dbid	Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

198.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_id     IN NUMBER,
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_id     IN NUMBER,
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   flush_level    IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   flush_level    IN VARCHAR2 DEFAULT 'BESTFIT')
 RETURN NUMBER;
```

Parameters

Table 198-29 CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
node_id	RMF node identifier of the database for which the snapshot needs to be created.
node_name	RMF node name of the database for which the snapshot needs to be created.
topology_name	RMF topology name of the database for which the snapshot needs to be created.

Table 198-29 (Cont.) CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
flush_level	The flush level can be one of the following: • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

198.3.24 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
   dbid        IN NUMBER   DEFAULT NULL,
   source_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
   dbid        IN NUMBER   DEFAULT NULL,
   source_name IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 198-30 CREATE_SNAPSHOT Parameters

Parameter	Description
`flush_level`	The flush level can be one of the following: • `BESTFIT`: Uses the default value depending on the type of snapshot being taken. • `LITE`: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • `TYPICAL`: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • `ALL`: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.
`dbid`	Database ID of the database for which the snapshot needs to be created.
`source_name`	Name of the database for which the snapshot needs to be created.

Examples

This example creates a snapshot of the local database with the flush level of `ALL`:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

198.3.25 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
   baseline_name  IN  VARCHAR2,
   cascade        IN  BOOLEAN  DEFAULT FALSE,
   dbid           IN  NUMBER   DEFAULT NULL);
```

Parameters

Table 198-31 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database ID for which the baseline needs to be dropped (defaults to local DBID).

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
       baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

198.3.26 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
   template_name    IN VARCHAR2,
   dbid             IN NUMBER   DEFAULT NULL);
```

Parameters

Table 198-32 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.

198.3.27 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
   low_snap_id    IN  NUMBER,
```

```
   high_snap_id   IN  NUMBER,
   dbid           IN  NUMBER   DEFAULT NULL);
```

Parameters

Table 198-33 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (defaults to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the dba_hist_snapshot view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

198.3.28 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()
 RETURN NUMBER;
```

198.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
   window_size    IN   NUMBER,
   dbid           IN   NUMBER   DEFAULT NULL);
```

Parameters

Table 198-34 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (defaults to local DBID).

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

198.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention       IN  NUMBER    DEFAULT  NULL,
   interval        IN  NUMBER    DEFAULT  NULL,
   topnsql         IN  NUMBER    DEFAULT  NULL,
   dbid            IN  NUMBER    DEFAULT  NULL,
   export_option      IN     VARCHAR2      DEFAULT  NULL,
   tablespace      IN  VARCHAR2  DEFAULT  NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention       IN  NUMBER    DEFAULT NULL,
   interval        IN  NUMBER    DEFAULT NULL,
   topnsql         IN  VARCHAR2,
   dbid            IN  NUMBER    DEFAULT  NULL,
   export_option      IN     VARCHAR2      DEFAULT  NULL,
   tablespace      IN  VARCHAR2  DEFAULT  NULL);
```

Parameters

Table 198-35 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
`retention`	New retention time (in minutes). The specified value must be in the range of `MIN_RETENTION` (1 day) to `MAX_RETENTION` (100 years). If `ZERO` is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If `NULL` is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.

Table 198-35 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.
topnsql	• If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. • If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.
export_option	Specifies the AWR export option. The possible values are: • NULL or ALL—all AWR tables • TYPICAL—typical set of AWR tables • SAFE_TYPICALtypical set of AWR tables without sensitive data • LITE—a minimal set of AWR tables • SAFE_LITE—a minimal set of AWR tables without sensitive data
tablespace	Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval  =>  60,
  retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

198.3.31 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from WRH$_SQLTEXT, WRH$_SQL_PLAN, and WRH$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
   numrows IN NUMBER DEFAULT NULL,
   dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 198-36 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
numrows	Number of rows
dbid	Database ID (default to local DBID)

198.3.32 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
   node_id  IN NUMBER);

DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 198-37 REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	RMF node identifier of the database that needs to be registered in the AWR.
node_name	RMF node name of the database that needs to be registered in the AWR.
topology_name	RMF topology name of the database that needs to be registered in the AWR.

Examples

This example registers the remote database having the RMF node identifier of `10` in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

198.3.33 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the `TOP` list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
   sql_id         IN VARCHAR2,
   dbid           IN NUMBER DEFAULT NULL);
```

Parameters

Table 198-38 *REMOVE_COLORED_SQL Procedure Parameters*

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional dbid, defaults to Local `DBID`

198.3.34 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
   old_baseline_name     IN   VARCHAR2,
   new_baseline_name     IN VARCHAR2,
   dbid                  IN NUMBER   DEFAULT NULL);
```

Parameters

Table 198-39 RENAME_BASELINE Procedure Parameters

Parameter	Description
`old_baseline_name`	Old baseline name.
`new_baseline_name`	New baseline name.
`dbid`	Database ID for which the baseline needs to be renamed (defaults to local DBID).

198.3.35 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
   l_baseline_id   IN  NUMBER,
   l_begin_snap    IN  NUMBER DEFAULT NULL,
   l_end_snap      IN  NUMBER DEFAULT NULL,
   l_dbid          IN  NUMBER DEFAULT NULL)
 RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 198-40 SELECT_BASELINE_DETAILS Function Parameters

Parameter	Description
l_baseline_id	ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.
l_begin_snap	Start snapshot sequence number for the baseline.
l_end_snap	End snapshot sequence number for the baseline.
l_dbid	Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.

198.3.36 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
   l_baseline_name     IN VARCHAR2,
   l_dbid              IN NUMBER DEFAULT NULL,
   l_instance_num      IN NUMBER DEFAULT NULL)
 RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 198-41 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
l_baseline_name	Name of the baseline for which the metrics need to be viewed.

Table 198-41 (Cont.) SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
l_dbid	Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.
l_instance_num	The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL.

198.3.37 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
   node_id        IN NUMBER,
   remote_check   IN BOOLEAN  DEFAULT TRUE);

DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   remote_check   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 198-42 UNREGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	Identifier of the remote database whose data needs to be removed from the AWR.
node_name	Name of the remote database whose data needs to be removed from the AWR.
topology_name	RMF topology name of the remote database.
remote_check	If set to TRUE, the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to FALSE, the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

198.3.38 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

198.3.39 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of `WRH$_SEG_STAT_OBJ` table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with `'MISSING'` and/or `'TRANSIENT'` values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
   maxrows   IN  NUMBER  DEFAULT 0);
```

Parameters

Table 198-43 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
`maxrows`	Maximum number of rows to be updated. Default= `0`, meaning there is no limit.

199
DBMS_XA

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Data Structures
- Summary of DBMS_XA Subprograms

> **See Also:**
>
> *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

199.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

199.2 DBMS_XA Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS. Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT or READ privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

199.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in Table 199-1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 199-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in Table 199-2 for Possible Return Values

Table 199-2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long

Table 199-2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVAL	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

199.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so

that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

199.5 DBMS_XA Data Structures

The DBMS_XA package uses this OBJECT type and associated TABLE type.

OBJECT Types

- DBMS_XA_XID Object Type

TABLE Types

- DBMS_XA_XID_ARRAY Table Type

199.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

> **Note:**
>
> For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
       gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
       gtrid     IN   RAW,
       bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
       formatid  IN   NUMBER,
```

```
    gtrid     IN   RAW,
    bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
  RETURN SELF AS RESULT)
```

Attributes

Table 199-3 DBMS_XA_XID Object Type

Attribute	Description
`formatid`	Format identifier, a number identifying different transaction managers (TM)
`gtrid`	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
`bqual`	Branch qualifier, of which the maximum size is 64 bytes

199.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

199.6 Summary of DBMS_XA Subprograms

This table lists the `DBMS_XA` subprograms and briefly describes them.

Table 199-4 DBMS_XA Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function	Commits the global transaction specified by `xid`
XA_END Function	Disassociates the current session from the transaction branch specified by `xid`
XA_FORGET Function	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function	Prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible
XA_RECOVER Function	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function	Sets the transaction timeout in seconds for the current session
XA_START Function	Associates the current session with the transaction branch specified by `xid`

199.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

199.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
   xid       IN  DBMS_XA_XID,
   onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 199-5 *XA_COMMIT Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`onePhase`	If `TRUE`, apply single phase commit

Return Values

See Table 199-2. Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

199.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 199-6 *XA_END Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`flag`	See Table 199-1.

Return Values

See Table 199-2. Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by xid from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT` is not allowed in a subordinate session.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session.

199.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (
   xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 199-7 *XA_FORGET Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See Table 199-2. Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

199.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
 RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

199.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 199-8 *XA_PREPARE Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See Table 199-2. Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and XA_PREPARE has returned XA_OK, the application may proceed to call XA_COMMIT.

199.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
 RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags TMSTARTSCAN, TMENDSCAN, TMNOFLAGS are not supported.
- The privilege SELECT ON DBA_PENDING_TRANSACTIONS must be granted to the user who needs to call XA_RECOVER.

199.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
   xid       IN  DBMS_XA_XID)
 RETURN PLS_INTEGER;
```

Parameters

Table 199-9 *XA_ROLLBACK Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See Table 199-2. Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

199.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
   seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 199-10 *XA_SETTIMEOUT Function Parameters*

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See Table 199-2. Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

199.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```
DBMS_XA.XA_START (
   xid   IN  DBMS_XA_XID,    flag  IN  PLS_INTEGER)  RETURN PLS_INTEGER;
```

Parameters

Table 199-11 *XA_START Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`flag`	See Table 199-1.

Return Values

See Table 199-2

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in flag, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in flag, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

200
DBMS_XDB

The DBMS_XDB package supports the following features:

The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- DBMS_XDB Overview
- DBMS_XDB Security Model
- DBMS_XDB Constants
- Summary of DBMS_XDB Subprograms

> **See Also:**
>
> - *Oracle XML DB Developer's Guide*
> - *Oracle Database New Features Guide*

200.1 DBMS_XDB Overview

DBMS_XDB provides a range of management functions.

The DBMS_XDB package supports the following features:

- The Resource Management functionality provides LINK Procedures, EXISTSRESOURCE Function, LOCKRESOURCE Function, GETLOCKTOKEN Procedure, UNLOCKRESOURCE Function, CREATERESOURCE Functions, RENAMERESOURCE Procedure, DELETERESOURCE Procedure, GETRESOID Function, CREATEOIDPATH Function, and CREATEFOLDER Function subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, and CHANGEPRIVILEGES Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and the DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

200.2 DBMS_XDB Security Model

Owned by XDB, the DBMS_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

200.3 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12*c*.

They are relocated to either the DBMS_XDB_CONFIG package or the DBMS_XDB_REPOS package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their DBMS_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 200-1 DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.	DBMS_XDB_REPOS
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.	DBMS_XDB_REPOS
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the corresponding row in the metadata table	DBMS_XDB_REPOS
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row in the metadata table	DBMS_XDB_REPOS
DEFAULT_LOCK_TIMEOUT CONSTANT	PLS_INTEGER	(60*60)	Default time (in seconds) after which lock will expire	DBMS_XDB_REPOS
LINK_TYPE_HARD	NUMBER	1	Type of link to be created (default)	DBMS_XDB_REPOS
LINK_TYPE_WEAK	NUMBER	2	Type of link to be created	DBMS_XDB_REPOS
LINK_TYPE_SYMBOLIC	NUMBER	3	Type of link to be created	DBMS_XDB_REPOS

Table 200-1 (Cont.) DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
ON_DENY_NEXT_CUSTOM	NUMBER	1	If access denied, the next custom authorization is tried	DBMS_XDB_CONFIG
ON_DENY_BASIC	NUMBER	2	If access denied, basic authentication is used	DBMS_XDB_CONFIG

200.4 Summary of DBMS_XDB Subprograms

This table lists the DBMS_XDB subprograms and briefly describes them.

Table 200-2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
ENABLEDIGESTAUTHENTICATION Procedure	Enables digest authentication
EXISTSRESOURCE Function	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a a REF to an XMLTYPE
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an XMLTYPE
GETHTTPREQUESTHEADER Function	Gets the values of the passed header

Table 200-2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns TRUE if the resource has BLOB content
HASCHARCONTENT Function	Returns TRUE if the resource has character content
HASXMLCONTENT Function	Returns TRUE if the resource has XML content
HASXMLREFERENCE Function	Returns TRUE if the resource has REF to XML content
ISFOLDER Function	Returns TRUE if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

200.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ACLCHECKPRIVILEGES Function.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 200-3 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
`acl_path`	Absolute path in the Hierarchy for ACL document
`owner`	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

200.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the APPENDRESOURCEMETADATA Procedure.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 200-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that theREF passed in must be unique. In other words, there must not be aREF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

200.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12*c*.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEOWNER Procedure.

Syntax

```
DBMS_XDB.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 200-5 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

200.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12*c*.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEPRIVILEGES Function.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 200-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Path name of the resource for which privileges need to be changed
`ace`	An `XMLType` instance of the `<ace>` element which specifies the `<principal>`, the operation `<grant>` and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (`grant`/`deny`) already exists in the ACL, the new ACE is added at the end of the ACL.

200.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHECKPRIVILEGES Function.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 200-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

200.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEFOLDER Function.

Syntax

```
DBMS_XDB.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-8 CREATEFOLDER Function Parameters

Parameter	Description
`path`	Path name for the new folder

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if `'/folder1/folder2'` is passed as the path parameter, then `'/folder1'` must already exist.

200.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

> **Note:**
>
> This funtion is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEOIDPATH Function.

Syntax

```
DBMS_XDB.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 200-9 CREATEOIDPATH Function Parameters

Parameter	Description
`oid`	Object ID of the resource

200.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATERESOURCE Functions.

Syntax

Given a `REF` to an existing `XMLType` row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 200-10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.

Table 200-10 (Cont.) CREATERESOURCE Function Parameters

Parameter	Description
`data`	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
`datarow`	REF to an `XMLType` row to be used as the contents
`csid`	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: • From the abspath extension, determine the resource's MIME type. • If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; • Otherwise, it is defaulted to the database character set.
`createfolders`	If `TRUE`, create the parent folders if they do not exist
`schemaurl`	For XML data, schema URL data conforms to (default `NULL`)
`elem`	Element name (default `NULL`)

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

200.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCE Procedure.

Syntax

```
DBMS_XDB.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 200-11 DELETERESOURCE Procedure Parameters

Parameter	Description
`path`	Path name of the resource to delete

Table 200-11 (Cont.) DELETERESOURCE Procedure Parameters

Parameter	Description
delete_option	The option that controls how a a resource is deleted; defined in Table 200-1: • DELETE_RESOURCE • DELETE_RECURSIVE • DELETE_FORCE • DELETE_RECURSIVE_FORCE

200.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCEMETADATA Procedures.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 200-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted

Table 200-12 (Cont.) DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: • `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table • `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

200.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ENABLEDIGESTAUTHENTICATION Procedure.

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

200.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the EXISTSRESOURCE Function.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

200.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETACLDOCUMENT Function.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 200-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

200.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a `BLOB`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTBLOB Function.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 200-15 GETCONTENTBLOB Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`csid`	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

200.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a `CLOB`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTCLOB Function.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 200-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

200.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTVARCHAR2 Function.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 200-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

200.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLREF Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 200-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

200.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an `XMLTYPE`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLTYPE Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 200-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

200.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

> **Note:**
>
> This procedure is deprecated in Release 12*c*.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name    IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 200-20 GETHTTPREQUESTHEADER Function Parameters

Parameter	Description
header_name	Passed header

Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

200.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETLOCKTOKEN Procedure.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
   path         IN      VARCHAR2,
   locktoken    OUT     VARCHAR2);
```

Parameters

Table 200-21 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

200.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETPRIVILEGES Function.

Syntax

```
DBMS_XDB.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 200-22 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

200.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETRESOID Function.

Syntax

```
DBMS_XDB.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 200-23 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

200.4.23 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETXDB_TABLESPACE Function.

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

200.4.24 HASBLOBCONTENT Function

This deprecated function returns `TRUE` if the resource has BLOB content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASBLOBCONTENT Function.

Syntax

```
DBMS_XDB.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-24 HASBLOBCONTENT Function Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

200.4.25 HASCHARCONTENT Function

This deprecated function returns TRUE if the resource has character content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASCHARCONTENT Function.

Syntax

```
DBMS_XDB.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-25 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

200.4.26 HASXMLCONTENT Function

This deprecated function returns TRUE if the resource has XML content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLCONTENT Function.

Syntax

```
DBMS_XDB.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-26 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

200.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLREFERENCE Function.

Syntax

```
DBMS_XDB.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-27 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

200.4.28 ISFOLDER Function

This deprecated function returns TRUE if the resource is a folder or container.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ISFOLDER Function.

Syntax

```
DBMS_XDB.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-28 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

200.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LINK Procedures.

Syntax

```
DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 200-29 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link

Table 200-29 (Cont.) LINK Procedure Parameters

Parameter	Description
linktype	Type of link to be created: • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

200.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LOCKRESOURCE Function.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 200-30 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

200.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PROCESSLINKS Procedure.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 200-31 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.

200.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PURGERESOURCEMETADATA Procedure.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 200-32 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

200.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the RENAMERESOURCE Procedure.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 200-33 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

200.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SETACL Procedure.

Syntax

```
DBMS_XDB.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 200-34 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

200.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SPLITPATH Procedure.

Syntax

```
DBMS_XDB.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 200-35 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

200.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the TOUCHRESOURCE Procedure.

Syntax

```
DBMS_XDB.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 200-36 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

200.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UNLOCKRESOURCE Function.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 200-37 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource

Table 200-37 (Cont.) UNLOCKRESOURCE Function Parameters

Parameter	Description
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

200.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UPDATERESOURCEMETADATA Procedures.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
```

```
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 200-38 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`oldmetadata`	REF to the old of metadata
`newmetadata`	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
`oldns`	Namespace identifying old metadata
`oldname`	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

201
DBMS_XDB_ADMIN

The DBMS_XDB_ADMIN package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- DBMS_XDB_ADMIN Security Model
- Summary of DBMS_XDB_ADMIN Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for information about Oracle XML DB Repository

201.1 DBMS_XDB_ADMIN Security Model

Owned by XDB, the DBMS_XDB_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

201.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 201-1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATENONCEKEY Procedure	Generates a nonce value for use in digest authentication
INSTALLDEFAULTWALLET Procedure	Installs the default XDB wallet in the default XDB wallet directory
MOVEXDB_TABLESPACE Procedure	Moves the XDB (user) to the specified tablespace
REBUILDHIERARCHICALINDEX Procedure	Rebuilds the hierarchical index after import or export operations

201.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

201.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/`*`db_name`*`/xdb_wallet` where *db_name* is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `SYS` can install or replace the default wallet.

201.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
   new_tablespace   IN  VARCHAR2);
```

Parameters

Table 201-2 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
`new_tablespace`	Name of the tablespace to where the XDB is moved

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command.Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

201.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

202
DBMS_XDB_CONFIG

The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_XDB_CONFIG Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

202.1 DBMS_XDB_CONFIG Overview

PL/SQL package DBMS_XDB_CONFIG is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package DBMS_XDB_CONFIG is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

202.2 DBMS_XDB_CONFIG Security Model

Owned by XDB, the DBMS_XDB_CONFIG package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

202.3 DBMS_XDB_CONFIG Constants

The DBMS_XDB_CONFIG package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 202-1 DBMS_XDB_CONFIG Constants

Constant	Type	Value	Description
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port
XDB_ENDPOINT_RHTTP	NUMBER	3	Defining listener for a remote HTTP port
XDB_ENDPOINT_RHTTPS	NUMBER	4	Defining listener for a remote HTTPS port
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol

202.4 Summary of DBMS_XDB_CONFIG Subprograms

The DBMS_XDB_CONFIG package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 202-2 DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDHTTPEXPIREMAPPING Procedure	Adds to XDB$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure	Adds a mime mapping to XDB configuration
ADDSCHEMALOCMAPPING Procedure	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure	Adds a security role REF to a specified servlet in XDB configuration
ADDXMLEXTENSION Procedure	Adds adds the following XML extension to the XDB configuration under <xml-extensions>: <extension>extension</extension>
CFG_GET Function	Retrieves the session's configuration information as an XMLType instance

Table 202-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
CFG_REFRESH Procedure	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure	Updates the configuration information and commits the change.
DELETEHTTPEXPIREMAPPING Procedure	Deletes from `XDB$CONFIG` all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure	Deletes the mime mapping for a specified extension from the XDB configuration
DELETESCHEMALOCMAPPING Procedure	Deletes the schema location mapping for a specified schema URL from the XDB configuration
DELETESERVLET Procedure	Deletes a servlet from the XDB configuration
DELETESERVLETMAPPING Procedure	Deletes the servlet mapping for a specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure	Enables enables digest authentication
GETFTPPORT Function	Gets the value of the current FTP port
GETHTTPPORT Function	Gets the value of the current HTTP port
GETHTTPCONFIGREALM Function	Gets the realm name
GETHTTPSPORT Function	Gets the value of the current HTTPS port
GETLISTENERENDPOINT Procedure	Gets the parameters of a listener end point corresponding to the XML DB HTTP server
GETREMOTEHTTPPORT Function	Gets the value of a remote HTTP port
GETREMOTEHTTPSPORT Function	Gets the value of a remote HTTPS port
ISGLOBALPORTENABLED Function	Returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure setting
SETGLOBALPORTENABLED Procedure	Enables the use of a global port for Oracle Enterprise Manager Database Express (EM Express) clients
SETFTPPORT Procedure	Sets the FTP port to a new value
SETHTTPPORT Procedure	Sets the HTTP port to a new value
SETHTTPCONFIGREALM Procedure	Sets the realm to a new value
SETHTTPSPORT Procedure	Sets the HTTPS port to a new value
SETLISTENERENDPOINT Procedure	Sets the parameters of a listener end point corresponding to the XML DB HTTP server

Table 202-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
SETLISTENERLOCALACCESS Procedure	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to TRUE) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to FALSE)
SETREMOTEHTTPPORT Procedure	Sets the remote HTTP port to a new value
SETREMOTEHTTPSPORT Procedure	Sets the remote HTTPS port to a new value
USEDPORT Procedure	Obtains the port numbers used by other pluggable databases in the same consolidation database

202.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
     pattern    IN    VARCHAR2,
     expire     IN    VARCHAR2);
```

Parameters

Table 202-3 *ADDHTTPEXPIREMAPPING Procedure Parameters*

Parameter	Description
`pattern`	URL pattern (only * accepted as wildcards)

`expire`	Expiration directive, follows the `ExpireDefault` in Apache's `mod_expires`:
	`base [plus] (num type)*`
	`-- base: now | modification`
	`-- type: year|years|month|months|week|weeks|day|days|minute|minutess|second|seconds`

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
             '/public/test2/*', 'modification plus 1 day 30 seconds');
```

202.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
     extension    IN   VARCHAR2,
     mimetype     IN   VARCHAR2);
```

Parameters

Table 202-4 *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

202.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
     namespace    IN   VARCHAR2,
     element      IN   VARCHAR2,
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 202-5 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

202.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
     <servlet-name>name</servlet-name>     <servlet-language>language</servlet-
language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
```

```
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
    name        IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL,
    schema      IN   VARCHAR2 := NULL);
```

Parameters

Table 202-6 ADDSERVLET Procedure Parameters

Parameter	Description
`name`	Servlet name
`language`	Must be one of "C", "Java", "PL/SQL"
`dispname`	Display name
`icon`	Icon
`descript`	Description
`class`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`jspfile`	This parameter is not supported. Always provide `NULL` value for this parameter. System throws an error if the value is not `NULL`.
`plsql`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`schema`	Schema is used to specify `servlet-schema` xml element name in `xdbconfig.xml`. It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.

202.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
     <servlet-pattern>pattern</servlet-pattern>
     <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,     name      IN   VARCHAR2);
```

Parameters

Table 202-7 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

202.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role REF to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
VARCHAR2,     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 202-8 *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Sservlet name
rolename	Role name
rolelink	Role link
descript	Description

202.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under <xml-extensions>.

It adds the following XML extension to the XDB configuration, under <xml-extensions>:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 202-9 *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
`extension`	XML extension to be added

202.4.8 CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET
 RETURN SYS.XMLType;
```

202.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

202.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(
   xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

Table 202-10 CFG_UPDATE Procedure Parameters

Parameter	Description
`xdbconfig`	The new configuration data

202.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from `XDB$CONFIG` all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
     pattern  IN   VARCHAR2);
```

Parameters

Table 202-11 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

202.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2);
```

Parameters

Table 202-12 *DELETEMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is to be deleted

202.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 202-13 *DELETESCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
schemaURL	Schema URL

202.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
     name        IN   VARCHAR2);
```

Parameters

Table 202-14 *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

202.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
     name       IN   VARCHAR2);
```

Parameters

Table 202-15 *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

202.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2);
```

Parameters

Table 202-16 *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

202.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 202-17 *DELETEXMLEXTENSION Procedure Parameters*

Parameter	Description
`extension`	XML extension to be deleted

202.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

202.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT
 RETURN NUMBER;
```

202.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
 RETURN VARCHAR2;
```

202.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT
 RETURN NUMBER;
```

202.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
 RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

202.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,    port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 202-18 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
`endpoint`	End point to be retrieved. Its value can be `XDB_ENDPOINT_HTTP` or `XDB_ENDPOINT_HTTP2`.
`host`	Interface on which the listener end point listens
`port`	Port on which the listener end point listens
`protocol`	Transport protocol accepted by the listener end point

202.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
 RETURN NUMBER;
```

202.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
 RETURN NUMBER;
```

202.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the `GlobalPortEnabled` setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

202.4.27 SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 202-19 SETFTPPORT Procedure Parameters

Parameter	Description
`new_port`	Value to which the FTP port is set

202.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

> **Note:**
>
> Starting from Oracle Database 21c Release, Oracle Enterprise Manager Database Express (EM Express) is deprecated. Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.

