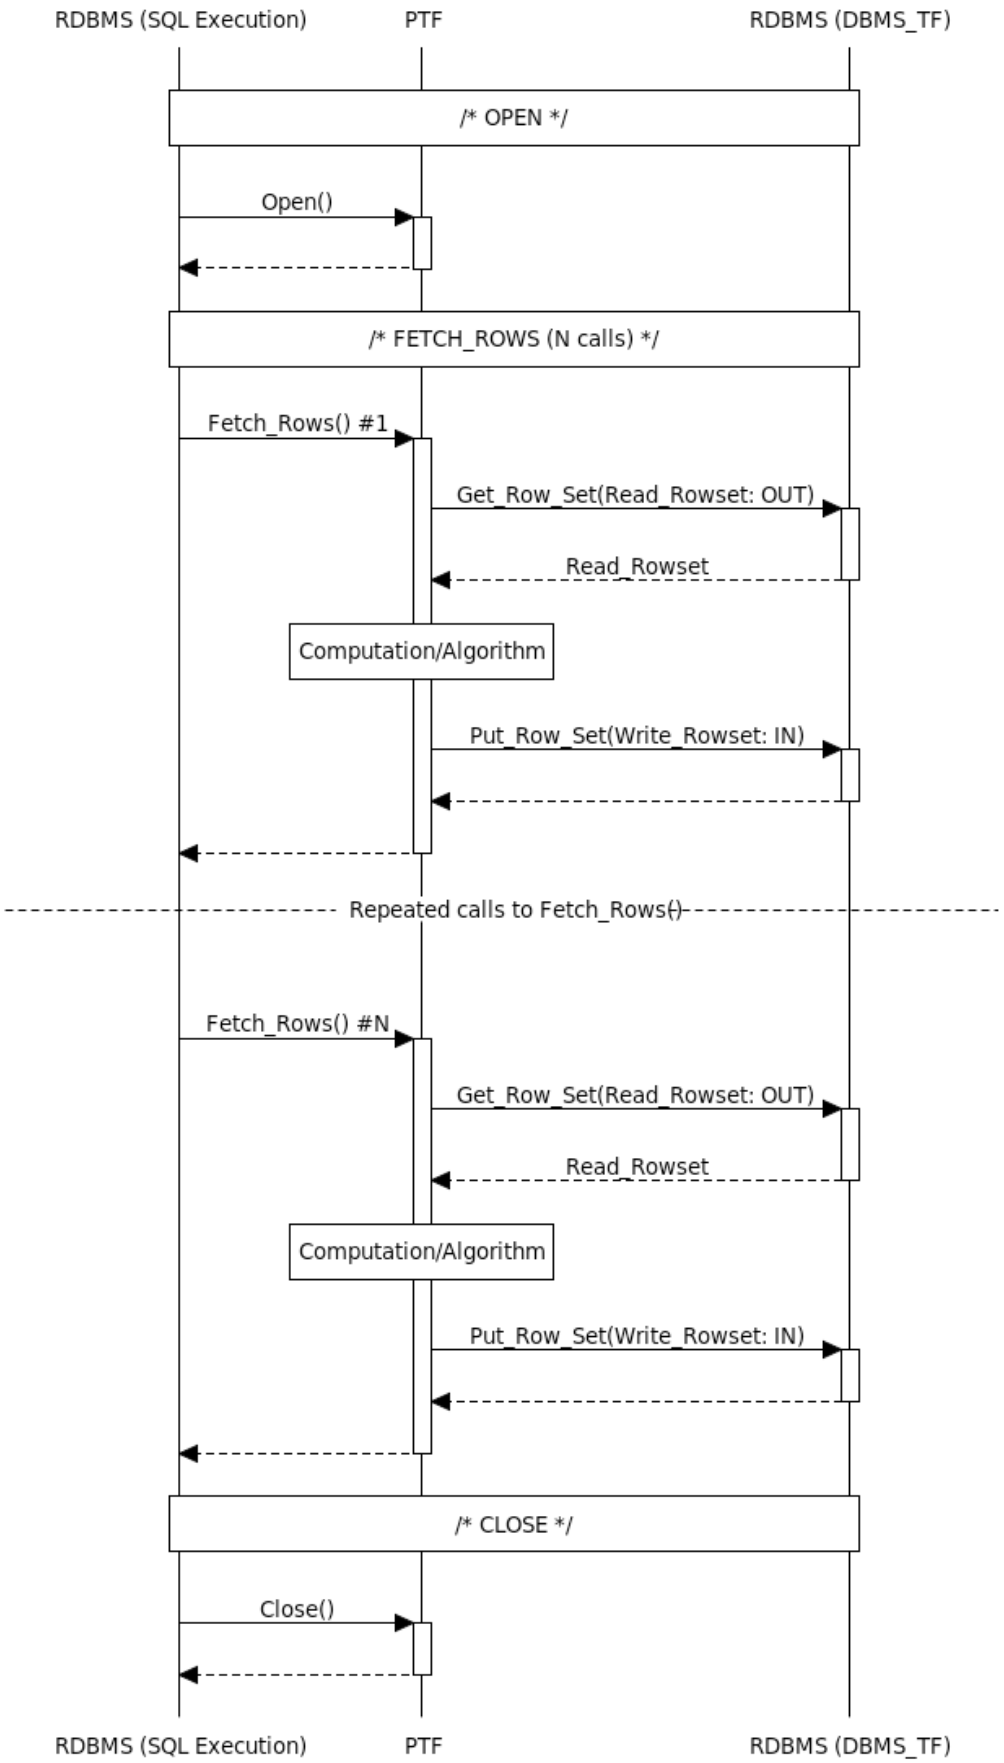
```

Table Semantics PTF

`Table Semantics` PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.



182.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

RDBMS (SQL Execution)
PTF
RDBMS (DBMS_TF)
/* OPEN */
Open()
/* FETCH_ROWS (N calls) */
Fetch_Rows() #1
Get_Row_Set(Read_Rowset: OUT)
Read_Rowset
Computation/Algorithm
Put_Row_Set(Write_Rowset: IN)
Repeated calls to Fetch_Rows()
Fetch_Rows() #N
Get_Row_Set(Read_Rowset: OUT)
Read_Rowset
Computation/Algorithm
Put_Row_Set(Write_Rowset: IN)
/* CLOSE */
Close()
RDBMS (SQL Execution)
PTF
RDBMS (DBMS_TF)

The FETCH_ROWS procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to FETCH_ROWS is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The GET_ROW_SET or GET_COL is used to read the input rowset.

The PUT_ROW_SET or PUT_COL is used to produce an output rowset, that is written back to the database.

PUT_ROW_SET is used to set all the new columns in a single call.

The ROWSET_T record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use PUT_COL to produce a single column. A given column can only be produced once within a call to FETCH_ROWS.

For a Row Semantics PTF, the FETCH_ROWS procedure will return the new rows using the PTF Server interface before returning back to the database.

182.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the DBMS_TF package.

Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the PUT_ROW_SET, PUT_COL, GET_ROW_SET and GET_COL procedures. All SQL types can be used with pass-through columns. The DESCRIBE function can determine the supported types using the DBMS_TF.SUPPORTED_TYPE function.

PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the FROM clause of a query. Nesting PTF is only allowed using WITH clause.

Nesting table function with polymorphic table function is only allowed using CURSOR expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The PARTITION BY and the ORDER BY clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods OPEN, FETCH_ROWS, and CLOSE must be invoked in the polymorphic table function execution context only.

You cannot invoke the DESCRIBE method directly.

This example shows ten PTF nested invocation.

```
WITH t0
     AS (SELECT /*+ parallel */ *
         FROM   noop(dept)),
     t1
```

```
      AS (SELECT *
          FROM   noop(t0)),
      t2
      AS (SELECT *
          FROM   noop(t1)),
      t3
      AS (SELECT *
          FROM   noop(t2)),
      t4
      AS (SELECT *
          FROM   noop(t3)),
      t5
      AS (SELECT *
          FROM   noop(t4)),
      t6
      AS (SELECT *
          FROM   noop(t5)),
      t7
      AS (SELECT *
          FROM   noop(t6)),
      t8
      AS (SELECT *
          FROM   noop(t7)),
      t9
      AS (SELECT *
          FROM   noop(t8))
SELECT *
FROM   noop(t9)
WHERE  deptno = 10;

        10 ACCOUNTING     NEW YORK
```

182.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

- Example 182-1, "Noop Polymorphic Table Function"
- Echo Polymorphic Table Function Example
- Example 182-2, "DBMS_TF Method Name Overrides"
- Example 182-3, "Query Transformations"
- Example 182-5 , "DBMS_TF.COLUMN_TYPE_NAME Example"
- Example 182-6 , "DBMS_TF.COL_TO_CHAR Example"
- Example 182-7, "DBMS_TF.CSTORE_EXISTS Example"
- Example 182-8, "DBMS_TF.GET_COL Example"
- Example 182-9, "DBMS_TF.GET_ENV Example"
- Example 182-10, "DBMS_TF.GET_ROW_SET Example"

- Example 182-12, "DBMS_TF.GET_XID Example"
- Rand_col Polymorphic Table Function Example, (DBMS_TF.PUT_COL Example)
- Stack Polymorphic Table Function Example
- Split Polymorphic Table Function Example, (DBMS_TF.GET_ROW_SET and PUT_ROW_SET Example)
- Example 182-14, "DBMS_TF.PUT_ROW_SET Example"
- Example 182-16, "Replicate : DBMS_TF.ROW_REPLICATION Example"
- Example 182-17, "DBMS_TF.ROW_TO_CHAR Example"
- Example 182-18, "DBMS_TF.TRACE Example"
- Row_num Polymorphic Table Function Example, (DBMS_TF.XSTORE_GET and XSTORE_SET Example)

  Oracle PL/SQL Language Reference, "To_doc Polymorphic Table Function Example"

182.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table tab, and adds to it the columns listed in cols but with the column names prefixed with "ECHO_".

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Echo Polymorphic Table Function

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));

   DEPTNO DNAME          LOC           ECHO_DNAME     ECHO_LOC
--------- -------------- ------------- -------------- -------------
        10 ACCOUNTING     NEW YORK      ACCOUNTING     NEW YORK
        20 RESEARCH       DALLAS        RESEARCH       DALLAS
        30 SALES          CHICAGO       SALES          CHICAGO
        40 OPERATIONS     BOSTON        OPERATIONS     BOSTON
```

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.
- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.

- PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab  IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
  PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab  IN OUT DBMS_TF.TABLE_T,
                    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id   PLS_INTEGER := 1;
  BEGIN
      FOR I IN 1 .. tab.COLUMN.COUNT LOOP
          FOR J IN 1 .. cols.COUNT LOOP
              IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
                IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
                THEN
                  RAISE_APPLICATION_ERROR(-20102, 'Unsupported column
type [' ||
                  TAB.COLUMN(i).description.TYPE||']');
                END IF;

                TAB.COLUMN(i).for_read := TRUE;
                NEW_COLS(col_id) := TAB.COLUMN(i).description;
                NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
                col_id := col_id + 1;

                EXIT;
              END IF;
          END LOOP;
      END LOOP;

      /* Verify all columns were found */
      IF ( col_id - 1 != cols.COUNT ) THEN
        RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id -
1||'], ['||cols.COUNT||']');
      END IF;

      RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
```

```
  END;
  PROCEDURE FETCH_ROWS
  AS
    ROWSET DBMS_TF.ROW_SET_T;
  BEGIN
      DBMS_TF.GET_ROW_SET(rowset);
      DBMS_TF.PUT_ROW_SET(rowset);
  END;
END echo_package;
```

The PTF echo references the implementation package echo_package.

```
CREATE FUNCTION echo(tab TABLE,
                     cols COLUMNS)
  RETURN TABLE
  PIPELINED ROW POLYMORPHIC USING echo_package;
```

Example 182-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO_ENAME, ECHO_HIREDATE, and ECHO_SAL.

```
SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;
```

```
EMPNO ENAME JOB      MGR  HIREDATE  SAL  COMM DEPTNO ECHO_ENAME ECHO_HIRE ECHO_SAL
----- ----- -------- ---- --------- ---- ---- ------ ---------- --------- --------
7369  SMITH CLERK    7902 17-DEC-80  800          20 SMITH      17-DEC-80      800
7566  JONES MANAGER  7839 02-APR-81 2975          20 JONES      02-APR-81     2975
7788  SCOTT ANALYST  7566 19-APR-87 3000          20 SCOTT      19-APR-87     3000
7876  ADAMS CLERK    7788 23-MAY-87 1100          20 ADAMS      23-MAY-87     1100
7902  FORD  ANALYST  7566 03-DEC-81 3000          20 FORD       03-DEC-81     3000
```

Using subquery W, display ENAME, ECHO_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
                dname,
                loc
         FROM   scott.emp e,
                scott.dept d
         WHERE  e.deptno = d.deptno)
SELECT ename,
       echo_loc,
       dname
FROM   echo(w, COLUMNS(sal, dname, loc, hiredate))
WHERE  deptno = 30
       AND echo_sal > 1000;
```

```
ENAME      ECHO_LOC        DNAME
---------- --------------- --------
```

```
ALLEN      CHICAGO         SALES
WARD       CHICAGO         SALES
MARTIN     CHICAGO         SALES
BLAKE      CHICAGO         SALES
TURNER     CHICAGO         SALES
```

Using subquery `W`, display `ENAME` and `DNAME` columns for all employees with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
                dname,
                loc
         FROM   scott.emp e,
                scott.dept d
         WHERE  e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                 FROM   echo(scott.emp, COLUMNS(sal, deptno, ename,
hiredate))
                 WHERE  deptno = e.echo_deptno
                        AND sal > 1000);

ECHO_ENAME DNAME
---------- ----------
ALLEN      SALES
MILLER     ACCOUNTING
CLARK      ACCOUNTING
WARD       SALES
ADAMS      RESEARCH
TURNER     SALES
SCOTT      RESEARCH
BLAKE      SALES
JONES      RESEARCH
KING       ACCOUNTING
FORD       RESEARCH
MARTIN     SALES
```

182.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

RECORD Types

- COLUMN_DATA_T Record Type
- COLUMN_METADATA_T Record Type
- COLUMN_T Record Type
- DESCRIBE_T Record Type
- ENV_T Record Type
- PARALLEL_ENV_T Record Type
- TABLE_T Record Type

TABLE Types

- Supported Types Collections (TAB_<typ>_T)
- COLUMNS_NEW_T Table Type
- COLUMNS_T Table Type
- COLUMNS_WITH_TYPE_T Table Type
- TABLE_COLUMNS_T Table Type
- ROW_SET_T Table Type

Types

- XID_T Subtype

CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See Collections For Compilation Storage for more information.

182.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```
TYPE TAB_BOOLEAN_T       IS TABLE OF BOOLEAN       INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_FLOAT_T  IS TABLE OF BINARY_FLOAT  INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_DOUBLE_T IS TABLE OF BINARY_DOUBLE INDEX BY PLS_INTEGER;

TYPE TAB_BLOB_T          IS TABLE OF BLOB          INDEX BY PLS_INTEGER;

TYPE TAB_CHAR_T          IS TABLE OF CHAR(32767)   INDEX BY PLS_INTEGER;

TYPE TAB_CLOB_T          IS TABLE OF CLOB          INDEX BY PLS_INTEGER;

TYPE TAB_DATE_T          IS TABLE OF DATE          INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_YM_T   IS TABLE OF YMINTERVAL_UNCONSTRAINED   INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_DS_T   IS TABLE OF DSINTERVAL_UNCONSTRAINED   INDEX BY PLS_INTEGER;

TYPE TAB_NATURALN_T      IS TABLE OF NATURALN      INDEX BY PLS_INTEGER;

TYPE TAB_NUMBER_T        IS TABLE OF NUMBER        INDEX BY PLS_INTEGER;

TYPE TAB_RAW_T           IS TABLE OF RAW(32767)    INDEX BY PLS_INTEGER;

TYPE TAB_ROWID_T         IS TABLE OF ROWID         INDEX BY PLS_INTEGER;

TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T     IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T  IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY PLS_INTEGER;
```

```
TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;
```

> **See Also:**
>
> Table 182-1 for more information about the DBMS_TF supported types

182.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See Table 182-1 for the list of supported types.

Syntax

```
TYPE COLUMN_DATA_T IS RECORD
 ( description            COLUMN_METADATA_T,
   tab_varchar2           TAB_VARCHAR2_T,
   tab_number             TAB_NUMBER_T,
   tab_date               TAB_DATE_T,
   tab_binary_float       TAB_BINARY_FLOAT_T,
   tab_binary_double      TAB_BINARY_DOUBLE_T,
   tab_raw                TAB_RAW_T,
   tab_char               TAB_CHAR_T,
   tab_clob               TAB_CLOB_T,
   tab_blob               TAB_BLOB_T,
   tab_timestamp          TAB_TIMESTAMP_T,
   tab_timestamp_tz       TAB_TIMESTAMP_TZ_T,
   tab_interval_ym        TAB_INTERVAL_YM_T,
   tab_interval_ds        TAB_INTERVAL_DS_T,
   tab_timestamp_ltz      TAB_TIMESTAMP_LTZ_T,
   tab_rowid              TAB_ROWID_T);
```

Fields

Table 182-7 COLUMN_DATA_T Fields

Field	Description
`description`	The tag defines the metadata for the column indicating which variant field is active.
`tab_varchar2`	Variant field
`tab_number`	Variant field
`tab_date`	Variant field
`tab_binary_float`	Variant field
`tab_binary_double`	Variant field
`tab_raw`	Variant field

Table 182-7 (Cont.) COLUMN_DATA_T Fields

Field	Description
tab_char	Variant field
tab_clob	Variant field
tab_blob	Variant field
tab_timestamp	Variant field
tab_timestamp_tz	Variant field
tab_interval_ym	Variant field
tab_interval_ds	Variant field
tab_timestamp_ltz	Variant field
tab_rowid	Variant field

182.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
  ( type               PLS_INTEGER,
    max_len            PLS_integer DEFAULT -1,
    name               VARCHAR2(32767),
    name_len           PLS_INTEGER,
    precision          PLS_INTEGER,
    scale              PLS_INTEGER,
    charsetid          PLS_INTEGER,
    charsetform        PLS_INTEGER,
    collation          PLS_INTEGER );
```

Fields

Table 182-8 COLUMN_METADATA_T Fields

Field	Description
type	Internal Oracle typecode for the column's type
max_len	Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored.
name	Name of the column
name_len	Length of the name
precision	The precision, or the maximum number of significant decimal digits (for numeric data types)
scale	Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)

Table 182-8 (Cont.) COLUMN_METADATA_T Fields

Field	Description
charsetid	Character set id (internal Oracle code, applies to string types)
charsetform	Character set form (internal Oracle code, applies to string types)
collation	Collation id (internal Oracle code, applies to string types)

182.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

```
TYPE column_t IS RECORD (
    description            COLUMN_METADATA_T,
    pass_through           BOOLEAN,
    for_read               BOOLEAN);
```

Fields

Table 182-9 COLUMN_T Fields

Field	Description
description	Column metadata
pass_through	Is this a pass through column
for_read	Is this column read by the PTF

182.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

Syntax

```
TYPE DESCRIBE_T          IS RECORD
  ( NEW_COLUMNS        COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
    CSTORE_CHR         CSTORE_CHR_T  DEFAULT CSTORE_CHR_T(),
    CSTORE_NUM         CSTORE_NUM_T  DEFAULT CSTORE_NUM_T(),
    CSTORE_BOL         CSTORE_BOL_T  DEFAULT CSTORE_BOL_T(),
    CSTORE_DAT         CSTORE_DAT_T  DEFAULT CSTORE_DAT_T(),
    METHOD_NAMES       METHODS_T     DEFAULT METHODS_T());
```

Fields

Table 182-10 DESCRIBE_T Fields

Field	Description
NEW_COLUMNS	New columns description that will be produced by the PTF
CSTORE_CHR	CStore array key type : VARCHAR2 (optional)

Table 182-10 (Cont.) DESCRIBE_T Fields

Field	Description
CSTORE_NUM	CStore array key type : NUMBER (optional)
CSTORE_BOL	CStore array key type : BOOLEAN (optional)
CSTORE_DAT	CStore array key type : DATE (optional)
METHOD_NAMES	Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods

182.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

Syntax

```
TYPE ENV_T IS RECORD (
  get_columns      TABLE_METADATA_T,
  put_columns      TABLE_METADATA_T,
  ref_put_col      REFERENCED_COLS_T,
  parallel_env     PARALLEL_ENV_T,
  query_optim      BOOLEAN,
  row_count        PLS_INTEGER,
  row_replication  BOOLEAN,
  row_insertion    BOOLEAN);
```

Fields

Table 182-11 ENV_T Fields

Field	Description
get_columns	Metadata about the columns read by PTF GET_COL procedure
put_columns	Metadata about columns sent back to database by PUT_COL procedure
ref_put_col	TRUE if the put column was referenced in the query
parallel_env	Parallel execution information (when a query runs in parallel)
query_optim	Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer
row_count	Number of rows in current row set
row_replication	Is Row Replication Enabled?
row_insertion	Is Row Insertion Enabled?

182.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

Syntax

```
TYPE PARALLEL_ENV_T         IS RECORD
  ( instance_id      PLS_INTEGER,
    session_id       PLS_INTEGER,
```

```
    slave_svr_grp    PLS_INTEGER,
    slave_set_no     PLS_INTEGER,
    no_slocal_slaves PLS_INTEGER,
    global_slave_no  PLS_INTEGER,
    no_local_slaves  PLS_INTEGER,
    local_slave_no   PLS_INTEGER );
```

Fields

Table 182-12 PARALLEL_ENV_T Fields

Field	Description
instance_id	QC instance ID
session_id	QC session ID
slave_svr_grp	Slave server group
slave_set_no	Slave server set number
no_slocal_slaves	Number of sibling slaves (including self)
global_slave_no	Global slave number (base 0)
no_local_slaves	Number of sibling slaves running on instance
local_slave_no	Local slave number (base 0)

182.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```
TYPE TABLE_T IS RECORD(
  column                TABLE_COLUMNS_T,
  schema_name           DBMS_id,
  package_name          DBMS_id,
  ptf_name              DBMS_id);
```

Fields

Table 182-13 TABLE_T Fields

Field	Description
column	Column information
schema_name	The PTF schema name
package_name	The PTF implementation package name
ptf_name	The PTF name invoked

182.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

182.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

182.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

182.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)

Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

182.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

182.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

182.9 Summary of DBMS_TF Subprograms

This summary briefly describes the DBMS_TF package subprograms.

Table 182-14 DBMS_TF Subprograms

Subprogram	Description
COLUMN_TYPE_NAME Function	Returns the type name of the specified column type
COL_TO_CHAR Function	Returns the string representation of the specified column

Table 182-14 (Cont.) DBMS_TF Subprograms

Subprogram	Description
CSTORE_EXISTS Function	Returns TRUE if an item with a given key exists in the PTF Compilation State management Store
CSTORE_GET Procedure	Gets item(s) of specified type from the PTF Compilation State management Store
GET_COL Procedure	Gets read column values
GET_ENV Function	Returns information about the PTF runtime environment
GET_ROW_SET Procedure	Gets read set of column values in the collection
GET_XID Function	Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state
PUT_COL Procedure	Puts column values in the database
PUT_ROW_SET Procedure	Puts the collection read set of column values in the database
ROW_REPLICATION Procedure	Sets the row replication factor
ROW_TO_CHAR Function	Returns the string representation of a row in a rowset
SUPPORTED_TYPE Function	Returns TRUE if a specified type is supported by PTF infrastructure
TRACE Procedure	Prints data structures to help development and problem diagnosis
XSTORE_CLEAR Procedure	Removes all key-value pairs from XStore
XSTORE_EXISTS Procedure	Returns TRUE if the key has an associated value
XSTORE_GET Procedure	Gets a key-value store for PTF Execution State Management
XSTORE_REMOVE Procedure	Removes any value associated with the given key
XSTORE_SET Procedure	Sets the value for the given key store for PTF Execution State Management

182.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

```
FUNCTION COLUMN_TYPE_NAME(
   col COLUMN_METADATA_T)
   RETURN VARCHAR2;
```

Parameters

Table 182-15 DBMS_TF.COLUMN_TYPE_NAME Function Parameters

Parameter	Description
`col`	The column metadata. See COLUMN_METADATA_T Record Type

Return Values

Returns the column type converted as text.

Example 182-5 DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
   tab   IN OUT DBMS_TF.table_t,
   cols  IN     DBMS_TF.columns_t)
   RETURN DBMS_TF.describe_t
AS
   new_cols DBMS_TF.columns_new_t;
   col_id    PLS_INTEGER := 1;
 BEGIN
     FOR i IN 1 .. tab.count LOOP
        FOR j IN 1 .. cols.count LOOP
           IF (tab(i).description.name = cols(j)) THEN
                IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2')
THEN
                   raise_application_error(-20102,
                    'Unsupported column type ['||tab(i).description.type||']');
                END IF;
              tab(i).for_read       := true;
              new_cols(col_id)      := tab(i).description;
              new_cols(col_id).name := 'ECHO_'|| tab(i).description.name;
              col_id                := col_id + 1;
               EXIT;
          END IF;
        END LOOP;
     END LOOP;

     --  Verify all columns were found
     IF (col_id - 1 != cols.count) THEN
        raise_application_error(-20101,
          'Column mismatch ['||col_id-1||'], ['||cols.count||']');
     END IF;

     RETURN DBMS_TF.describe_t(new_columns => new_cols);
 END;
```

182.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

```
FUNCTION COL_TO_CHAR(
   col   COLUMN_DATA_T,
   rid   PLS_INTEGER,
   quote VARCHAR2 DEFAULT '"')
  RETURN VARCHAR2;
```

Parameters

Table 182-16 DBMS_TF.COL_TO_CHAR Function Parameters

Parameter	Description
col	The column whose value is to be converted
rid	Row number
quote	Quotation mark to use for non-numeric values

Return Values

The string representation of a column data value.

Example 182-6 DBMS_TF.COL_TO_CHAR Example

```
PROCEDURE Fetch_Rows AS
    rowset DBMS_TF.rROW_SET_T;
    str    VARCHAR2(32000);
BEGIN
     DBMS_TF.GET_ROW_SET(rowset);
     str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
END;
```

182.9.3 CSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

Syntax

```
FUNCTION CSTORE_EXISTS
  (key      IN VARCHAR2,
   key_type IN PLS_INTEGER default NULL)
   return BOOLEAN;
```

Parameters

Table 182-17 CSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional) Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

Example 182-7 DBMS_TF.CSTORE_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

182.9.4 CSTORE_GET Procedure

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE` function.

You can get the PTF compilation state during runtime procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

This procedure is overloaded. The `DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

See Table 182-3 for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT VARCHAR2);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT NUMBER);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT DATE);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
```

```
   value IN OUT BOOLEAN);
```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);
```

Parameters

Table 182-18 DBMS_TF.CSTORE_GET Procedure Parameters

Parameter	Description
`key`	A unique character key
`value`	Value corresponding to the key for supported types
`key_value`	Key value

182.9.5 GET_COL Procedure

Get Read Column Values

Syntax

```
PROCEDURE GET_COL(
   columnId NUMBER,
   collection IN OUT NOCOPY <datatype>);
```

Where *<datatype>* can be any one of the supported types.

See Table 182-1 for the list of supported types.

Parameters

Table 182-19 GET_COL Procedure Parameters

Parameter	Description
`columnid`	The id for the column
`collection`	The data for the column

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in `DESCRIBE` method of PTF.

For the same ColumnId, `GET_COL` and `PUT_COL` may correspond to different column.

Example 182-8 DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
  col1 DBMS_TF.TAB_CLOB_T;
  col2 DBMS_TF.TAB_CLOB_T;
  out1 DBMS_TF.TAB_CLOB_T;
  out2 DBMS_TF.TAB_CLOB_T;
BEGIN
    DBMS_TF.GET_COL(1, col1);
    DBMS_TF.GET_COL(2, col2);

    FOR I IN 1 .. col1.COUNT LOOP
        out1(i) := 'ECHO-' || col1(i);
    END LOOP;

    FOR I IN 1 .. col2.COUNT LOOP
        out2(i) := 'ECHO-' || col2(i);
    END LOOP;

    DBMS_TF.PUT_COL(1, out1);
    DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows

ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

182.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

```
FUNCTION GET_ENV
        RETURN ENV_T;
```

Return Values

Returns information about the PTF runtime environment.

Example 182-9 DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable env of type ENV_T with the PTF execution information in a `FETCH_ROWS` implementation procedure.

```
env         DBMS_TF.ENV_T  := DBMS_TF.GET_ENV();
```

182.9.7 GET_ROW_SET Procedure

Get Read Column Values

The FETCH_ROW procedure can call the GET_ROW_SET procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

Syntax

```
PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER,
  col_count OUT        PLS_INTEGER);
```

Parameters

Table 182-20 GET_ROW_SET Procedure Parameters

Parameter	Description
rowset	The collection of data and metadata
row_count	The number of rows in the columns
col_count	The number of columns

Example 182-10 DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
  rowset      DBMS_TF.ROW_SET_T;
  accumulator DBMS_TF.TAB_VARCHAR2_T;
  row_count   PLS_INTEGER;

  FUNCTION get_value(col  PLS_INTEGER,
                     ROW  PLS_INTEGER)
  RETURN VARCHAR2
  AS
    col_type  PLS_INTEGER := rowset(col).description.TYPE;
  BEGIN
      CASE col_type
        WHEN DBMS_TF.TYPE_VARCHAR2 THEN
          RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
        ELSE
          RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||
col_type);
```

```
      END CASE;
  END;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset, row_count);

    IF ( rowset.count = 0 ) THEN
      RETURN;
    END IF;

    FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
    END LOOP;

    FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
            accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
        END LOOP;
    END LOOP;
    -- Pushout the accumulator
    DBMS_TF.PUT_COL(1, accumulator);
END;
```

182.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 182-11 Stack Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Stack Polymorphic Table Function

Create the PTF implementation package stack_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

  FUNCTION  describe(tab  IN OUT dbms_tf.table_t,
                     col         dbms_tf.columns_t)
            RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body stack_p.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

  FUNCTION  describe(tab  IN OUT dbms_tf.table_t,
                     col         dbms_tf.columns_t)
            RETURN dbms_tf.describe_t  AS
  BEGIN
    FOR i IN 1 .. tab.column.count LOOP
      FOR j IN 1 .. col.count LOOP
        IF (tab.column(i).description.name = col(j) AND
            tab.column(i).description.TYPE = dbms_tf.type_number) THEN
          tab.column(i).pass_through := false;
          tab.column(i).for_read     := true;
        END IF;
      END LOOP;
    END LOOP;

    RETURN dbms_tf.describe_t(
             new_columns => dbms_tf.columns_new_t(
               1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                              TYPE =>
dbms_tf.type_varchar2),
               2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                              TYPE =>
dbms_tf.type_number)),
             row_replication => true);
  END;

  PROCEDURE fetch_rows  AS
    env    dbms_tf.env_t := dbms_tf.get_env();
    rowset dbms_tf.row_set_t;
    colcnt PLS_INTEGER;
    rowcnt PLS_INTEGER;
    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
      repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
      FOR c IN 1 .. colcnt LOOP
        IF rowset(c).tab_number(r) IS NOT NULL THEN
          repfac(r)                    := repfac(r) + 1;
          namcol(nvl(namcol.last+1,1)) :=
            INITCAP(regexp_replace(env.get_columns(c).name, '^"|"$'));
```

```
          valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
        END IF;
      END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

  END;

END stack_p;
```

Create the standalone PTF named stack. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is stack_p.