Syntax

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (
   isenabled  IN  BOOLEAN);
```

Parameters

Table 202-20 SETGLOBALPORTENABLED Procedure Parameters

Parameter	Description
isenabled	TRUE enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port. FALSE enables the port ID to determine the PDB to use. The default is TRUE for PDBs but FALSE for the CDB root.

Usage Notes

- Use the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED procedure if you use EM Express to manage database ports in a multitenant environment.
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED procedure in the CDB root.
- After you set DBMS_XDB_CONFIG.SETGLOBALPORTENABLED to TRUE, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the **Container Name** field of the EM Express login page. For example, if you enter hr_pdb, then the EM Express URL becomes http://*server_name*:5500/hr_pdb/em. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB hr_pdb. The port can be an HTTP or HTTPS port.
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run DBMS_XDB_CONFIG.SETGLOBALPORTENABLED. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the OPEN_MODE column of the V$PDBS dynamic view.
- The DBMS_XDB_CONFIG.ISGLOBALPORTENABLED function returns the value of the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED setting.
- You can use the XDB_PROTOCOLS lockdown profile to control the security for the global port.

> **See Also:**
>
> *Oracle Database Security Guide* for information about lockdown profiles

202.4.29 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 202-21 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

202.4.30 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
   realm IN VARCHAR2);
```

Parameters

Table 202-22 SETHTTPPORT Procedure Parameters

Parameter	Description
realm	Realm as defined in IETF's RFC2617

202.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 202-23 SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

202.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
```

```
   host      IN  VARCHAR2,    port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 202-24 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

202.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when l_access is set to TRUE) or to listen on both localhost and non-localhost interfaces (when l_access is set to FALSE).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
   l_access   BOOLEAN);
```

Parameters

Table 202-25 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
l_access.	TRUE or FALSE.

202.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 202-26 SETREMOTEHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTP port is set

202.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
   new_port  IN  NUMBER);
```

Parameters

Table 202-27 SETREMOTEHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTPS port is set

202.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

203
DBMS_XDB_CONSTANTS

The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XDB_CONSTANTS Subprograms

203.1 DBMS_XDB_CONSTANTS Security Model

Owned by XDB, the DBMS_XDB_CONSTANTS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

203.2 Summary of DBMS_XDB_CONSTANTS Subprograms

This table lists the DBMS_XDB_CONSTANTS subprograms and briefly describes them.

Table 203-1 DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
ENCODING_DEFAULT Function	Returns 'AL32UTF8'
ENCODING_ISOLATIN1 Function	Returns 'WE8ISO8859P1'
ENCODING_UTF8 Function	Returns 'AL32UTF8'
ENCODING_WIN1252 Function	Returns 'WE8MSWIN1252'
NAMESPACE_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
NAMESPACE_METADATA Function	Returns 'http://xmlns.oracle.com/xdbuserMetaData'
NAMESPACE_ORACLE Function	Returns 'http://xmlns.oracle.com'
NAMESPACE_ORACLE_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NAMESPACE_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
NAMESPACE_RESOURCE_EVENT Function	Returns 'http://xmlns.oracle.com/resourceEvent'
NAMESPACE_RESOURCE_CONFIG Function	Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'
NAMESPACE_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
NAMESPACE_XMLDIFF Function	Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'
NAMESPACE_XMLINSTANCE Function	Returns 'http://www.w3.org/2001/XMLSchema-instance'

Table 203-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
NAMESPACE_XMLSCHEMA Function	Returns 'http://www.w3.org/2001/XMLSchema'
NSPREFIX_ACL_ACL Function	Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
NSPREFIX_RESCONFIG_RC Function	Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'
NSPREFIX_RESOURCE_R Function	Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
NSPREFIX_XDB_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NSPREFIX_XMLINSTANCE_XSI Function	Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
NSPREFIX_XMLDIFF_XD Function	Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
NSPREFIX_XMLSCHEMA_XSD Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
SCHEMAURL_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
SCHEMAELEM_RES_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'
SCHEMAELEM_RESCONTENT_BINARY Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
SCHEMAELEM_RESCONTENT_TEXT Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
SCHEMAURL_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
SCHEMAURL_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
XDBSCHEMA_PREFIXES Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'
XSD_ATTRIBUTE Function	Returns 'attribute'
XSD_COMPLEX_TYPE Function	Returns 'complexType'
XSD_ELEMENT Function	Returns 'element'
XSD_GROUP Function	Returns 'group'

203.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

203.2.2 ENCODING_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'

203.2.3 ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

203.2.4 ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'

203.2.5 NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

203.2.6 NAMESPACE_METADATA Function

This function returns `'http://xmlns.oracle.com/xdbuserMetaData'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdbuserMetaData'`

203.2.7 NAMESPACE_ORACLE Function

This function returns `'http://xmlns.oracle.com'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com'`

203.2.8 NAMESPACE_ORACLE_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb'`

203.2.9 NAMESPACE_RESOURCE Function

This function returns `'/XDBResource.xsd'`

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd`

203.2.10 NAMESPACE_RESOURCE_EVENT Function

This function returns `'http://xmlns.oracle.com/resourceEvent'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/resourceEvent'`

203.2.11 NAMESPACE_RESOURCE_CONFIG Function

This function returns `'http://xmlns.oracle.com/XDBResConfig.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/XDBResConfig.xsd'`

203.2.12 NAMESPACE_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

203.2.13 NAMESPACE_XMLDIFF Function

This function returns `'http://xmlns.oracle.com/xdb/xdiff.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/xdiff.xsd'`

203.2.14 NAMESPACE_XMLINSTANCE Function

This function returns `'http://www.w3.org/2001/XMLSchema-instance'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema-instance'`

203.2.15 NAMESPACE_XMLSCHEMA Function

This function returns `'http://www.w3.org/2001/XMLSchema'`.

Syntax

```
DBMS_XDB_CONSTANTS. NAMESPACE_XMLSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema'`

203.2.16 NSPREFIX_ACL_ACL Function

This function returns `'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`

203.2.17 NSPREFIX_RESCONFIG_RC Function

This function returns `''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'`

203.2.18 NSPREFIX_RESOURCE_R Function

This function returns `'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'`

203.2.19 NSPREFIX_XDB_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb'`

203.2.20 NSPREFIX_XMLINSTANCE_XSI Function

This function returns `'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`

203.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns `'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`

203.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`

203.2.23 SCHEMAURL_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/acl.xsd'`

203.2.24 SCHEMAELEM_RES_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd#acl'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/acl.xsd#acl'`

203.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`

203.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`

203.2.27 SCHEMAURL_RESOURCE Function

This function returns `'http://xmlns.oracle.com/xdb/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd'`

203.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

203.2.29 XDBSCHEMA_PREFIXES Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`

203.2.30 XSD_ATTRIBUTE Function

This function returns `'attribute'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'attribute'`

203.2.31 XSD_COMPLEX_TYPE Function

This function returns `'complexType'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'complexType'`

203.2.32 XSD_ELEMENT Function

This function returns `'element'`.

Syntax

```
DBMS_XDB_CONSTANTS. XSD_ELEMENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'element'`

203.2.33 XSD_GROUP Function

This function returns `'group'`

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'group'`

204
DBMS_XDB_REPOS

The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_XDB_REPOS Subprograms

> **See Also:**
>
> Oracle XML DB Developer's Guide for more information regarding:
>
> - Using and managing repository resources
> - ACL-based security management (controlling access to repository resources)
> - Managing XLink and XInclude links
> - Loading documents into the repository
> - Creating, deleting, and managing resource metadata

204.1 DBMS_XDB_REPOS Overview

The DBMS_XDB_REPOS package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - DBMS_XDB_REPOS, DBMS_XDBZ, and DBMS_XDB_VERSION - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

204.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the DBMS_XDB_REPOS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

204.3 DBMS_XDB_REPOS Constants

The DBMS_XDB_REPOS package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

Table 204-1 DBMS_XDB_REPOS Constants

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the row in the metadata
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row
DEFAULT_LOCK_TIMEOUT	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
LINK_TYPE_HARD	NUMBER	1	Hard link of a folder to a resource
LINK_TYPE_WEAK	NUMBER	2	Weak link of a folder to a resource
LINK_TYPE_SYMBOLIC	NUMBER	3	Symbolic link of a folder to a resource

204.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the DBMS_XDB_REPOS subprograms and briefly describes them.

Table 204-2 DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy

Table 204-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
EXISTSRESOURCE Function	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a a REF to an XMLTYPE
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an XMLTYPE
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns TRUE if the resource has BLOB content
HASCHARCONTENT Function	Returns TRUE if the resource has character content
HASXMLCONTENT Function	Returns TRUE if the resource has XML content
HASXMLREFERENCE Function	Returns TRUE if the resource has REF to XML content
ISFOLDER Function	Returns TRUE if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath

Table 204-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

204.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 204-3 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
`acl_path`	Absolute path in the Hierarchy for ACL document
`owner`	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

204.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 204-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that theREF passed in must be unique. In other words, there must not be aREF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

204.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 204-5 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

204.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 204-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

204.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 204-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

204.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-8 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

204.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 204-9 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

204.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 204-10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: • From the abspath extension, determine the resource's MIME type. • If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; • Otherwise, it is defaulted to the database character set.
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

204.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 204-11 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a a resource is deleted: • DELETE_RESOURCE • DELETE_RECURSIVE • DELETE_FORCE • DELETE_RECURSIVE_FORCE

204.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 204-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	REF to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: • `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table • `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

204.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

204.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 204-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

204.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
```

```
    locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 204-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

204.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 204-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

204.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 204-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

204.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a a REF to an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 204-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

204.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 204-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

204.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(
   path         IN      VARCHAR2,
   locktoken    OUT     VARCHAR2);
```

Parameters

Table 204-20 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

204.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 204-21 GETPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the hierarchy of the resource

Return Values

An `XMLType` instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

204.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 204-22 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

204.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

204.4.22 HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-23 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

204.4.23 HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-24 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

204.4.24 HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-25 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

204.4.25 HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-26 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

204.4.26 ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-27 ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

204.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 204-28 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

204.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 204-29 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

204.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 204-30 PROCESSLINKS Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the recurse flag.
recurse	Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.

204.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 204-31 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

204.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 204-32 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

204.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 204-33 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

204.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 204-34 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

204.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 204-35 TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

204.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 204-36 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

204.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 204-37 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`oldmetadata`	REF to the old of metadata
`newmetadata`	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
`oldns`	Namespace identifying old metadata
`oldname`	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

205
DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the DBMS_XBD_VERSION package. Functions and procedures of DBMS_XDB_VERSION help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- Security Model
- Summary of DBMS_XDB_VERSION Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

205.1 DBMS_XDB_VERSION Security Model

Owned by XDB, the DBMS_XDB_VERSION package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

205.2 Summary of DBMS_XDB_VERSION Subprograms

This table lists the DBMS_XDB_VERSION subprograms and briefly describes them.

Table 205-1 ***DBMS_XDB_VERSION Package Subprograms***

Method	Description
CHECKIN Function	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure	Checks out a VCR before updating or deleting it
GETCONTENTSBLOBBYRESID Function	Obtain contents as a BLOB
GETCONTENTSCLOBBYRESID Function	Obtain contents as a CLOB
GETCONTENTSXMLBYRESID Function	Obtain contents as an XMLType
GETPREDECESSORS Function	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function	Obtains the resource as an XMLType, given the resource object ID
GETSUCCESSORS Function	Retrieves the list of successors by path name

Table 205-1 (Cont.) *DBMS_XDB_VERSION Package Subprograms*

Method	Description
GETSUCCSBYRESID Function	Retrieves the list of successors by resource id
MAKEVERSIONED Function	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

205.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
   pathname VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 205-2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

205.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
   pathname    VARCHAR2);
```

Parameters

Table 205-3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

205.2.3 GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN BLOB;
```

Parameters

Table 205-4 GETCONTENTSBLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

205.2.4 GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYRESID(
   resid     DBMS_XDB.resid_type)
 RETURN CLOB;
```

Parameters

Table 205-5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

205.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an `XMLType`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN XMLType;
```

Parameters

Table 205-6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Return Values

If the contents are not valid XML, returns `NULL`.

205.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
   pathname       VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 205-7 GETPREDECESSORS Function Parameters

Parameter	Description
`pathname`	The path name of the resource.

Return Values

An exception is raised if `pathname` is illegal.

205.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
   resid      resid_type)
 RETURN resid_list_type;
```

Parameters

Table 205-8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.

205.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
   resid      resid_type)
 RETURN XMLType;
```

Parameters

Table 205-9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
resid	The resource id.

205.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
   pathname VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 205-10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

205.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid    resid_type)
  RETURN resid_list_type;
```

Parameters

Table 205-11 GETSUCCSBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

205.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 205-12 MAKEVERSIONED Function Parameters

Parameter	Description
`pathname`	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

205.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname    VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 205-13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.

206
DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XDBRESOURCE Subprograms

> **See Also:**
>
> Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

206.1 DBMS_XDBRESOURCE Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAKEDOCUMENT routine.

206.2 DBMS_XDBRESOURCE Security Model

Owned by XDB, the DBMS_XDBRESOURCE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

206.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the DBMS_XDBRESOURCE subprograms and briefly describes them.

Table 206-1 ***DBMS_XDBRESOURCE Package Subprograms***

Subprogram	Description
FREERESOURCE Procedure	Frees any memory associated with an XDBResource
GETACL Function	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function	Returns the ACL Document for the given resource as XMLType
GETAUTHOR Function	Given an XDBResource, returns its author
GETCHARACTERSET Function	Given an XDBResource, returns its character set

Table 206-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
GETCOMMENT Function	Given an XDBResource, returns its comment
GETCONTENTBLOB Function	Returns the contents of the resource as a `BLOB`
GETCONTENTCLOB Function	Returns the contents of the resource as a `CLOB`
GETCONTENTREF Function	Returns the contents of the resource as an `XMLTypeRef`
GETCONTENTTYPE Function	Given an XDBResource, returns its content-type
GETCONTENTXML Function	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function	Returns the contents of the resource as a string
GETCREATIONDATE Function	Given an XDBResource, returns its creation date
GETCREATOR Function	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function	Given an XDBResource, returns its display name
GETLANGUAGE Function	Given an XDBResource, returns its language
GETLASTMODIFIER Function	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function	Given an XDBResource, returns its modification date
GETOWNER Function	Given an XDBResource, returns its owner.
GETREFCOUNT Function	Given an XDBResource, returns its reference count
GETVERSIONID Function	Given an XDBResource, returns its version ID.
HASACLCHANGED Function	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise
HASAUTHORCHANGED Function	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function	Returns TRUE if the creator of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise

Table 206-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
HASDISPLAYNAMECHANGED Function	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
HASLANGUAGECHANGED Function	Returns TRUE if the language of the given resource has changed, FALSE otherwise
HASLASTMODIFIERCHANGED Function	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
HASMODIFICATIONDATECHANGED Function	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
HASOWNERCHANGED Function	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
HASREFCOUNTCHANGED Function	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
HASVERSIONIDCHANGED Function	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
ISFOLDER Function	Returns TRUE if the given resource is a folder, FALSE otherwise
ISNULL Function	Returns TRUE if input resource is NULL, FALSE otherwise
MAKEDOCUMENT Function	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure	Updates the resource with any modifications
SETACL Procedure	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure	Sets the character set of the given XDBResource to a specified character set
SETCOMMENT Procedure	Sets a comment associated with the given XDBResource
SETCONTENT Procedures	Replaces the contents of the given resource with the given CLOB
SETCONTENTTYPE Procedure	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure	Sets the display name of the given XDBResource
SETLANGUAGE Procedure	Sets the language of the given XDBResource
SETOWNER Procedure	Sets the owner of the given XDBResource

206.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

206.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESOURCE.GETACL (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-3 GETACL Function Parameters

Parameter	Description
res	XDBResource

206.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as `XMLType`.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (
   res   IN    XDBResource)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 206-4 GETACLDOCFROMRES Function Parameters

Parameter	Description
res	XDBResource

206.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-5 GETAUTHOR Function Parameters

Parameter	Description
res	XDBResource

206.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

206.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-7 GETCOMMENT Function Parameters

Parameter	Description
res	XDBResource

206.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a `BLOB`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (
   res    IN     XDBResource,
   csid   OUT    PLS_INTEGER)
 RETURN BLOB;
```

Parameters

Table 206-8 GETCONTENTBLOB Function Parameters

Parameter	Description
`res`	XDBResource
`csid`	Character set ID of the `BLOB` returned

206.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a `CLOB`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (
   res   IN    XDBResource)
 RETURN CLOB;
```

Parameters

Table 206-9 GETCONTENTCLOB Function Parameters

Parameter	Description
`res`	XDBResource

206.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-10 GETCONTENTREF Function Parameters

Parameter	Description
res	XDBResource

206.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-11 GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

206.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (
   res   IN    XDBResource)
 RETURN XMLType;
```

Parameters

Table 206-12 GETCONTENTXML Function Parameters

Parameter	Description
res	XDBResource

206.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

206.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
   res   IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 206-14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

206.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

206.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
   res        IN    XDBResource,
```

```
   xpath      IN    VARCHAR2,    namespace  IN    VARCHAR2)
 RETURN XMLType;
```

Parameters

Table 206-16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

206.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

206.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

206.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-19 GETLASTMODIFIER Function Parameters

Parameter	Description
res	XDBResource

206.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (
   res   IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 206-20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

206.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 206-21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

206.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (
   res   IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 206-22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

206.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (
   res   IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 206-23 GETVERSIONID Function Parameters

Parameter	Description
res	XDBResource

206.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-24 HASACLCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.24 HASAUTHORCHANGED Function

This function returns TRUE if the author of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
   res          IN    XDBResource,
   xpath        IN    VARCHAR2,
   namespace    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 206-26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

206.3.26 HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.27 HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.28 HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-29 HASCONTENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.29 HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.30 HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.31 HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.34 HASLANGUAGECHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.35 HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.36 HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.37 HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-38 HASOWNERCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.38 HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.39 HASVERSIONIDCHANGED Function

This function returns TRUE if the version ID of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
res	XDBResource

206.3.40 ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

206.3.41 ISNULL Function

This function returns TRUE if input resource is NULL.

Syntax

```
DBMS_XDBRESOURCE.ISNULL (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 206-42 ISNULL Function Parameters

Parameter	Description
res	Input resource

206.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

> **See Also:**
>
> The DBMS_XMLDOM package

Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
   res    IN    XDBResource)
 RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 206-43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

206.3.43 SAVE Procedure

This procedures updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (
   res    IN    XDBResource);
```

Parameters

Table 206-44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

206.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESOURCE.SETACL (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 206-45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

206.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
   res     IN OUT  XDBResource,
   author  IN      VARCHAR2);
```

Parameters

Table 206-46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource
author	Author

206.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (
   res      IN OUT  XDBResource,
   charSet  IN      VARCHAR2);
```

Parameters

Table 206-47 SETCHARACTERSET Procedure Parameters

Parameter	Description
res	XDBResource
charset	New character set

206.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
   res      IN OUT  XDBResource,
   comment  IN      VARCHAR2);
```

Parameters

Table 206-48 SETCOMMENT Procedure Parameters

Parameter	Description
res	XDBResource
comment	New comment

206.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BFILE,
   csid     IN      NUMBER);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BLOB,
   csid     IN      PLS_INTEGER);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      CLOB);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      REF SYS.XMLType,
   sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      SYS.XMLType);
```

Parameters

Table 206-49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

206.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENTTYPE (
   res         IN OUT  XDBResource,
   conttype    IN      VARCHAR2);
```

Parameters

Table 206-50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

206.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
   res          IN OUT  XDBResource,
   xpath        IN      VARCHAR2,
   namespace    IN      VARCHAR2,
   newMetadata  IN      XMLType);
```

Parameters

Table 206-51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use

Table 206-51 (Cont.) SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

206.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
   res      IN OUT  XDBResource,
   name     IN      VARCHAR2);
```

Parameters

Table 206-52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

206.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 206-53 SETLANGUAGE Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	New path

206.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (
   res      IN OUT  XDBResource,
   owner    IN      VARCHAR2);
```

Parameters

Table 206-54 SETOWNER Procedure Parameters

Parameter	Description
`res`	XDBResource
`owner`	New owner

Usage Notes

The user must have the `XDBADMIN` privilege to call this subprogram.

207
DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- Security Model
- Constants
- Summary of DBMS_XDBZ Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

207.1 DBMS_XDBZ Security Model

Owned by `XDB`, the `DBMS_XDBZ` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

207.2 DBMS_XDBZ Constants

The `DBMS_XDBZ` package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 207-1 *DBMS_XDBZ Constants* - Name Format

Constant	Type	Value	Description
`NAME_FORMAT_SHORT`	`PLS_INTEGER`	1	DB user name or LDAP nickname
`NAME_FORMAT_DISTINGUISHED`	`PLS_INTEGER`	2	LDAP distinguished name

Table 207-2 *DBMS_XDBZ Constants* - Enable Option

Constant	Type	Value	Description
`ENABLE_CONTENTS`	`PLS_INTEGER`	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure

Table 207-2 (Cont.) *DBMS_XDBZ Constants* - Enable Option

Constant	Type	Value	Description
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 207-3 *DBMS_XDBZ Constants* - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

207.3 Summary of DBMS_XDBZ Subprograms

This table lists the DBMS_XDBZ subprograms and briefly describes them.

Table 207-4 *DBMS_XDBZ Package Subprograms*

Method	Description
DISABLE_HIERARCHY Procedure	Disables repository support for the specified XMLTYPE table or view
ENABLE_HIERARCHY Procedure	Enables repository support for the specified XMLType table or view
GET_ACLOID Function	Retrieves the ACL Object ID for the specified resource
GET_USERID Function	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function	Determines if repository support for the specified XMLType table or view is enabled
PURGELDAPCACHE Function	Purges the LDAP nickname cache

207.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

207.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular `XMLType` table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
   object_schema IN VARCHAR2,
   object_name   IN VARCHAR2);
```

Parameters

Table 207-5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	Schema name of the `XMLType` table or view
`object_name`	Name of the `XMLType` table or view

207.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular `XMLType` table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
   object_schema   IN   VARCHAR2,
   object_name     IN   VARCHAR2,
   hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 207-6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	Schema name of the `XMLType` table or view
`object_name`	Name of the `XMLType` table or view

Table 207-6 (Cont.) ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
hierarchy_type	How to enable the hierarchy. • ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository • ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

207.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
   aclpath   IN   VARCHAR2,
   acloid    OUT  RAW)
 RETURN BOOLEAN;
```

Parameters

Table 207-7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

Return Values

Returns TRUE if successful.

207.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
   username IN  VARCHAR2,
   userid   OUT RAW,
   format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
 RETURN BOOLEAN;
```

Parameters

Table 207-8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: • DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname • DBMS_XDBZ.NAME_FORMAT_DISTINGUISHIED -- LDAP distinguished name.

Return Values

Returns TRUE if successful.

207.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
   object_schema   IN  VARCHAR2,
   object_name     IN  VARCHAR2,
   hierarchy_type  IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
 RETURN BOOLEAN;
```

Parameters

Table 207-9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view
hierarchy_type	Type of hierarchy to check for: • IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS • IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

207.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
 RETURN BOOLEAN;
```

208
DBMS_XEVENT

The DBMS_XEVENTpackage provides event-related types and supporting subprograms.

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_XEVENT Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

208.1 DBMS_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

208.2 DBMS_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

Table 208-1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	

Table 208-1 (Cont.) DBMS_XEVENT Constants

Name	Type	Value	Description
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

208.3 Subprogram Groups

The subprograms in the DBMS_XEVENT package can be divided in groups.

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms

208.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 208-2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event
GETEVENT Function	Returns a value identifying the triggering event
ISNULL Functions	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 208-3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function	Returns an `XDBLink` object for the target resource
GETLOCK Function	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function	Returns the original `XDBResource` object before the operation was executed
GETOPENACCESSMODE Function	Returns the access mode for the open operation
GETOPENDENYMODE Function	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function	Returns the value of a request or session-specific parameter
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function	Returns the `XDBPath` object representing the path of the resource for which the event was fired

Table 208-3 (Cont.) XDBRepositoryEvent Subprograms

Subprogram	Description
GETRESOURCE Function	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type
ISNULL Functions	Returns `TRUE` if input argument is `NULL`
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure	sets the `BLOB` from which the rendered contents can be read

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 208-4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure	Clears the handler list
GETFIRST Function	Returns the first handler in the list
GETNAME Function	Returns the next handler in the list
ISNULL Functions	Returns `TRUE` if input argument is `NULL`
REMOVE Procedure	Removes the specified handler from the handler list

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 208-5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function	Returns the implementation language of the handler

Table 208-5 (Cont.) XDBHandler Type Subprograms

Subprogram	Description
GETSCHEMA Function	Returns the schema of the handler's source
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions	Returns TRUE if input argument is NULL

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 208-6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function	Returns the string representation of the path
GETPARENTPATH Function	Returns the parent's path
ISNULL Functions	Returns TRUE if input argument is NULL

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.3.6 DBMS_XEVENT XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 208-7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDOID Function	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function	Returns the link's parent folder's name
GETPARENTOID Function	Returns the link's parent folder's OID
ISNULL Functions	Returns TRUE if input argument is NULL

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

208.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

Table 208-8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure	Clears the handler list	XDBHandlerList Type Subprograms
GETAPPLICATIONDATA Function	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms
GETCHILDOID Function	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms
GETEVENT Function	Returns a value identifying the triggering event	XDBEvent Type Subprograms
GETFIRST Function	Returns the first handler in the list	XDBHandlerList Type Subprograms
GETHANDLERLIST Function	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms
GETLANGUAGE Function	Returns the implementation language of the handler	XDBHandler Type Subprograms
GETLINK Function	Returns an `XDBLink` object for the target resource	XDBRepositoryEvent Type Subprograms
GETLOCK Function	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms
GETNAME Function	Returns the string representation of the path	XDBPath Type Subprograms
GETNAME Function	Returns the next handler in the list	XDBHandlerList Type Subprograms
GETOLDRESOURCE Function	Returns the original `XDBResource` object before the operation was executed	XDBRepositoryEvent Type Subprograms
GETOPENACCESSMODE Function	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOPENDENYMODE Function	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms
GETPARAMETER Function	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms

Table 208-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETPARENTNAME Function	Returns the link's parent folder's name	XDBLink Type Subprograms
GETPARENTOID Function	Returns the link's parent folder's OID	XDBLink Type Subprograms
GETPARENTNAME Function	Returns the parent's path	XDBPath Type Subprograms
GETPATH Function	Returns the `XDBPath` object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms
GETRESOURCE Function	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms
GETSCHEMA Function	Returns the schema of the handler's source	XDBHandler Type Subprograms
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms
GETXDBEVENT Function	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type	XDBRepositoryEvent Type Subprograms
ISNULL Functions	Returns `TRUE` if input argument is `NULL`	XDBEvent Type Subprograms XDBRepositoryEvent Type Subprograms XDBHandlerList Type Subprograms XDBHandler Type Subprograms XDBPath Type Subprograms
REMOVE Procedure	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms
SETRENDERSTREAM Procedure	sets the `BLOB` from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms

208.4.1 CLEAR Procedure

This procedure clears the handler list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl       IN OUT   XDBHandlerList);
```

Parameters

Table 208-9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

208.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev   IN   XDBRepositoryEvent)
  RETURN XMLType;
```

Parameters

Table 208-10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.3 GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 208-11 GETCHILDOID Function Parameters

Parameter	Description
link	Link

208.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:**
>
> XDBEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev   IN   XDBEvent)
  RETURN VARCHAR2;
```

Parameters

Table 208-12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

208.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:**
>
> XDBEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev   IN   XDBEvent)
  RETURN XDBEventID;
```

Parameters

Table 208-13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

208.4.6 GETFIRST Function

This function returns the first handler in the list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 208-14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

208.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBHandlerList;
```

Parameters

Table 208-15 GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev   IN   XDBRepositoryEvent)
  RETURN VARCHAR2;
```

Parameters

Table 208-16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 208-17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

208.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLink;
```

Parameters

Table 208-18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.11 GETLINKNAME Function

This function returns the name of the link.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 208-19 GETLINKNAME Function Parameters

Parameter	Description
link	Link

208.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation.I t is only valid for lock and unlock events.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLock;
```

Parameters

Table 208-20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 208-21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

208.4.14 GETNAME Function

This function returns the string representation of the path.

> **See Also:**
>
> XDBPath Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
  RETURN VARCHAR2;
```

Parameters

Table 208-22 GETNAME Function Parameters

Parameter	Description
path	Path

208.4.15 GETNEXT Function

This function returns the next handler in the list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 208-23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

208.4.16 GETOLDRESOURCE Function

This function returns the original XDBResource object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 208-24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 208-25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- `XDBRepositoryEvent.OPEN_ACCESS_READ` (value 1)
- `XDBRepositoryEvent.OPEN_ACCESS_WRITE` (value 2)
- `XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE` (value 3)

208.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 208-26 GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- `XDBRepositoryEvent.OPEN_DENY_NONE` (value 0)
- `XDBRepositoryEvent.OPEN_DENY_READ` (value 1)
- `XDBRepositoryEvent.OPEN_DENY_READ_WRITE` (value 2)

208.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev   IN   XDBRepositoryEvent)
  RETURN BLOB;
```

Parameters

Table 208-27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the key parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 208-28 GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: • ACCEPT • ACCEPT-LANGUAGE • ACCEPT-CHARSET • ACCEPT_ENCODING

208.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 208-29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 208-30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

208.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 208-31 GETPARENTOID Function Parameters

Parameter	Description
`link`	Link

208.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

> **See Also:**
>
> XDBPath Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path   IN   XDBPath,
   level   IN   INTEGER)
  RETURN XDBPath;
```

Parameters

Table 208-32 GETPARENTPATH Function Parameters

Parameter	Description
`path`	Path
`level`	Number of levels up the hierarchy

208.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBPath;
```

Parameters

Table 208-33 GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 208-34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 208-35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

208.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 208-36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

208.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 208-37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 208-38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBETEVENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters

Table 208-39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

208.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

> **See Also:**
>
> - XDBEvent Type Subprograms for other subprograms in this group
> - XDBRepositoryEvent Type Subprograms for other subprograms in this group
> - XDBHandlerList Type Subprograms for other subprograms in this group
> - XDBHandler Type Subprograms for other subprograms in this group
> - XDBPath Type Subprograms for other subprograms in this group
> - XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev         IN   XDBEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev         IN   XDBRepositoryEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl         IN   XDBHandlerList)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler    IN   XDBHandler)
  RETURN BOOLEAN;
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path       IN   XDBPath)
  RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
    link       IN   XDBLink)
  RETURN BOOLEAN;
```

Parameters

Table 208-40 ISNULL Function Parameters

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler
path	Path

208.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

Table 208-41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

208.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);
```

Parameters

Table 208-42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

208.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN   XDBRepositoryEvent,
    istr  IN   BLOB);
```

Parameters

Table 208-43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

209
DBMS_XMLDOM

The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Types
- Exceptions
- Subprogram Groups
- Subprogram Groups
- Summary of DBMS_XMLDOM Subprograms

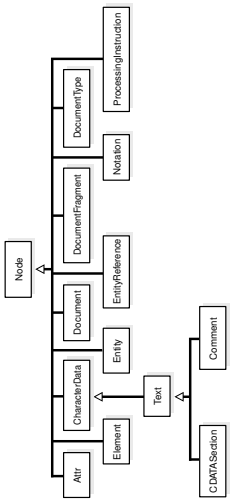
> **See Also:**
>
> *Oracle XML Developer's Kit Programmer's Guide*

209.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the DBMS_XMLDOM package allows you access to both schema-based and non schema-based documents.

> **Note:**
>
> Read-from and write-to files must be on the server file system.



With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a `DOMNode n`, the APPENDCHILD FunctionPL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement elem`SETATTRIBUTE Procedures, use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 209-1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `make`*`XXX`* functions, where `DOM`*`XXX`* is the desired DOM type.

Figure 209-1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

209.2 DBMS_XMLDOM Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

209.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 209-1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

209.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the DBMS_XMLDOM.DOMTYPE package.

Table 209-2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDataSection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.

Table 209-2 (Cont.) XDB_XMLDOM Types

Type	Description
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

209.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS_XMLDOM:

Table 209-3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

209.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms
- DOMAttr Subprograms
- DOMCDataSection Subprograms
- DOMCharacterData Subprograms
- DOMComment Subprograms
- DOMDocument Subprograms
- DOMDocumentFragment Subprograms
- DOMDocumentType Subprograms
- DOMElement Subprograms
- DOMEntity Subprograms
- DOMEntityReference Subprograms
- DOMImplementation Subprograms
- DOMNamedNodeMap Subprograms
- DOMNodeList Subprograms
- DOMNotation Subprograms
- DOMProcessingInstruction Subprograms
- DOMText Subprograms

209.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the DOMNode subprograms of DBMS_XMLDOM.

Table 209-4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function	Adopts a node from another document
APPENDCHILD Function	Appends a new child to the node
CLONENODE Function	Clones the node
FREENODE Procedure	Frees all resources associated with the node
GETATTRIBUTES Function	Retrieves the attributes of the node
GETCHILDNODES Function	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the node
GETFIRSTCHILD Function	Retrieves the first child of the node
GETLASTCHILD Function	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions	Retrieves the node's namespace URI

Table 209-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
GETNEXTSIBLING Function	Retrieves the next sibling of the node
GETNODENAME Function	Retrieves the Name of the Node
GETNODETYPE Function	Retrieves the Type of the node
GETNODEVALUE Function	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function	Retrieves the owner document of the node
GETPARENTNODE Function	Retrieves the parent of this node
GETPREFIX Function	Retrieves the namespace prefix
GETPREVIOUSSIBLING Function	Retrieves the previous sibling of the node
GETSCHEMANODE Function	Retrieves the associated schema URI
HASATTRIBUTES Function	Tests if the node has attributes
HASCHILDNODES Function	Tests if the node has child nodes
IMPORTNODE Function	Imports a node from another document
INSERTBEFORE Function	Inserts a child before the reference child
ISNULL Functions	Tests if the node is NULL
MAKEATTR Function	Casts the node to an Attribute
MAKECDATASECTION Function	Casts the node to a CData Section
MAKECHARACTERDATA Function	Casts the node to Character Data
MAKECOMMENT Function	Casts the node to a Comment
MAKEDOCUMENT Function	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type
MAKEELEMENT Function	Casts the node to a DOM Element
MAKEENTITY Function	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference
MAKENOTATION Function	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction
MAKETEXT Function	Casts the node to a DOM Text
REMOVECHILD Function	Removes a specified child from a node
REPLACECHILD Function	Replaces the old child with a new child
SETNODEVALUE Procedure	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream
SETPREFIX Procedure	Sets the namespace prefix

Table 209-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
USEBINARYSTREAM Function	Establishes that the stream is valid
WRITETOBUFFER Procedures	Writes the contents of the node to a buffer
WRITETOCLOB Procedures	Writes the contents of the node to a `CLOB`
WRITETOFILE Procedures	Writes the contents of the node to a file

209.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions	Retrieves the local name of the attribute
GETNAME Functions	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function	Tests if attribute was specified in the element
GETVALUE Function	Retrieves the value of the attribute
ISNULL Functions	Tests if the Attribute node is `NULL`
MAKENODE Functions	Casts the Attribute to a node
SETVALUE Procedure	Sets the value of the attribute

209.6.3 DBMS_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `CDataSection` is `NULL`
MAKENODE Functions	Casts the `CDatasection` to a node

209.6.4 DBMS_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure	Appends the specified data to the node data
DELETEDATA Procedure	Deletes the data from the specified offSets
GETDATA Functions	Retrieves the data of the node
GETLENGTH Functions	Retrieves the length of the data
INSERTDATA Procedure	Inserts the data in the node at the specified offSets
ISNULL Functions	Tests if the CharacterData is NULL
MAKENODE Functions	Casts the CharacterData to a node
REPLACEDATA Procedure	Changes a range of characters in the node
SETDATA Procedures	Sets the data to the node
SUBSTRINGDATA Function	Retrieves the substring of the data

209.6.5 DBMS_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the comment is NULL
MAKENODE Functions	Casts the Comment to a node

209.6.6 DBMS_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions	Creates an Attribute
CREATECDATASECTION Function	Creates a CDataSection node
CREATECOMMENT Function	Creates a Comment node
CREATEDOCUMENT Function	Creates a new Document
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment
CREATEELEMENT Functions	Creates a new Element

Table 209-9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEENTITYREFERENCE Function	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction
CREATETEXTNODE Function	Creates a Text node
FREEDOCFRAG Procedure	Frees the document fragment
FREEDOCUMENT Procedure	Frees the document
GETCHARSET Function	Retrieves the characterset of the DOM document
GETDOCTYPE Function	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function	Retrieves the DOM implementation
GETSTANDALONE Function	Retrieves the standalone property of the document
GETVERSION Function	Retrieves the version of the document
GETXMLTYPE Function	Retrieves the XMLType associated with the DOM Document
ISNULL Functions	Tests if the document is NULL
MAKENODE Functions	Casts the document to a node
NEWDOMDOCUMENT Functions	Creates a new document
SETCHARSET Procedure	Sets the characterset of the DOM document
SETDOCTYPE Procedure	Sets the DTD of the document
SETSTANDALONE Procedure	Sets the standalone property of the document
SETVERSION Procedure	Sets the version of the document
WRITETOBUFFER Procedures	Writes the document to a buffer
WRITETOCLOB Procedures	Writes the document to a CLOB
WRITETOFILE Procedures	Writes the document to a file

209.6.7 DBMS_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure	Frees the specified document fragment
ISNULL Functions	Tests if the DocumentFragment is NULL
MAKENODE Functions	Casts the Document Fragment to a node
WRITETOBUFFER Procedures	Writes the contents of a document fragment into a buffer

209.6.8 DBMS_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function	Finds the specified entity in the document type
FINDNOTATION Function	Finds the specified notation in the document type
GETENTITIES Function	Retrieves the nodemap of entities in the Document type
GETNAME Functions	Retrieves the name of the Document type
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions	Retrieves the public ID of the document type
GETSYSTEMID Functions	Retrieves the system ID of the document type
ISNULL Functions	Tests if the Document Type is NULL
MAKENODE Functions	Casts the document type to a node

209.6.9 DBMS_XMLDOM DOMElement Subprograms

This table lists the DOMElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 209-12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure	Frees memory allocated to a DOMElement handle
GETATTRIBUTE Functions	Retrieves the attribute node by name
GETATTRIBUTENODE Functions	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name

Table 209-12 (Cont.) Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions	Retrieves the qualified name of the element
GETTAGNAME Function	Retrieves the Tag name of the element
HASATTRIBUTE Functions	Tests if an attribute exists
ISNULL Functions	Tests if the Element is `NULL`
MAKENODE Functions	Casts the Element to a node
NORMALIZE Procedure	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures	Sets the attribute specified by the name
SETATTRIBUTENODE Functions	Sets the attribute node in the element

209.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

Table 209-13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function	Retrieves the notation name of the entity
GETPUBLICID Functions	Retrieves the public Id of the entity
GETSYSTEMID Functions	Retrieves the system Id of the entity
ISNULL Functions	Tests if the Entity is `NULL`
MAKENODE Functions	Casts the Entity to a node

209.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

Table 209-14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `DOMEntityReference` is `NULL`
MAKENODE Functions	Casts the `DOMEntityReference` to `NULL`

209.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

Table 209-15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `DOMImplementation` node is `NULL`
HASFEATURE Function	Tests if the `DOMImplementation` implements a feature

209.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

Table 209-16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions	Retrieves the number of items in the map
GETNAMEDITEM Function	Retrieves the item specified by the name
ISNULL Functions	Tests if the `NamedNodeMap` is `NULL`
ITEM Functions	Retrieves the item given the index in the map
REMOVENAMEDITEM Function	Removes the item specified by name
SETNAMEDITEM Function	Sets the item in the map specified by the name

209.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

Table 209-17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure	Frees all resources associated with a nodelist
GETLENGTH Functions	Retrieves the number of items in the list
ISNULL Functions	Tests if the `NodeList` is `NULL`
ITEM Functions	Retrieves the item given the index in the list

209.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

Table 209-18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions	Retrieves the public Id of the notation
GETSYSTEMID Functions	Retrieves the system Id of the notation
ISNULL Functions	Tests if the Notation is `NULL`
MAKENODE Functions	Casts the notation to a node

209.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

Table 209-19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions	Retrieves the data of the processing instruction
GETTARGET Function	Retrieves the target of the processing instruction
ISNULL Functions	Tests if the Processing Instruction is `NULL`
MAKENODE Functions	Casts the Processing Instruction to a node
SETDATA Procedures	Sets the data of the processing instruction

209.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

Table 209-20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the text is `NULL`
MAKENODE Functions	Casts the text to a node
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes

209.7 Summary of DBMS_XMLDOM Subprograms

This table lists the DBMS_XMLDOM subprograms and briefly describes them.

Table 209-21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function	Adopts a node from another document	DOMNode Subprograms
APPENDCHILD Function	Appends a new child to the node	DOMNode Subprograms
APPENDDATA Procedure	Appends the specified data to the node data	DOMCharacterData Subprograms
CLONENODE Function	Clones the node	DOMNode Subprograms
CREATEATTRIBUTE Functions	Creates an Attribute	DOMDocument Subprograms
CREATECDATASECTION Function	Creates a `CDataSection` node	DOMDocument Subprograms
CREATECOMMENT Function	Creates a Comment node	DOMDocument Subprograms
CREATEDOCUMENT Function	Creates a new Document	DOMDocument Subprograms
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment	DOMDocument Subprograms
CREATEELEMENT Functions	Creates a new Element	DOMDocument Subprograms
CREATEENTITYREFERENCE Function	Creates an Entity reference	DOMDocument Subprograms
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction	DOMDocument Subprograms
CREATETEXTNODE Function	Creates a Text node	DOMDocument Subprograms
DELETEDATA Procedure	Deletes the data from the specified offSets	DOMCharacterData Subprograms
FINDENTITY Function	Finds the specified entity in the document type	DOMDocumentType Subprograms
FINDNOTATION Function	Finds the specified notation in the document type	DOMDocumentType Subprograms
FREEDOCFRAG Procedure	Frees the document fragment	DOMDocument Subprograms and DOMDocumentFragment Subprograms
FREEDOCUMENT Procedure	Frees the document	DOMDocument Subprograms
FREEELEMENT Procedure	Frees memory allocated to a DOMElement handle	DOMElement Subprograms
FREENODE Procedure	Frees all resources associated with the node	DOMNode Subprograms
FREENODELIST Procedure	Frees all resources associated with a nodelist	DOMNodeList Subprograms
GETATTRIBUTE Functions	Retrieves the attribute node by name	DOMElement Subprograms
GETATTRIBUTENODE Functions	Retrieves the attribute node by name	DOMElement Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETATTRIBUTES Function	Retrieves the attributes of the node	DOMNode Subprograms
GETCHARSET Function	Retrieves the characterset of the DOM document	DOMDocument Subprograms
GETCHILDNODES Function	Retrieves the children of the node	DOMNode Subprograms
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name	DOMCharacterData Subprograms
GETDATA Functions	Retrieves • the data of the node • the data of the processing instruction	• DOMCharacterData Subprograms • DOMProcessingInstruction Subprograms
GETDOCTYPE Function	Retrieves the DTD of the document	DOMDocument Subprograms
GETDOCUMENTELEMENT Function	Retrieves the root element of the document	DOMDocument Subprograms
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname	• DOMDocument Subprograms • DOMElement Subprograms
GETENTITIES Function	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms
GETEXPANDEDNAME Procedure and Functions	Retrieves • the expanded name of the node • the expanded name of the attribute • the expanded name of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms
GETFIRSTCHILD Function	Retrieves the first child of the node	DOMNode Subprograms
GETIMPLEMENTATION Function	Retrieves the DOM implementation	DOMDocument Subprograms
GETLASTCHILD Function	Retrieves the last child of the node	DOMNode Subprograms
GETLENGTH Functions	Retrieves • the length of the data • the number of items in the map • the number of items in the list	• DOMCharacterData Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETLOCALNAME Procedure and Functions	Retrieves • the local part of the qualified name • the local name of the attribute • the local name of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms
GETNAME Functions	Retrieves • the name of the attribute • the name of the Document type	• DOMAttr Subprograms • DOMDocumentType Subprograms
GETNAMEDITEM Function	Retrieves • an item specified by name • and namespace URI)	• DOMNamedNodeMap Subprograms • DOMNamedNodeMap Subprograms
GETNAMESPACE Procedure and Functions	Retrieves • the node's namespace URI • the NS URI of the attribute • the NS URI of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms
GETNEXTSIBLING Function	Retrieves the next sibling of the node	DOMNode Subprograms
GETNODENAME Function	Retrieves the Name of the Node	DOMNode Subprograms
GETNODETYPE Function	Retrieves the Type of the node	DOMNode Subprograms
GETNODEVALUE Function	Retrieves the Value of the Node	DOMNode Subprograms
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves the Node Value as binary stream	DOMNode Subprograms
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves the Node Value as character stream	DOMNode Subprograms
GETNOTATIONNAME Function	Retrieves the notation name of the entity	DOMEntity Subprograms
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms
GETTARGET Function	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms
GETOWNERDOCUMENT Function	Retrieves the owner document of the node	DOMNode Subprograms
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms
GETPARENTNODE Function	Retrieves the parent of this node	DOMNode Subprograms
GETPREFIX Function	Retrieves the namespace prefix)	DOMNode Subprograms
GETPREVIOUSSIBLING Function	Retrieves the previous sibling of the node	DOMNode Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETPUBLICID Functions	Retrieves • the public ID of the document type • the public Id of the entity • the public Id of the notation	• DOMDocumentType Subprograms • DOMEntity Subprograms • DOMNotation Subprograms
GETQUALIFIEDNAME Functions	Retrieves • the Qualified Name of the attribute • the qualified name of the element	• DOMAttr Subprograms • DOMElement Subprograms
GETSCHEMANODE Function	Retrieves the associated schema URI	DOMNode Subprograms
GETSPECIFIED Function	Tests if attribute was specified in the element.	DOMAttr Subprograms
GETSTANDALONE Function	Retrieves the standalone property of the document	DOMDocument Subprograms
GETSYSTEMID Functions	Retrieves • the system ID of the document type • the system Id of the entity • the system Id of the notation	• DOMDocumentType Subprograms • DOMEntity Subprograms • DOMNotation Subprograms
GETTAGNAME Function	Retrieves the Tag name of the element	DOMElement Subprograms
GETVALUE Function	Retrieves the value of the attribute	DOMAttr Subprograms
GETVERSION Function	Retrieves the version of the document	DOMDocument Subprograms)
GETXMLTYPE Function	Retrieves the `XMLType` associated with the DOM Document	DOMDocument Subprograms
HASATTRIBUTES Function	Tests if the node has attributes	DOMNode Subprograms
HASATTRIBUTE Functions	Tests if an attribute exists	DOMElement Subprograms
HASCHILDNODES Function	Tests if the node has child nodes	DOMNode Subprograms
HASFEATURE Function	Tests if the `DOMImplementation` implements a feature	DOMImplementation Subprograms
IMPORTNODE Function	Imports a node from another document	DOMNode Subprograms
INSERTBEFORE Function	Inserts a child before the reference child	DOMNode Subprograms
INSERTDATA Procedure	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions	Tests • if the node is NULL • if the Attribute node is NULL • if the CDataSection is NULL • if the CharacterData is NULL • if the comment is NULL • if the document is NULL • if the DocumentFragment is NULL • if the Document Type is NULL • if the Element is NULL • if the Entity is NULL • if the DOMEntityReference is NULL • if the DOMImplementation node is NULL • if the NamedNodeMap is NULL • if the NodeList is NULL • if the Notation is NULL • if the Processing Instruction is NULL • if the text is NULL	• DOMNode Subprograms • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMImplementation Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms
ITEM Functions	Retrieves • the item given the index in the map • the item given the index in the NodeList	• DOMNamedNodeMap Subprograms • DOMNodeList Subprograms
MAKEATTR Function	Casts the node to an Attribute	DOMNode Subprograms
MAKECDATASECTION Function	Casts the node to a CData Section	DOMNode Subprograms
MAKECHARACTERDATA Function	Casts the node to Character Data	DOMNode Subprograms
MAKECOMMENT Function	Casts the node to a Comment	DOMNode Subprograms
MAKEDOCUMENT Function	Casts the node to a DOM Document	DOMNode Subprograms
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment	DOMNode Subprograms)

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type	DOMNode Subprograms
MAKEELEMENT Function	Casts the node to a DOM ElemenT	DOMNode Subprograms
MAKEENTITY Function	Casts the node to a DOM Entity	DOMNode Subprograms
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference	DOMNode Subprograms
MAKENODE Functions	Casts • the Attribute to a node • the `CDatasection` to a node • the CharacterData to a node • the Comment to a node • the document to a node • the Document Fragment to a node • the document type to a node • the Element to a node • the Entity to a node • • the `DOMEntityReference` to `NULL` • the notation to a node • the Processing Instruction to a node • the text to a node	• DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms
MAKENOTATION Function	Casts the node to a DOM Notation	DOMNode Subprograms
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction	DOMNode Subprograms
MAKETEXT Function	Casts the node to a DOM Text	DOMNode Subprograms
NEWDOMDOCUMENT Functions	Creates a new document	DOMDocument Subprograms
NORMALIZE Procedure	Normalizes the text children of the element	DOMElement Subprograms
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name	DOMElement Subprograms
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element	DOMElement Subprograms
REMOVECHILD Function	Removes a specified child from a node	DOMNode Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVENAMEDITEM Function	Removes the item specified by name	DOMNamedNodeMap Subprograms
REPLACECHILD Function	Replaces the old child with a new child	DOMNode Subprograms
REPLACEDATA Procedure	Changes a range of characters in the node	DOMCharacterData Subprograms
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI	DOMElement Subprograms
SETATTRIBUTE Procedures	Sets the attribute specified by the name	DOMElement Subprograms
SETATTRIBUTENODE Functions	Sets the attribute node in the element	DOMElement Subprograms
SETCHARSET Procedure	Sets the characterset of the DOM document	DOMDocument Subprograms
SETDATA Procedures	Sets • the data to the node • the data of the processing instruction	• DOMCharacterData Subprograms • DOMProcessingInstruction Subprograms
SETDOCTYPE Procedure	Sets the DTD of the document.	DOMDocument Subprograms
SETNAMEDITEM Function	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms
SETNODEVALUE Procedure	Sets the Value of the node	DOMNode Subprograms
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as a binary stream	DOMNode Subprograms
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream	DOMNode Subprograms
SETPREFIX Procedure	Sets the namespace prefix	DOMNode Subprograms
SETSTANDALONE Procedure	Sets the standalone property of the document	DOMDocument Subprograms
SETVALUE Procedure	Sets the value of the attribute	DOMAttr Subprograms
SETVERSION Procedure	Sets the version of the document	DOMDocument Subprograms
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes	DOMText Subprograms
SUBSTRINGDATA Function	Retrieves the substring of the data	DOMCharacterData Subprograms
USEBINARYSTREAM Function	Strabismus that the stream is valid for use	DOMNode Subprograms

Table 209-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
WRITETOBUFFER Procedures	Writes • the contents of the node to a buffer • the document to a buffer • the contents of a document fragment into a buffer	• DOMNode Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms
WRITETOCLOB Procedures	Writes • the contents of the node to a CLOB • the document to a CLOB	• DOMNode Subprograms • DOMDocument Subprograms
WRITETOFILE Procedures	Writes • the contents of the node to a file • the document to a file	• DOMNode Subprograms • DOMDocument Subprograms

209.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

> **See Also:**
>
> DOMNode Subprograms for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc            IN   DOMDocument,
   importedNode   IN   DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 209-22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

209.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
   n          IN    DOMNode,
   newchild   IN    DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 209-23 APPENDCHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The child to be appended to the list of children of node `n`

209.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.APPENDDATA(
   cd      IN    DOMCHARACTERDATA,
   arg     IN    VARCHAR2);
```

Parameters

Table 209-24 APPENDDATA Procedure Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`

Table 209-24 (Cont.) APPENDDATA Procedure Parameters

Parameter	Description
arg	The data to append to the existing data

209.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.CLONENODE(
   n       IN    DOMNODE,
   deep    IN    BOOLEAN)
 RETURN DOMNODE;
```

Parameters

Table 209-25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

209.7.5 CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc     IN    DOMDOCUMENT,
   name    IN    VARCHAR2)
 RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc     IN    DOMDOCUMENT,
   qname    IN    VARCHAR2,
   ns      IN    VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 209-26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

209.7.6 CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
   doc     IN      DOMDOCUMENT,
   data    IN      VARCHAR2)
 RETURN DOMCDATASECTION;
```

Parameters

Table 209-27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

209.7.7 CREATECOMMENT Function

This function creates a DOMCOMMENT node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCOMMENT;
```

Parameters

Table 209-28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

209.7.8 CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
   namespaceURI      IN     VARCHAR2,
   qualifiedName     IN     VARCHAR2,
   doctype           IN     DOMTYPE := NULL)
 RETURN DOMDOCUMENT;
```

Parameters

Table 209-29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI

Table 209-29 (Cont.) CREATEDOCUMENT Function Parameters

Parameter	Description
qualifiedName	Root element name
doctype	Document type

209.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
   doc      IN     DOMDOCUMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 209-30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

209.7.10 CREATEELEMENT Functions

This function creates a DOMELEMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc        IN      DOMDOCUMENT,
   tagName    IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN     DOMDOCUMENT,
   tagName     IN     VARCHAR2,
   ns          IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Parameters

Table 209-31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

209.7.11 CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
   doc         IN     DOMDOCUMENT,
   name        IN     VARCHAR2)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 209-32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

209.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
   doc       IN      DOMDocument,
   target    IN      VARCHAR2,
   data      IN      VARCHAR2)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 209-33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

209.7.13 CREATETEXTNODE Function

This function creates a DOMTEXT node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
   doc      IN     DOMDocument,
   data     IN     VARCHAR2)
 RETURN DOMTEXT;
```

Parameters

Table 209-34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

209.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.DELETEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER);
```

Parameters

Table 209-35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

209.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.FINDENTITY(
   dt     IN     DOMDOCUMENTTYPE,
   name   IN     VARCHAR2,
   par    IN     BOOLEAN)
 RETURN  DOMENTITY;
```

Parameters

Table 209-36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

209.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
   dt        IN     DOMDocumentType,
   name      IN     VARCHAR2)
 RETURN DOMNOTATION;
```

Parameters

Table 209-37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

209.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

> **See Also:**
>
> DOMDocument Subprograms and DOMDocumentFragment Subprograms

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
   df    IN    DOMDOCUMENTFRAGMENT);
```

Parameters

Table 209-38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

209.7.18 FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
   doc     IN     DOMDOCUMENT);
```

Parameters

Table 209-39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

209.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

> **See Also:**
>
> DBMS_XMLDOM DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.FREEELEMENT(
    elem IN DOMELEMENT);
```

Parameters

Table 209-40 FREEELEMENT Procedure Parameters

Parameter	Description
elem	Of type DOMELEMENT

209.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.FREENODE(
   n      IN     DOMNODE);
```

Parameters

Table 209-41 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

209.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

> **See Also:**
>
> DBMS_XMLDOM DOMNodeList Subprograms

Syntax

```
DBMS_XMLDOM.FREENODELIST(
   nl IN DOMNodeList);
```

Parameters

Table 209-42 FREENODELIST Procedure Parameters

Parameter	Description
nl	Of type DOMNODELIST

209.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an DOMELEMENT by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem       IN      DOMELEMENT,
   name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 209-43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

209.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2)
 RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 209-44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

209.7.24 GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
   n      IN      DOMNode)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 209-45 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

209.7.25 GETCHARSET Function

This function retrieves the characterset of the DOM document.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETCHARSET(
   doc IN    DOMDocument)
 RETURN VARCHAR2;
```

Parameters

Table 209-46 GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

Usage Notes

For a newly parsed document, we return the database characterset. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.