```
CREATE FUNCTION stack(tab TABLE,
                      col columns)
                   RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;
```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```
SELECT   deptno, ename, column_name, column_value
FROM     stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE    deptno IN (10, 30)
ORDER BY deptno, ename;
```

```
    DEPTNO ENAME      COLUMN_NAME     COLUMN_VALUE
---------- ---------- --------------- ------------

```

182.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```
FUNCTION GET_XID
      RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 182-12 DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
  xst(DBMS_TF.GET_XID()) := 0;
END;
```

182.9.9 PUT_COL Procedure

Put Column Values

Syntax

```
PROCEDURE PUT_COL(
   columnid NUMBER,
   collection IN <datatype>);
```

Where <*datatype*> can be any one of the supported types.

See Table 182-1 for the list of supported types.

Parameters

Table 182-21 PUT_COL Procedure Parameters

Parameter	Description
`columnid`	The id for the column
`collection`	The data for the column

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in `DESCRIBE` method of PTF.

For the same columnid, `GET_COL` and `PUT_COL` may correspond to different column.

182.9.9.1 Rand_col Polymorphic Table Function Example

The rand_col PTF appends specified number of random-valued columns to the output.

Example 182-13 Rand_col Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Rand_col Polymorphic Table Function

This rand_col PTF example appends col_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND_<*n*>"

Create the PTF implementation package rand_col_p.

The parameters are :

- tab : Input table
- col_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

  FUNCTION describe(tab       IN OUT DBMS_TF.table_t,
                    col_count        NATURALN DEFAULT 1,
                    low              NUMBER   DEFAULT NULL,
                    high             NUMBER   DEFAULT NULL)
           RETURN DBMS_TF.describe_t;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                       low       NUMBER   DEFAULT NULL,
                       high      NUMBER   DEFAULT NULL);

END rand_col_p;
```

Create the PTF implementation package body rand_col_p.

The parameter col_count is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of col_count to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```
CREATE PACKAGE BODY rand_col_p AS
  col_name_prefix CONSTANT dbms_id := 'RAND_';
```

```
  FUNCTION describe(tab       IN OUT DBMS_TF.table_t,
                    col_count        NATURALN DEFAULT 1,
                    low              NUMBER   DEFAULT NULL,
                    high             NUMBER   DEFAULT NULL)
           RETURN DBMS_TF.describe_t
  AS
    cols DBMS_TF.columns_new_t;
  BEGIN
    FOR i IN 1 .. col_count LOOP
     cols(i):= DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
TYPE=>DBMS_TF.type_number);
    END LOOP;

    RETURN DBMS_TF.describe_t(new_columns => cols);
  END;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                       low       NUMBER   DEFAULT NULL,
                       high      NUMBER   DEFAULT NULL)
  AS
    row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
    col       DBMS_TF.tab_number_t;
  BEGIN
    FOR c IN 1 .. col_count LOOP
      FOR i IN 1 .. row_count LOOP
        col(i) :=  CASE WHEN (low IS NULL OR high IS NULL)
                        THEN dbms_random.VALUE
                         ELSE dbms_random.VALUE(low,
high)
                    END;
      END LOOP;
      DBMS_TF.put_col(c, col);
    END LOOP;
  END;

END rand_col_p;
```

Create the standalone rand_col PTF. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is rand_col_p.

```
CREATE FUNCTION rand_col(tab TABLE,
                         col_count NATURALN DEFAULT 1,
                         low       NUMBER   DEFAULT NULL,
                         high      NUMBER   DEFAULT NULL)
                  RETURN TABLE
                  PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the rand_col PTF to display all columns of table SCOTT.DEPT with one produced RAND_1 column.

```
  SELECT *
    FROM rand_col(scott.dept);

    DEPTNO DNAME          LOC              RAND_1

182.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
   rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
  PROCEDURE PUT_ROW_SET(
   rowset             IN   ROW_SET_T,
   replication_factor IN   NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
   rowset             IN   ROW_SET_T,
   replication_factor IN   TAB_NATURALN_T);
```

Parameters

Table 182-22 PUT_ROW_SET Procedure Parameters

Parameter	Description
`rowset`	The collection of data and metadata
`replication_factor`	The replication factor per row

Example 182-14 DBMS_TF.PUT_ROW_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
  rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

182.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 182-15 Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

Live SQL:

You can view and run this example on Oracle Live SQL at Split Polymorphic Table Function

Create the PTF implementation package split_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

  FUNCTION  describe(tab  IN OUT DBMS_TF.table_t,
                     col         DBMS_TF.columns_t,
                     cnt         NATURALN)
            RETURN DBMS_TF.describe_t;

  PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

  FUNCTION  describe(tab  IN OUT DBMS_TF.Table_t,
                     col         DBMS_TF.Columns_t,
                     cnt         NATURALN)
            RETURN DBMS_TF.describe_t
  AS
    new_cols DBMS_TF.columns_new_t;
    col_id   PLS_INTEGER := 1;
  BEGIN
    FOR i IN 1 .. tab.column.count LOOP
      FOR j IN 1 .. col.count LOOP
        IF (tab.column(i).description.name = col(j) AND
            tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
          tab.column(i).pass_through := FALSE;
          tab.column(i).for_read     := TRUE;
          new_cols(col_id) := tab.column(i).description;
          col_id := col_id + 1;
        END IF;
      END LOOP;
    END LOOP;

    RETURN DBMS_TF.describe_t(new_columns=>new_cols, row_replication=>true);
  END;
  PROCEDURE fetch_rows(cnt NATURALN)
```

```
  AS
    inp_rs DBMS_TF.row_set_t;
    out_rs DBMS_TF.row_set_t;
    rows   PLS_INTEGER;
  BEGIN
    DBMS_TF.get_row_set(inp_rs, rows);

    FOR c IN 1 .. inp_rs.count() LOOP
      FOR r IN 1 .. rows LOOP
        FOR i IN 1 .. cnt LOOP
          out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/
cnt;
        END LOOP;
      END LOOP;
    END LOOP;

    DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
  END;

END split_p;
```

Create the standalone PTF named split. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is split_p.

```
CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
                  RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;
```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the split PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```
SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;
```

```
ENAME            SAL               COMM
---------- ---------- ------------------
ALLEN            800                150

```

182.9.11 ROW_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
  replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
  replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 182-23 ROW_REPLICATION Procedure Parameters

Parameter	Description
`replication_factor`	The replication factor per row

Example 182-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the replication_factor that is given as a parameter.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Replicate Polymorphic Table Function

Create the PTF implementation package replicate_p.

```
CREATE PACKAGE replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
                      replication_factor NATURAL)
        RETURN DBMS_TF.describe_t;

    PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;
```

Create the PTF implementation package body replicate_p. The PTF replicates each input row by the replication_factor that is given as a parameter.

```
CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                      , replication_factor NATURAL)
        RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;
```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate_p.

```
CREATE FUNCTION replicate(tab TABLE,
                          replication_factor NATURAL)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;
```

This example sets the replication_factor to 2 which results in doubling the number of rows.

```
 SELECT *
 FROM replicate(dept, replication_factor => 2);

   DEPTNO DNAME          LOC
---------- -------------- -------------
        10 ACCOUNTING     NEW YORK
        10 ACCOUNTING     NEW YORK
        20 RESEARCH       DALLAS
        20 RESEARCH       DALLAS
        30 SALES          CHICAGO
        30 SALES          CHICAGO
        40 OPERATIONS     BOSTON
        40 OPERATIONS     BOSTON
```

This example sets the replication_factor to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);

no rows selected
```

Count the number of employees in each department. Invoke the replicate PTF to report from the SCOTT.EMP table to set the replication_factor to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;

    DEPTNO   COUNT(*)
---------- ----------
        30    6000000
        10    3000000
        20    5000000
```

This sets the replication_factor to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);

  COUNT(*)
----------
1000000000
```

182.9.12 ROW_TO_CHAR Function

The ROW_TO_CHAR function converts a row data value to a string representation.

Syntax

```
FUNCTION ROW_TO_CHAR(
   rowset ROW_SET_T,
   rid    PLS_INTEGER,
   format PLS_INTEGER DEFAULT FORMAT_JSON)
   RETURN VARCHAR2;
```

Parameters

Table 182-24 DBMS_TF.ROW_TO_CHAR Function Parameters

Parameter	Description
rowset	The rowset whose value is to be converted
rid	Row number
format	The string format (default is FORMAT_JSON)

Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 182-17 DBMS_TF.ROW_TO_CHAR Example

```
PROCEDURE Fetch_Rows as
  rowset DBMS_TF.ROW_SET_T;
  str    VARCHAR2(32000);
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;
```

182.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

```
FUNCTION SUPPORTED_TYPE(
   type_id PLS_INTEGER)
   RETURN BOOLEAN;
```

Parameters

Table 182-25 DBMS_TF.SUPPORTED_TYPE Function Parameters

Parameter	Description
type_id	The type

Return Values

Returns TRUE if the type_id is a scalar supported by `PUT_COL` and `GET_COL`.

> **See Also:**
>
> Echo Polymorphic Table Function Example for an example of DBMS_TF.SUPPORTED_TYPE use.

182.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

```
PROCEDURE TRACE(
   msg          VARCHAR2,
   with_id      BOOLEAN   DEFAULT FALSE,
   separator    VARCHAR2  DEFAULT NULL,
   prefix       VARCHAR2  DEFAULT NULL);

PROCEDURE TRACE(
   rowset       IN ROW_SET_T);

PROCEDURE TRACE(
   env          IN ENV_T);
```

```
PROCEDURE TRACE(
   columns_new  IN COLUMNS_NEW_T);

PROCEDURE trace(
   cols         IN COLUMNS_T);

PROCEDURE trace(
   columns_with_type  IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
   tab          IN TABLE_T);

PROCEDURE trace(
   col          IN COLUMN_METADATA_T);
```

Parameters

Table 182-26 TRACE Procedure Parameters

Parameter	Description
msg	Custom user tracing message
with_id	Include the unique execution ID in the trace?
separator	Specify a string to use to separate values
prefix	Specify a string to prefix the actual values
rowset	Data for a rowset
env	Metadata about the polymorphic table function execution state
columns_new	Collection for new columns
cols	Collection containing column names
columns_with_type	Collection containing columns metadata
tab	Table descriptor
col	Metadata about an existing table column or a new column produced

Example 182-18 DBMS_TF.TRACE Example

This example adds tracing to a fetch_rows procedure.

```
PROCEDURE fetch_rows
AS
   rowset DBMS_TF.ROW_SET_T;
BEGIN
   DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
   DBMS_TF.TRACE(rowset);
   DBMS_TF.GET_ROW_SET(rowset);
   DBMS_TF.TRACE(rowset);
   DBMS_TF.PUT_ROW_SET(rowset);
   DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

182.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

```
PROCEDURE XSTORE_CLEAR;
```

182.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

```
FUNCTION XSTORE_EXISTS(
   key      IN VARCHAR2,
   key_type IN PLS_INTEGER DEFAULT NULL)
  RETURN BOOLEAN;
```

Parameters

Table 182-27 DBMS_TF.XSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional). Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

> **See Also:**
>
> Table 182-6 for more information about supported key types.

182.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See Table 182-6 for more information about supported key types.

Syntax

```
PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT VARCHAR2);

PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT NUMBER);

PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT DATE);

PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT BOOLEAN);
```

Parameters

Table 182-28 DBMS_TF.XSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If the key is not found, the value is unchanged.

182.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 182-19 Row_num Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Row_num Polymorphic Table Function

Create the PTF implementation package row_num_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)
- inc - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
```

```
                    ini NUMBER DEFAULT 1,
                    inc NUMBER DEFAULT 1)
            RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column ROW_ID to the table. The sequence values start with the specified value (ini) and each time it is incremented by the specified value (inc).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                    ini NUMBER DEFAULT 1,
                    inc NUMBER DEFAULT 1)
           RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
             dbms_tf.columns_new_t(1 =>
               dbms_tf.column_metadata_t(name => 'ROW_ID',
                                         TYPE => dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid     NUMBER               := ini;
    col     dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;

 END;
```

Create a standalone polymorphic table function named row_num. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is row_num_p.

```
CREATE FUNCTION row_num(tab TABLE,
                        ini NUMBER DEFAULT 1,
                        inc NUMBER DEFAULT 1)
                        RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

```
DEPTNO DNAME          LOC            ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK              1
    20 RESEARCH       DALLAS                2
    30 SALES          CHICAGO               3
    40 OPERATIONS     BOSTON                4
```

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

```
DEPTNO DNAME          LOC            ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK             100
    20 RESEARCH       DALLAS               101
    30 SALES          CHICAGO              102
    40 OPERATIONS     BOSTON               103
```

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

```
DEPTNO DNAME          LOC            ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK              0
    20 RESEARCH       DALLAS               -1
    30 SALES          CHICAGO              -2
    40 OPERATIONS     BOSTON               -3
```

The row_num PTF invocation reporting from the SCOTT.EMP table produces a new column ROW_ID with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
  FROM   row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
WHERE  deptno IN (10, 30);
```

```
DEPTNO ENAME      JOB              SAL     ROW_ID
------ ---------- --------- ---------- ----------
    10 CLARK      MANAGER         2450          0
    10 KING       PRESIDENT       5000        .25
    10 MILLER     CLERK           1300         .5
    30 ALLEN      SALESMAN        1600          0
    30 BLAKE      MANAGER         2850        .25
    30 JAMES      CLERK            950         .5
    30 MARTIN     SALESMAN        1250        .75
    30 TURNER     SALESMAN        1500          1
    30 WARD       SALESMAN        1250       1.25
```

182.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.

Syntax

```
PROCEDURE XSTORE_REMOVE(
   key      IN VARCHAR2,
   key_type IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 182-29 DBMS_TF.XSTORE_REMOVE Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key to remove (optional)

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

182.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store and item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```
PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN VARCHAR2);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN NUMBER);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN DATE);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN BOOLEAN);
```

Parameters

Table 182-30 DBMS_TF.XSTORE_SET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If an item for a given key already exists, the value is replaced.

183
DBMS_TNS

The DBMS_TNS package provides the RESOLVE_TNSNAME function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- DBMS_TNS Overview
- DBMS_TNS Security Model
- Summary of DBMS_TNS Subprograms

183.1 DBMS_TNS Overview

The DBMS_TNS package contains one function, RESOLVE_TNSNAME, which returns the resolved connect string from configured sources that have been defined in the names.directory_path parameter in the sqlnet.ora file.

The RESOLVE_TNSNAME function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

> **See Also:**
>
> - *Oracle Database Administrator's Guide* for more information about finding database link information
> - *Oracle Database Reference* for information about the ALL_DB_LINKS data dictionary view

183.2 DBMS_TNS Security Model

You must be granted the EXECUTE privilege on the DBMS_TNS package.

183.3 Summary of DBMS_TNS Subprograms

This table lists the DBMS_TNS subprograms and briefly describes them.

Table 183-1 DBMS_TNS Parameters

Subprogram	Description
RESOLVE_TNSNAME Function	Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the sqlnet.ora names.directory_path parameter)

183.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
   tns_name VARCHAR2)
  RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

Parameter	Description
`tns_name`	Database address for establishing the connection

Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME function` to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;

DB_LINK
--------------------------------------------------------------------------------
--------
DBMS_TNS.RESOLVE_TNSNAME(HOST)
--------------------------------------------------------------------------------
--------
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)
(HOST=juno)(USER=psmith))
))
```

184
DBMS_TRACE

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes
- Summary of DBMS_TRACE Subprograms

184.1 DBMS_TRACE Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.

   Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

184.2 DBMS_TRACE Security Model

This package must be created under SYS.

184.3 DBMS_TRACE Constants

DBMS_TRACE defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 184-1 DBMS_TRACE Event Constants

Name	Type	Value	Description
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as • PL/SQL Trace Tool started • Trace flags changed • PL/SQL Virtual Machine started • PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Table 184-2 DBMS_TRACE Version Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	

Oracle recommends using the symbolic form for all these constants.

184.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

184.5 DBMS_TRACE Operational Notes

Certain operational notes apply to `DBMS_TRACE`.