209.7.26 GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
   n      IN    DOMNode)
 RETURN DOMNodeList;
```

Parameters

Table 209-47 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

209.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2,
   ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 209-48 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

209.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.GETDATA(
   cd      IN    DOMCHARACTERDATA)
 RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.GETDATA(
   pi      IN    DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 209-49 GETDATA Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`pi`	The `DOMPROCESSINGINSTRUCTION`

209.7.29 GETDOCTYPE Function

This function returns the DTD associated to the `DOMDOCUMENT`.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
   doc      IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 209-50 GETDOCTYPE Function Parameters

Parameter	Description
`doc`	`DOMDOCUMENT`

209.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
   doc       IN      DOMDOCUMENT)
 RETURN DOMELEMENT;
```

Parameters

Table 209-51 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

209.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc          IN      DOMDOCUMENT,
   tagname      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2,
   ns         IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Parameters

Table 209-52 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

209.7.32 GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.GETENTITIES(
   dt      IN     DOMDocumentType)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 209-53 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

209.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the Node if is in an Element or Attribute type; otherwise, returns NULL (See Also: DOMNode Subprograms)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   n       IN      DOMNODE
   data    OUT     VARCHAR);
```

Returns the expanded name of the DOMAttr (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   a       IN     DOMAttr)
 RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   elem      IN    DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-54 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the Node
a	DOMATTR
elem	DOMELEMENT

209.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
   n      IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 209-55 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

209.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
   doc      IN     DOMDOCUMENT)
 RETURN DOMIMPLEMENTATION;
```

Parameters

Table 209-56 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

209.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
   n     IN    DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 209-57 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

209.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   cd     IN     DOMCHARACTERDATA)
 RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   nnm      IN     DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   nl     IN    DOMNODELIST)
 RETURN NUMBER;
```

Parameters

Table 209-58 GETLENGTH Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`nnm`	`DOMNAMEDNODEMAP`
`nl`	`DOMNODELIST`

209.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.GETLOCALNAME(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETLOCALNAME(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: DOMElement Subprograms)

```
DBMS_XMLDOM.GETLOCALNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-59 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
`n`	`DOMNode`
`data`	Returned local name.
`a`	`DOMAttr`.
`elem`	`DOMElement`.

209.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETNAME(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETNAME(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Parameters

Table 209-60 GETNAME Function Parameters

Parameter	Description
`a`	`DOMATTR`
`dt`	`DOMDOCUMENTTYPE`

209.7.40 GETNAMEDITEM Function

`GETNAMEDITEM` retrieves a node specified by name.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2)
 RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2,
   ns     IN  VARCHAR2)
 RETURN DOMNODE;
```

Parameters

Table 209-61 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

209.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Retrieves the namespace of the `DOMATTR` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-62 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

209.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
   n       IN     DOMNODE)
 RETURN DOMNode;
```

Parameters

Table 209-63 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

209.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODETYPE(
   n       IN     DOMNODE)
 RETURN NUMBER;
```

Parameters

Table 209-64 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

209.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODENAME(
   n       IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 209-65 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

209.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
   n       IN     DOMNODE)
 RETURN VARCHAR2;*
```

Parameters

Table 209-66 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

209.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 209-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

209.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n        IN     DOMNODE)
 RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n        IN   DOMNODE,
   value    IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 209-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

209.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

> **See Also:**
>
> DOMEntity Subprograms

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Parameters

Table 209-69 GETNOTATIONNAME Function Parameters

Parameter	Description
`ent`	`DOMENTITY`

209.7.49 GETNOTATIONS Function

This function retrieves a `DOMNAMEDNODEMAP` containing the notations declared in the DTD.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 209-70 GETNOTATIONS Function Parameters

Parameter	Description
`dt`	`DOMDOCUMENTTYPE`

209.7.50 GETTARGET Function

This function returns the target of the `DOMPROCESSINGINSTRUCTION`.

> **See Also:**
>
> DOMProcessingInstruction Subprograms

Syntax

```
DBMS_XMLDOM.GETTARGET(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 209-71 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

209.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n       IN     DOMNODE)
 RETURN DOMDOCUMENT;
```

Parameters

Table 209-72 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

209.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
   a       IN     DOMATTR)
 RETURN DOMElement;
```

Parameters

Table 209-73 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

209.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
   n       IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 209-74 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

209.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n       IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 209-75 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

209.7.55 GETPREVIOUSSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPREVIOUSSIBLING(
   n       IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 209-76 GETPREVIOUSSIBLING Function Parameters

Parameter	Description
n	DOMNODE

209.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   ent      IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   n        IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 209-77 GETPUBLICID Function Parameters

Parameter	Description
`dt`	The DTD
`ent`	`DOMENTITY`
`n`	`DOMNOTATION`

209.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the qualified name of the `DOMElement` (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   elem     IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-78 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

209.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n       IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 209-79 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

209.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
   a       IN     DOMATTR)
 RETURN BOOLEAN;
```

Parameters

Table 209-80 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

209.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
   doc       IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-81 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

209.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   ent      IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   n        IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 209-82 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

209.7.62 GETTAGNAME Function

This function returns the name of the DOMELEMENT.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-83 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

209.7.63 GETVALUE Function

This function retrieves the value of the attribute.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETVALUE(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Parameters

Table 209-84 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

209.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc       IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 209-85 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

209.7.65 GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
   doc       IN     DOMDOCUMENT)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 209-86 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

209.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMELEMENT, or has a default value.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2)
 RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2,
   ns       IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 209-87 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

209.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
   n       IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 209-88 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

209.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
   n       IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 209-89 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

209.7.69 HASFEATURE Function

This function tests if the `DOMIMPLEMENTATION` implements a specific feature.

> **See Also:**
>
> DOMImplementation Subprograms

Syntax

```
DBMS_XMLDOM.HASFEATURE(
   di       IN     DOMIMPLEMENTATION,
   feature  IN     VARCHAR2,
   version  IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 209-90 HASFEATURE Function Parameters

Parameter	Description
`di`	`DOMIMPLEMENTATION`
`feature`	The feature to check for
`version`	The version of the DOM to check in

209.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
   doc            IN  DOMDOCUMENT,
   importedNode   IN  DOMNODE,
   deep           IN  BOOLEAN)
  RETURN DOMNODE;
```

Parameters

Table 209-91 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. • If this value is TRUE, the entire subtree of the node will be imported with the node. • If this value is FALSE, only the node itself will be imported.

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

209.7.71 INSERTBEFORE Function

This function inserts the node newchild before the existing child node refchild. If refchild is NULL, insert newchild at the end of the list of children.

If newchild is a DOCUMENTFRAGMENT object, all of its children are inserted, in the same order, before refchild. If the newchild is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
   n           IN     DOMNODE,
   newchild    IN     DOMNODE,
   refchild    IN     DOMNODE)
  RETURN DOMNode;
```

Parameters

Table 209-92 INSERTBEFORE Function Parameters

Parameter	Description
n	DOMNODE
newChild	The child to be inserted in the DOMNODE
refChild	The reference node before which the newchild is to be inserted

209.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

Table 209-93 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

209.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.ISNULL(
  n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.ISNULL(
   a       IN     DOMATTR)
 RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms):

```
DBMS_XMLDOM.ISNULL(
   cds      IN     DOMCDATASECTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.ISNULL(
   cd       IN     DOMCHARACTERDATA)
 RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms):

```
DBMS_XMLDOM.ISNULL(
   com       IN     DOMCOMMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.ISNULL(
   doc       IN     DOMDOCUMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.ISNULL(
   df       IN     DOMDOCUMENTFRAGMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.ISNULL(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.ISNULL(
   elem     IN     DOMELEMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.ISNULL(
   ent       IN     DOMENTITY)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms):

```
DBMS_XMLDOM.ISNULL(
   EREF       IN     DOMENTITYREFERENCE)
 RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms):

```
DBMS_XMLDOM.ISNULL(
   di       IN     DOMIMPLEMENTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.ISNULL(
   nnm       IN     DOMNAMEDNODEMAP)
 RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.ISNULL(
   nl       IN     DOMNODELIST)
 RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.ISNULL(
   n       IN     DOMNOTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.ISNULL(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms):

```
DBMS_XMLDOM.ISNULL(
   t       IN     DOMTEXT)
 RETURN BOOLEAN;
```

Parameters

Table 209-94 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check

Table 209-94 (Cont.) ISNULL Function Parameters

Parameter	Description
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

209.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the INDEX parameter. If INDEX is greater than or equal to the number of nodes in this map, this returns NULL (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.ITEM(
   nnm       IN     DOMNAMEDNODEMAP,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the INDEX parameter. If index is greater than or equal to the number of nodes in the list, this returns NULL (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.ITEM(
   nl        IN     DOMNODELIST,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Parameters

Table 209-95 ITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
index	The index in the node map at which the item is to be retrieved
nl	DOMNODELIST
index	The index in the NodeList used to retrieve the item

209.7.75 MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEATTR(
   n       IN     DOMNODE)
 RETURN DOMATTR;
```

Parameters

Table 209-96 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.76 MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
   n       IN     DOMNODE)
 RETURN DOMCDATASECTION;
```

Parameters

Table 209-97 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.77 MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
   n       IN     DOMNode)
 RETURN DOMCharacterData;
```

Parameters

Table 209-98 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.78 MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
   n       IN     DOMNODE)
 RETURN DOMCOMMENT;
```

Parameters

Table 209-99 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
   n       IN     DOMNODE)
 RETURN DOMDocument;
```

Parameters

Table 209-100 MAKEDOCUMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

209.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
   n       IN     DOMNODE)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 209-101 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

209.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n       IN     DOMNODE)
 RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 209-102 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

209.7.82 MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
   n       IN     DOMNODE)
 RETURN DOMELEMENT;
```

Parameters

Table 209-103 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.83 MAKEENTITY Function

This function casts a specified `DOMNODE` to a `DOMENTITY`, and returns the `DOMENTITY`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n       IN     DOMNODE)
 RETURN DOMENTITY;
```

Parameters

Table 209-104 MAKEENTITY Function Parameters

Parameter	Description
n	`DOMNODE` to cast

209.7.84 MAKEENTITYREFERENCE Function

This function casts a specified `DOMNODE` to a `DOMENTITYREFERENCE`, and returns the `DOMENTITYREFERENCE`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
   n       IN     DOMNODE)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 209-105 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	`DOMNODE` to cast

209.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   a        IN     DOMATTR)
 RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   cds      IN     DOMCDATASECTION)
 RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   cd       IN     DOMCHARACTERDATA)
 RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   com      IN     DOMCOMMENT)
 RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   doc      IN     DOMDOCUMENT)
 RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   df       IN     DOMDOCUMENTFRAGMENT)
 RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   elem       IN     DOMELEMENT)
 RETURN DOMNODE;
```

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   ent        IN     DOMENTITY)
 RETURN DOMNODE;
```

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   eref       IN     DOMENTITYREFERENCE)
 RETURN DOMNODE;
```

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   n       IN     DOMNOTATION)
 RETURN DOMNODE;
```

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN DOMNODE;
```

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   t       IN     DOMTEXT)
 RETURN DOMNODE;
```

Parameters

Table 209-106 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast

Table 209-106 (Cont.) MAKENODE Function Parameters

Parameter	Description
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast
t	DOMTEXT to cast

209.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
   n       IN     DOMNODE)
 RETURN DOMNOTATION;
```

Parameters

Table 209-107 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n       IN     DOMNODE)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 209-108 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKETEXT(
   n       IN     DOMNODE)
 RETURN DOMTEXT;
```

Parameters

Table 209-109 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

209.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc    IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl       IN    CLOB)
 RETURN DOMDOCUMENT;
```

Parameters

Table 209-110 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
cl	CLOB source for the DOMDOCUMENT

209.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.NORMALIZE(
   elem       IN     DOMELEMENT);
```

Parameters

Table 209-111 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

209.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2,
   ns       IN    VARCHAR2);
```

Parameters

Table 209-112 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

209.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
   elem       IN     DOMELEMENT,
   oldAttr    IN     DOMATTR)
  RETURN DOMAttr;
```

Parameters

Table 209-113 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

209.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
   n          IN     DOMNode,
   oldchild   IN     DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 209-114 REMOVECHILD Function Parameters

Parameter	Description
`n`	`DOMNODE`
`oldCHild`	The child of the node `n` to be removed

209.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2)
 RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
```

```
   name      IN      VARCHAR2,
   ns        IN      VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 209-115 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

209.7.95 REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
   n            IN     DOMNode,
   newchild     IN     DOMNode,
   oldchild     IN     DOMNode)
 RETURN DOMNode;
```

Parameters

Table 209-116 REPLACECHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The new child which is to replace the old child
oldchild	The child of the node n which is to be replaced

209.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.REPLACEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER,
   arg       IN     VARCHAR2);
```

Parameters

Table 209-117 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

209.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
   elem       IN     DOMELEMENT,
   prefix     IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 209-118 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

209.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2,
   ns         IN  VARCHAR2);
```

Parameters

Table 209-119 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

209.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR)
 RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR,
   ns        IN  VARCHAR2)
 RETURN DOMATTR;
```

Parameters

Table 209-120 SETATTRIBUTENODE Function Parameters

Parameter	Description
`elem`	The `DOMELEMENT`
`newAttr`	The new `DOMATTR`
`ns`	The namespace

209.7.100 SETCHARSET Procedure

This function sets the characterset of the DOM document.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETCHARSET(
   doc      IN    DOMDocument,
   charset  IN    VARCHAR2);
```

Parameters

Table 209-121 SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Characterset

Usage Notes

This is used for WRITETOFILE Procedures if not explicitly specified at that time.

209.7.101 SETDATA Procedures

This overloaded procedure sets character data or DOMPROCESSINGINSTRUCTION content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.SETDATA(
   cd       IN     DOMCHARACTERDATA,
   data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.SETDATA(
   pi       IN     DOMPROCESSINGINSTRUCTION,
   data     IN     VARCHAR2);
```

Parameters

Table 209-122 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

209.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Parameters

Table 209-123 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

209.7.103 SETNAMEDITEM Function

This function adds a node using its NodeName attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm     IN     DOMNAMEDNODEMAP,
   arg     IN     DOMNODE)
 RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm     IN     DOMNAMEDNODEMAP,
   arg      IN    DOMNODE,
   ns      IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 209-124 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its NodeName attribute
ns	Namespace

209.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.SETNODEVALUE(
   n         IN     DOMNODE,
   nodeValue IN     VARCHAR2);
```

Parameters

Table 209-125 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

209.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 209-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	`DOMNODE`
value	`BINARYINPUTSTREAM`

209.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n        IN     DOMNODE)
 RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of

the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n        IN   DOMNODE,
   value    IN   SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 209-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

209.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.SETPREFIX(
   n       IN     DOMNODE,
   prefix  IN     VARCHAR2);
```

Parameters

Table 209-128 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

209.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
   doc         IN     DOMDOCUMENT,
   newvalue    IN     VARCHAR2);
```

Parameters

Table 209-129 SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

209.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.SETVALUE(
   a       IN     DOMATTR,
   value   IN     VARCHAR2);
```

Parameters

Table 209-130 SETVALUE Procedure Parameters

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

209.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETVERSION(
   doc         IN     DOMDOCUMENT,
   version     IN     VARCHAR2);
```

Parameters

Table 209-131 SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

209.7.111 SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

> **See Also:**
>
> DBMS_XMLDOM DOMText Subprograms

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
   t         IN     DOMTEXT,
   offset    IN     NUMBER)
 RETURN DOMText;
```

Parameters

Table 209-132 SPLITTEXT Function Parameters

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

209.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 209-133 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

209.7.113 USEBINARYSTREAM Function

This function returns TRUE if the datatype of the node is RAW or BLOB, so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM.

If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM   (
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 209-134 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

209.7.114 WRITETOBUFFER Procedures

WRITETOBUFFER is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   n        IN      DOMNODE,
   buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   doc      IN      DOMDOCUMENT,
   buffer   IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   df       IN      DOMDOCUMENTFRAGMENT,
   buffer   IN OUT  VARCHAR2);
```

Parameters

Table 209-135 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

209.7.115 WRITETOCLOB Procedures

`WRITETOCLOB` is an overloaded procedure that writes an XML node or document to a specified `CLOB`.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified `CLOB` using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOCLOB(
   n       IN      DOMNODE,
   cl      IN OUT  CLOB);
```

Writes XML document to a specified `CLOB` using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOCLOB(
   doc     IN      DOMDOCUMENT,
   cl      IN OUT  CLOB);
```

Parameters

Table 209-136 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

209.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2,
   charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc       IN   DOMDOCUMENT,
   fileName  IN   VARCHAR2,
   charset   IN   VARCHAR2);
```

Parameters

Table 209-137 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE

Table 209-137 (Cont.) WRITETOFILE Procedure Parameters

Parameter	Description
`fileName`	File to which to write. The filename should be in the format of `database_directory_object_name/filename`, for example `mydir/filename` (on windows, use \ instead of `/`).
`charset`	specified character set
`doc`	`DOMDOCUMENT`
`charset`	Character set

210
DBMS_XMLGEN

The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Security Model
- Summary of DBMS_XMLGEN Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide, f*or more information on XML support and on examples of using DBMS_XMLGEN

210.1 DBMS_XMLGEN Security Model

Owned by XDB, the DBMS_XMLGEN package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

210.2 Summary of DBMS_XMLGEN Subprograms

This table lists the DBMS_XMLGEN subprograms and briefly describes them.

Table 210-1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure	Closes the context and releases all resources
CONVERT Functions	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions	Gets the XML document
GETXMLTYPE Functions	Gets the XML document and returns it as XMLType
NEWCONTEXT Functions	Creates a new context handle
NEWCONTEXTFROMHIERARCHY Function	Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result
RESTARTQUERY Procedure	Restarts the query to start fetching from the beginning

Table 210-1 (Cont.) Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
SETCONVERTSPECIALCHARS Procedure	Sets whether special characters such as $, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure	Sets NULL handling options
SETROWSETTAG Procedure	Sets the name of the element enclosing the entire result
SETROWTAG Procedure	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure	Forces the use of the collection column name appended with the tag _ITEM for collection elements
USENULLATTRIBUTEINDICATOR Procedure	Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.

210.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
   ctx  IN ctxHandle);
```

Parameters

Table 210-2 CLOSECONTEXT Procedure Parameters

Parameter	Description
ctx	The context handle to close.

210.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
   xmlData IN VARCHAR2,
   flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
   xmlData IN CLOB,
   flag    IN NUMBER := ENTITY_ENCODE)
 RETURN CLOB;
```

Parameters

Table 210-3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

210.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
   ctx     IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 210-4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

210.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functionscall is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   tmpclob      IN OUT NCOPY CLOB,
   dtdOrSchema  IN number := NONE)
 RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Parameters

Table 210-5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

210.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
   ctx           IN ctxhandle,
   dtdOrSchema   IN number := NONE)
 RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN sys.XMLType
```

Parameters

Table 210-6 GETXMLTYPE Function Parameters

Parameter	Description
`ctx`	The context handle obtained from the `newContext` call.
`sqlQuery`	The SQL query string.
`dtdOrSchema`	Generate a DTD or a schema? Only `NONE` is supported.

210.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
      query     IN VARCHAR2)
 RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
   queryString  IN SYS_REFCURSOR)
 RETURN ctxHandle;
```

Parameters

Table 210-7 NEWCONTEXT Function Parameters

Parameter	Description
`query`	The query, in the form of a VARCHAR, the result of which must be converted to XML.
`queryString`	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

210.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
   queryString IN VARCHAR2)
 RETURN ctxHandle;
```

Parameters

Table 210-8 NEWCONTEXTFROMHIERARCHY Function Parameters

Parameter	Description
`queryString`	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a `CONNECT BY` clause, and the result must have the same property as the result set generated by a `CONNECT BY` query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

210.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 210-9 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

210.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to <.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx   IN ctxHandle,
conv  IN BOOLEAN);
```

Parameters

Table 210-10 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
ctx	The context handle obtained from one of the NEWCONTEXT Functions call.
conv	TRUE indicates that conversion is needed.

210.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the maxrows parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
ctx      IN ctxHandle,
maxRows  IN NUMBER);
```

Parameters

Table 210-11 SETMAXROWS Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
maxRows	The maximum number of rows to get for each call to GETXML Functions

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

210.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

Parameters

Table 210-12 SETNULLHANDLING Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
flag	The NULL handling option set. • DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements. • NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true". • EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>.

210.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is ROWSET.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 210-13 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.
rowSetTagName	The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.

Usage Notes

The user can set the rowSetTag to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

210.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
ctx         IN ctxHandle,
rowTagName  IN VARCHAR2);
```

Parameters

Table 210-14 SETROWTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.
rowTagName	The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

210.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
ctx       IN ctxHandle,
skipRows  IN NUMBER);
```

Parameters

Table 210-15 SETSKIPROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`skipRows`	The number of rows to skip for each call to `getXML`.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

210.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
   ctx  IN ctxHandle);
```

Parameters

Table 210-16 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
`ctx`	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

210.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx       IN   ctxType,
attrind   IN   BOOLEAN := TRUE);
```

Parameters

Table 210-17 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
`ctx`	Context handle.
`attrind`	Use attribute to indicate `NULL`?

211
DBMS_XMLINDEX

The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLINDEX Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

211.1 DBMS_XMLINDEX Overview

DBMS_XMLINDEX provides a mechanism for asynchronous index maintenance.

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. DBMS_XMLINDEX provides this mechanism.

211.2 DBMS_XMLINDEX Security Model

Owned by XDB, the DBMS_XMLINDEX package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

211.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the DBMS_XMLINDEX subprograms and briefly describes them.

Table 211-1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure	Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex

Table 211-1 (Cont.) DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATENUMBERINDEX Procedure	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
DROPPARAMETER Procedure	Drops the XMLIndex parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure	Modifies the XMLIndex parameter string that is associated with a given parameter name
PROCESS_PENDING Procedure	Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex
REGISTERPARAMETER Procedure	Registers a parameter string and XMLIndex parameter string pair in XDB
SYNCINDEX Procedure	Synchronizes the index manually

211.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2,
   date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 211-2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema

Table 211-2 (Cont.) CREATEDATEINDEX Procedure Parameters

Parameter	Description
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

211.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   num_index_name     IN   VARCHAR2,
   num_index_clause   IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 211-3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

211.3.3 DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
   name         IN      VARCHAR2);
```

Parameters

Table 211-4 DROPPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
   'myIndexParam');
```

211.3.4 MODIFYPARAMETER Procedure

This procedure modifies the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   name         IN      VARCHAR2,
   parameter    IN      CLOB);
```

Parameters

Table 211-5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string
`parameter`	`XMLIndex` parameter clause that can appear in a `CREATE INDEX` or an `ALTER INDEX` statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

211.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a `NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN` operation on an `XMLIndex`.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
   xml_index_schema    IN     VARCHAR2,
   xml_index_name      IN     VARCHAR2,
   pending_row_count   OUT    BINARY_INTEGER,
   error_row_count     OUT    BINARY_INTEGER);
```

Parameters

Table 211-6 PROCESS_PENDING Procedure Parameters

Parameter	Description
`xml_index_schema`	Name of the owner of the `XMLIndex`
`xml_index_name`	Name of the `XMLIndex` to be altered using `NONBLOCKING ALTER INDEX OPERATION`
`pending_row_count`	Number of pending rows to be processed
`error_row_count`	Number of rows for which indexing may have failed because of an error

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the `NONBLOCKING ALTER INDEX OPERATION`.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in `SYS_AIXSXI_######_PENDINGTAB` and errors in `SYS_AIXSXI_#####_ERRORTAB`.. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
   'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

211.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and `XMLIndex` parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   name         IN      VARCHAR2,
   parameter    IN      CLOB);
```

Parameters

Table 211-7 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx
    PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
    GROUP MASTERGROUP XMLTABLE PO_TAB
    (''/p:PurchaseOrder''
        COLUMNS
           REFERENCE VARCHAR2(30) PATH ''p:Reference'',
           REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )
    GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
    (''/p:PurchaseOrder/p:LineItems/p:LineItem''
        COLUMNS
           LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',
           QUANTITY NUMBER(38) PATH ''@p:Quantity'',
           DESCRIPTION VARCHAR2(256) PATH ''p:Description'''));
```

211.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
   xml_index_schema      IN VARCHAR2,
   xml_index_name        IN VARCHAR2,
   partition_name        IN VARCHAR2 DEFAULT NULL,
   reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 211-8 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]

Table 211-8 (Cont.) SYNCINDEX Procedure Parameters

Parameter	Description
reindex	Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

212
DBMS_XMLPARSER

Using DBMS_XMLPARSER, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XMLPARSER Subprograms

212.1 DBMS_XMLPARSER Security Model

Owned by XDB, the DBMS_XMLPARSER package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

212.2 Summary of DBMS_XMLPARSER Subprograms

This table lists the DBMS_XMLPARSER subprograms and briefly describes them.

Table 212-1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER	Frees a parser object.
GETDOCTYPE	Gets parsed DTD.
GETDOCUMENT	Gets DOM document.
GETRELEASEVERSION	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE	Returns validation mode.
NEWPARSER	Returns a new parser instance
PARSE	Parses XML stored in the given url/file.
PARSEBUFFER	Parses XML stored in the given buffer
PARSECLOB	Parses XML stored in the given clob
PARSEDTD	Parses DTD stored in the given url/file
PARSEDTDBUFFER	Parses DTD stored in the given buffer
PARSEDTDCLOB	Parses DTD stored in the given clob
SETBASEDIR	Sets base directory used to resolve relative URLs.
SETDOCTYPE	Sets DTD.
SETERRORLOG	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE	Sets white space preserve mode
SETVALIDATIONMODE	Sets validation mode.
SHOWWARNINGS	Turns warnings on or off.

212.2.1 FREEPARSER

This procedures frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameters

Table 212-2 FREEPARSER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

212.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(
  p Parser)
RETURN DOMDocumentType;
```