These are described in the following sections:

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY]  <libunit-name> compile debug;
```

> **Note:**
>
> You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

> **Note:**
>
> For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level *n* changes the record limit to 1024 * *n*.

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as `PL/SQL Trace Tool started`, `Trace flags changed`, `PL/SQL Virtual Machine started`, and `PL/SQL Virtual Machine stopped`.

184.6 Summary of DBMS_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

Table 184-3 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function	Gets the trace level

Table 184-3 (Cont.) DBMS_TRACE Package Subprograms

Subprogram	Description
PLSQL_TRACE_VERSION Procedure	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure	Starts tracing in the current session

184.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

184.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more `DBMS_TRACE` constants.

See Table 184-1 for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
  RETURN BINARY_INTEGER;
```

184.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the `DBMS_TRACE` package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
   major OUT BINARY_INTEGER,
   minor OUT BINARY_INTEGER);
```

Parameters

Table 184-4 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
`major`	Major version number of `DBMS_TRACE`.
`minor`	Minor version number of `DBMS_TRACE`.

184.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
   trace_level INTEGER);
```

Parameters

Table 184-5 *SET_PLSQL_TRACE Procedure Parameters*

Parameter	Description
`trace_level`	You must supply one or more of the constants as listed in Table 184-1. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information.

185
DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

> **See Also:**
>
> *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- DBMS_TRANSACTION Security Model
- Summary of DBMS_TRANSACTION Subprograms

185.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

185.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the `DBMS_TRANSACTION` subprograms and briefly describes them.

Table 185-1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`
ADVISE_NOTHING Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`
ADVISE_ROLLBACK Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`
COMMIT Procedure	Equivalent to the SQL statement: `COMMIT`
COMMIT_COMMENT Procedure	Equivalent to the SQL statement: `COMMIT COMMENT <text>`
COMMIT_FORCE Procedure	Equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`
LOCAL_TRANSACTION_ID Function	Returns the local (to instance) unique identifier for the current transaction

Table 185-1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
PURGE_LOST_DB_ENTRY Procedure	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure	Equivalent to the SQL statement: `SET TRANSACTION READ ONLY`
READ_WRITE Procedure	equivalent to the SQL statement: `SET TRANSACTION READ WRITE`
ROLLBACK Procedure	Equivalent to the SQL statement: `ROLLBACK`
ROLLBACK_FORCE Procedure	Equivalent to the SQL statement: `ROLLBACK FORCE <text>`
ROLLBACK_SAVEPOINT Procedure	Equivalent to the SQL statement: `ROLLBACK TO SAVEPOINT <savepoint_name>`
SAVEPOINT Procedure	Equivalent to the SQL statement: `SAVEPOINT <savepoint_name>`
STEP_ID Function	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
USE_ROLLBACK_SEGMENT Procedure	Equivalent to the SQL statement: `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`

185.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

185.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

185.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

185.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: `COMMIT`

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

185.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: `COMMIT COMMENT <text>`

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
   cmnt VARCHAR2);
```

Parameters

Table 185-2 COMMIT_COMMENT Procedure Parameters

Parameter	Description
`cmnt`	Comment to associate with this commit.

185.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
   xid VARCHAR2,
   scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 185-3 COMMIT_FORCE Procedure Parameters

Parameter	Description
`xid`	Local or global transaction ID.
`scn`	System change number.

185.2.7 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
   create_transaction BOOLEAN := FALSE)
  RETURN VARCHAR2;
```

Parameters

Table 185-4 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
`create_transaction`	If true, then start a transaction if one is not currently active.

185.2.8 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
   xid VARCHAR2);
```

Parameters

Table 185-5 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

Usage Notes

WARNING:

PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 185-6 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

Note:

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

> **Note:**
>
> Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.

185.2.9 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in DBA_2PC_PENDING by setting the MIXED column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
   xid VARCHAR2);
```

Parameters

Table 185-7 PURGE_MIXED Procedure Parameters

Parameter	Description
xid	Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.

185.2.10 READ_ONLY Procedure

This procedure is equivalent to the SQL statement SET TRANSACTION READ ONLY.

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

185.2.11 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

185.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

185.2.13 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
   xid VARCHAR2);
```

Parameters

Table 185-8 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
`xid`	Local or global transaction ID.

185.2.14 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 185-9 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
`savept`	Savepoint identifier.

185.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>` .

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 185-10 SAVEPOINT Procedure Parameters

Parameter	Description
`savept`	Savepoint identifier.

185.2.16 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```

185.2.17 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

Table 185-11 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
`rb_name`	Name of rollback segment to use.

186
DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide*for more on message format transformations.

186.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the DBMS_TRANSFORM subprograms and briefly describes them.

Table 186-1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_TRANSFORMATION Procedure	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_TRANSFORMATION Procedure	Drops the given transformation
MODIFY_TRANSFORMATION Procedure	Modifies an existing transformation

186.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema               VARCHAR2(30),
    name                 VARCHAR2(30),
    from_schema          VARCHAR2(30),
    from_type            VARCHAR2(30),
    to_schema            VARCHAR2(30),
    to_type              VARCHAR2(30),
    transformation       VARCHAR2(4000));
```

Parameters

Table 186-2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

186.1.2 DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
```

schema VARCHAR2(30),

```
    name         VARCHAR2(30));
```

Parameters

Table 186-3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

186.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
   schema             VARCHAR2(30),
   name               VARCHAR2(30),
   attribute_number   INTEGER,
   transformation     VARCHAR2(4000));
```

Parameters

Table 186-4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

187
DBMS_TSDP_MANAGE

The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies.

DBMS_TSDP_MANAGE is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_TSDP_MANAGE Subprograms

Related Topics

- DBMS_TSDP_PROTECT
  The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package.

> **See Also:**
>
> *Oracle Database Security Guide*

187.1 DBMS_TSDP_MANAGE Overview

The DBMS_TSDP_MANAGE package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the DBMS_TSDP_PROTECT package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

187.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker's rights. The DBMS_TSDP_MANAGE package is owned by SYS.

The EXECUTE privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the EXECUTE privilege for this package, while the DBMS_TSDP_PROTECT package would be governed by a security administrator.

187.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the DBMS_TSDP_MANAGE subprograms and briefly describes them.

Table 187-1 DBMS_TSDP_MANAGE Package Subprograms

Subprogram	Description
ADD_SENSITIVE_COLUMN Procedure	Adds a column to the sensitive column list
ADD_SENSITIVE_TYPE Procedure	Creates and adds a sensitive column type to the list of sensitive column types in the database
ALTER_SENSITIVE_COLUMN Procedure	Alters the sensitive type and/or the comment of a column in the sensitive column list.
DROP_SENSITIVE_COLUMN Procedure	Removes columns from the sensitive column list
DROP_SENSITIVE_TYPE Procedure	Drops a sensitive column type from the list sensitive column types in the database
DROP_SENSITIVE_TYPE_SOURCE Procedure	Drops sensitive column types corresponding to a source from the list sensitive column types in the database
IMPORT_DISCOVERY_RESULT Procedure	Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance
IMPORT_SENSITIVE_TYPES Procedure	Imports a list of sensitive column types from a source
REMOVE_DISCOVERY_RESULT Procedure	Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

187.3.1 ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCHAR2,
   column_name        IN VARCHAR2,
   sensitive_type     IN VARCHAR2,
   user_comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 187-2 *ADD_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL',
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary column');
```

187.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCAHR2,
   column_name        IN VARCAHR2,
   sensitive_type     IN VARCAHR2,
   user_comment       IN VARCAHR2 DEFAULT NULL);
```

Parameters

Table 187-3 *ALTER_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL',
  sensitive_type     => 'FINANCE_Type',
  user_comment       => 'Finance Type. Earlier categorized as Salary Type');
```

187.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
   sensitive_type     IN  VARCHAR2,
   user_comment       IN  VARCAHR2 DEFAULT NULL);
```

Parameters

Table 187-4 *ADD_SENSITIVE_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary data');
```

187.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2 DEFAULT '%',
   table_name         IN VARCAHR2 DEFAULT '%',
   column_name        IN VARCAHR2 DEFAULT '%');
```

Parameters

Table 187-5 *DROP_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column

Table 187-5 (Cont.) *DROP_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
column_name	Sensitive column name

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL');
```

187.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
   sensitive_type     IN VARCHAR2);
```

Parameters

Table 187-6 *DROP_SENSITIVE_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type to be dropped

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE');
```

187.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      IN VARCHAR2);
```

Parameters

Table 187-7 *DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters*

Parameter	Description
source	Name of the source

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      =>  'ADM_DEMO');
```

187.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  CLOB,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  XMLTYPE,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);
```

Parameters

Table 187-8 *IMPORT_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
discovery_result	List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).
discovery_source	Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.

Table 187-8 (Cont.) *IMPORT_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
force	Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source. • FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. • TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_results        =>  xml_adm_result,
  discovery_source         => 'ADM_Demo');
```

187.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN CLOB,
  source                 IN VARCHAR2);

DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN XMLTYPE,
  source                 IN VARCHAR2);
```

Parameters

Table 187-9 *IMPORT_SENSITIVE_TYPES Procedure Parameters*

Parameter	Description
sensitive_types	List of sensitive column types in XML Format (possibly as a CLOB)
source	Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        =>  xml_adm_result,
  source                 => 'ADM_Demo');
```

187.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source     IN  VARCHAR2);
```

Parameters

Table 187-10 *REMOVE_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
`discovery_source`	Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.

Examples

Remove the sensitive columns corresponding to ADM instance, `ADM_Demo`:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source    => 'ADM_Demo');
```

188
DBMS_TSDP_PROTECT

The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package.

DBMS_TSDP_PROTECT is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of DBMS_TSDP_PROTECT Subprograms

Related Topics

- DBMS_TSDP_MANAGE
  The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies.

> **See Also:**
>
> *Oracle Database Security Guide*

188.1 DBMS_TSDP_PROTECT Overview

Use the DBMS_TSDP_PROTECT package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the DBMS_TSDP_MANAGE package.

188.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the EXECUTE privilege for this package.

188.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

Table 188-1 DBMS_TDSP_PROTECT Constants - Compression Types

Constant	Type	Value	Description
TSDP_PARAM_MAX	INTEGER	4000	Maximum length of the parameter value that can be specified in FEATURE_OPTIONS

188.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- FEATURE_OPTIONS Table Type

  POLICY_CONDITIONS Table Type

188.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by VARCHAR2(M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```

188.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

188.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.

Table 188-2 DBMS_TSDP_PROTECT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure	Creates a TSDP policy
ALTER_POLICY Procedure	Alters a TDSP policy
ASSOCIATE_POLICY Procedure	Associates or disassociates a TSDP policy with a sensitive column type
DISABLE_PROTECTION_COLUMN Procedure	Disables protection for columns
DISABLE_PROTECTION_SOURCE Procedure	Disables protection based on the source of truth for the sensitive columns
DISABLE_PROTECTION_TYPE Procedure	Disables protection for a sensitive column type
DROP_POLICY Procedure	Removes a TDSP policy
ENABLE_PROTECTION_COLUMN Procedure	Enables protection for columns
ENABLE_PROTECTION_SOURCE Procedure	Enables protection based on the source of truth for the sensitive columns
ENABLE_PROTECTION_TYPE Procedure	Enables protection for a sensitive column type

188.5.1 ADD_POLICY Procedure

This procedure creates a TDSP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
   policy_name              IN VARCHAR2,
   security_feature         IN PLS_INTEGER,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 188-3 *ADD_POLICY Procedure Parameters*

Parameter	Description
`policy_name`	Name of the policy being created. The maximum length for this identifier is `M_IDEN`. This follows the Oracle naming convention.
`security_feature`	Oracle security feature with which the policy is associated. Allowed values: • `DBMS_TSDP_PROTECT.REDACT` • `DBMS_TSDP_PROTECT.VPD` • `DBMS_TSDP_PROTECT.UNIFIED_AUDIT` • `DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT` • `DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION`
`policy_enable_options`	Initialized with the parameter-value pairs corresponding to the `security_feature` setting

Table 188-3 (Cont.) *ADD_POLICY Procedure Parameters*

Parameter	Description
policy_apply_condition	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(*Property*)= *property_value*. Permissible values for Property: • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy PARTIAL_MASK_POLICY:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
   'SYS_CONTEXT(''USERENV'',''SESSION_USER'')      =''APPUSER''';
  redact_feature_options ('function_type')        := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')  := 'STR, VVVVVVVVV,VVVVVVVVV,
*,  1, 6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)   := 'VARCHAR2';
 DBMS_TSDP_PROTECT.ADD_POLICY
  ('PARTIAL_MASK_POLICY',  DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;
```

188.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```
DBMS_TSDP_PROTECT.ALTER_POLICY (
   policy_name              IN VARCHAR2,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION default TSDP$default_condition);
```

Parameters

Table 188-4 *ALTER_POLICY Procedure Parameters*

Parameter	Description
`policy_name`	Name of the policy to alter
`policy_enable_options`	Initialized with the parameter-value pairs corresponding to the security feature
`policy_apply_condition`	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding `policy_enable_options`. This is an associative array with Property as the key (`PLS_INTEGER`). Example: `example_policy_condition(`*`Property`*`)=`*`property_value`*. Permissible values for Property: • `DBMS_TSDP_PROPERTY.DATATYPE` • `DBMS_TSDP_PROPERTY.LENGTH` • `DBMS_TSDP_PROPERTY.PARENT_SCHEMA` • `DBMS_TSDP_PROPERTY.PARENT_TABLE`

Usage Notes

- If the `policy_apply_condition` matches an existing condition for the policy, then the corresponding enable options are updated with `policy_enable_options`.
- If the `policy_apply_condition` does not match any existing condition for the policy, the combination of `policy_enable_options` and `policy_apply_condition` is added to the policy.

Examples

Add a new combination of `policy_apply_condition` and `policy_enable_options` to an existing policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   redact_feature_options ('expression') :=
       'SYS_CONTEXT(''USERENV'',''SESSION_USER'')=''APPUSER''';
   redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
   redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV,VVVVVVVVV, *,
        1, 6';
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY',  redact_feature_options,
policy_conditions);
END;
```

188.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
   policy_name        IN  VARCHAR2,
```

```
   sensitive_type     IN  VARCHAR2,
   associate          IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 188-5 *ASSOCIATE_POLICY Procedure Parameters*

Parameter	Description
policy_name	Name of the TDSP policy
sensitive_type	Name of the sensitive column type:
associate	Associate or Disassociate. TRUE implies Associate

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

188.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
   schema_name        IN  VARCHAR2 DEFAULT '%',
   table_name         IN  VARCHAR2 DEFAULT '%',
   column_name        IN  VARCHAR2 DEFAULT '%',
   policy_name        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 188-6 *DISABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is disabled.

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

188.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 188-7 *DISABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
`discovery_sourcename`	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Disable protection for all columns corresponding to `ADM_Demo`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

188.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 188-8 *DISABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
`sensitive_type`	Name of the sensitive column type

Examples

Disable protection for all columns identified by `SSN_TYPE`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

188.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2,
```

```
   policy_apply_condition   IN POLICY_CONDITIONS);

DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2);
```

Parameters

Table 188-9 *DROP_POLICY Procedure Parameters*

Parameter	Description
`policy_name`	Name of the policy to drop
`policy_apply_condition`	To be initialized with the relevant condition

Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;
```

Dropping a TSDP policy:

```
BEGIN
   DBMS_TSDP_PROTECT.DROP_POLICY(
   policy_name => 'PARTIAL_MASK_POLICY');
END;
```

188.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
   schema_name         IN  VARCHAR2 DEFAULT '%',
   table_name          IN  VARCHAR2 DEFAULT '%',
   column_name         IN  VARCHAR2 DEFAULT '%',
   policy_name         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 188-10 *ENABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is enabled.