Parameters

Table 212-3 GETDOCTYPE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

212.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(
  p Parser)
RETURN DOMDocument;
```

Parameters

Table 212-4 GETDOCUMENT Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

212.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

212.2.5 GETVALIDATIONMODE

The GETVALIDATIONMODE function retrieves the validation mode: TRUE for validating, FALSE otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(
  p Parser)
RETURN BOOLEAN;
```

Parameters

Table 212-5 GETVALIDATIONMODE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

212.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser
RETURN Parser;
```

212.2.7 PARSE

PARSE parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(
  p Parser,
  url VARCHAR2);
```

Parameters

Table 212-6 PARSE Subprogram Parameters

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

212.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
  p   Parser,
doc VARCHAR2);
```

Parameters

Table 212-7 PARSEBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

212.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
  p   Parser,
doc CLOB);
```

Parameters

Table 212-8 PARSECLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

212.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
  p     Parser,
  url   VARCHAR2,
  root  VARCHAR2);
```

Parameters

Table 212-9 PARSEDTD Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

212.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
  p    Parser,
  dtd  VARCHAR2,
  root VARCHAR2);
```

Parameters

Table 212-10 PARSEDTDBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

212.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(
  p    Parser,
  dtd  CLOB,
  root VARCHAR2);
```

Parameters

Table 212-11 PARSEDTDCLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

212.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(
  p   Parser,
  dir VARCHAR2);
```

Parameters

Table 212-12 SETBASEDIR Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

212.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
  p   Parser,
  dtd DOMDocumentType);
```

Parameters

Table 212-13 SETDOCTYPE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

212.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
  p        Parser,
  fileName VARCHAR2);
```

Parameters

Table 212-14 SETERRORLOG Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

212.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(
  p   Parser,
  yes BOOLEAN);
```

Parameters

Table 212-15 SETPRESERVEWHITESPACE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

212.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

Syntax

```
PROCEDURE setValidationMode(
  p   Parser,
  yes BOOLEAN);
```

Parameters

Table 212-16 SETVALIDATIONMODE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

212.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
  p   Parser,
  yes BOOLEAN);
```

Paramters

Table 212-17 SHOWWARNINGS Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

213
DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script dbmsxsch.sql during Oracle database installation.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_XMLSCHEMA Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

213.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

213.2 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

213.3 DBMS_XMLSCHEMA Constants

The DBMS_XMLSCHEMA package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- Table 213-1
- Table 213-2
- Table 213-3

Table 213-1 *DBMS_XMLSCHEMA Constants* - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to DELETE_CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 213-2 *DBMS_XMLSCHEMA Constants* - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema

Table 213-2 (Cont.) *DBMS_XMLSCHEMA Constants* - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 213-3 *DBMS_XMLSCHEMA Constants* - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

213.4 Views

This table lists the views used by the DBMS_XMLSCHEMA package

The columns of these views are described in detail in the *Oracle Database Reference*

Table 213-4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMlType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

213.5 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

213.6 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the `DBMS_XMLSCHEMA` subprograms and briefly describes them.

Table 213-5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure	Removes the schema from the database
INPLACEEVOLVE Procedure	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure	Removes the XML schema
REGISTERSCHEMA Procedures	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure	Registers an XML schema specified by a URI name

213.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
   schemaurl IN VARCHAR2);
```

Parameters

Table 213-6 COMPILESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema

213.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved

- drops temporary tables

> **See Also:**
>
> – "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
>
> – *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
   schemaurls       IN  XDB$STRUBG_LIST_T,
   newschemas       IN  XMLSequenceType,
   transforms       IN  XMLSequenceType :=NULL,
   preserveolddocs  IN  BOOLEAN :=FALSE,
   maptablename     IN  VARCHAR2 :=NULL,
   generatetables   IN  BOOLEAN :=TRUE,
   force            IN  BOOLEAN :=FALSE,
   schemaowners     IN  XDB$STRING_LIST_T :=NULL
   parallelDegree   IN  PLS_INTEGER := 0,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 213-7 COPYEVOLVE Procedure Parameters

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.

Table 213-7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: • SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms • SCHEMA_OWNER -VARCHAR2(30) - Owner of the schema • ELEMENT_NAME - VARCHAR2(256)- Element to which this table conforms • TAB_NAME - VARCHAR2(65) - Qualified table name: *<owner_name>.<table_name>* • COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) • TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: • new tables will not be generated after registration of new schemas • preserveolddocs must be TRUE • maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.

213.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
   schemaurl      IN  VARCHAR2,
   delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 213-8 DELETESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema to be deleted
`delete_option`	Delete options: • `DELETE_RESTRICT` - Schema deletion fails if there are any tables or schemas that depend on this schema • `DELETE_INVALIDATE` - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. • `DELETE_CASCADE` - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. • `DELETE_CASCADE_FORCE` - Similar to `DELETE_CASCADE` except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 213-9 DELETESCHEMA Procedure Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

213.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
   schemaURL     IN   VARCHAR2,
   diffXML       IN   XMLType,
   flags         IN   NUMBER);
```

Parameters

Table 213-10 INPLACEEVOLVE Procedure Parameters

Parameter	Description
`schemaurl`	URL of the schema to evolve
`diffXML`	Changes to be applied to the schema. This is an XML document conforming to the `XDIFF` schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
`flags`	The following bits may be set in this parameter to control the behavior of this procedure: • `INPLACE_EVOLVE` (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. • `INPLACE_TRACE` (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition: • Bit `INPLACE_EVOLVE` carries out those evolution steps and replaces the old XML schema with the new. • Bit `INPLACE_TRACE` saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid `XPATH` expressions and for `XDIFF` documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

213.6.5 PURGESCHEMA Procedure

This procedure removes the XML schema.

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);
```

Parameters

Table 213-11 PURGESCHEMA Procedure Parameters

Parameter	Description
`schemaid`	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

213.6.6 REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

> **Note:**
>
> As of Oracle Database 11*g* Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  VARCHAR2,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   genTypes         IN  BOOLEAN := TRUE,
   genBean          IN  BOOLEAN := FASLE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `CLOB`

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  CLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as an `XMLTYPE`.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.XMLTYPE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.URIType,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 213-12 REGSITERSCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside `schemalocation` attribute of XML Schema import element.
`schemadoc`	A valid XML schema document
`local`	Is this a local or global schema? • By default, all schemas are registered as local schemas, under `/sys/schemas/<username>/...` • If a schema is registered as global, it is added under `/sys/schemas/PUBLIC/...` You need write privileges on the directory to be able to register a schema as global.
`gentypes`	Determines whether the schema compiler generates object types. By default, `TRUE`. If you use binary XML, you must be set `gentypes` to `FALSE`.
`genbean`	Determines whether the schema compiler generates Java beans. By default, `FALSE`. Oracle recommends that this parameter always be set to `FALSE`.
`gentables`	Determines whether the schema compiler generates default tables. By default, `TRUE`
`force`	If this parameter is set to `TRUE`, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is `FALSE`.

Table 213-12 (Cont.) REGSITERSCHEMA Procedure Parameters

Parameter	Description
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	• ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema • ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. • ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: • REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column) • REGISTER_BINARYXML - Register the schema for Binary XML • REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

213.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

> **Note:**
>
> As of Oracle Database 11g Release 2 (11.2) the genbean parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
   schemaurl      IN  VARCHAR2,
   schemadocuri   IN  VARCHAR2,
```

```
   local          IN  BOOLEAN := TRUE,
   gentypes       IN  BOOLEAN := TRUE,
   genbean        IN  BOOLEAN := FALSE,
   gentables      IN  BOOLEAN := TRUE,
   force          IN  BOOLEAN := FALSE,
   owner          IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 213-13 REGISTERURI Procedure Parameters

Parameter	Description
schemaurl	Uniquely identifies the schema document. Can be used inside schemaLocation attribute of XML Schema import element.
schemadocuri	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the urifactory, and invokes the REGISTERSCHEMA Procedures.
local	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.
gentypes	Determines whether the compiler generate object types. By default, TRUE.
genbean	Determines whether the compiler generate Java beans. By default, FALSE.
gentables	Determines whether the compiler generate default tables. TRUE by default.
force	TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: • REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)

214
DBMS_XMLSCHEMA_ANNOTATE

The DBMS_XMLSCHEMA_ANNOTATE package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

214.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The DBMS_XMLSCHEMA_ANNOTATE package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

214.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by XDB, the DBMS_XMLSCHEMA_ANNOTATE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

214.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the DBMS_XMLSCHEMA_ANNOTATE package subprograms.

Table 214-1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
ADDXDBNAMESPACE Procedure	Adds the XDB namespace required for XDB annotation

Table 214-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
DISABLEDEFAULTTABLECREATION Procedure	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element
DISABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to FALSE
ENABLEDEFAULTTABLECREATION Procedure	Enables the creation of ALL top level tables by removing the empty default table name annotation
ENABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to TRUE
GETSCHEMAANNOTATIONS Function	Creates a document containing the differences between the annotated XML schema and the original XML schema
GETSIDXDEFFROMVIEW Function	Takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table
PRINTWARNINGS Procedure	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
REMOVEANYSTORAGE Procedure	Removes the setting of the SQL type from the ANY child of the complex type with the given name
REMOVEDEFAULTTABLE Procedure	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
REMOVEMAINTAINDOM Procedure	Removes all annotations used to maintain DOM from the given schema
REMOVEOUTOFLINE Procedure	Removes any existing SQLInline attributes to prevent out-of-line storage
REMOVESQLCOLLTYPE Procedure	Removes a SQL collection type.
REMOVESQLNAME Procedure	Removes a SQLNAME from a global element
REMOVESQLTYPE Procedure	Removes a SQL type
REMOVESQLTYPEMAPPING Procedure	Removes the SQL type mapping for the given schema type.
REMOVETABLEPROPS Procedure	Removes the table storage properties from the CREATE TABLE statement
REMOVETIMESTAMPWITHTIMEZONE Procedure	Removes he setting of the TimeStampWithTimeZone datatype from all dateTime typed elements in the XML schema
SETANYSTORAGE Procedure	Assigns a SQL datatype to the ANY child of the complex type with the given name
SETDEFAULTTABLE Procedure	Sets the name of the table for the specified global element
SETOUTOFLINE Procedure	Sets the SQLInline attribute to FALSE
SETSCHEMAANNOTATATIONS Procedure	Takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema
SETSQLCOLLTYPE Procedure	Assigns a SQL type name for a collection
SETSQLNAME Procedure	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
SETSQLTYPE Procedure	Assigns a SQL type to a global object

Table 214-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
SETSQLTYPEMAPPING Procedure	Defines a mapping of schema type and SQL type
SETTABLEPROPS Procedure	Specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement
SETTIMESTAMPWITHTIMEZONE Procedure	Sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema

214.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
   xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 214-2 ADDXDBNAMESPACE Procedure Parameters

Parameter	Description
`xmschema`	Gets an XML Schema as `XMLTYPE`, performs the annotation and returns it

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

214.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType,
   globalElementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType);
```

Parameters

Table 214-3 DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

The purchaseOrder element will have an annotation similar to xdb:defaultTable="".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                                       'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

214.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to FALSE.

There are two overloads. The first sets DOM fidelity attribute to FALSE for all complex types, and the second sets it to FALSE for the named complex type. This is equivalent to adding xdb:maintainDOM="false" on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2,
   overwrite       IN BOOLEAN default TRUE);
```

Parameters

Table 214-4 DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

214.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2););
```

Parameters

Table 214-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`gloablElementName`	Name of the global element in the schema

Usage Notes

This procedure does not affect elements that have a default table name.

214.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to TRUE for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema        IN OUT XMLType,
   complexTypeName  IN VARCHAR2,
   overwrite        IN BOOLEAN default TRUE);
```

Parameters

Table 214-6 ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`complexTypeName`	The name of the complex type

Table 214-6 (Cont.) ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`

214.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
   xmlschema IN xmlType)
  RETURN XMLType;
```

Parameters

Table 214-7 GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
`xmlschema`	The original XML schema

Return Values

This function returns the document `annotations.xml` as an `XMLType`.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

> **See Also:**
>
> SETSCHEMAANNOTATATIONS Procedure

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in SETSCHEMAANNOTATATIONS Procedure.

214.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
   viewName   IN xmlType)
  RETURN CLOB;
```

Parameters

Table 214-8 GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

214.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
   value       IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-9 PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

214.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2);
```

Parameters

Table 214-10 REMOVEANYSTORAGE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated.
`complexTypeName`	The name of the complex type.

Usage Notes

This procedure reverses the SETANYSTORAGE Procedure.

214.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
   xmlschema          IN OUT XMLTYPE,
   globalElementName  IN     VARCHAR2);
```

Parameters

Table 214-11 REMOVEDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema

Example

Annotations can be verified anytime using "`select out from annotation_tab`".

```
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
   xml_schema XMLTYPE;
```

```
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                              'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

214.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
   xmlschema    IN OUT XMLType);
```

Parameters

Table 214-12 REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

214.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing SQLInline attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the SQLInline attribute for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema           IN OUT  XMLType,
   elementName         IN      VARCHAR2,
   elementType         IN      VARCHAR2,
   overwrite           IN      BOOLEAN default TRUE);
```

Removes the SQLInline attribute for the object specified by its global object and local element names.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localElementName   IN      VARCHAR2);
```

Removes the SQLInline attribute for the referenced global element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2);
```

Parameters

Table 214-13 REMOVEOUTOFLINE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
elementType	The element type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

This procedure reverses SETOUTOFLINE Procedure.

214.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema   IN OUT XMLType,
   elementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema        IN OUT XMLType,
   globalObject     IN VARCHAR2,
   globalName       IN VARCHAR2,
   localElementName IN VARCHAR2);
```

Parameters

Table 214-14 REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
globalObject	The global object (global complex type or global element)
globalName	The name of the global object

Table 214-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
localElementName	The name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETSQLCOLLTYPE Procedure.

214.3.14 REMOVESQLNAME Procedure

This procedure removes a SQLNAME from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-15 REMOVESQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The shipTo element will have an annotation similar to xdb:SQLName="SHIPTO_SQLNAME".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
```

```
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

214.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema in out XMLType,
   globalElementName   IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema           IN OUT  XMLTYPE,
   globalObject        IN      VARCHAR2,
   globalObjectName    IN      VARCHAR2,
   localObject         IN      VARCHAR2,
   localObjectName     IN      VARCHAR2);
```

Parameters

Table 214-16 REMOVESQLTYPE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated.
`globalObject`	Global object (global complex type or global element)
`globalElementName`	Name of the global element.
`globalObjectName`	Name of the global object
`localObject`	Object descended from the global object
`localObjectName`	Name of the local object

Usage Notes

This procedure reverses the SETSQLTYPE Procedure.

214.3.16 REMOVESQLTYPEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEMAPPING (
   xmlschema        IN OUT  XMLTYPE,
   schemaTypeName   IN      VARCHAR2);
```

Parameters

Table 214-17 REMOVESQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the SETSQLTYPEMAPPING Procedure.

214.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the CREATE TABLE statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2);
```

Parameters

Table 214-18 REMOVETABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETTABLEPROPS Procedure.

214.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema          IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema         IN OUT  XMLTYPE,
   schemaTypeName    IN      VARCHAR2);
```

Parameters

Table 214-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`schemaTypeName`	Name of the schema type

Usage Notes

This procedure reverses the SETTIMESTAMPWITHTIMEZONE Procedure.

214.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE )
   xmlschema       IN OUT  XMLType,
   complexTypeName IN      VARCHAR2,
   sqlTypeName     IN      VARCHAR2,
   overwrite       IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-20 SETANYSTORAGE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`complexTypeName`	Name of the complex type
`sqlTypeName`	Name of the SQL type
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `xsd:any child` of complex type `Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE   xml_schema  XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM
annotation_tab;   DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items',                                          'VARCHAR');   UPDATE annotation_tab
SET out = xml_schema;END;
/
```

214.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
   xmlschema           IN  OUT  XMLTYPE,
   globalElementName   IN       VARCHAR2,
   tableName           IN       VARCHAR2,
   overwrite           IN       BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 214-21 SETDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema
`tableName`	Name being assigned to the table
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

214.3.21 SETOUTOFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInLine=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding `'1000 column limit'` errors during XML schema registration, when some elements have complex types with many elements.

> **Also See:**
>
> *Oracle XML DB Developer's Guide*

There are three overloads.

Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   elementName        IN      VARCHAR2,
   elementType        IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localElementName   IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2,
   defaultTableName  IN      VARCHAR2,
   overwrite         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-22 SETOUTOFLINE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated.
`elementName`	The element name
`elementType`	The element type
`defaultTableName`	The name of the default table.
`globalObject`	The global object (global complex type or global element)
`globalObjectName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element.
`reference`	A reference to a global element

Table 214-22 (Cont.) SETOUTOFLINE Procedure Parameters

Parameter	Description
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

After XML schema registration and before loading XML instance data, use DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES() to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to xdb:defaultTable="CMMNT_DEFAULT_TABLE"

```
DECLARE
   xml_schema xmltype;
BEGIN
SELECT OUT INTO xml_schema FROM annotation_tab;

DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                      'ipo:comment',
                                      'CMMNT_DEFAULT_TABLE');
UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

214.3.22 SETSCHEMAANNOTATATIONS Procedure

This procedure takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
   xmlschema     IN OUT xmlType,
   annotations   IN VARCHAR2);
```

Parameters

Table 214-23 SETSCHEMAANNOTATIONS Procedure Parameters

Parameter	Description
xmlschema	An XML schema to be patched.
annotations	The differences document produced by calling DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS on the original XML schema and an annotated XML schema.

Usage Notes

`DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

> **See Also:**
>
> GETSCHEMAANNOTATIONS Function

Example

The following example illustrates `DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS` shown here and GETSCHEMAANNOTATIONS Function.

```
-- test getannotations and apply them
declare
 xml_schema xmltype;
 xml_schema2 xmltype;
 annotations xmltype;
begin
   select out into xml_schema from annotation_tab;

   -- get the annotations from the schema
   annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

   -- apply the annotations to the schema
   select inp into xml_schema2 from annotation_tab;

   DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

   update annotation_tab t set t.out = xml_schema2;
end;
/
```

214.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates `SQLTypes` with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT   XMLTYPE,
   elementName        IN       VARCHAR2,
   sqlCollType        IN       VARCHAR2,
   overwrite          IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT XMLType,
   globalObject       IN VARCHAR2,
```

```
   globalObjectName   IN VARCHAR2,
   localElementName   IN VARCHAR2,
   sqlCollType        IN VARCHAR2,
   overwrite          IN BOOLEAN default TRUE );
```

Parameters

Table 214-24 SETSQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
sqlCollType	The SQL collection type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The item element will have an annotation similar to xdb:SQLCollType="ITEM_SQL_COL_TYPE".

```
declare
   xml_schema xmltype;
begin
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                           'item',
                                           'ITEM_SQL_COL_TYPE',TRUE);
   UPDATE annotation_tab SET out = xml_schema;
end;
```

214.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-25 SETSQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The shipTo element will have an annotation similar to xdb:SQLName="SHIPTO_SQLNAME".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

214.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema            IN OUT   XMLTYPE,
   globalElementName    IN       VARCHAR2,
   sqlType              IN       VARCHAR2,
   overwrite            IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema           IN OUT   XMLTYPE,
   globalObject        IN       VARCHAR2,
   globalObjectName    IN       VARCHAR2,
   localObject         IN       VARCHAR2,
   localObjectName     IN       VARCHAR2,
```

```
   sqlType             IN       VARCHAR2,
   overwrite           IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-26 SETSQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
globalElementName	Name of the global element
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlType	SQL type assigned to the named global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The purchaseOrder element will have an annotation similar to xdb:SQLType="PO_SQLTYPE" and the shipTo element has one similar to xdb:SQLType="VARCHAR".

```
DECLARE
   xml_schema  xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                      'purchaseOrder',
                                      'PO_SQLTYPE');
  UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE   xml_schema   xmltype;BEGIN  SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType
(xml_schema,
'element','purchaseOrder',
'element' ,'shipTo',                                          'VARCHAR');  UPDATE
annotation_tab SET out = xml_schema;END;
/
```

214.3.26 SETSQLTYPEMAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the SETSQLTYPE procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPEMAPPING (
   xmlschema         IN OUT   XMLType,
```

```
   schemaTypeName    IN       VARCHAR2,
   sqlTypeName       IN       VARCHAR2,
   overwrite         IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-27 SETSQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Schema type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

Example

The attribute orderDate will have an annotation similar to xdb:SQLType="DATE".

```
declare   xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',                                          'DATE');UPDATE annotation_tab
SET out = xml_schema;end;
/
```

214.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLType,
   globalElementName    IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-28 SETTABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
tableProps	Table properties
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The purchaseOrder element will have an annotation similar to xdb:tableProps="CACHE".

```
DECLARE   xml_schema XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
   'purchaseOrder' ,'CACHE');   UPDATE annotation_tab SET out = xml_schema;END;
/
```

214.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema.

This is equivalent to adding xdb:SQLType="TIMESTAMP WITH TIME ZONE" to all dateTime objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
   xmlschema      IN OUT   XMLTYPE,
   overwrite      IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 214-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

215
DBMS_XMLSTORAGE_MANAGE

The DBMS_XMLSTORAGE_MANAGE package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

215.1 DBMS_XMLSTORAGE_MANAGE Overview

DBMS_XMLSTORAGE_MANAGE contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

215.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the DBMS_XMLSTORAGE_MANAGE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

215.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the DBMS_XML_STORAGE package subprograms.

Table 215-1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
DISABLEINDEXESANDCONSTRAINTS Procedure	Disables the indexes and constraints for XMLType tables and XMLType columns

Table 215-1 (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
ENABLEINDEXESANDCONSTRAINTS Procedure	Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables
EXCHANGEPOSTPROC Procedure	Enable constraints after exchange partition
EXCHANGEPREPROC Procedure	Disable constraints before exchange partition
INDEXXMLREFERENCES Procedure	Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table
REFPARTITIONEXCHANGEIN Procedure	This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex.
REFPARTITIONEXCHANGEOUT Procedure	Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.
RENAMECOLLECTIONTABLE Procedure	Renames a collection table to the given table name
SCOPEXMLREFERENCES Procedure	Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types
XPATH2TABCOLMAPPING Function	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

215.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
   owner_name    IN  VARCHAR2 DEFAULT USER,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2 DEFAULT NULL,
   clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 215-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_name	Owner's name
table_name	Name of the XMLType table that the procedure is being performed on
column_name	XMLType column name

Table 215-2 (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
clear	Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

> **Note:**
>
> If the DISABLEINDEXESANDCONTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.

Example

The following example illustrates the use of clear in the DISABLEINDEXESANDCONSTRAINTS procedure and the ENABLEINDEXESANDCONSTRAINTS Procedure.

First, add a not-NULL constraint on comment element of the PURCHASEORDER_TAB table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check           ("XMLDATA"."comment"
IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the clear as TRUE, by calling the DISABLEINDEXESANDCONSTRAINTS procedure:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB',NULL,TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint c1 in the ALTER table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
   tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the ENABLEINDEXESANDCONSTRAINTS procedure. It raises an error because c1, the not null constraint, is violated by the bulk load operation:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
                                          ( USER,'PURCHASEORDER_TAB');
END;
/
```

To disable all the indexes and constraints, again use DISABLEINDEXESANDCONSTRAINTS, but set clear= FALSE (because the ENABLEINDEXESANDCONSTRAINTS failed to complete successfully). Note: clear = FALSE by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB');
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
     WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using ENABLEINDEXESANDCONSTRAINTS, which completes successfully.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
                                          ( USER,'PURCHASEORDER_TAB');
END;
/
```

215.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables.

When column_name is passed, it does the same for this XMLType column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2,
   column_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 215-3 ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from
column_name	Column name

Usage Notes

This procedure reverses DISABLEINDEXESANDCONSTRAINTS Procedure.

Example

See DISABLEINDEXESANDCONSTRAINTS Procedure

215.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 215-4 EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

215.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 215-5 EXCHANGEPREPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

215.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends _1, _2, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
   owner_name    IN VARCHAR2 DEFAULT USER,
   table_name    IN VARCHAR2,
   column_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 215-6 INDEXXMLREFERENCES Procedure Parameters

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

Usage Notes

This procedure is only used if the REFs are scoped. See SCOPEXMLREFERENCES Procedure.

Indexed REFs lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFs.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFs recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

> **Note:**
>
> This procedure is limited to the structured storage model.

215.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
   owner_name                 IN VARCHAR2,
   parent_table_name          IN VARCHAR2,
   child_table_name           IN VARCHAR2,
   parent_exchange_table_name IN VARCHAR2,
   child_exchange_table_name  IN VARCHAR2,
   parent_exchange_stmt       IN CLOB,
   child_exchange_stmt        IN CLOB);
```

Parameters

Table 215-7 REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name

Table 215-7 (Cont.) REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

215.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
   owner_name                 IN VARCHAR2,
   parent_table_name          IN VARCHAR2,
   child_table_name           IN VARCHAR2,
   parent_exchange_table_name IN VARCHAR2,
   child_exchange_table_name  IN VARCHAR2,
   parent_exchange_stmt       IN CLOB,
   child_exchange_stmt        IN CLOB);
```

Parameters

Table 215-8 REFPARTITIONEXCHANGEOUT Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

215.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the `XMLtype` base table or an `XMLType` column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
   owner_name             IN VARCHAR2 DEFAULT USER,
   table_name             IN VARCHAR2,
   column_name            IN VARCHAR2 DEFAULT NULL,
   xpath                  IN VARCHAR2,
   collection_table_name  IN VARCHAR2
   namespaces             IN VARCHAR2 default NULL);  // For release 11.2 only
```

Parameters

Table 215-9 RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
`owner_name`	The name of the owner
table_name	The name of a base table that can be used as the starting point for specifying the collection table
`column_name`	An `XMLType` column that can be the starting point for specifying the collection table
`xpath`	The XPath expression that specifies the collection table
`collection_table_name`	The name of the collection table
`namespaces`	For Oracle Database 11*g* Release 2 (11.2) and higher. The namespaces used in XPath.