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

188.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 188-11 *ENABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
`discovery_sourcename`	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Enable protection for all columns corresponding to `ADM_Demo`:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

188.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 188-12 *ENABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
`sensitive_type`	Name of the sensitive column type

Examples

Enable protection for all columns identified by `SSN_TYPE`:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

189
DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

This chapter contains the following topics:

- Security Model
- Exceptions
- Operational Notes
- Summary of DBMS_TTS Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Upgrade Guide*

189.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

189.2 DBMS_TTS Exceptions

The `DBMS_TTS` package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

189.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

189.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 189-1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure	Downgrades transportable tablespace-related data
TRANSPORT_SET_CHECK Procedure	Checks if a set of tablespaces (to be transported) is self-contained

189.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

189.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
   ts_list          IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 189-2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of one or more tablespaces, separated by comma.

Table 189-2 (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
`incl_constraints`	`TRUE` if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The `incl_constraints` parameter is a default so that `TRANSPORT_SET_CHECK` will work if it is called with only the `ts_list` argument.)
`full_check`	Indicates whether a full or partial dependency check is required. If `TRUE`, treats all `IN` and `OUT` pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to `TRUE` for TSPITR or if a strict version of transportable is desired. By default the parameter is set to `FALSE`. It will only consider `OUT` pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

190
DBMS_TYPES

The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Constants
- Exceptions

190.1 DBMS_TYPES Constants

The DBMS_TYPES package defines several constants to use when specifying parameter values.

These constants are listed in following table .

Table 190-1 ***DBMS_TYPES Constants***

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type

Table 190-1 (Cont.) *DBMS_TYPES Constants*

Constant	Description
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

190.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

191
DBMS_UMF

The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- Summary of DBMS_UMF Subprograms

191.1 Summary of DBMS_UMF Subprograms

This topic lists the DBMS_UMF subprograms in alphabetical order and briefly describes them.

Table 191-1 DBMS_UMF Package Subprograms

Subprogram	Description
CONFIGURE_NODE Procedure	Configures a node in the RMF topology
CREATE_LINK Procedure	Creates a database link between two nodes in the RMF topology
CREATE_TOPOLOGY Procedure	Creates the RMF topology
DROP_LINK Procedure	Removes a database link between two nodes in the RMF topology
DROP_TOPOLOGY Procedure	Deletes the RMF topology
ENABLE_SERVICE Procedure	Enables a service on a node in the RMF topology
GET_NODE_ID_LOCAL Function	Returns the node ID of a node in the RMF topology
GET_NODE_NAME_LOCAL Function	Returns the node name of a node in the RMF topology
GET_TARGET_ID Function	Returns the destination ID in the RMF topology
GET_TOPOLOGY_NAME_LOCAL Function	Returns the RMF topology name of the local node
QUERY_LINK_INFO Procedure	Returns the information about a database link in the RMF topology
QUERY_NODE_INFO Procedures	Returns the information about a node in the RMF topology
REGISTER_NODE Function and Procedure	Registers a node in the RMF topology

Table 191-1 (Cont.) DBMS_UMF Package Subprograms

Subprogram	Description
SWITCH_DESTINATION Procedure	Designates a source node as a destination node in the RMF topology
UNCONFIGURE_NODE Procedure	Resets the configuration of a node in the RMF topology
UNREGISTER_NODE Procedure	Removes the registration of a node in the RMF topology

191.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```
DBMS_UMF.CONFIGURE_NODE(
   node_name          IN VARCHAR2 DEFAULT NULL,
   dblink_to_target   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 191-2 CONFIGURE_NODE Procedure Parameters

Parameter	Description
node_name	Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter DB_UNIQUE_NAME is assigned as the name for the node by default.
dblink_to_target	Database link from this node to the destination node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK(
   topology_name      IN VARCHAR2,
   node_a_name        IN VARCHAR2,
```

```
   node_b_name         IN VARCHAR2,
   dblink_a_to_b       IN VARCHAR2,
   dblink_b_to_a       IN VARCHAR2);
```

Parameters

Table 191-3 CREATE_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.
dblink_a_to_b	Database link from the first node to the second node.
dblink_b_to_b	Database link from the second node to the first node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```
DBMS_UMF.CREATE_TOPOLOGY(
   topology_name IN VARCHAR2);
```

Parameters

Table 191-4 CREATE_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_LINK(
   topology_name  IN VARCHAR2,
   node_a_name    IN VARCHAR2,
   node_b_name    IN VARCHAR2);
```

Parameters

Table 191-5 DROP_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_TOPOLOGY(
   topology_name IN VARCHAR2);
```

Parameters

Table 191-6 DROP_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the topology to delete.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.ENABLE_SERVICE(
   topology_name      IN VARCHAR2,
   node_name          IN VARCHAR2,
   service_type       IN NUMBER);
```

Parameters

Table 191-7 ENABLE_SERVICE Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node on which a specific service needs to be enabled.
service_type	Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(
   topology_name  IN  VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 191-8 GET_NODE_ID_LOCAL Function Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

Security Model

Only the database users SYS and SYS$UMF can execute this function.

191.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(
   topology_name  IN  VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 191-9 GET_TARGET_ID Function Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.11 QUERY_LINK_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_LINK_INFO(
   topology_name      IN   VARCHAR2,
   from_node_id       IN   NUMBER,
   to_node_id         IN   NUMBER,
   link_name          OUT  VARCHAR2);
```

Parameters

Table 191-10 QUERY_LINK_INFO Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
from_node_id	Node ID of the first node.
to_node_id	Node ID of the second node.
link_name	Name of the database link from the first node to the second node returned by the procedure.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.12 QUERY_NODE_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_NODE_INFO(
   topology_name      IN    VARCHAR2  DEFAULT NULL,
   node_name          IN    VARCHAR2,
   node_id            OUT   NUMBER);

DBMS_UMF.QUERY_NODE_INFO(
   node_id            IN    NUMBER,
   topology_name      OUT   VARCHAR2,
   node_name          OUT   VARCHAR2);
```

Parameters

Table 191-11 QUERY_NODE_INFO Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.
node_name	Name of the node.
node_id	Identifier of the node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE(
   topology_name          IN  VARCHAR2,
   node_name              IN  VARCHAR2,
   dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
   as_source              IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');

DBMS_UMF.REGISTER_NODE(
   topology_name          IN  VARCHAR2,
   node_name              IN  VARCHAR2,
   dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
```

```
   as_source              IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE');
   node_id                OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
   topology_name          IN  VARCHAR2,
   node_name              IN  VARCHAR2,
   dblink_to_node         IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node       IN  VARCHAR2 DEFAULT NULL,
   as_source              IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target    IN  VARCHAR2 DEFAULT 'FALSE')
 RETURN NUMBER;
```

Parameters

Table 191-12 REGISTER_NODE Function and Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node to register.
dblink_to_node	Name for the database link from the destination to the node.
dblink_from_node	Name for the database link from the node to the destination.
as_source	Set to TRUE, if the node is a source, else set to FALSE.
as_candidate_target	Set to TRUE, if the node is a candidate destination, else set to FALSE.
node_id	Node ID returned by the procedure.

Return Value

Returns the node ID of the registered node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

Syntax

```
DBMS_UMF.SWITCH_DESTINATION(
   topology_name      IN VARCHAR2,
   force_switch       IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 191-13 SWITCH_DESTINATION Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
force_switch	If set to FALSE, the execution of this procedure fails in the following situations: • Candidate destination is a read-only database, and hence it cannot become the new destination. • Candidate destination does not have database links to one or more sources in the topology. • Candidate destination is unable to get the latest AWR data from the old destination. If set to TRUE, the execution of this procedure fails in the following situation: • Candidate destination is a read-only database, and hence it cannot become the new destination.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

191.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.UNREGISTER_NODE(
   topology_name    IN VARCHAR2,
   node_name        IN VARCHAR2);
```

Parameters

Table 191-14 UNREGISTER_NODE Procedure Parameters

Parameter	Description
`topology_name`	Name of the RMF topology.
`node_name`	Name of the node which needs to be removed from the topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

192
DBMS_USER_CERTS

The DBMS_USER_CERTS package allows you add and delete certificates.

This chapter contains the following topics:

- DBMS_USER_CERTS Overview
- DBMS_USER_CERTS Security Model
- Summary of DBMS_USER_CERTS Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Concepts*
> - *Oracle Database SQL Language Reference*
> - *Oracle Database Reference*
> - For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

192.1 DBMS_USER_CERTS Overview

The DBMS_USER_CERTS package allows you add and delete certificates.

The DBMS_USER_CERTS package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

192.2 DBMS_USER_CERTS Security Model

The DBMS_USER_CERTS package is owned by SYS and is installed as part of database installation.

- Both ADD_CERTIFICATE( ) and DROP_CERTIFICATE( ) sub-programs can be executed by any database user. The EXECUTE privilege on DBMS_USER_CERTS package is granted to PUBLIC role.

- Using `ADD_CERTIFICATE()`, a database user can add multiple certificates, each one would be identified uniquely using a `GUID`.
- Only `SYSDBA` or the user who owns the certificate, can drop it using `DROP_CERTIFICATE()`.

192.3 Summary of DBMS_USER_CERTS Subprograms

The `DBMS_USER_CERTS` package uses `ADD_CERTIFICATE` and `DROP_CERTIFICATE` subprograms to add and delete `X.509` certificates which are used for signature verification for blockchain tables by the current user.

Table 192-1 DBMS_USER_CERTS Package Subprograms

Subprogram	Description
ADD_CERTIFICATE Procedure	Adds `X.509` certificates which are used for signature verification of blockchain tables.
DROP_CERTIFICATE Procedure	Drops a certificate that is used for signature verification of blockchain tables.

192.3.1 ADD_CERTIFICATE Procedure

This procedure can be used by the current user to add an `X.509` certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE(
   x509_cert                 IN  BLOB,
   cert_id                   OUT RAW);
```

Parameters

Table 192-2 ADD_CERTIFICATE Procedure Parameters

Parameter	Description
`x509_cert`	The `X.509` certificate used for signature verification of blockchain tables.
`cert_id`	The Global Unique Identifier (GUID) for the certificate.

192.3.2 DROP_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE(
   cert_id                    IN  RAW);
```

Parameters

Table 192-3 DROP_CERTIFICATE Procedure Parameters

Parameter	Description
`cert_id`	The Global Unique Identifier (GUID) of the certificate.

193
DBMS_UTILITY

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- DBMS_UTILITY Deprecated Subprograms
- Security Model
- Constants
- Exceptions
- Data Structures
- Summary of DBMS_UTILITY Subprograms

193.1 DBMS_UTILITY Deprecated Subprograms

These DBMS_UTILITY subprograms are deprecated in Oracle Database 12*c* release 12.2.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- GET_PARAMETER_VALUE Function

  Query v$_parameter directly to find the value of an init.ora parameter.
- ANALYZE_PART_OBJECT Procedure

  Use DBMS_STATS to gather statistics.
- GET_DEPENDENCY Procedure

  There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

193.2 DBMS_UTILITY Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE procedure and the COMPILE_SCHEMA procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Related Topics

- NAME_RESOLVE Procedure
  This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- COMPILE_SCHEMA Procedure
  This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

193.3 DBMS_UTILITY Constants

The DBMS_UTILITY package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

Table 193-1 DBMS_UTILITY Constants

Name	Type	Value	Description
INV_ERROR_ON_RESTRICTIONS	PLS_INTEGER	1	This constant is the only legal value for the p_option_flags parameter of the INVALIDATE subprogram

193.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by DBMS_UTILITY.

Table 193-2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
INV_NOT_EXIST_OR_NO_PRIV	-24237	Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	-24238	Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	-24239	Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened

193.5 DBMS_UTILITY Data Structures

The DBMS_UTILITY package defines a single RECORD type and TABLE types.

Record Types

- INSTANCE_RECORD Record Type

Table Types

- DBLINK_ARRAY TABLE Type
- INDEX_TABLE_TYPE Table Type
- INSTANCE_TABLE Table Type
- LNAME_ARRAY Table Type
- NAME_ARRAY Table Type
- NUMBER_ARRAY Table Type
- UNCL_ARRAY Table Type

193.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (
     inst_number   NUMBER,
     inst_name     VARCHAR2(60));
```

Fields

Table 193-3 INSTANCE_RECORD Record Type Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

193.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

193.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

193.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` Is 1; `INSTANCE_TABLE` Is Dense.

Related Topics

- DBMS_UTILITY INSTANCE_RECORD Record Type
  This type describes a list of active instance number-name pairs.

193.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

193.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

193.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

193.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of `"user"."name"."column"@link`

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

193.6 Summary of DBMS_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

Table 193-4 ***DBMS_UTILITY Package Subprograms***

Subprogram	Description
ACTIVE_INSTANCES Procedure	Returns the active instance
ANALYZE_DATABASE Procedure	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure	Analyzes the given tables and indexes This procedure is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. Use `DBMS_STATS` to gather statistics.
ANALYZE_SCHEMA Procedure	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure	Canonicalizes a given string
COMMA_TO_TABLE Procedures	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure	Creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement
CURRENT_INSTANCE Function	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function	Gets the file number part of a data block address
DB_VERSION Procedure	Returns version information for the database
EXEC_DDL_STATEMENT Procedure	Executes the DDL statement in `parse_string`
EXPAND_SQL_TEXT Procedure	Recursively replaces any view references in the input SQL query with the corresponding view subquery
FORMAT_CALL_STACK Function	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function	Formats the current error stack
GET_CPU_TIME Function	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure	Shows the dependencies on the object passed in. This procedure is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.
GET_ENDIANNESS Function	Gets the endianness of the database platform
GET_HASH_VALUE Function	Computes a hash value for the given string
GET_PARAMETER_VALUE Function	Gets the value of specified init.ora parameter. This function is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. You can query `v$_parameter` directly.
GET_SQL_HASH Function	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function	Returns the current time in 100th's of a second
GET_TZ_TRANSITIONS Procedure	Returns time zeone transitions by `regionid` from the `timezone.dat` file

Table 193-4 (Cont.) *DBMS_UTILITY Package Subprograms*

Subprogram	Description
INVALIDATE Procedure	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function	Checks the bit setting for the given bit in the given RAW value
IS_CLUSTER_DATABASE Function	Determines if the database is running in cluster database mode
MAKE_DATA_BLOCK_ADDRESS Function	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure	Resolves the given name
NAME_TOKENIZE Procedure	Calls the parser to parse the given name
OLD_CURRENT_SCHEMA Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')
OLD_CURRENT_USER Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')
PORT_STRING Function	Returns a string that uniquely identifies the version of Oracle and the operating system
SQLID_TO_SQLHASH Function	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure	Makes invalid database objects valid
WAIT_ON_PENDING_DML Function	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

193.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
   instance_table   OUT INSTANCE_TABLE,
   instance_count   OUT NUMBER);
```

Parameters

Table 193-5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances

193.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 193-6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
`method`	One of `ESTIMATE`, `COMPUTE` or `DELETE`. If `ESTIMATE` then either `estimate_rows` or `estimate_percent` must be nonzero.
`estimate_rows`	Number of rows to estimate
`estimate_percent`	Percentage of rows to estimate. If `estimate_rows` is specified ignore this parameter.

`method_opt`	Method options of the following format:
	`[ FOR TABLE ]`
	`[ FOR ALL [INDEXED] COLUMNS] [SIZE n]`
	`[ FOR ALL INDEXES ]`

Exceptions

`ORA-20000`: Insufficient privileges for some object in this database

193.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "`ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]`

> **Note:**
>
> This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use DBMS_STATS to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
   schema        IN VARCHAR2 DEFAULT NULL,
   object_name   IN VARCHAR2 DEFAULT NULL,
   object_type   IN CHAR     DEFAULT 'T',
   command_type  IN CHAR     DEFAULT 'E',
```

```
   command_opt   IN VARCHAR2 DEFAULT NULL,
   sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 193-7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

Usage Notes

For each partition of the object, run in parallel using job queues.

193.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
   schema             IN  VARCHAR2,
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 193-8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

193.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
   name           IN    VARCHAR2,
   canon_name     OUT   VARCHAR2,
   canon_len      IN    BINARY_INTEGER);
```

Parameters

Table 193-9 CANONICALIZE Procedure Parameters

Parameter	Description
name	String to be canonicalized
canon_name	Canonicalized string
canon_len	Length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a

- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with",c.f" ignored.

193.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT lname_array);
```

Parameters

Table 193-10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
list	Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c]][@ d] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted).
tablen	Number of tables in the PL/SQL table
tab	PL/SQL table which contains list of names

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in tab are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

193.6.7 COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
   schema          IN VARCHAR2,
   compile_all     IN BOOLEAN DEFAULT TRUE,
   reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 193-11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 193-12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for the RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

  ```
  SHOW ERRORS <type> <schema>.<name>
  ```

193.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
   schema_name      IN     VARCHAR2,
   table_name       IN     VARCHAR2);
```

Parameters

Table 193-13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
`schema_name`	Name of the schema
`table_name`	Name of the table created

Exceptions

An error is returned if the table already exists.

193.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
   RETURN NUMBER;
```

193.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 193-14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
`dba`	Data block address

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

193.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 193-15 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

193.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (
   version       OUT VARCHAR2,
   compatibility OUT VARCHAR2);
```

Parameters

Table 193-16 DB_VERSION Procedure Parameters

Parameter	Description
`version`	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
`compatibility`	The compatibility setting of the database determined by the "compatible" `init.ora` parameter. If the parameter is not specified in the `init.ora` file, then `NULL` is returned.

193.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
   parse_string IN VARCHAR2);
```

Parameters

Table 193-17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
`parse_string`	DDL statement to be executed

193.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
   input_sql_text     IN           CLOB,
   output_sql_text    OUT NOCOPY   CLOB);
```

Parameters

Table 193-18 EXPAND_SQL_TEXT Procedure Parameters

Parameter	Description
`input_sql_text`	Input SQL query text
`output_sql_text`	View-expanded query text

Exceptions

Table 193-19 EXPAND_SQL_TEXT Procedure Exceptions

Exception	Description
ORA-00942	Current user does not have select privileges on all the views and tables recursively referenced in the input_sql_text
ORA-24251	input_sql_text is not a SELECT statement
ORA-00900	Input is not valid
ORA-29477	Input LOB size exceeds maximum size of 4GB -1

Usage Notes

The expanded and merged SQL statement text is copied to output_sql_text on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic WHERE clause. This function would return differently, for example, if the userid caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

193.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

193.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A `NULL` string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

BEGIN
  WHILE Output_One_Line() LOOP NULL;
  END LOOP;
END Log_Errors;

    or database administrator.
*/
```

193.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
  RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

193.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
  DBMS_UTILITY.GET_CPU_TIME
   RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

193.6.19 GET_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

> **Note:**
>
> This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
 type      IN     VARCHAR2,
 schema    IN     VARCHAR2,
 name      IN     VARCHAR2);
```

Parameters

Table 193-20 GET_DEPENDENCY Procedure Parameters

Parameter	Description
`type`	Type of the object, for example if the object is a table give the type as 'TABLE'
`schema`	Schema name of the object
`name`	Name of the object

Usage Notes

This procedure uses the DBMS_OUTPUT package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

193.6.20 GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
 RETURN NUMBER;
```

Return Values

A NUMBER value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

193.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
   name      VARCHAR2,
   base      NUMBER,
   hash_size NUMBER)
  RETURN NUMBER;
```

Parameters

Table 193-21 GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

193.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified init.ora parameter.

> **Note:**
>
> This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query v$_parameter directly.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
   parnam     IN        VARCHAR2,
```

```
   intval     IN OUT    BINARY_INTEGER,
   strval     IN OUT    VARCHAR2,
   listno     IN        BINARY_INTEGER DEFAULT 1)
  RETURN BINARY_INTEGER;
```

Parameters

Table 193-22 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
`parnam`	Parameter name
`intval`	Value of an integer parameter or the value length of a string parameter
`strval`	Value of a string parameter
`listno`	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the `SELECT` privilege on the V$PARAMETER dynamic view.

Examples

```
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                             intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```

193.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
   name          IN   VARCHAR2,
   hash          OUT  RAW,
   pre10ihash    OUT  NUMBER)
  RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(`Get_sql_hash`, `Wnds`, `Rnds`, `Wnps`, `Rnps`);

Parameters

Table 193-23 GET_SQL_HASH Procedure Parameters

Parameter	Description
`name`	String to be hashed
`hash`	Optional field to store all 16 bytes of returned hash value
`pre10ihash`	Optional field to store the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10*i* hash value of 4 bytes in the pre10*i* hash optional parameter.

193.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
  RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,

application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

193.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
   regionid      IN     NUMBER,
   transitions   OUT    MAXRAW);
```

Parameters

Table 193-24 GET_TZ_TRANSITIONS Procedure Parameters

Parameter	Description
`regionid`	Number corresponding to the region
`transitions`	Raw bytes from the `timezone.dat` file

Exceptions

Table 193-25 GET_TZ_TRANSITIONS Procedure Exceptions

Exception	Description
`ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR`	For an invalid `regionid`

193.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
   p_object_id              NUMBER,
   p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
   p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

Table 193-26 INVALIDATE Procedure Parameters

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_settings	Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	Optional parameter defaults to zero (no flags). Option flags supported by invalidate. • inv_error_on_restrictions (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 193-27 INVALIDATE Exceptions

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened

Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the `HR` schema. Then the above call will mark the remove_emp procedure invalid and change it's `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the `OE` schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

193.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
   r     IN    RAW,    n     IN    NUMBER)
 RETURN NUMBER;
```

Parameters

Table 193-28 IS_BET_SET Function Parameters

Parameter	Description
r	RAW source
n	Bit in r to check

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

193.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

193.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
   file  NUMBER,
   block NUMBER)
  RETURN NUMBER;
```

Parameters

Table 193-29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
`file`	File that contains the block
`block`	Offset of the block within the file in terms of block increments

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

193.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
   name          IN  VARCHAR2,
   context       IN  NUMBER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT NUMBER,
   object_number OUT NUMBER);
```

Parameters

Table 193-30 NAME_RESOLVE Procedure Parameters

Parameter	Description
`name`	Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the `schema`, `part1`, `part2` and `dblink` `OUT` parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).

Table 193-30 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
context	Must be an integer between 0 and 9. • 0 - table • 1 - PL/SQL (for 2 part names) • 2 - sequences • 3 - trigger • 4 - Java Source • 5 - Java resource • 6 - Java class • 7 - type • 8 - Java shared data • 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: • 5 - synonym • 7 - procedure (top level) • 8 - function (top level) • 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

193.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as `a [. b [. c ]][@ dblink ]`.

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
   name    IN  VARCHAR2,
   a       OUT VARCHAR2,
   b       OUT VARCHAR2,
   c       OUT VARCHAR2,
```

```
   dblink  OUT VARCHAR2,
   nextpos OUT BINARY_INTEGER);
```

Parameters

Table 193-31 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
a	Output for the first token of the name
b	Output for the second token of the name (if applicable)
c	Output for the third token of the name (if applicable)
dblink	Output for the dblink of the name
nextpos	Next position after parsing the input name

193.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from sys_context ('userenv', 'current_schema').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
 RETURN VARCHAR2;
```

193.6.33 OLD_CURRENT_USER Function

This function returns the session value from sys_context ('userenv', 'current_user').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
 RETURN VARCHAR2;
```

193.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
   RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

193.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
   sql_id    IN   VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 193-32 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
`sql_id`	SQL ID of a SQL statement. Must be `VARCHAR2(13)`.

193.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, `1..n`, terminated with `n+1 null`. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  UNCL_ARRAY,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);

DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  lname_array,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);
```

Parameters

Table 193-33 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
`tab`	PL/SQL table which contains list of table names
`tablen`	Number of tables in the PL/SQL table
`list`	Comma separated list of tables

Return Values

A comma-delimited list and the number of elements found in the table.

193.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
   owner          VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER,   edition_name   := SYS_CONTEXT ('USERENV',
'CURRENT_EDITION'));
```

Parameters

Table 193-34 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows: • 1 — TABLE/PROCEDURE/TYPE • 2 — BODY • 3 — TRIGGER • 4 — INDEX • 5 — CLUSTER • 8 — LOB • 9 — DIRECTORY • 10 — QUEUE • 11 — REPLICATION OBJECT GROUP • 12 — REPLICATION PROPAGATOR • 13 — JAVA SOURCE • 14 — JAVA RESOURCE • 58 — (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its object_id. The subprogram automatically switches to the edition in which the object is

actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.

193.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables     IN       VARCHAR2,
    timeout    IN       BINARY_INTEGER,
    scn        IN OUT   NUMBER)
  RETURN BOOLEAN;
```

Parameters

Table 193-35 WAIT_ON_PENDING_DML Function Parameters

Parameter	Description
tables	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
timeout	Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.
scn	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

194
DBMS_WARNING

The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_WARNING Subprograms

194.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.

194.2 Summary of DBMS_WARNING Subprograms

This table lists the DBMS_WARNING subprograms and briefly describes them.

Table 194-1 ***DBMS_WARNING Package Subprograms***

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure	Modifies the current session or system warning settings of the warning_category previously supplied
ADD_WARNING_SETTING_NUM Procedure	Modifies the current session or system warning settings of the or warning_number previously supplied
GET_CATEGORY Function	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure	Replaces previous settings with the new value

194.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE`/`DISABLE`/`ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 194-2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
`warning_category`	Name of the category. Allowed values are `ALL`, `INFORMATIONAL`, `SEVERE` and `PERFORMANCE`.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

194.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE`/ `ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 194-3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
`warning_number`	The warning number. Allowed values are all valid warning numbers.

Table 194-3 (Cont.) ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
warning_value	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

Example 194-1 Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

```
BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                        'ENABLE',
                                        'SESSION');
END;
```

194.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
   warning_number  IN   pls_integer)
RETURN VARCHAR2;
```

Parameters

Table 194-4 GET_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

194.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2)
RETURN warning_value;
```

Parameters

Table 194-5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

194.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER)
RETURN warning_value;
```

Parameters

Table 194-6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

194.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
 RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have SELECT or READ privilege on v$parameter or v$paramater2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.

194.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` or `ALTER SYSTEM` command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
   warning_value   IN   VARCHAR2,
   scope           IN   VARCHAR2);
```

Parameters

Table 194-7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
`warning_value`	The new string that will constitute the new value.
`scope`	This will specify if the changes are being done in the session context, or system context. Allowed values are `SESSION` or `SYSTEM`.

195
DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

196
DBMS_WORKLOAD_CAPTURE

The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAY package.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_WORKLOAD_CAPTURE Subprograms

> **See Also:**
>
> *Oracle Database Testing Guide* for more information about database replay

196.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

196.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using DBMS_WORKLOAD_CAPTURE.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
```

```
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

196.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the DBMS_WORKLOAD_CAPTURE package subprograms in alphabetical order.

Table 196-1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures	Adds a specified filter
DECRYPT_CAPTURE Procedure	This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.
DELETE_CAPTURE_INFO Procedure	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
DELETE_FILTER Procedure	Deletes a specified filter
ENCRYPT_CAPTURE Procedure	This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.
EXPORT_AWR Procedure	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
IMPORT_AWR Function	Imports the AWR snapshots associated with a given capture ID
REPORT Function	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

196.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   NUMBER NOT NULL);
```

Parameters

Table 196-2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: • INSTANCE_NUMBER - type NUMBER • USER - type STRING • MODULE - type STRING • ACTION - type STRING • PROGRAM - type STRING • SERVICE - type STRING • PDB_NAME - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME',
'CDB1_PDB1');
```

- To use DBMS_APPLICATION_INFO to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION',
'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE',
'ORDER_ENTRY');
```

196.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (
   src_dir               IN   VARCHAR2,
   dst_dir               IN   VARCHAR2);
```

Parameters

Table 196-3 DECRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be decrypted. This parameter is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory This parameter is case sensitive.

Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

196.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
   capture_id     IN   NUMBER);
```

Parameters

Table 196-4 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to `DBA_WORKLOAD_CAPTURES.ID`. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

196.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
   filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

Table 196-5 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	Filter to be deleted

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.

196.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in START_CAPTURE procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
   src_dir     IN VARCHAR2,
   dst_dir     IN VARCHAR2,
   encryption  IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

Table 196-6 ENCRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive.
encryption	Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256.

Usage Notes

For encrypted capture, the ENCRYPT_CAPTURE Procedure relies on a software keystore. The identifier is oracle.rat.database_replay.encryption (case-sensitive).

196.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id     IN NUMBER);
```

Parameters

Table 196-7 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

196.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
   timeout     IN   NUMBER  DEFAULT 30
   reason       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 196-8 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send it's acknowledgement to FINISH_CAPTURE.

  To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.

196.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir      IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 196-9 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function simply returns that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row is inserted to DBA_WORKLOAD_CAPTURES and that row's ID is returned.

196.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id       IN   NUMBER,
   staging_schema   IN   VARCHAR2,
   force_cleanup    IN   BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 196-10 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema.The SYS schema is not a valid input. (Mandatory, Case sensitive).

force_cleanup	Values:
	• TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:
	`SELECT table_name FROM dba_tables`
	`WHERE owner = staging_schema`
	`AND table_name like 'WR_$%';`
	Use this option only if you are sure that there are no important data in any such tables in the staging_schema.
	• FALSE - (default) no tables dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

- EXPORT_AWR Procedure
  This procedure exports the AWR snapshots associated with a given capture ID.

196.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
   capture_id      IN   NUMBER,
   format          IN   VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 196-11 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB.

Table 196-12 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Used as input to the format argument to generate the text version of the report

196.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
   name              IN  VARCHAR2,
   dir               IN  VARCHAR2,
   duration          IN  NUMBER   DEFAULT NULL,
   default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
   auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE,
   capture_sts       IN  BOOLEAN  DEFAULT FALSE,
   sts_cap_interval  IN  NUMBER   DEFAULT 300,
   plsql_mode        IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
   encryption        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 196-13 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. • If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) • If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. • If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) • If FALSE, no database instance is automatically unrestricted.
capture_sts	If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Table 196-13 (Cont.) START_CAPTURE Procedure Parameters

Parameter	Description
plsql_mode	Specifies the PL/SQL capture mode: • TOP_LEVEL — only top-level PL/SQL calls are captured • EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured
encryption	Specify if sensitive data in workload capture is encrypted or not. The possible values are: • NULL — capture files are not encrypted • AES128 — capture files are encrypted using AES128 • AES192 — capture files are encrypted using AES192 • AES256 — capture files is encrypted using AES256 The default value is NULL.

Usage Notes

- All user requests sent to database after a successful invocation of START_CAPTURE are recorded in the given dir directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the FINISH_CAPTURE Procedure is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until FINISH_CAPTURE is executed, whichever occurs first.
- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as SMON, PMON, MMON) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in RESTRICTED mode using STARTUP RESTRICT are UNRESTRICTED upon a successful invocation of START_CAPTURE Use FALSE for the auto_unrestrict input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when START_CAPTURE is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after START_CAPTURE are replayed.
- For encrypted capture, the START_CAPTURE Procedure relies on a software keystore. The identifier is oracle.rat.database_replay.encryption (case-sensitive).
- You must configure a software keystore in auto-login mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

197
DBMS_WORKLOAD_REPLAY

The DBMS_WORKLOAD_REPLAY package provides a interface to replay a workload capture.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms

> **See Also:**
>
> *Oracle Database Testing Guide* for more information about database replay

197.1 DBMS_WORKLOAD_REPLAY Overview

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package.

Typically, the DBMS_WORKLOAD_CAPTURE package is used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics

- DBMS_WORKLOAD_CAPTURE
  The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data.

197.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using DBMS_WORKLOAD_REPLAY.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

197.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

Table 197-1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_CAPTURE Function	Adds the given capture to the current schedule
ADD_FILTER Procedure	Adds a filter to replay only a subset of the captured workload
ADD_SCHEDULE_ORDERING Function	Adds a schedule order between two captures
ASSIGN_GROUP_TO_INSTANCE Procedure	Modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`
BEGIN_REPLAY_SCHEDULE Procedure	Initiates the creation of a reusable replay schedule
CALIBRATE Function	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure	Cancels the workload replay in progress
COMPARE_PERIOD_REPORT Procedure	Generates a report comparing a replay to its capture or to another replay of the same capture
COMPARE_SQLSET_REPORT Function	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
CREATE_FILTER_SET Procedure	Uses the replay filters added to create a set of filters to use against the replay in `replay_dir`
DELETE_FILTER Procedure	Deletes the named filter
DELETE_REPLAY_INFO Procedure	Deletes the rows in `DBA_WORKLOAD_REPLAYS` that corresponds to the given workload replay ID
END_REPLAY_SCHEDULE Procedure	Wraps up the creation of the current schedule

Table 197-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
EXPORT_AWR Procedure	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GENERATE_CAPTURE_SUBSET Procedure	Creates a new capture from an existing workload capture
GET_DIVERGING_STATEMENT Function	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GET_REPLAY_DIRECTORY Function	Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure.
GET_REPLAY_INFO Function	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
GET_REPLAY_TIMEOUT Procedure	Retrieves the replay timeout setting
IMPORT_AWR Function	Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
INITIALIZE_CONSOLIDATED_REPLAY Procedure	Puts the database state in `INIT` for a multiple-capture replay
INITIALIZE_REPLAY Procedure	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function	Reports whether the replay is currently paused
LOAD_LONG_SQLTEXT Procedure	Loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view
PAUSE_REPLAY Procedure	Pauses the in-progress workload replay
POPULATE_DIVERGENCE Procedure	Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_CONSOLIDATED_REPLAY Procedure	Puts the database in a special "Prepare" mode for a multiple-capture replay
PREPARE_REPLAY Procedure	Puts the database in a special "Prepare" mode
PROCESS_CAPTURE Procedure	Processes the workload capture found in `capture_dir` in place
REMAP_CONNECTION Procedure	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
REMOVE_CAPTURE Procedure	Removes the given capture from the current schedule
REMOVE_SCHEDULE_ORDERING Procedure	Removes an existing schedule order from the current replay schedule
REPORT Function	Generates a report on the given workload replay
RESUME_REPLAY Procedure	Resumes a paused workload replay
REUSE_REPLAY_FILTER_SET Procedure	Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function

Table 197-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
SET_ADVANCED_PARAMETER Procedure	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
SET_REPLAY_DIRECTORY Procedure	Sets a directory that contains multiple workload captures as the current replay directory
SET_REPLAY_TIMEOUT Procedure	Sets the replay timeout setting
SET_SQL_MAPPING Procedure	Specifies SQL statements to be skipped or replaced during a database replay operation
SET_USER_MAPPING Procedure	Sets a new schema or user name to be used during replay instead of the captured user
START_CONSOLIDATED_REPLAY Procedure	Starts the replay of a multiple-capture capture
START_REPLAY Procedure	Starts the workload replay
USE_FILTER_SET Procedure	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

197.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;

DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    VARCHAR2 DEFAULT 'N')
 RETURN NUMBER;
```