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

> **Note:**
>
> This procedure is limited to the structured storage model.

For Oracle Database 11*g* Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
            USER,
            'EMP_TAB',
            NULL,
            '"XMLDATA"."EMPLOYEE"."NAME"',
           ''EMP_TAB_NAMELIST);
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
               USER,
               'EMP_TAB',
               NULL,
               '/e:Employee/Name',
               'EMP_TAB_NAMELIST',
               '''http://www.oracle.com/emp.xsd'' as "e"');
```

215.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used SETOUTOFLINE Procedure in the DBMS_XMLSTORAGE_MANAGE package to avoid raising `'1000 column limit'` errors during XML schema registration, you should also use SCOPEXMLREFERENCES Procedure.
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

> **Note:**
>
> This procedure is limited to the structured storage model.

215.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   owner_name   IN  VARCHAR2 DEFAULT USER,
   table_name   IN  VARCHAR2,
   column_name  IN  VARCHAR2 DEFAULT NULL,
   xpath        IN  VARCHAR2,
   namespaces   IN  VARCHAR2 DEFAULT NULL)
 RETURN XMLTYPE;
```

Parameters

Table 215-10 XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
`owner_user`	Owner's name
`table_name`	Name of the base table
`column_name`	Optional name of the XML type column if `table_name` is not an XMLtype table. If table_name refers to XMLType table then `column_name` should be NULL.
`xpath`	Path expression in DOT notation or XPath notation (see examples below)
`namespaces`	Optional namespace definitions for path expression

Examples

XPath2TablColMapping evaluated on XMLType table with Xpath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER, 'XML_TAB', '', '//n1:item/n1:location','''xdbXmark'' as "n1"')
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table `SYS_NT12345` and column `location`.

XPath2TablColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER,'PurchaseOrderTab','XMLCOL','xmldata.LineItems.LineItem', '')
FROM DUAL;
```

216
DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- Security Model
- Types
- Summary of DBMS_XMLSTORE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

216.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

216.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

Table 216-1 *Types of DBMS_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT.

216.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the DBMS_XMLSTORE subprograms and briefly describes them.

Table 216-2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST	Clears the key column list.
CLEARUPDATECOLUMNLIST	Clears the update column list.
CLOSECONTEXT	It closes/deallocates a particular save context.
DELETEXML	Deletes records specified by data from the XML document, from the table specified at the context creation time.

Table 216-2 (Cont.) DBMS_XMLSTORE Package Subprograms

Method	Description
INSERTXML	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT	Creates a save context, and returns the context handle.
SETKEYCOLUMN	This method adds a column to the key column list.
SETROWTAG	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN	Adds a column to the "update column list".
UPDATEXML	Updates the table given the XML document.

216.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Table 216-3 CLEARKEYCOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

216.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Table 216-4 CLEARUPDATECOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

216.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

Table 216-5 CLOSECONTEXT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

216.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxPType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 216-6 DELETEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

216.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into

those columns unless SETUPDATECOLUMN is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 216-7 INSERTXML Function Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

216.3.6 NEWCONTEXT

`NEWCONTEXT` creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Table 216-8 NEWCONTEXT Function Parameters

Parameter	IN / OUT	Description
`targetTable`	`(IN)`	The target table into which to load the XML document.

216.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Table 216-9 SETKEYCOLUMN Procedure Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column to be added to the key column list; cannot be `NULL`.

216.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Table 216-10 SETROWTAG Procedure Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`tag`	`(IN)`	Tag name.

216.3.9 SETUPDATECOLUMN

`SETUPDATECOLUMN` adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Table 216-11 SETUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

216.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

The following syntax passes the xDoc parameter as a VARCHAR2.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the xDoc parameter as a CLOB.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax passes the xDoc parameter as a XMLType.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 216-12 UPDATEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

217
DBMS_XPLAN

The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats.

You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the V$SQL_PLAN fixed view, see *Oracle Database Reference*
- For more information on the V$SQL_PLAN_STATISTICS fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- Overview
- Security Model
- Examples
- Summary of DBMS_XPLAN Subprograms

217.1 DBMS_XPLAN Overview

The DBMS_XPLAN package supplies five table functions.

These functions are listed below:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_SQL_PLAN_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

217.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires SELECT or READ privileges on the following fixed views: VSQL_PLAN, VSESSION and V$SQL_PLAN_STATISTICS_ALL. This function also requires SELECT/READ permissions on V$SQL.

DISPLAY_AWR Function requires the user to have SELECT or READ privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

DISPLAY_SQLSET Function requires the user to have the SELECT or READ privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

DISPLAY_SQL_PLAN_BASELINE Function requires the user to have the SELECT or READ privilege on DBA_SQL_PLAN_BASELINES as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of SELECT_CATALOG_ROLE.

217.3 DBMS_XPLAN Data Structures

The DBMS_XPLAN package defines a TABLE type.

Table Types

- DBMS_XPLAN PLAN_OBJECT_LIST Table Type

217.3.1 DBMS_XPLAN PLAN_OBJECT_LIST Table Type

This type allows for a list of generic objects as input to the COMPARE_PLANS function.

Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the plan_object_list superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for cursor_cache_object, then it matches all cursor cache statements with the specified SQL ID.

Table 217-1 Plan Sources for PLAN_OBJECT_LIST

Plan Source	Specification	Description
Plan table	`plan_table_object(owner, plan_table_name, statement_id, plan_id)`	The parameters are as follows: • `owner`—The owner of the plan table • `plan_table_name`—The name of the plan table • `statement_id`—The ID of the statement (optional) • `plan_id`—The ID of the plan (optional)
Cursor cache	`cursor_cache_object(sql_id, child_number)`	The parameters are as follows: • `sql_id`—The SQL ID of the plan • `child_number`—The child number of the plan in the cursor cache (optional)
AWR	`awr_object(sql_id, dbid, con_dbid, plan_hash_value)`	The parameters are as follows: • `sql_id`—The SQL ID of the plan • `dbid`—The database ID (optional) • `con_dbid`—The CDB ID (optional) • `plan_hash_value`—The hash value of the plan (optional)
SQL tuning set	`sqlset_object (sqlset_owner, sqlset_name, sql_id, plan_hash_value)`	The parameters are as follows: • `sqlset_owner`—The owner of the SQL tuning set • `sqlset_name`—The name of the SQL tuning set • `sql_id`—The SQL ID of the plan • `plan_hash_value`—The hash value of the plan (optional)
SQL plan management	`spm_object (sql_handle, plan_name)`	The parameters are as follows: • `sql_handle`—The SQL handle of plans protected by SQL plan management • `plan_name`—The name of the SQL plan baseline (optional)
SQL profile	`sql_profile_object (profile_name)`	The `profile_name` parameter specifies the name of the SQL profile.
Advisor	`advisor_object (task_name, execution_name, sql_id, plan_id)`	The parameters are as follows: • `task_name`—The name of the advisor task • `execution_name`—The name of the task execution • `sql_id`—The SQL ID of the plan • `plan_id`—The advisor plan ID (optional)

217.4 Examples

These examples show sample uses of DBMS_XPLAN.

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
-------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."ENAME"='benoit')

15 rows selected.
```

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
   WHERE   e.deptno = d.deptno
   AND   e.empno=7369;

ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
-------------------------------------------------------------------
```

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369

-------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
|*  1 |  HASH JOIN         |      |     1 |    16 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    13 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    12 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."EMPNO"=7369)

21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID         CHILD_NUMBER
----------     ----------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
-------------------------------------------------------
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

-------------------------------------------------------------------------------
| Id  | Operation           | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT    |      |       |       |     7 (100)|          |
|   1 |  SORT GROUP BY      |      |     4 |    64 |     7  (43)| 00:00:01 |
|*  2 |   HASH JOIN         |      |    14 |   224 |     6  (34)| 00:00:01 |
|   3 |    TABLE ACCESS FULL| DEPT |     4 |    44 |     3  (34)| 00:00:01 |
|   4 |    TABLE ACCESS FULL| EMP  |    14 |    70 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename    ='hermann'
   ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

```
-------------------------------------------------------------------------------------------------------------
| Id | Operation          | Name    | Rows | Bytes | Cost (%CPU)| Time     | TQ    |INOUT |PQ Distrib   |
-------------------------------------------------------------------------------------------------------------
| 0  | SELECT STATEMENT   |         | 1    | 117   | 6 (50)     | 00:00:01 |       |      |             |

-------------------------------------------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
---------------------------------------------------
```

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no

need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

217.5 Summary of DBMS_XPLAN Subprograms

This table lists the DBMS_XPLAN subprograms and briefly describes them.

Table 217-2 ***DBMS_XPLAN Package Subprograms***

Subprogram	Description
COMPARE_PLANS Function	Compares each plan in a list with a reference plan and returns the report
DIFF_PLAN Function	Compares plans
DISPLAY Function	Displays the contents of the plan table
DISPLAY_AWR Function	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function	Displays the execution plan of any cursor in the cursor cache
DISPLAY_PLAN Function	Displays the contents of the plan table in a variety of formats with `CLOB` output type
DISPLAY_SQL_PLAN_BASELINE Function	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function	Displays the execution plan of a given statement stored in a SQL tuning set

217.5.1 COMPARE_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

Syntax

```
DBMS_XPLAN.COMPARE_PLANS(
   reference_plan    IN generic_plan_object,
   compare_plan_list IN plan_object_list,
   type              IN VARCHAR2 := 'TEXT',
   level             IN VARCHAR2 := 'TYPICAL',
   section           IN VARCHAR2 := 'ALL')
 RETURN CLOB;
```

Parameters

Table 217-3 COMPARE_PLANS Function Parameters

Parameter	Description
`reference_plan`	The reference plan. This plan should always evaluate to a single plan.
`compare_plan_list`	List of plans to compare with reference plan. The `compare_plan_list` is a list of `generic_object` and each `generic_object` could correspond to one or more plans.
`type`	Type of the report. Possible values are: • TEXT • HTML • XML
`level`	Format of the report. Possible values are: • BASIC • TYPICAL • ALL
`section`	A particular section in the report. Possible values are: • SUMMARY • FINDINGS • PLANS • INFORMATION • ERRORS

Example 217-1 Examples

The following examples illustrate the usage of COMPARE_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
                - plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
                plan_object_list( spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL_024d0f7d21351f5d' and plan name is 'SQL_PLAN_sdfjkd'. Returns the report in the text format (default).

```
var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
               plan_object_list( cursor_cache_object('8mkxm7ur07za0'),
sqlset_object('SH', 'SQLT_WORKLOAD', '               6vfqvav0rgyad'),
awr_object('6vfqvav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_              sdfjkd'), plan_table_object('SH', 'plan_table', NULL, 38),
sql_profile_object('pe3r3ejsfd'), a              dvisor_object('TASK_1228',
'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
               level => 'ALL', section => 'SUMMARY');
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- cursor_cache_object('8mkxm7ur07za0'): All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- sqlset_object('SH', 'SQLT_WORKLOAD', '6vfqvav0rgyad'): All the plans generated in the SQL tuning set SH. SQLT_WORKLOAD for the SQL ID '6vfqvav0rgyad'.
- awr_object('6vfqvav0rgyad', 5): All the plans in AWR that are captured for database ID 5 and SQL ID '6vfqvav0rgyad'.
- spm_object ('SQL_024d0f7d21351f5d, 'SQL_PLAN_sdfjkd'): The plan baseline for the query with SQL handle 'SQL_024d0f7d21351f5d' with name 'SQL_PLAN_sdfjkd'.
- plan_table_object('SH', 'plan_table', NULL, 38): Plan stored in SH.plan_table identified by plan_id=38.
- sql_profile_object('pe3r3ejsfd'): Plan identified by the SQL profile name 'pe3r3ejsfd'.
- advisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0')): All the plans stored in SQL advisor identified by task name 'TASK_1228', execution name 'EXEC_1928' and SQL ID '8mkxm7ur07za0'.

217.5.2 DIFF_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a `task_id` that can be used to retrieve the report of findings.

Syntax

```
DBMS_XPLAN.DIFF_PLAN(
   sql_text    IN   CLOB,
   outline     IN   CLOB,
   user_name   IN   VARCHAR2 := 'NULL')
 RETURN VARCHAR2;
```

Parameters

Table 217-4 DIFF_PLAN Function Parameters

Parameter	Description
`sql_text`	The text of the SQL statement.
`outline`	Used to generate the target plan.
`user_name`	The parsing schema name default to current user.

217.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
   table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
   statement_id  IN  VARCHAR2  DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL',
   filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217-5 DISPLAY Function Parameters

Parameter	Description
`table_name`	Specifies the table name where the plan is stored. This parameter defaults to `PLAN_TABLE`, which is the default plan table for the `EXPLAIN PLAN` command. If `NULL` is specified it also defaults to `PLAN_TABLE`.
`statement_id`	Specifies the `statement_id` of the plan to be displayed. This parameter defaults to `NULL`, which is the default when the `EXPLAIN PLAN` command is executed without a `set statement_id` clause. If no `statement_id` is specified, the function shows you the plan of the most recent explained statement.

Table 217-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts the following values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).

Table 217-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
`filter_preds`	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is `NULL` (the default), the plan displayed corresponds to the last executed explain plan. For example: `filter_preds=>'plan_id = 10'` Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **`WARNING`** under Usage Notes)

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use '`ALL -PROJECTION -NOTE`' to display everything except the projection and note sections.
- Use '`TYPICAL PROJECTION`' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply '`PROJECTION`' is equivalent.
- Use '`-BYTES -COST -PREDICATE`' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use '`BASIC ROWS`' to display basic information with the additional number of rows estimated by the optimizer.

> **WARNING:**
>
> Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "`my_plan_table`":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='sales_query'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

217.5.4 DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in AWR.

> **Note:**
>
> This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER DEFAULT NULL,
   db_id             IN      NUMBER DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 217-6 DISPLAY_AWR Table Function Parameters

Parameter	Description
`sql_id`	Specifies the `SQL_ID` of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column `SQL_ID` in `DBA_HIST_SQLTEXT`.
`plan_hash_value`	Specifies the `PLAN_HASH_VALUE` of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given `SQL_ID`.
`db_id`	Specifies the `database_id` for which the plan of the SQL statement, identified by `SQL_ID` should be displayed. If not supplied, the `database_id` of the local database is used, as shown in `V$DATABASE`.

Table 217-6 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.
- The following examples show different ways of using the format parameter:
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM   DBA_HIST_SQLTEXT ht, table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null,
null,  'ALL' )) tf
WHERE  ht.sql_text like '%TOTO%';
```

217.5.5 DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
   sql_id            IN  VARCHAR2  DEFAULT  NULL,
   cursor_child_no   IN  NUMBER    DEFAULT  0,
   format            IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

Table 217-7 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of the child_number=0 cursor matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.

Table 217-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: – Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join. – Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans. – Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this. – Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer. For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the

Table 217-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. • MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' • LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following formats are deprecated but supported for backward compatibility: • RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. • RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor You can prefix format keywords with the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

217.5.6 DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
   table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',
   statement_id     IN    VARCHAR2   DEFAULT NULL,
   format           IN    VARCHAR2   DEFAULT 'TYPICAL',
   filter_preds     IN    VARCHAR2   DEFAULT NULL,
   type             IN    VARCHAR2   DEFAULT 'TEXT')
  RETURN CLOB;
```

Parameters

Table 217-8 DISPLAY_PLAN Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Table 217-8 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated): - A list of the rowsources from the original which may be replaced, and the rowsources to replace them - If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the

Table 217-8 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
	DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
type	Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE). '

Return Values

Returns the requested report as CLOB

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

> **WARNING:**
>
> Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

217.5.7 DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
   sql_handle      IN VARCHAR2 := NULL,
   plan_name       IN VARCHAR2 := NULL,
   format          IN VARCHAR2 := 'TYPICAL')
 RETURN dbms_xplan_type_table;
```

Parameters

Table 217-9 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies a SQL statement whose plans are to be displayed.

Table 217-9 (Cont.) DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
plan_name	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
format	Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: BASIC, TYPICAL, and ALL.

Return Values

A PL/SQL type table

Usage Notes

This function uses plan information stored in the plan baseline to explain and display the plans. The plan_id stored in the SQL management base may not match the plan_id of the generated plan. A mismatch between the stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle SYS_SQL_b1d49f6074ab95af using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string HR2 using BASIC format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE sql_text
LIKE '%HR2%') pb,
     TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

217.5.8 DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
   sqlset_name      IN  VARCHAR2,
```

```
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN NUMBER := NULL,
  format           IN  VARCHAR2  := 'TYPICAL',
  sqlset_owner     IN  VARCHAR2  := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 217-10 DISPLAY_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.

Table 217-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter STATISTICS_LEVEL to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. • MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' • LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.

Table 217-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	The following two formats are deprecated but supported for backward compatibility: • RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. • RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.
sqlset_owner	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405":

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

217.5.9 DISPLAY_WORKLOAD_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

> **Note:**
>
> This function replaces `DISPLAY_AWR`, which is deprecated.

Syntax

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER   DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT 'TYPICAL'
   dbid              IN      NUMBER   DEFAULT NULL,
   con_dbid          IN      NUMBER   DEFAULT NULL,
   awr_location      IN      VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

Parameters

Table 217-11 DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
`sql_id`	Specifies the `SQL_ID` of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column `SQL_ID` in `DBA_HIST_SQLTEXT`.
`plan_hash_value`	Specifies the `PLAN_HASH_VALUE` of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given `SQL_ID`.

Table 217-11 (Cont.) DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.
dbid	Identifies the plans for a specific database. If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.
con_dbid	Identifies the plans for a specific container. If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').
awr_location	Specifies the location of the AWR repository. Supported values are: • AWR_ROOT when the AWR to be accessed is in the root container. This is the default. • 'AWR_PDB', if the AWR to be accessed is in the local container.

Example 217-2 Querying an AWR Plan

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint `DBA_HIST_SQLTEST` to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000

SELECT t.*
FROM   DBA_HIST_SQLTEXT ht,
       TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
         (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE  ht.SQL_TEXT LIKE '%sAleS%';

SQL_ID 2f4cx9qjnqd70
--------------------
select count(*) from sh.sAleS

Plan hash value: 1123225294

-------------------------------------------------------------------------------
-----------------------------
| Id  | Operation                     | Name            | Rows  | Cost
(%CPU)| Time     | Pstart| Pstop |
-------------------------------------------------------------------------------
-----------------------------
|   0 | SELECT STATEMENT              |                 |       |    27
(100)|          |       |       |
|   1 |  SORT AGGREGATE               |                 |     1
|            |          |       |       |
|   2 |   PARTITION RANGE ALL         |                 |   918K|    27
(0)| 00:00:01 |     1 |    28 |
|   3 |    BITMAP CONVERSION COUNT    |                 |   918K|    27
(0)| 00:00:01 |       |       |
|   4 |     BITMAP INDEX FAST FULL SCAN| SALES_PROMO_BIX |
|            |          |     1 |    28 |
-------------------------------------------------------------------------------
-----------------------------

Query Block Name / Object Alias (identified by operation id):
-------------------------------------------------------------

   1 - SEL$1
   3 - SEL$1 / "SALES"@"SEL$1"
```

218
DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- DBMS_XSLPROCESSOR Overview
- DBMS_XSLPROCESSOR Security Model
- Summary of DBMS_XSLPROCESSOR Subprograms

> **See Also:**
>
> – *Oracle XML DB Developer's Guide*

218.1 DBMS_XSLPROCESSOR Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

218.2 DBMS_XSLPROCESSOR Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

218.3 Summary of DBMS_XSLPROCESSOR Subprograms

This table lists the `DBMS_XSLPROCESSOR` subprograms and briefly describes them.

Table 218-1 *DBMS_XSLPROCESSOR Package Subprograms*

Method	Description
FREEPROCESSOR Procedure	Frees a processor object
FREESTYLESHEET Procedure	Frees a stylesheet object
NEWPROCESSOR Function	Returns a new processor instance
NEWSTYLESHEET Functions	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures	Transforms an input XML document
REMOVEPARAM Procedure	Removes a top-level stylesheet parameter
RESETPARAMS Procedure	Resets the top-level stylesheet parameters
SELECTNODES Function	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure	Sets errors to be sent to the specified file
SETPARAM Procedure	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure	Turns warnings on or off
TRANSFORMNODE Function	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure	Gets the value of the first node that matches a pattern

218.3.1 FREEPROCESSOR Procedure

This procedure frees a `Processor` object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p  IN  Processor);
```

Parameters

Table 218-2 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

218.3.2 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

Table 218-3 FREESTYLESHEET Procedure Parameters

Parameter	Description
`ss`	Stylesheet

218.3.3 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

218.3.4 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   xmldoc  IN   DOMDOCUMENT,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   inp     IN   VARCHAR2,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Parameters

Table 218-4 NEWSTYLESHEET Function Parameters

Parameter	Description
xmldoc	DOMDocument to use for construction
inp	Input URL to use for construction
ref	Reference URL

218.3.5 PROCESSXSL Functions and Procedures

This function transforms input XMLDocument.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p      IN   Processor,
   ss     IN   Stylesheet,
   xmldoc IN   DOMDOCUMENT),
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN   Stylesheet,
   url   IN   VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN  Stylesheet,
   clb   IN  CLOB)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
   p           IN    Processor,
   ss          IN    Stylesheet,
   xmldoc      IN    DOMDOCUMENT,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN    Processor,
   ss          IN    Stylesheet,
   url         IN    VARCHAR2,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN      Processor,
   ss          IN      Stylesheet,
   xmldoc      IN      DOMDOCUMENT,
   cl          IN OUT  CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT,
   dir        IN    VARCHAR2,
   filename   IN    VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN       Processor,
   ss          IN       Stylesheet,
   xmldf       IN       DOMDOCUMENTFRAGMENT,
   buf         IN OUT   VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p           IN      Processor,
   ss          IN      Stylesheet,
   xmldf       IN      DOMDOCUMENTFRAGMENT,
   cl          IN OUT  CLOB);
```

Parameters

Table 218-5 PROCESSXSL Function and Procedure Parameters

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xmldoc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldf	XMLDocumentFragment being transformed

218.3.6 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
   ss     IN  Stylesheet,
   name   IN  VARCHAR2);
```

Parameters

Table 218-6 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

218.3.7 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
   ss  IN   Stylesheet);
```

Parameters

Table 218-7 RESETPARAMS Procedure Parameters

Parameter	Description
ss	Stylesheet instance

218.3.8 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 218-8 SELECTNODES Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

218.3.9 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 218-9 SELECTSINGLENODE Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use

Table 218-9 (Cont.) SELECTSINGLENODE Function Parameters

Parameter	Description
namespace	Namespace declared

218.3.10 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

> **Note:**
>
> This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
   p         IN   Processor,
   fileName  IN   VARCHAR2);
```

Parameters

Table 218-10 SETERRORLOG Procedure Parameters

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

218.3.11 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
   ss       IN   Stylesheet,
   name     IN   VARCHAR2,
   value    IN   VARCHAR2);
```

Parameters

Table 218-11 SETPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance

Table 218-11 (Cont.) SETPARAM Procedure Parameters

Parameter	Description
name	Name of the parameter
value	Value of the parameter

218.3.12 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
   p     IN   Processor,
   yes   IN   BOOLEAN);
```

Parameters

Table 218-12 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

218.3.13 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
   n    IN  DOMNODE,
   ss   IN  Stylesheet)
 RETURN DOMDocumentFragment;
```