Parameters

Table 197-2 ADD_CAPTURE Function Parameters

Parameter	Description
capture_dir_name	Name of the OS directory containing the capture under the replay top-level directory
start_delay_seconds	Delay time in seconds before the replay of this capture starts
stop_replay	Stop the replay after it finishes
take_begin_snapshot	Take an AWR snapshot when the replay of this capture starts
take_end_snapshot	Take an AWR snapshot when the replay of this capture finishes
query_only	Replay only the read-only queries of this workload capture

Usage Notes

The SET_REPLAY_DIRECTORY Procedure must have already been called.

197.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname          IN VARCHAR2,
   fattribute     IN VARCHAR2,
   fvalue         IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname          IN VARCHAR2,
   fattribute     IN VARCHAR2,
   fvalue         IN NUMBER);
```

Parameters

Table 197-3 ADD_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.

Table 197-3 (Cont.) ADD_FILTER Procedure Parameters

Parameter	Description
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING : • USER • MODULE • ACTION • PROGRAM • SERVICE • CONNECTION_STRING
fvalue	(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture.

197.3.3 ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, schedule_capture_id and waitfor_capture_id form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function. The order is that replay of capture indicated by schedule_capture_id will not start unless the replay of capture indicated by waiting_for_capture_id finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
   schedule_capture_id     IN VARCHAR2,
   waitfor_capture_id      IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 197-4 ADD_SCHEDULE_ORDERING Function Parameters

Parameter	Description
schedule_capture_id	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by waitfor_capture_id runs to completion.
waitfor_capture_id	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by schedule_capture_id will not start until the replay of this capture runs to completion.

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

197.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view DBA_WORKLOAD_GROUP_ASSIGNMENTS.

Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
   group_id          IN INTEGER,
   instance_number   IN INTEGER);
```

Parameters

Table 197-5 ASSIGN_GROUP_TO_INSTANCE Procedure Parameters

Parameter	Description
group_id	The identifier of the specified group of capture files
instance_number	The number used for instance registration. It is equivalent to the INSTANCE_NUMBER column in V$INSTANCE.

See Also:

- DBA_WORKLOAD_GROUP_ASSIGNMENTS in *Oracle Database Reference*
- V$INSTANCE in *Oracle Database Reference*

197.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE  (
   replay_dir_obj     IN     VARCHAR2,
   schedule_name      IN     VARCHAR2);
```

Parameters

Table 197-6 BEGIN_REPLAY_SCHEDULE Procedure Parameters

Parameter	Description
`replay_dir_obj`	Directory object that points to the replay directory that contains all the capture directories involved in the schedule
`schedule_name`	Name of the schedule to be replayed

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The SET_REPLAY_DIRECTORY Procedure has already been called.

197.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML `CLOB`.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
  RETURN CLOB;
```

Parameters

Table 197-7 CALIBRATE Function Parameters

Parameter	Description
`capture_dir`	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
`process_per_cpu`	Maximum number of processes allowed for each CPU (default is 4)
`threads_per_process`	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a `CLOB` formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

197.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
   error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-8 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

197.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
   replay_id1   IN   NUMBER,
   replay_id2   IN   NUMBER,
   format       IN   VARCHAR2,
   result       OUT  CLOB );
```

Parameters

Table 197-9 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

197.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
   replay_id1    IN NUMBER,
   replay_id2    IN NUMBER,
   format        IN VARCHAR2,
   r_level       IN VARCHAR2 DEFAULT 'ALL',
   r_sections    IN VARCHAR2 DEFAULT 'ALL',
   result        OUT CLOB )
  RETURN VARCHAR2;
```

Parameters

Table 197-10 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
r_sections	See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
result	Output of the report (CLOB)

197.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the ADD_FILTER Procedure. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the USE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
   replay_dir       IN  VARCHAR2,
   filter_set       IN  VARCHAR2,
   default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 197-11 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
`replay_dir`	Object directory of the replay to be filtered
`filter_set`	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
`default_action`	Can be either `INCLUDE` or `EXCLUDE`. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as `INCLUSION` filters or `EXCLUSION` filters.) If it is `INCLUDE`, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as `EXCLUSION` filters, and will determine the workload that will not be replayed. If it is `EXCLUDE`, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using he ADD_SCHEDULE_ORDERING Function are treated as `INCLUSION` filters, and will determine the workload that is replayed. Default: `INCLUDE` and all the filters specified are assumed to be `EXCLUSION` filters

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

197.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
   fname    IN  VARCHAR2);
```

Parameters

Table 197-12 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

197.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
   replay_id    IN  NUMBER);
```

Parameters

Table 197-13 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to DBA_WORKLOAD_REPLAYS.ID

197.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The BEGIN_REPLAY_SCHEDULE Procedure must have already been called.

197.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id    IN  NUMBER);
```

Parameters

Table 197-14 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

197.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
   input_capture_dir          IN   VARCHAR2,
   output_capture_dir         IN   VARCHAR2,
   new_capture_name           IN   VARCHAR2,
   begin_time                 IN   NUMBER,
   begin_include_incomplete   IN   BOOLEAN DEFAULT TRUE,
   end_time                   IN   NUMBER,
   end_include_incomplete     IN   BOOLEAN DEFAULT FALSE,
   parallel_level             IN   NUMBER DEFAULT NULL);
```

Parameters

Table 197-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture
new_capture_name	(Mandatory) Name of new capture
begin_time	Start of the time range - time offset in seconds from the start of a workload capture
begin_include_incomplete	Column to include incomplete calls caused by begin_time
end_time	End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.

Table 197-15 (Cont.) GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
`end_include_incomplete`	Column to include incomplete calls caused by `end_time`
`parallel_level`	Number of Oracle processes used to process the input captures in a parallel fashion. The `NULL` default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

197.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
   replay_id    IN NUMBER,
   stream_id    IN NUMBER,
   call_counter IN NUMBER)
  RETURN CLOB;
```

Parameters

Table 197-16 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
`replay_id`	ID of the replay in which that call diverged
`stream_id`	Stream ID of the diverging call
`call_counter`	Call counter of the diverging call

Usage Notes

- Returns a `CLOB` formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

197.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
   RETURN VARCHAR2;
```

Related Topics

- SET_REPLAY_DIRECTORY Procedure
  This procedure sets a directory that contains multiple workload captures as the current replay directory.

197.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
   replay_dir    IN VARCHAR2,
   load_details  IN BOOLEAN DFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 197-17 GET_REPLAY_INFO Function Parameters

Parameter	Description
replay_dir	(Mandatory) Name of the workload replay directory object (case sensitive).
load_details	Load the divergence and tracked commits data. The default value is FALSE.

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

197.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN,
   min_delay     OUT  NUMBER,
   max_delay     OUT  NUMBER,
   delay_factor  OUT  NUMBER);
```

Parameters

Table 197-18 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
`enabled`	TRUE if the timeout action is enabled, FALSE otherwise.
`min_delay`	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than `min_delay`.
`max_delay`	Upper bound of call delay in minutes. The timeout action throws `ORA-15569` when the delay is more than `max_delay`.
`delay_factor`	Factor for the call delay that is between `min_delay` and `max_delay`. The timeout action throws `ORA-15569` when the current replay elapsed time is more than the product of capture elapsed time and `delay_factor`.

Usage Notes

This procedure can be called anytime during replay.

197.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
   replay_id       IN   NUMBER,
   staging_schema  IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 197-19 IMPORT_AWR Function Parameters

Parameter	Description
`replay_id`	(Mandatory) ID of the replay whose AWR snapshots must be imported

Table 197-19 (Cont.) IMPORT_AWR Function Parameters

Parameter	Description
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

197.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the SET_REPLAY_DIRECTORY Procedure, pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
   replay_name        IN    VARCHAR2,
   schedule_name      IN    VARCHAR2,
   plsql_mode         IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 197-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
schedule_name	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir.

Table 197-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
plsql_mode	Specifies the replay options for PL/SQL calls: • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Usage Notes

Prerequisites:

- Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The SET_REPLAY_DIRECTORY Procedure has been called.

197.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
   replay_name     IN  VARCHAR2,
   replay_dir      IN  VARCHAR2,
   plsql_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
   rac_inst_list   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-21 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data
plsql_mode	Specifies the replay options for PL/SQL calls: • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Table 197-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
rac_inst_list	Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: `rac_inst_list='1,3,5'`

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

  For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:

  ```
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.
- For encrypted capture, the `INITIALIZE_REPLAY` Procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

Related Topics

- PAUSE_REPLAY Procedure
  This procedure pauses the in-progress workload replay.
- INITIALIZE_REPLAY Procedure
  This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).
- PROCESS_CAPTURE Procedure
  This procedure processes the workload capture found in `capture_dir` in place.
- REMAP_CONNECTION Procedure
  This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

197.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
   RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the PAUSE_REPLAY Procedure has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a prerequisite.

197.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (
   capture_id     IN  NUMBER);
```

Parameters

Table 197-22 LOAD_LONG_SQLTEXT Procedure Parameters

Parameter	Description
capture_id	Internal key for the workload capture

> **Note:**
>
> This procedure is available starting with Oracle Database Release 18c.

> **See Also:**
>
> `DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

197.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

197.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
   replay_id    IN   NUMBER,
   stream_id    IN   NUMBER DEFAULT NULL,
   call_counter IN   NUMBER DEFAULT NULL);
```

Parameters

Table 197-23 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
`replay_id`	ID of the replay
`stream_id`	Stream ID of the diverging call. If `NULL` is provided, then divergence information is precomputed for all diverging calls in the given replay.
`call_counter`	Call counter of the diverging call. If `NULL` is provided, then divergence information is precomputed for all diverging calls in the given stream.

Related Topics

- GET_DIVERGING_STATEMENT Function
  This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

197.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the PREPARE_REPLAY Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization           IN BOOLEAN,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'OBJECT_ID',,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);
```

Parameters

Table 197-24 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
synchronization	Sets the synchronization mode for replay: • 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). • 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • 'OBJECT_ID' — Every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This value is deprecated. For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter: • TRUE means 'SCN' • FALSE means 'TIME'

Table 197-24 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 197-1".
think_time_scale	Scales the time elapsed between two successive user calls "Example 197-1"from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 197-2".
think_time_auto_correct	Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 197-3".
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

- PREPARE_REPLAY Procedure
  This procedure puts the database state in PREPARE FOR REPLAY mode.

197.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN BOOLEAN   DEFAULT TRUE,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
```

```
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300,
   rac_mode                  IN NUMBER    DEFAULT GLOBAL_SYNC,
   query_only                IN BOOLEAN   DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'OBJECT_ID',
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300),
   rac_mode                  IN NUMBER    DEFAULT GLOBAL_SYNC,
   query_only                IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 197-25 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	Sets the synchronization mode for replay: • 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). • 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • 'OBJECT_ID' — Every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This value is deprecated. For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter: • TRUE means 'SCN' • FALSE means 'TIME'
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 197-1".
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 197-2".

Table 197-25 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
think_time_auto_correct	Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 197-3".
scale_up_multiplier	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the scale_up_multiplier. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.
rac_mode	Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: • GLOBAL_SYNC — Synchronization across all Oracle RAC instances. This is the default value. • PER_INSTANCE_CLIENT — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. • PER_INSTANCE_SYNC — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance
query_only	Replays only the read-only queries of the workload capture. The default value is FALSE.

Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.
- With regard to scale_up_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.

- The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
- Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 197-1 Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect  (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect  (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect  ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect  (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect  (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect  (84m after)
```

Example 197-2 Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min  (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Example 197-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
        call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
        call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

197.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
   capture_dir            IN   VARCHAR2,
   parallel_level         IN   NUMBER DEFAULT NULL,
   synchronization        IN   VARCHAR2 DEFAULT 'SCN',
   plsql_mode             IN   VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 197-26 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
`capture_dir`	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
`parallel_level`	Number of Oracle processes used to process the capture in parallel. The `NULL` default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Table 197-26 (Cont.) PROCESS_CAPTURE Procedure Parameters

Parameter	Description
synchronization	Determines the synchronization mode that the user will be able to use for replay: • 'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only. When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). • 'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default. When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • 'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode. When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.
plsql_mode	Specifies the processing mode for PL/SQL: • 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. • 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in capture_dir.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using PROCESS_CAPTURE in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in rec_dir in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory rec_dir:

  ```
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, rec_dir contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.
- For encrypted capture, the PROCESS_CAPTURE procedure relies on Oracle wallet. The identifier is oracle.rat.database_replay.encryption (case-sensitive).

197.3.30 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);

DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   capture_number        IN  VARCHAR2,
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);
```

Parameters

Table 197-27 REMAP_CONNECTION Procedure Parameters

Parameter	Description
capture_number	Pointing to a capture of the current replay schedule
connection_id	ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID.
replay_connection	New connection string to be used during replay

Usage Notes

- Prior to calling REMAP_CONNECTION all replay connection strings are set to NULL by default. If a replay_connection is NULL, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable TNS_ADMIN is defined and the user does not call the REMAP_CONNECTION Procedure, then the wrc executable will connect to the server specified in the tnsnames.ora file pointed to by TNS_ADMIN.
- A valid replay_connection must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as

net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

197.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
   schedule_capture_number    IN     NUMBER);
```

Parameters

Table 197-28 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
`schedule_capture_number`	Unique ID that identifies this capture within this schedule

197.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
   schedule_capture_id     IN         NUMBER,
   waitfor_capture_id      IN         NUMBER);
```

Parameters

Table 197-29 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
`schedule_capture_id`	Points to a capture that has been added to the current replay schedule (see procedure description).
`waitfor_capture_id`	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The BEGIN_REPLAY_SCHEDULE Procedure must have been called.
- The replay schedule order should have already been added using the ADD_SCHEDULE_ORDERING Function.