Parameters

Table 218-13 TRANSFORMNODE Function Parameters

Parameter	Description
n	DOMNode to transform
ss	Stylesheet to use

218.3.14 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  namespace   IN    VARCHAR2 := NULL)
 RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  val         OUT   VARCHAR2,
  namespace   IN    VARCHAR2 := NULL);
```

Parameters

Table 218-14 VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

219
DBMS_XSTREAM_ADM

This DBMS_XSTREAM_ADM package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_XSTREAM_ADM Subprograms

> **See Also:**
>
> - *Oracle Database XStream Guide*
> - *Oracle Call Interface Programmer's Guide*
> - *Oracle Database XStream Java API Reference*

219.1 DBMS_XSTREAM_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

219.2 DBMS_XSTREAM_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

See Also:

- GRANT_ADMIN_PRIVILEGE Procedure

219.3 DBMS_XSTREAM_ADM Operational Notes

Some subprograms in the DBMS_APPLY_ADM package can manage XStream outbound servers, and some subprograms in the DBMS_APPLY_ADM package can manage XStream inbound servers.

> **See Also:**
>
> DBMS_APPLY_ADM for details about which subprograms can manage outbound servers and inbound servers

219.4 Summary of DBMS_XSTREAM_ADM Subprograms

This table lists the DBMS_XSTREAM_ADM subprograms and briefly describes them.

Table 219-1 DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure	Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_OUTBOUND Procedure	Creates an XStream outbound server that dequeues LCRs from the specified queue
ADD_SCHEMA_PROPAGATION_RULES Procedure	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure	Adds rules to a rule set of XStream clients.
ADD_SUBSET_OUTBOUND_RULES Procedure	Adds subset rules to an outbound server configuration
ADD_SUBSET_PROPAGATION_RULES Procedure	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure	Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist

Table 219-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_TABLE_PROPAGATION_RULES Procedure	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure	This procedure adds rules to a rule set of an XStream client.
ALTER_INBOUND Procedure	Modifies an XStream inbound server
ALTER_OUTBOUND Procedure	Modifies an XStream outbound server
CREATE_INBOUND Procedure	Creates an XStream inbound server and its queue
CREATE_OUTBOUND Procedure	Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs
DELETE_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
DROP_INBOUND Procedure	Removes an inbound server configuration
DROP_OUTBOUND Procedure	Removes an outbound server configuration
ENABLE_GG_XSTREAM_FOR_STREAMS Procedure	Enables XStream performance optimizations for Oracle Replication components
GET_MESSAGE_TRACKING Function	Returns the tracking label for the current session
GET_TAG Function	Gets the binary tag for all redo entries generated by the current session
IS_GG_XSTREAM_FOR_STREAMS Function	Returns TRUE if XStream performance optimizations are enabled for Oracle Replication components, or returns FALSE if XStream performance optimizations are disabled for Oracle Replication components
KEEP_COLUMNS Procedure	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MERGE_STREAMS Procedure	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the MERGE_STREAMS procedure to merge the two streams
PURGE_SOURCE_CATALOG Procedure	Removes all Oracle Replication data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure	Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure	Removes the specified ANYDATA queue

Table 219-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
REMOVE_RULE Procedure	Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.
REMOVE_SUBSET_OUTBOUND_RULES Procedure	Removes subset rules from an outbound server configuration
REMOVE_XSTREAM_CONFIGURATION Procedure	Removes the XStream configuration at the local database
RENAME_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_TRACKING Procedure	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_PARAMETER Procedure	Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process
SET_TAG Procedure	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream
SPLIT_STREAMS Procedure	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process
START_OUTBOUND Procedure	Starts an XStream outbound server
STOP_OUTBOUND Procedure	Stops an XStream outbound server

Note:

All subprograms commit unless specified otherwise.

219.4.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- ADD_COLUMN transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 219-2 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

Table 219-2 (Cont.) ADD_COLUMN Procedure Parameters

Parameter	Description
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.

table_name	column_name	step_number	Result
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

219.4.2 ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 219-3 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 219-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 219-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence

number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

  This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

> **Note:**
>
> If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
```

```
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-4 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
`streams_type`	The type of XStream client: • Specify `capture` for a capture process. • Specify `apply` for an apply process.
`streams_name`	The name of the capture process or apply process. Do not specify an owner. If `NULL`, if `streams_type` is `capture`, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If `NULL` and multiple XStream clients of the specified `streams_type` for the queue exist, then the procedure raises an error. If `NULL`, if `streams_type` is `apply`, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in `source_database` and uses the queue specified in `queue_name`, then the procedure uses this apply process. • If `source_database` is `NULL` and one existing apply process is using the queue specified in `queue_name`, then the procedure uses this apply process. If `NULL` and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If `NULL` and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.

Table 219-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

Table 219-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.

Table 219-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

> **See Also:**
>
> - "Operational Notes"
> - "Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.4 ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the CREATE_OUTBOUND Procedure.

To create the capture process individually, use one of the following packages:

- `DBMS_XSTREAM_ADM`
- `DBMS_CAPTURE_ADM`

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

> **Note:**
>
> - A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
> - This procedure enables the outbound server that it creates.
> - Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
   server_name             IN  VARCHAR2,
   queue_name              IN  VARCHAR2   DEFAULT NULL,
   source_database         IN  VARCHAR2   DEFAULT NULL,
   table_names             IN  DBMS_UTILITY.UNCL_ARRAY,
   schema_names            IN  DBMS_UTILITY.UNCL_ARRAY,
   connect_user            IN  VARCHAR2   DEFAULT NULL,
   comment                 IN  VARCHAR2   DEFAULT NULL,
   capture_name            IN  VARCHAR2   DEFAULT NULL,
   start_scn               IN  NUMBER     DEFAULT NULL,
   start_time              IN  TIMESTAMP  DEFAULT NULL,
   include_dml             IN  BOOLEAN    DEFAULT TRUE,
   include_ddl             IN  BOOLEAN    DEFAULT FALSE,
   source_root_name        IN  VARCHAR2   DEFAULT NULL,
   source_container_name   IN  VARCHAR2   DEFAULT NULL,
   lcrid_version           IN  NUMBER     DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_OUTBOUND(
   server_name             IN  VARCHAR2,
   queue_name              IN  VARCHAR2   DEFAULT NULL,
   source_database         IN  VARCHAR2   DEFAULT NULL,
   table_names             IN  VARCHAR2   DEFAULT NULL,
   schema_names            IN  VARCHAR2   DEFAULT NULL,
   connect_user            IN  VARCHAR2   DEFAULT NULL,
   comment                 IN  VARCHAR2   DEFAULT NULL,
   capture_name            IN  VARCHAR2   DEFAULT NULL,
   start_scn               IN  NUMBER     DEFAULT NULL,
   start_time              IN  TIMESTAMP  DEFAULT NULL,
   include_dml             IN  BOOLEAN    DEFAULT TRUE,
   include_ddl             IN  BOOLEAN    DEFAULT FALSE,
   source_root_name        IN  VARCHAR2   DEFAULT NULL,
   source_container_name   IN  VARCHAR2   DEFAULT NULL,
   lcrid_version           IN  NUMBER     DEFAULT NULL);
```

Parameters

Table 219-5 ADD_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The `server_name` setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
`queue_name`	The name of the local queue from which the outbound server dequeues LCRs, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be `ANYDATA` type. For example, to specify a queue named `xstream_queue` in the `xstrmadmin` schema, enter `xstrmadmin.xstream_queue` for this parameter. If the schema is not specified, then the current user is the default. If `NULL`, the procedure raises an error.

Table 219-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
table_names	The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name.*]*table_name*. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
connect_user	The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user. If NULL, then the current user is the default.
comment	An optional comment associated with the outbound server.

Table 219-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If the specified name matches the name of an existing capture process for an apply process, then an error is raised. If the specified name does not match the name of an existing capture process, then an error is raised. If NULL, then the outbound server is created without a capture process.
start_scn	A valid system change number (SCN) for the database from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive.
start_time	A valid time from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. The start_scn and start_time parameters are mutually exclusive.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Table 219-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
lcrid_version	The LCRID version for captured LCRs, either 1 or 2. If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher. If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower. If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

> **Note:**
>
> An empty array includes one NULL entry.

219.4.5 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name              IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   include_dml              IN   BOOLEAN   DEFAULT TRUE,
   include_ddl              IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
   source_database          IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name            OUT  VARCHAR2,
   ddl_rule_name            OUT  VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   and_condition            IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name              IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   include_dml              IN   BOOLEAN   DEFAULT TRUE,
   include_ddl              IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
   source_database          IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   and_condition            IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 219-6 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

Table 219-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

Table 219-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 219-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.6 ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

> **Note:**
>
> If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name             IN   VARCHAR2,
   streams_type            IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   queue_name              IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
```

```
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name            IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-7 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.

Table 219-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 219-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.

Table 219-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the

sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

> **See Also:**
>
> - "Operational Notes"
> - "Security Model"

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.7 ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

> **Note:**
>
> This procedure does not add rules to the outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN DBMS_UTILITY.LNAME_ARRAY,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN VARCHAR2  DEFAULT NULL,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-8 ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
server_name	The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default. If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database. The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.
condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` If NULL, then the procedure raises an error. **Note:** The quotation marks in the preceding example are all single quotation marks.
column_list	The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the keep parameter. The columns can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL. To include or exclude all of the columns in a table, specify each column in the table in the list or array. If NULL, then the procedure raises an error.
keep	If TRUE, then the columns specified in the column_list parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the condition parameter are streamed to the outbound server's client application. If FALSE, then the columns specified in the column_list parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application. **See Also:** "Usage Notes"

Table 219-8 (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the container where the specified table_names and schema_names are located. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.

Usage Notes

When the keep parameter is set to TRUE, this procedure creates a keep columns declarative rule-based transformation for the columns listed in column_list.

When the keep parameter is set to FALSE, this procedure creates a delete column declarative rule-based transformation for each column listed in column_list.

> **See Also:**
>
> *Oracle Database XStream Guide* for information about declarative rule-based transformations

219.4.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
```

```
   delete_rule_name         OUT  VARCHAR2,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name               IN   VARCHAR2,
   dml_condition            IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
   source_database          IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 219-9 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

Table 219-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes

Table 219-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

> **Note:**
>
> Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

219.4.9 ADD_SUBSET_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name             IN   VARCHAR2,
   dml_condition          IN   VARCHAR2,
   streams_type           IN   VARCHAR2 DEFAULT 'apply',
   streams_name           IN   VARCHAR2 DEFAULT NULL,
   queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr     IN   BOOLEAN  DEFAULT FALSE,
   source_database        IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name       OUT  VARCHAR2,
   update_rule_name       OUT  VARCHAR2,
   delete_rule_name       OUT  VARCHAR2,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name             IN   VARCHAR2,
   dml_condition          IN   VARCHAR2,
   streams_type           IN   VARCHAR2 DEFAULT 'apply',
   streams_name           IN   VARCHAR2 DEFAULT NULL,
   queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr     IN   BOOLEAN  DEFAULT FALSE,
   source_database        IN   VARCHAR2 DEFAULT NULL,
   source_root_name       IN  VARCHAR2  DEFAULT NULL,
   source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-10 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary > 4000 and job_id = ''SA_MAN'' ' **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.

Table 219-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.

Table 219-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the XStream client performs its action regardless of the tag: • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an XStream client performs its action only when the tag is NULL: • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes

Table 219-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The

ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

> **Note:**
>
> Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

219.4.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
```

```
  include_ddl             IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
  source_database         IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
  and_condition           IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 219-11 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

Table 219-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.

Table 219-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.11 ADD_TABLE_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
```

```
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 219-12 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Replication does not validate the existence of the table.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.

Table 219-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 219-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag: • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is NULL: • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

Table 219-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.

Table 219-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

219.4.12 ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
   server_name IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-13 ALTER_INBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.
`apply_user`	The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the `ALTER_INBOUND` procedure must be granted the `DBA` role. Only the `SYS` user can set the `apply_user` to `SYS`. If `NULL`, then the apply user is not changed. See "CREATE_INBOUND Procedure" for information about the required privileges for an apply user.
`comment`	An optional comment associated with the inbound server. If non-`NULL`, then the specified comment replaces the existing comment. If `NULL`, then the existing comment is not changed.

219.4.13 ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the `CREATE_OUTBOUND` procedure in this package.
- The queue used by the capture process was created by the `CREATE_OUTBOUND` procedure.

To check whether this procedure can alter the outbound server's capture process, query the `CAPTURE_NAME` column in the `ALL_XSTREAM_OUTBOUND` view. When the name of the capture process appears in the `CAPTURE_NAME` column of this view, the `ALTER_OUTBOUND` procedure can manage the capture process's rules or change the capture user for the capture process. When the `CAPTURE_NAME` column of this view is `NULL`, the `ALTER_OUTBOUND` procedure cannot manage the capture process.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

> **Note:**
>
> Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `start_scn` and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names          IN DBMS_UTILITY.UNCL_ARRAY,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHR2    DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
   inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
   start_scn             IN NUMBER     DEFAULT NULL,
   start_time            IN TIMESTAMP  DEFAULT NULL,
   include_dml           IN BOOLEAN    DEFAULT TRUE,
   include_ddl           IN BOOLEAN    DEFAULT FALSE,
   source_database       IN VARCHAR2   DEFAULT NULL,
   source_container_name IN VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN VARCHAR2   DEFAULT NULL,
   schema_names          IN VARCHAR2   DEFAULT NULL,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHAR2   DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
```

```
  inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
  start_scn             IN NUMBER     DEFAULT NULL,
  start_time            IN TIMESTAMP  DEFAULT NULL,
  include_dml           IN BOOLEAN    DEFAULT TRUE,
  include_ddl           IN BOOLEAN    DEFAULT FALSE,
  source_database       IN VARCHAR2   DEFAULT NULL,
  source_container_name IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 219-14 ALTER_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.
table_names	The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter. The tables can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name.*]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter
schema_names	The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
add	If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter. If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.

Table 219-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If NULL, then the capture user is not changed. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a capture user. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user. Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS. If NULL, then the connect user is not changed. If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.
comment	An optional comment associated with the outbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

Table 219-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
inclusion_rule	If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application. If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration. If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application. If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration.
start_scn	A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process. If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted. An error is returned if an invalid SCN is specified. If NULL and the start_time parameter is NULL, then the start SCN is not changed. If NULL and the start_time parameter is non-NULL, then the start SCN is changed to match the specified start time. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL.

Table 219-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
start_time	A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process. If a valid time is specified, then the capture process captures changes from the specified time when it is restarted. An error is returned if an invalid time is specified. If NULL and the start_scn parameter is NULL, then the start time is not changed. If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_database	The global name of the container where the specified table_names and schema_names are located. If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for schemas are not changed for the XStream Out configuration.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

> **Note:**
>
> An empty array includes one `NULL` entry.

219.4.14 CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

> **Note:**
>
> A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
   server_name IN VARCHAR2,
   queue_name  IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-15 CREATE_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.
queue_name	The name of the local queue used by the inbound server, specified as [*schema_name*.]*queue_name*. If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it. For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default. **Note:** An inbound server's queue is used only to store error transactions.
apply_user	The apply user. If NULL, then the current user is the default. The client application must attach to the inbound server as the apply user. The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user: • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the inbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the apply user for an inbound server is dropped using DROP USER . . . CASCADE, then the inbound server is also dropped automatically.
comment	An optional comment associated with the inbound server.

Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the DBMS_XSTREAM_ADM and DBMS_RULE_ADM packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

> **See Also:**
>
> *Oracle Database XStream Guide*

219.4.15 CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names           IN DBMS_UTILITY.UNCL_ARRAY,
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
   include_dml            IN BOOLEAN   DEFAULT TRUE,
   include_ddl            IN BOOLEAN   DEFAULT FALSE,
   source_root_name       IN VARCHAR2  DEFAULT NULL,
   source_container_name  IN VARCHAR2  DEFAULT NULL,
   lcrid_version          IN NUMBER    DEFAULT NULL);

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN VARCHAR2  DEFAULT NULL,
   schema_names           IN VARCHAR2  DEFAULT NULL,
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
   include_dml            IN BOOLEAN   DEFAULT TRUE,
   include_ddl            IN BOOLEAN   DEFAULT FALSE,
   source_root_name       IN VARCHAR2  DEFAULT NULL,
   source_container_name  IN VARCHAR2  DEFAULT NULL,
   lcrid_version          IN NUMBER    DEFAULT NULL);
```

Parameters

Table 219-16 CREATE_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
source_database	The global name of the source database. The source database is where the changes to be captured originated. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See *Oracle Database XStream Guide* for instructions. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.
table_names	The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter

Table 219-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. In addition, ensure that the capture user has the following privileges: • EXECUTE privilege on the rule sets used by the capture process • EXECUTE privilege on all rule-based transformation functions used in the positive rule set You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.

Table 219-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user. If NULL, then the current user is the default. The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, grant the following privileges to the connect user: • EXECUTE privilege on the rule sets used by the outbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set You can grant these privileges directly to the connect user, or you can grant them through roles. In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.
comment	An optional comment associated with the outbound server.
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised. If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name. If NULL, then the system creates a new capture process with a system-generated name. **Note:** The capture process name cannot be altered after the capture process is created.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 219-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.
lcrid_version	The LCRID version for captured LCRs, either 1 or 2. If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher. If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower. If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the

schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

> **Note:**
>
> An empty array includes one NULL entry.

219.4.16 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> - The DELETE_COLUMN procedure supports the same data types supported by Oracle Replication capture processes.
> - The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
> - Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> - *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
> - KEEP_COLUMNS Procedure

Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
   rule_name      IN  VARCHAR2,
   table_name     IN  VARCHAR2,
   column_name    IN  VARCHAR2,
   value_type     IN  VARCHAR2   DEFAULT '*',
   step_number    IN  NUMBER     DEFAULT 0,
   operation      IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 219-17 DELETE_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table from which the column is deleted in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.

table_name	column_name	step_number	Result
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

219.4.17 DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

> **See Also:**
>
> "CREATE_INBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 219-18 DROP_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.

219.4.18 DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the DROP_OUTBOUND procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the CREATE_OUTBOUND procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

> **See Also:**
>
> - "ADD_OUTBOUND Procedure"
> - "CREATE_OUTBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 219-19 DROP_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.

219.4.19 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply

- Dependency computation and scheduling
- Capture process parallelism

Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
   enable IN BOOLEAN  TRUE);
```

Parameters

Table 219-20 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

Parameter	Description
`enable`	If `TRUE`, then enable XStream performance optimizations for Oracle Replication components. If `FALSE`, then disable XStream performance optimizations for Oracle Replication components.

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays `XStream Streams`:
  - `ALL_APPLY`
  - `DBA_APPLY`
  - `ALL_CAPTURE`
  - `DBA_CAPTURE`
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

> **See Also:**
>
> - IS_GG_XSTREAM_FOR_STREAMS Function
> - *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream"*

219.4.20 GET_MESSAGE_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

> **See Also:**
>
> SET_MESSAGE_TRACKING Procedure

Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

219.4.21 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

> **See Also:**
>
> "SET_TAG Procedure"

Syntax

```
DBMS_XSTREAM_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_XSTREAM_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

219.4.22 IS_GG_XSTREAM_FOR_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components.

> **See Also:**
>
> "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

219.4.23 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- DELETE_COLUMN Procedure

Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_list   IN  VARCHAR2,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
   value_type    IN  VARCHAR2 DEFAULT '*',
```

```
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 219-21 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/ column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.

table_name	column_list/ column_table	step_number	Result
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified column_list/ column_table and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified column_list/ column_table for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified table_name and column_list/column_table for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified table_name, column_list/column_table, and step_number for the specified rule.

219.4.24 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

> **See Also:**
>
> SPLIT_STREAMS Procedure

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-22 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: • The queue specified in the queue_name parameter does not exist. • The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: • script_name • script_directory_object

Table 219-22 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

219.4.25 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name

parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure
- SPLIT_STREAMS Procedure

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name IN VARCHAR2,
   propagation_name        IN VARCHAR2 DEFAULT NULL,
   queue_name              IN VARCHAR2 DEFAULT NULL,
   merge_threshold         IN NUMBER,
   schedule_name           IN VARCHAR2 DEFAULT NULL,
   merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 219-23 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: • The queue specified in the queue_name parameter does not exist. • The queue specified in the queue_name parameter exists but is not used by a capture process.

Table 219-23 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

219.4.26 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2,
   source_root_name    IN  VARCHAR2);
```

Parameters

Table 219-24 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
`source_database`	In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `.NET`, then the procedure specifies `DBS1.NET` automatically.
`source_object_name`	The name of the object specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`source_object_type`	Type of the object. Currently, `TABLE` is the only possible object type.

Table 219-24 (Cont.) PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_root_name	The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If the source_root_name parameter is NULL, then the global name of the local root is the default. **Note:** This parameter only applies to a CDB.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

> **Note:**
>
> These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

219.4.27 RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-`NULL` values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

> **Note:**
>
> To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

> **See Also:**
>
> - "SPLIT_STREAMS Procedure"
> - "MERGE_STREAMS Procedure"
> - "MERGE_STREAMS_JOB Procedure"

Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 219-25 RECOVER_OPERATION Procedure Parameters

Parameter	Description
script_id	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.
operation_mode	If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.

219.4.28 REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the XStream clients that are using the queue.

> **Note:**
>
> The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
   queue_name                IN  VARCHAR2,
   cascade                   IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 219-26 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any XStream clients that use the queue. If FALSE, then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no XStream clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

219.4.29 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

> **Note:**
>
> If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the DBMS_RULE_ADM.DROP_RULE procedure. If you use the DBMS_RULE_ADM.DROP_RULE procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 219-27 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule to remove, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify propagation for a propagation. • Specify apply for an apply process.
streams_name	The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.
drop_unused_rule	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
inclusion_rule	If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.

219.4.30 REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD_SUBSET_OUTBOUND_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
   FROM ALL_XSTREAM_RULES
   WHERE SUBSETTING_OPERATION IS NOT NULL;
```

Note:

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

See Also:

"ADD_SUBSET_OUTBOUND_RULES Procedure"

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   insert_rule_name IN VARCHAR2,
   update_rule_name IN VARCHAR2,
   delete_rule_name IN VARCHAR2);
```

219.4.31 REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
   container IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-28 REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

Parameter	Description
container	If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB. If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to a CDB.

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes

- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- Drops propagations that were created using either the DBMS_XSTREAM_ADM package or the DBMS_PROPAGATION_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS_AQADM package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the SET_MESSAGE_NOTIFICATION procedure in the DBMS_XSTREAM_ADM package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the DBMS_XSTREAM_ADM package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the DBMS_RULE_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

> **Note:**
>
> Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

> **Note:**
>
> - Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
> - This procedure commits multiple times.

219.4.32 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> - The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
> - Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
```

```
   value_type        IN  VARCHAR2  DEFAULT '*',
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 219-29 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

219.4.33 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
   rule_name          IN  VARCHAR2,
   from_schema_name   IN  VARCHAR2,
   to_schema_name     IN  VARCHAR2,
   step_number        IN  NUMBER    DEFAULT 0,
   operation          IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 219-30 RENAME_SCHEMA Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_schema_name`	The name of the schema to be renamed in each row LCR that satisfies the rule.
`to_schema_name`	The new name of the schema in each row LCR that satisfies the rule.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified from_schema_name, to_schema_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

219.4.34 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
   rule_name         IN  VARCHAR2,
   from_table_name   IN  VARCHAR2,
   to_table_name     IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 219-31 RENAME_TABLE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_table_name`	The name of the table to be renamed in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`to_table_name`	The new name of the table in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `humres.staff`. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.

Table 219-31 (Cont.) RENAME_TABLE Procedure Parameters

Parameter	Description
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

from_table_name	to_table_name	step_number	Result
`NULL`	`NULL`	`NULL`	Remove all rename table transformations for the specified rule.
`NULL`	`NULL`	non-`NULL`	Remove all rename table transformations with the specified `step_number` for the specified rule.
`NULL`	non-`NULL`	non-`NULL`	Remove all rename table transformations with the specified `to_table_name` and `step_number` for the specified rule.
non-`NULL`	`NULL`	non-`NULL`	Remove all rename table transformations with the specified `from_table_name` and `step_number` for the specified rule.
`NULL`	non-`NULL`	`NULL`	Remove all rename table transformations with the specified `to_table_name` for the specified rule.
non-`NULL`	non-`NULL`	`NULL`	Remove all rename table transformations with the specified `from_table_name` and `to_table_name` for the specified rule.
non-`NULL`	`NULL`	`NULL`	Remove all rename table transformations with the specified `from_table_name` for the specified rule.

from_table_name	to_table_name	step_number	Result
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified `from_table_name`, `to_table_name`, and `step_number` for the specified rule.

219.4.35 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

> **Note:**
>
> The tracking label set by this procedure does not track non-LCR messages.

> **See Also:**
>
> KAWGET_MESSAGE_TRACKING

Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

Parameters

Table 219-32 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
`tracking_label`	The label used to track the LCRs produced by the session. Set this parameter to `NULL` to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
`actions`	When `DBMS_XSTREAM_ADM.ACTION_MEMORY` is specified, the LCRs are tracked in memory. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

219.4.36 SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER(
   streams_name    IN  VARCHAR2,
   streams_type    IN  VARCHAR2,
   parameter       IN  VARCHAR2,
   value           IN  VARCHAR2  DEFAULT NULL,
   no_wait         IN  BOOLEAN   DEFAULT FALSE,
   source_database IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-33 SET_PARAMETER Procedure Parameters

Parameter	Description
`streams_type`	The type of XStream client: • Specify `capture` for a capture process. • Specify `apply` for an outbound server or inbound server.
`streams_name`	The name of the capture process, outbound server, or inbound server. Do not specify an owner.
`parameter`	The name of the parameter you are setting. See "Capture Process Parameters" for information about capture process parameters. See "Apply Component Parameters" for information about outbound server and inbound server parameters.
`value`	The value to which the parameter is set. If `NULL`, then the parameter is set to its default value.
`no_wait`	If `TRUE`, then the parameter is set immediately. If `FALSE`, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to `TRUE` speeds up each call. However, if the process is currently running, you must set this parameter to `FALSE` in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to `TRUE` for the last call to the procedure, the running process might not detect the parameter changes.

Table 219-33 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
source_database	If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then the parameter is set in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters: • include_objects capture parameter • excludetag capture or apply parameter • excludetrans capture or apply parameter • excludeuser capture or apply parameter • excludeuserid capture or apply parameter • getreplicates capture or apply parameter • getapplops capture or apply parameter

219.4.37 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 219-34 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

> **See Also:**
>
> BUILD Procedure

219.4.38 SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 219-35 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.

Table 219-35 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference*for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10*g* release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release before Oracle Database 10*g* release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.
- If the specified queue table exists, then the queue uses the properties of the existing queue table.

- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

> **Note:**
>
> If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

219.4.39 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original

stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note:

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure"
- "MERGE_STREAMS_JOB Procedure"

Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
   propagation_name         IN      VARCHAR2,
   cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
   perform_actions          IN      BOOLEAN   DEFAULT TRUE,
   script_name              IN      VARCHAR2  DEFAULT NULL,
   script_directory_object  IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
   schedule_name            IN OUT  VARCHAR2,
   merge_job_name           IN OUT  VARCHAR2);
```

Parameters

Table 219-36 SPLIT_STREAMS Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: • script_name • script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 219-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$XSTREAM_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name*.]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.

Table 219-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name*.]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

Oracle Database Administrator's Guide for information about Oracle Scheduler

219.4.40 START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
   server_name      IN  VARCHAR2);
```

Parameters

Table 219-37 START_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.

219.4.41 STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
   server_name  IN  VARCHAR2,
   force        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 219-38 STOP_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being stopped. A `NULL` specification is not allowed. Do not specify an owner.
`force`	If `TRUE`, then the procedure stops the outbound server and its capture process as soon as possible. If `FALSE`, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the `force` parameter and the setting specified for the `commit_serialization` apply component parameter.

220
DBMS_XSTREAM_AUTH

The DBMS_XSTREAM_AUTH package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- Overview
- Security Model
- Summary of DBMS_XSTREAM_AUTH Subprograms

> **See Also:**
>
> GRANT_ADMIN_PRIVILEGE Procedure

220.1 DBMS_XSTREAM_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

220.2 DBMS_XSTREAM_AUTH Security Model

Security on this package can be controlled by either granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

The user executing the subprograms in the DBMS_XSTREAM_AUTH package must have SYSDBA administrative privilege, and the user must exercise the privilege using AS SYSDBA at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

220.3 Summary of DBMS_XSTREAM_AUTH Subprograms

This table lists the DBMS_XSTREAM_AUTH subprograms and briefly describes them.

Table 220-1 DBMS_XSTREAM_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure	Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure	Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure	Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure	Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link

Note:

All subprograms commit unless specified otherwise.

220.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

See Also:

"GRANT_ADMIN_PRIVILEGE Procedure"

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee                    IN  VARCHAR2,
   privilege_type             IN  VARCHAR2  DEFAULT '*',
   grant_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_grants                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                  IN  VARCHAR2  DEFAULT NULL,
   directory_name             IN  VARCHAR2  DEFAULT NULL
   grant_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                  IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 220-2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
privilege_type	Specify one of the following values: • CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes. • APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.
do_grants	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Table 220-2 (Cont.) GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grant_optional_privileges	A comma-separated list of optional privileges to grant to the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_TRANSFORM
  - DBMS_XSTREAM_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets

  - Rules

  In addition, the grantee can grant these privileges to other users.