197.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
   replay_id          IN NUMBER,
   format             IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 197-30 REPORT Function Parameters

Parameter	Description
`replay_id`	(Mandatory) Specifies the ID of the workload replay whose report is requested.
`format`	(Mandatory) Specifies the report format. Valid values: • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a `CLOB`

197.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.

197.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function.

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
   replay_dir  IN VARCHAR2,
   filter_set  IN VARCHAR2);
```

Parameters

Table 197-31 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

Related Topics

- ADD_SCHEDULE_ORDERING Function
  This function adds a schedule order between two captures.

197.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   NUMBER);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   BOOLEAN);
```

Parameters

Table 197-32 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the COMMIT issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

Related Topics

- PREPARE_REPLAY Procedure
  This procedure puts the database state in PREPARE FOR REPLAY mode.

197.3.37 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
   replay_dir    IN    VARCHAR2);
```

Parameters

Table 197-33 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
replay_dir	Name of the OS directory containing the captures for a workload consolidation

197.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN DEFAULT TRUE,
   min_delay     OUT  NUMBER DEFAULT 10,
   max_delay     OUT  NUMBER DEFAULT 120,
   delay_factor  OUT  NUMBER DEFAULT 8);
```

Parameters

Table 197-34 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE to enable the timeout action, and FALSE to disable.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.

Table 197-34 (Cont.) SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
  - If the delay in minutes is more than a upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

197.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
   schedule_cap_id      IN NUMBER,
   sql_id               IN VARCHAR2,
   operation            IN VARCHAR2,
   replacement_sql_text IN VARCHAR2 DEFAULT NULL);

PROCEDURE SET_SQL_MAPPING (
   sql_id               IN VARCHAR2,
   operation            IN VARCHAR2,
   replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 197-35 SET_SQL_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of a capture in the schedule
sql_id	SQL identifier of the SQL statement at the time of capture
operation	Directs that one of the following actions be performed for the specified statement during database replay: • 'SKIP' — Skip the SQL statement identified by sql_id • 'REPLACE' — Replace this SQL statement identified by sql_id with the SQL statement in the replacement_sql_text parameter

Usage Notes

- replacement_sql_text: When 'SKIP' is specified for the operation parameter, this parameter is NULL. When 'REPLACE' is specified for the operation parameter, this parameter's value is the SQL statement to be used.
- schedule_cap_id is used for consolidated replay.

197.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   schedule_cap_id      IN NUMBER,
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);
```

Parameters

Table 197-36 SET_USER_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of the a capture in the schedule
capture_user	User name during the time of the workload capture
replay_user	User name to which captured user is remapped during replay.

Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

  ```
  SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
  ```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

  ```
  DELETE * FROM DBA_WORKLOAD_USER_MAP
  ```

197.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the PREPARE_REPLAY Procedure was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

197.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.

  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  ```
  $ wrc mode=calibrate replaydir=.
  ```

197.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   capture_number   IN    VARCHAR2,
   filter_set       IN    VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   filter_set       IN    VARCHAR2);
```

Parameters

Table 197-37 USE_FILTER_SET Procedure Parameters

Parameter	Description
`capture_number`	Pointing to a capture of the current replay schedule
`filter_set`	Name of the filter set

Usage Notes

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

198
DBMS_WORKLOAD_REPOSITORY

The DBMS_WORKLOAD_REPOSITORY package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- Examples
- Data Structures
- Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

> *Oracle Database Performance Tuning Guide* for more information about the Automatic Workload Repository

198.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
   DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
     1557521192,  1, 5390, 5392) ) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.

198.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The DBMS_WORKLOAD_REPOSITORY package defines an object and associated table types.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type
- AWRRPT_INSTANCE_LIST_TYPE Table Type

198.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
   baseline_name      VARCHAR2(64),
   dbid               NUMBER NOT NULL,
   instance_number    NUMBER NOT NULL,
   beg_time           DATE NOT NULL,
   end_time           DATE NOT NULL,
   metric_id          NUMBER NOT NULL,
   metric_name        VARCHAR2(64) NOT NULL,
   metric_unit        VARCHAR2(64) NOT NULL,
   num_interval       NUMBER NOT NULL,
   interval_size      NUMBER NOT NULL,
   average            NUMBER NOT NULL,
   minimum            NUMBER NOT NULL,
   maximum            NUMBER NOT NULL);
```

Fields

Table 198-1 AWR_BASELINE_METRIC_TYPE Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

198.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics

- SELECT_BASELINE_METRIC Function
  This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

198.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

198.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the `DBMS_WORKLOAD_REPOSITORY` subprograms and briefly describes them.

Table 198-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure	Adds a colored SQL ID
ASH_GLOBAL_REPORT_HTML Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_ANALYTICS Function	Displays the ASH Analytics active report
ASH_REPORT_HTML Function	Displays the ASH report in HTML
ASH_REPORT_TEXT Function	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_HTML Functions	Displays the Global AWR Compare Periods Report in HTML

Table 198-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
AWR_GLOBAL_DIFF_REPORT_TEXT Functions	Displays the Global AWR Compare Periods Report in text
AWR_EXP Procedure	Extracts AWR data from the AWR schema into a dump file.
AWR_GLOBAL_REPORT_HTML Functions	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions	Displays the Global AWR report in text
AWR_IMP Procedure	Loads the AWR data from a dump file into the SYS schema.
AWR_REPORT_HTML Function	Displays the AWR report in HTML
AWR_REPORT_TEXT Function	Displays the AWR report in text
AWR_SET_REPORT_THRESHOLDS Procedure	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function	Displays the AWR SQL Report in text format
CONTROL_RESTRICTED_SNAPSHOT Procedure	Controls the AWR snapshot creation for a database in the *restricted session* mode.
CREATE_BASELINE Functions & Procedures	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures	Creates a baseline template
CREATE_REMOTE_SNAPSHOT Function and Procedure	Creates a manual *remote* snapshot immediately using the Remote Management Framework (RMF)
CREATE_SNAPSHOT Function and Procedure	Creates a manual *local* snapshot immediately
DROP_BASELINE Procedure	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure	Drops a range of snapshots
LOCAL_AWR_DBID Function	Returns the database identifier for the local AWR database
MODIFY_BASELINE_WINDOW_SIZE Procedure	Modifies the window size for the Default Moving Window Baseline
MODIFY_SNAPSHOT_SETTINGS Procedures	Modifies the snapshot settings
PURGE_SQL_DETAILS Procedure	Purges SQL details, specifically rows from `WRH$_SQLTEXT` and `WRH$_SQL_PLAN` that do not have corresponding rows (DBID, SQL_ID) in `WRH$_SQLSTAT`.
REGISTER_REMOTE_DATABASE Procedures	Registers a remote database in the AWR using the Remote Management Framework (RMF)
REMOVE_COLORED_SQL Procedure	Removes a colored SQL ID
RENAME_BASELINE Procedure	Renames a baseline

Table 198-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
SELECT_BASELINE_DETAILS Function	Shows the values of the metrics corresponding to a baseline for a range of snapshots
SELECT_BASELINE_METRIC Function	Shows the values of the metrics corresponding to a baseline for all the snapshots
UNREGISTER_REMOTE_DATABASE Procedures	Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)
UPDATE_DATAFILE_INFO Procedure	Updates the data file and tablespace information stored in the AWR with the current information in the database
UPDATE_OBJECT_INFO Procedure	Updates rows of `WRH$_SEG_STAT_OBJ` table that represent objects in the local database

198.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time.To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
   sql_id         IN VARCHAR2,
   dbid           IN NUMBER DEFAULT NULL);
```

Parameters

Table 198-3 *ADD_COLORED_SQL Procedure Parameters*

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional DBID, defaults to Local `DBID`

198.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN VARCHAR2((1023),
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
```

```
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 198-4 *ASH_GLOBAL_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 198-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

198.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
   l_dbid          IN VARCHAR2(1023),
   l_inst_num      IN NUMBER,
```

```
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER    DEFAULT 0,
  l_slot_width    IN NUMBER    DEFAULT 0,
  l_sid           IN NUMBER    DEFAULT NULL,
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
  l_wait_class    IN VARCHAR2  DEFAULT NULL,
  l_service_hash  IN NUMBER    DEFAULT NULL,
  l_module        IN VARCHAR2  DEFAULT NULL,
  l_action        IN VARCHAR2  DEFAULT NULL,
  l_client_id     IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
  l_data_src      IN NUMBER    DEFAULT 0,
  l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 198-6 *ASH_GLOBAL_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

Table 198-6 (Cont.) *ASH_GLOBAL_REPORT_TEXT Parameters*

Parameter	Description
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that SQL_ID value to the l_sql_id argument:

```
l_sql_id =>  'abcdefghij123'
```

Table 198-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes

Table 198-7 (Cont.) ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

198.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
   dbid           IN NUMBER DEFAULT NULL,
   inst_id        IN NUMBER DEFAULT NULL,
   begin_time     IN DATE,
   end_time       IN DATE,
   report_level   IN VARCHAR2 DEFAULT NULL,
   filter_list    IN VARCHAR2 DEFAULT NULL)
 RETURN CLOB;
```

Parameters

Table 198-8 ASH_REPORT_ANALYTICS Parameters

Parameter	Description
dbid	Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.
inst_id	Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.
begin_time	The start time of the interval for which the ASH report is required.
end_time	The end time of the interval for which the ASH report is required.
report_level	Describes the list of components to build.
filter_list	Describes the list of filters to apply. Its default value is NULL (no filters to apply).

Return Values

Returns the ASH Analytics active report.

198.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 198-9 *ASH_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 198-9 (Cont.) *ASH_REPORT_HTML Parameters*

Parameter	Description
l_data_src	Can be used to specify a data source (see Usage Notes) • 1 => memory (V$ACTIVE_SESION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to

generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 198-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes

198.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 198-11 *ASH_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier

Table 198-11 (Cont.) *ASH_REPORT_TEXT Parameters*

Parameter	Description
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Can be used to specify a data source (see Usage Notes) • 1 => memory (V$ACTIVE_SESION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or

disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

```
l_data_src =>  1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that SQL_ID value to the l_sql_id argument:

```
l_sql_id =>  'abcdefghij123'
```

Table 198-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

198.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 198-13 *AWR_DIFF_REPORT_HTML Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

198.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
```

```
  inst_num2 IN NUMBER,
  bid2      IN NUMBER,
  eid2      IN NUMBER)
 RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 198-14 *AWR_DIFF_REPORT_TEXT Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

198.3.9 AWR_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_EXP(
   dmpfile              IN   VARCHAR2   DEFAULT 'awrdat',
   dmpdir               IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
   dbid                 IN   NUMBER     DEFAULT NULL,
   bid                  IN   NUMBER     DEFAULT 1,
   eid                  IN   NUMBER     DEFAULT 1000000);
```

Parameters

Table 198-15 *AWR_EXP Procedure Parameters*

Parameter	Description
dmpfile	The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is dmpfile.dmp. The `dmpfile.log` log file shows the status of the export job. The default value for the prefix is `awrdat`.

Table 198-15 (Cont.) *AWR_EXP Procedure Parameters*

Parameter	Description
dmpdir	Name of the Directory Object for the file system directory where the extract dump file will be written. The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: `create directory dmpdir as '/directory/path'`. The default value is DATA_PUMP_DIR.
dbid	The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID.
bid	The begin snapshot ID for snapshots to be exported. The default value is 1.
eid	The end Snapshot Id for snapshots to be exported. The default value is 10000000.

198.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 198-16 *AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(1500).

198.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 198-17 *AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(320).

198.3.12 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 198-18 *AWR_GLOBAL_REPORT_HTML Function Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	Report level (currently not used)

Return Values

The output will be one column of VARCHAR2(1500).

198.3.13 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 198-19 *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
l_dbid	Database identifier

Table 198-19 (Cont.) *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(320).

198.3.14 AWR_IMP Procedure

This procedure loads the AWR data from a dump file into the SYS schema.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP(
   dmpfile              IN   VARCHAR2   DEFAULT 'awrdat',
   dmpdir               IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
   new_dbid             IN   NUMBER     DEFAULT NULL);
```

Parameters

Table 198-20 *AWR_IMP Procedure Parameters*

Parameter	Description
dmpfile	The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data. The default value is awrdat.
dmpdir	The name of the Directory Object for the file system directory where the load dump file is located. The default value is DATA_PUMP_DIR.
new_dbid	The database ID to be used instead of existing database ID.

198.3.15 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
```

```
   l_options     IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 198-21 *AWR_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: • l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

198.3.16 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 198-22 AWR_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_insT_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID

Table 198-22 (Cont.) AWR_REPORT_TEXT Parameters

Parameter	Description
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: • l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

198.3.17 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
   top_n_events          IN   NUMBER DEFAULT NULL,
   top_n_files           IN   NUMBER DEFAULT NULL,
   top_n_segments        IN   NUMBER DEFAULT NULL,
   top_n_services        IN   NUMBER DEFAULT NULL,
   top_n_sql             IN   NUMBER DEFAULT NULL,
   top_n_sql_max         IN   NUMBER DEFAULT NULL,
   top_sql_pct           IN   NUMBER DEFAULT NULL,
   shmem_threshold       IN   NUMBER DEFAULT NULL,
   versions_threshold    IN   NUMBER DEFAULT NULL,
   top_n_disks           IN   NUMBER DEFAULT NULL,
   outlier_pct           IN   NUMBER DEFAULT NULL,
   outlier_cpu_pct       IN   NUMBER DEFAULT NULL);
```

Parameters

Table 198-23 *AWR_SET_REPORT_THRESHOLDS Procedure Parameters*

Parameter	Description
top_n_events	Number of most significant wait events to be included
top_n_files	Number of most active files to be included
top_n_segments	Number of most active segments to be included
top_n_services	Number of most active services to be included
top_n_sql	Number of most significant SQL statements to be included
top_n_sql_max	Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct

Table 198-23 (Cont.) *AWR_SET_REPORT_THRESHOLDS Procedure Parameters*

Parameter	Description
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold
top_n_disks	Number of cell disks with most I/O
outlier_pct	Percentage of maximum capacity before displaying outliers for Exadata sections
outlier_cpu_pct	Threshold for mean percentage CPU to display outliers

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

198.3.18 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 198-24 *AWR_SQL_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_sqlid	SQL ID of statement to be analyzed

Table 198-24 (Cont.) *AWR_SQL_REPORT_HTML Parameters*

Parameter	Description
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

198.3.19 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 198-25 *AWR_SQL_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

198.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

> **Note:**
>
> To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
   allow IN BOOLEAN);
```

Parameters

Table 198-26 CONTROL_RESTRICTED_SNAPSHOT Parameters

Parameter	Description
`allow`	This parameter can have one of the following values: • TRUE: AWR snapshots can be created for the database in the *restricted session* mode. • FALSE: AWR snapshots cannot be created for the database in the *restricted session* mode.

198.3.21 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL)
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
```

```
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);
 RETURN NUMBER;
```

Parameters

Table 198-27 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline.
end_snap_id	End snapshot sequence number for the baseline.
start_time	Start time for the baseline.
end_time	End time for the baseline.
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                  end_snap_id   => 107,
                                                  baseline_name =>
'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

198.3.22 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name           IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER   DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   day_of_week             IN VARCHAR2,
   hour_in_day             IN NUMBER,
   duration                IN NUMBER,
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name_prefix    IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER   DEFAULT NULL);
```

Parameters

Table 198-28 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