- `SELECT_CATALOG_ROLE`
- `SELECT` or `READ` privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

  This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

> **Note:**
>
> - To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
> - This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

> **See Also:**
>
> - "GRANT_REMOTE_ADMIN_ACCESS Procedure"
> - *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

220.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 220-3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
`grantee`	The user who allows remote access. The procedure adds the grantee to the `DBA_XSTREAM_ADMINISTRATOR` data dictionary view with `YES` for the `ACCESS_FROM_REMOTE` column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the `ACCESS_FROM_REMOTE` column to `YES`.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

> **Note:**
>
> The `GRANT_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

> **See Also:**
>
> "GRANT_ADMIN_PRIVILEGE Procedure"

220.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 220-4 *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

Parameter	Description
`grantee`	The user from whom privileges are revoked

Table 220-4 (Cont.) *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

Parameter	Description
privilege_type	Specify one of the following values: • CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes. • APPLY Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • * Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
revoke_select_privileges	If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Table 220-4 (Cont.) *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

Parameter	Description
`revoke_optional_privileges`	A comma-separated list of optional privileges to revoke from the grantee, such as the `DV_XSTREAM_ADMIN` and `DV_GOLDENGATE_ADMIN` privileges
`container`	If `CURRENT`, then revokes privileges from the grantee only in the container where the procedure is invoked. `CURRENT` can be specified while connected to the root or to a PDB. If `ALL`, then revokes privileges from the grantee in all containers in the CDB. To specify `ALL`, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use `CDB$ROOT` while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the `GRANT_ADMIN_PRIVILEGE` procedure in this package.

> **Note:**
>
> To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

> **See Also:**
>
> - "GRANT_ADMIN_PRIVILEGE Procedure"
> - *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

220.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

> **Note:**
>
> The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

> **See Also:**
>
> "REVOKE_ADMIN_PRIVILEGE Procedure"

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 220-5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user for whom access from a remote XStream administrator is disabled. If a row for the grantee exists in the DBA_XSTREAM_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_XSTREAM_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.

221
DEBUG_EXTPROC

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms

221.1 DEBUG_EXTPROC Security Model

Your Oracle account must have EXECUTE privileges on the package and CREATE LIBRARY privileges.

221.2 DEBUG_EXTPROC Operational Notes

These operational notes apply to DEBUG_EXTPROC.

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

> **Note:**
>
> These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.

- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

221.3 Rules and Limits

DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.

221.4 Summary of DEBUG_EXTPROC Subprograms

The STARTUP_EXTPROC_AGENT procedure is the only DEBUG_EXTPROC subprogram.

Table 221-1 DEBUG_EXTPROC Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure	Starts up the extproc agent process in the session

221.4.1 STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

222
HTF

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Deprecated Subprograms
- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTF Subprograms

222.1 HTF Deprecated Subprograms

The ESCAPE_URL function is deprecated with Oracle Database 10*g*.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Related Topics

- ESCAPE_URL Function
  This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

222.2 HTF Operational Notes

These operational notes apply to the HTF package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated Web page.

222.3 Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

222.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
   HTP.P (HTF.HTMLOPEN); -- generates <HTML>
   HTP.P (HTF.HEADOPEN); -- generates <HEAD>
   HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
   HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
   HTP.P (HTF.BODYOPEN); -- generates <BODY>
   HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
   HTP.P (HTF.BODYCLOSE); -- generates </BODY>
   HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

222.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>

HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>

BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->

http://www.w3.org.BASE Function - generates <BASE>

LINKREL Function - generates <LINK> with the REL attribute

LINKREV Function - generates <LINK> with the REV attribute

TITLE Function - generates <TITLE>

META Function - generates <META>

SCRIPT Function - generates <SCRIPT>

STYLE Function - generates <STYLE>

ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>

PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>

ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>

DLISTOPEN Function, DLISTCLOSE Function- generate <DL> and </DL>

DLISTTERM Function - generates <DT>

DLISTDEF Function - generates <DD>

DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>

LISTHEADER Function - generates <LH>

LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>

MENULISTOPEN Function - generate <MENU> and </MENU>

LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>

FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Function - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates <INPUT TYPE="PASSWORD">

FORMRADIO Function - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate <SELECT> and </SELECT>

FORMSELECTOPTION Function - generates <OPTION>

FORMTEXT Function - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Function - generate <TEXTAREA>

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Function - generates <INPUT TYPE="RESET">

FORMSUBMIT Function - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate <TABLE> and </TABLE>

TABLECAPTION Function - generates <CAPTION>

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>

TABLEHEADER Function - generates <TH>

TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>

IMG Function, IMG2 Function - generate <IMG>

ANCHOR Function, ANCHOR2 Function - generate <A>

MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)

PARA Function, PARAGRAPH Function - generate <P>

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Function - generates <DIV>

NL Function, BR Function - generate

NOBR Function - generates <NOBR>

WBR Function - generates <WBR>

PLAINTEXT Function - generates <PLAINTEXT>

ADDRESS Function - generates <ADDRESS>

MAILTO Function - generates <A> with the MAILTO attribute

AREA Function - generates <AREA>

BGSOUND Function - generates <BGSOUND>

Character Formatting Tags

BASEFONT Function - generates <BASEFONT>

BIG Function - generates <BIG>

BOLD Function - generates <B>

CENTER Function - generates <CENTER> and </CENTER>

CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>

CITE Function - generates <CITE>

CODE Function - generates <CODE>

DFN Function - generates <DFN>

EM Function, EMPHASIS Function - generate <EM>

FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>

ITALIC Function - generates <I>

KBD Function, KEYBOARD Function - generate <KBD> and </KBD>

S Function - generates <S>

SAMPLE Function - generates <SAMP>

SMALL Function - generates <SMALL>

STRIKE Function - generates <STRIKE>

STRONG Function - generates <STRONG>

SUB Function - generates <SUB>

SUP Function - generates <SUP>

TELETYPE Function - generates <TT>

UNDERLINE Function - generates <U>

VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>

FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

222.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

Table 222-1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Function	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function	Generates the <AREA> tag, which defines a client-side image map
BASE Function	Generates the <BASE> tag which records the URL of the document
BASEFONT Function	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Function	Generates the tag which begins a new line of text
CENTER Function	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation

Table 222-1 (Cont.) HTF Package Subprograms

Subprogram	Description
CODE Function	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Function	Generates the comment tags <!-- ctext -->
DFN Function	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function	Generates the <DIR> which starts a directory list section
DIV Function	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function	Generates the </DL> tag which ends a definition list
DLISTDEF Function	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function	Generates the <DL> tag which starts a definition list
DLISTTERM Function	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Function	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Function	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Function	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function	Generates the <FORM> tag which marks the beginning of a form section in an HTML document

Table 222-1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMPASSWORD Function	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Function	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function	Generates the </HTML> tag which marks the end of an HTML document

Table 222-1 (Cont.) HTF Package Subprograms

Subprogram	Description
HTMLOPEN Function	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function	Creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program
ITALIC Function	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function	Generates the <LI> tag, which indicates a list item
MAILTO Function	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function	Generates the <MENU> tag which begins a list that presents one line for each item
META Function	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Function	Generates the tag which begins a new line of text

Table 222-1 (Cont.) HTF Package Subprograms

Subprogram	Description
NOBR Function	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Function	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Function	Generates the <OL> tag which marks the beginning of an ordered list
PARA Function	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function	Adds attributes to the <P> tag
PARAM Function	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Function	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions	Generates the specified parameter as a string
S Function	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Function	Generates the _{and} tags which direct the browser to render the text they surround as subscript

Table 222-1 (Cont.) HTF Package Subprograms

Subprogram	Description
SUP Function	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Function	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Function	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

222.6.1 ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
   cvalue         IN       VARCHAR2
   cnowrap        IN       VARCHAR2   DEFAULT NULL
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 222-2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

222.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 222-3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

222.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 222-4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

222.6.4 APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using APPLETOPEN Function

Syntax

```
HTF.APPLETCLOSE
 RETURN VARCHAR2;
```

222.6.5 APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Function which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

222.6.6 AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-6 AREA Function Parameters

Parameter	Description
ccords	The value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

222.6.7 BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

222.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (
   nsize    IN    INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 222-8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

222.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

222.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-10 BIG Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

222.6.11 BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

222.6.12 BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-11 BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

222.6.13 BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

222.6.14 BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-12 BODYOPEN Function Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

222.6.15 BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

222.6.16 BR Function

This function generates the
 tag which begins a new line of text.

It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-14 BR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

222.6.17 CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

222.6.18 CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

222.6.19 CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the CENTERCLOSE Function.

Syntax

```
HTF.CENTEROPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

222.6.20 CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-16 CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

222.6.21 CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-17 CODE Function Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

222.6.22 COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

222.6.23 DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

222.6.24 DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

Related Topics

- DIRLISTOPEN Function
  This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

222.6.25 DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

Related Topics

- DIRLISTCLOSE Function
  This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

222.6.26 DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

222.6.27 DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

Related Topics

- DLISTOPEN Function
  This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

222.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

222.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- DLISTCLOSE Function
  This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

222.6.30 DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

222.6.31 EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
     ctext          IN       VARCHAR2,
```

```
    cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

222.6.32 EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EM Function.

Syntax

```
HTF.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

222.6.33 ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- & to &
- " to &quot:

- < to <
- > to >

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
     ctext           IN       VARCHAR2);
```

Parameters

Table 222-26 ESCAPE_SC Function Parameters

Parameter	Description
ctext	The text string to convert.

222.6.34 ESCAPE_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

> **Note:**
>
> This procedure, deprecated in Release 10*g*, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the ESCAPE Functionin the UTL_URL package.

The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >
- % to &25

Syntax

```
HTF.ESCAPE_URL(
     p_url           IN       VARCHAR2);
```

Parameters

Table 222-27 ESCAPE_URL Function Parameters

Parameter	Description
p_url	The string to convert.

222.6.35 FONTCLOSE Function

This function generates the</FONT> tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</FONT>

222.6.36 FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

222.6.37 FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
   columnValue          IN       VARCHAR2
   format_numbers       IN       VARCHAR2   DEFAULT NULL
 RETURN VARCHAR2;
```

Parameters

Table 222-29 FORMAT_CELL Function Parameters

Parameter	Description
`columnValue`	The value that needs to be formatted in an HTML table.
`format_numbers`	The format that numeric data is displayed in. If the value of this parameter is not `NULL`, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

Related Topics

- TABLEDATA Function
  This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

222.6.38 FORMCHECKBOX Function

This function generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-30 FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

222.6.39 FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

222.6.40 FORMFILE Function

This function generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

222.6.41 FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

222.6.42 FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name

of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-33 FORMIMAGE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

222.6.43 FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".

Table 222-34 (Cont.) FORMOPEN Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

222.6.44 FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-35 FORMPASSWORD Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

222.6.45 FORMRADIO Function

This function generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-36 FORMRADIO Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

222.6.46 FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

222.6.47 FORMSELECTCLOSE Function

This function generates the </SELECT> tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

222.6.48 FORMSELECTOPEN Function

This function generates the <SELECT> tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
  cname        IN    VARCHAR2,
  cprompt      IN    VARCHAR2   DEFAULT NULL,
  nsize        IN    INTEGER    DEFAULT NULL,
  cattributes  IN    VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

222.6.49 FORMSELECTOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue           IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-39 FORMSELECTOPTION Function Parameters

Parameter	Description
`cvalue`	The text for the option
`cvalue`	If the value for this parameter is not `NULL`, the `SELECTED` attribute is added to the tag.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the FORMSELECTOPEN Function.

222.6.50 FORMSUBMIT Function

This function generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-40 FORMSUBMIT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

222.6.51 FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-41 FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.

Table 222-41 (Cont.) FORMTEXT Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

222.6.52 FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

222.6.53 FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

222.6.54 FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element.

You open a text area element by means of eitherFORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

222.6.55 FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

222.6.56 FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
```

```
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

222.6.57 FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

222.6.58 FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

222.6.59 FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-47 FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

222.6.60 HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```
HTF.HEADCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

222.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-48 HEADER Function Parameters

Parameter	Description
nsize	The heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1,'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

222.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

222.6.63 HR Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

222.6.64 HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document.

You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

222.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

222.6.66 IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The IMG2 Function performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTF.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-50 IMG Function Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.

Table 222-50 (Cont.) IMG Function Parameters

Parameter	Description
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

222.6.67 IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The IMG Function performs the same operation but does not use the cusemap parameter.

Syntax

```
HTF.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-51 IMG2 Function Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

222.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

222.6.69 ITALIC Function

This function generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-53 ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

222.6.70 KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-54 KBD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

222.6.71 KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-55 KEYBOARD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

222.6.72 LINE Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

222.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
   crel            IN       VARCHAR2,
   curl            IN       VARCHAR2,
   ctitle          IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

222.6.74 LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

222.6.75 LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

222.6.76 LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

222.6.77 LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

222.6.78 LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

222.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
```

```
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

222.6.80 MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

222.6.81 MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-62 MAPOPEN Function Parameters

Parameter	Description
`cname`	The value for the `NAME` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

222.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

222.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Function.The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

222.6.84 META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

222.6.85 NL Function

This function generates the
 tag which begins a new line of text.

It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
   cclear         IN       VARCHAR2   DEFAULT NULL,
```

```
  cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 222-64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

222.6.86 NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
ctext        IN        VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-65 NOBR Function Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

222.6.87 NOFRAMESCLOSE Function

This function generates the </NOFRAMES> tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

222.6.88 NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

222.6.89 OLISTCLOSE Function

This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

222.6.90 OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

222.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

222.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.

Table 222-67 (Cont.) PARAGRAPH Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- PARA Function
  This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

222.6.93 PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

222.6.94 PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

222.6.95 PRECLOSE Function

This function generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

222.6.96 PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-70 PREOPEN Function Parameters

Parameter	Description
`cclear`	The value for the `CLEAR` attribute.
`cwidth`	The value for the `WIDTH` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

222.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the `\n` newline character.

The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRINT (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRINT (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 222-71 PRINT Function Parameters

Parameter	Description
`cbuf`	The string to generate terminated by a newline.
`dbuf`	The string to generate terminated by a newline.
`nbuf`	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as
. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use
 to control how the browser renders the HTML source.
- These functions do not have function equivalents.

222.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRN (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRN (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 222-72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

222.6.99 S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

222.6.100 SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

222.6.101 SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

222.6.102 SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

222.6.103 STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Function.

Syntax

```
STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-77 STRIKE Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

222.6.104 STRONG Function

This function generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTF.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-78 STRONG Function Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

222.6.105 STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page.

You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
   cstyle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-79 STYLE Function Parameters

Parameter	Description
cstyle	The style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

222.6.106 SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
   ctext           IN       VARCHAR2,
   calign          in       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

222.6.107 SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

222.6.108 TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

222.6.109 TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Function.

Syntax

```
HTF.TABLECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

222.6.110 TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

222.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

222.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

222.6.113 TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

222.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-86 TABLEROWOPEN Function Parameters

Parameter	Description
`calign`	The value for the `ALIGN` attribute.
`cvalign`	The value for the `VALIGN` attribute.
`cdp`	The value for the `DP` attribute.
`cnowrap`	If the value of this parameter is not `NULL`, the `NOWRAP` attribute is added to the tag.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

222.6.115 TELETYPE Function

This function generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-87 TELETYPE Function Parameters

Parameter	Description
`ctext`	The text to render in a fixed width typewriter font.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

222.6.116 TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
   ctitle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 222-88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

222.6.117 ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

222.6.118 ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
```

```
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-89 ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

222.6.119 UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

222.6.120 VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 222-91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

222.6.121 WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
  RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```

223
HTP

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

This chapter contains the following topics:

- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTP Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

223.1 HTP Operational Notes

Certain operational notes apply to the HTP package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PRINT procedure. It then prints its parameters to the generated Web page.

223.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

223.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

223.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

HTML, HEAD, and BODY Tags

HTMLOPEN Procedure, HTMLCLOSE Procedure - generate <HTML> and </HTML>

HEADOPEN Procedure, HEADCLOSE Procedure - generate <HEAD> and </HEAD>

BODYOPEN Procedure, BODYCLOSE Procedure - generate <BODY> and </BODY>

Comment Tag

COMMENT Procedure - generates <!-- and -->

Tags in the <HEAD> Area

BASE Procedure - generates <BASE>

LINKREL Procedure - generates <LINK> with the REL attribute

LINKREV Procedure - generates <LINK> with the REV attribute

TITLE Procedure - generates <TITLE>

META Procedure - generates <META>

SCRIPT Procedure - generates <SCRIPT>

STYLE Procedure - generates <STYLE>

ISINDEX Procedure - generates <ISINDEX>

Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate <APPLET> and </APPLET>

PARAM Procedure - generates <PARAM>

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate <OL> and </OL>

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate <UL> and </UL>

DLISTOPEN Procedure, DLISTCLOSE Procedure- generate <DL> and </DL>

DLISTTERM Procedure - generates <DT>

DLISTDEF Procedure - generates <DD>

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate <DIR> and </DIR>

LISTHEADER Procedure - generates <LH>

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate <LISTING> and </LISTING>

MENULISTOPEN Procedure - generate <MENU> and </MENU>

LISTITEM Procedure - generates <LI>

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate <FORM> and </FORM>

FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD">

FORMRADIO Procedure - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate <SELECT> and </SELECT>

FORMSELECTOPTION Procedure - generates <OPTION>

FORMTEXT Procedure - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Procedure - generate <TEXTAREA>

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Procedure - generates <INPUT TYPE="RESET">

FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>

TABLECAPTION Procedure - generates <CAPTION>

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>

TABLEHEADER Procedure - generates <TH>

TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>

IMG Procedure, IMG2 Procedure - generate <IMG>

ANCHOR Procedure, ANCHOR2 Procedure - generate <A>

MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)

PARA Procedure, PARAGRAPH Procedure - generate <P>

PRN Procedures, PRINT Procedures - generate any text that is passed in

PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Procedure - generates <DIV>

NL Procedure, BR Procedure - generate

NOBR Procedure - generates <NOBR>

WBR Procedure - generates <WBR>

PLAINTEXT Procedure - generates <PLAINTEXT>

ADDRESS Procedure - generates <ADDRESS>

MAILTO Procedure - generates <A> with the MAILTO attribute

AREA Procedure - generates <AREA>

BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>

BIG Procedure - generates <BIG>

BOLD Procedure - generates <B>

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate <EM>

FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates <STRONG>

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

223.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

Table 223-1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure	Generates the <A> and </A> tags which specify the source or destination of a hypertext link

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
APPLETCLOSE Procedure	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Procedure	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Procedure	Generates the tag which begins a new line of text
CENTER Procedure	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Procedure	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Procedure	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure	Generates procedure generates the comment tags <!-- ctext -->
DFN Procedure	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure	Generates the <DIR> which starts a directory list section
DIV Procedure	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure	Generates the <DD> tag, which inserts definitions of terms

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
DLISTOPEN Procedure	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure	Generates the <DT> tag which defines a term in a definition list <DL>
EM Procedure	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Procedure	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Procedure	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Procedure	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMTEXTAREA2 Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure	Generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Procedure	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Procedure	Creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program
ITALIC Procedure	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
LINKREV Procedure	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure	Generates the <LI> tag, which indicates a list item
MAILTO Procedure	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure	Generates the <MENU> tag which begins a list that presents one line for each item
META Procedure	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure	Generates the tag which begins a new line of text
NOBR Procedure	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Procedure	Generates the <OL> tag which marks the beginning of an ordered list
PARA Procedure	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure	Adds attributes to the <P> tag
PARAM Procedure	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
PRINT Procedures	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures	Generates the specified parameter as a string
PS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font

Table 223-1 (Cont.) HTP Package Subprograms

Subprogram	Description
TITLE Procedure	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Procedure	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Procedure	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

223.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
   cvalue         IN       VARCHAR2
   cnowrap        IN       VARCHAR2   DEFAULT NULL
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

223.5.2 ANCHOR Procedure

Like the ANCHOR2 procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-3 ANCHOR Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

223.5.3 ANCHOR2 Procedure

Like the ANCHOR procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the ANCHOR procedure is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

223.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

223.5.5 APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-5 APPLETOPEN Procedure Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

223.5.6 AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-6 AREA Procedure Parameters

Parameter	Description
`ccords`	The the value for the `COORDS` attribute.
`cshape`	The value for the `SHAPE` attribute.
`chref`	The value for the `HREF` attribute.
`cnohref`	If the value for this parameter is not `NULL`, the `NOHREF` attribute is added to the tag.
`ctarget`	The value for the `TARGET` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

223.5.7 BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-7 BASE Procedure Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

223.5.8 BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
   nsize    IN    INTEGER);
```

Parameters

Table 223-8 BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

223.5.9 BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

223.5.10 BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-10 BIG Procedure Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

223.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

223.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

223.5.13 BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

223.5.14 BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```
HTP.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-12 BODYOPEN Procedure Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

223.5.15 BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-13 BOLD Procedure Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

223.5.16 BR Procedure

This procedure generates the
 tag which begins a new line of text.

It performs the same operation as the NL Procedure.

Syntax

```
HTP.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-14 BR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

223.5.17 CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
   ctext          IN       VARCHAR2);
```

Parameters

Table 223-15 CENTER Parameters

Parameter	Description
`ctext`	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

223.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

223.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

223.5.20 CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

223.5.21 CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-17 CODE Procedure Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

223.5.22 COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext          IN       VARCHAR2);
```

Parameters

Table 223-18 COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

223.5.23 DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (
   ctext          IN       VARCHAR2);
```

Parameters

Table 223-19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

223.5.24 DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

Related Topics

- DIRLISTOPEN Procedure
  This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

223.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

Related Topics

- DIRLISTCLOSE Procedure
  This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

223.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-20 DIV Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

223.5.27 DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
</DL>
```

Related Topics

- DLISTOPEN Procedure
  This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

223.5.28 DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-21 DLISTDEF Procedure Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

223.5.29 DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-22 DLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- DLISTCLOSE Procedure
  This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

223.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-23 DLISTTERM Procedure Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

223.5.31 EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EMPHASIS Procedure.

Syntax

```
HTP.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-24 EM Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

223.5.32 EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EM Procedure.

Syntax

```
HTP.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-25 EMPHASIS Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

223.5.33 ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```
HTP.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 223-26 ESCAPE_SC Procedure Parameters

Parameter	Description
ctext	The text string to convert.

223.5.34 FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

223.5.35 FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-27 FONTOPEN Procedure Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

223.5.36 FORMCHECKBOX Procedure

This procedure generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-28 FORMCHECKBOX Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

223.5.37 FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

223.5.38 FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
```

```
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-29 FORMOPEN Procedure Parameters

Parameter	Description
curl	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

223.5.39 FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-30 FORMFILE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

223.5.40 FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

223.5.41 FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-32 FORMIMAGE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.

Table 223-32 (Cont.) FORMIMAGE Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

223.5.42 FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-33 FORMPASSWORD Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

223.5.43 FORMRADIO Procedure

This procedure generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one.

Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-34 FORMRADIO Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

223.5.44 FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-35 FORMRESET Procedure Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

223.5.45 FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

223.5.46 FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

223.5.47 FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
   cvalue         IN       VARCHAR2,
   cselected      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
`cvalue`	The text for the option.
`cvalue`	If the value for this parameter is not `NULL`, the `SELECTED` attribute is added to the tag.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.

223.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
```

```
   cvalue        IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-38 FORMSUBMIT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

223.5.49 FORMTEXT Procedure

This procedure generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-39 FORMTEXT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

223.5.50 FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign       , IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

223.5.51 FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

223.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the </TEXTAREA> tag which ends a text area form element.

You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

223.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

223.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP =
"cwrap" cattributes>
```

223.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

223.5.56 FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

223.5.57 FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-45 FRAMESETOPEN Procedure Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

223.5.58 HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

223.5.59 HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-46 HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```

223.5.60 HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

223.5.61 HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-47 HR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

223.5.62 HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document.

You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

223.5.63 HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document.

You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

223.5.64 IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page.

The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-48 IMG Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

223.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

```
HTP.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
```

```
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-49 IMG2 Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

223.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL);
```

Parameters

Table 223-50 ISINDEX Procedure Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

223.5.67 ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

223.5.68 KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

223.5.69 KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-53 KEYBOARD Procedure Parameters

Parameter	Description
`ctext`	The text to be rendered in monospace.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

223.5.70 LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-54 LINE Procedure Parameters

Parameter	Description
`cclear`	The value for the CLEAR attribute.
`csrc`	The value for the SRC attribute which specifies a custom image as the source of the line.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

223.5.71 LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

223.5.72 LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

223.5.73 LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

223.5.74 LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

223.5.75 LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

223.5.76 LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

223.5.77 MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

223.5.78 MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

223.5.79 MAPOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-60 MAPOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

223.5.80 MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

223.5.81 MENULISTOPEN Procedure

This procedure generates the <MENU> tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Procedure.The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

223.5.82 META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2);
```

Parameters

Table 223-61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

223.5.83 NL Procedure

This procedure generates the
 tag which begins a new line of text.

It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

223.5.84 NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
ctext        IN        VARCHAR2);
```

Parameters

Table 223-63 NOBR Procedure Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

223.5.85 NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

223.5.86 NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

223.5.87 OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

223.5.88 OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
```

```
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-64 OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

223.5.89 PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

223.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-65 PARAGRAPH Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.

Table 223-65 (Cont.) PARAGRAPH Procedure Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- PARA Procedure
  This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

223.5.91 PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 223-66 PARAM Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

223.5.92 PLAINTEXT Procedure

This procedure generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-67 PLAINTEXT Procedure Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

223.5.93 PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

223.5.94 PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
```

```
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-68 PREOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

223.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character.

The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
   cbuf      IN       VARCHAR2);

HTP.PRINT (
   dbuf      IN       DATE);

HTP.PRINT (
   nbuf      IN       NUMBER);
```

Parameters

Table 223-69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as
. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use
 to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

223.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 223-70 PRINTS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).

223.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (
   cbuf       IN       VARCHAR2);

HTP.PRN (
   dbuf       IN       DATE);

HTP.PRN (
   nbuf       IN       NUMBER);
```

Parameters

Table 223-71 PRN Procedure Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

223.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 223-72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).

223.5.99 S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-73 S Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

223.5.100 SAMPLE Procedure

This procedure generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-74 SAMPLE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

223.5.101 SCRIPT Procedure

This procedure generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-75 SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

223.5.102 SMALL Procedure

This procedure generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-76 SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.

Table 223-76 (Cont.) SMALL Procedure Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

223.5.103 STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-77 STRIKE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

223.5.104 STRONG Procedure

This procedure generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTP.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-78 STRONG Procedure Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

223.5.105 STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page.

You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
   cstyle          IN       VARCHAR2);
```

Parameters

Table 223-79 STYLE Procedure Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

223.5.106 SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(
   ctext           IN       VARCHAR2,
   calign          in       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

223.5.107 SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

223.5.108 TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(
   ccaption       IN       VARCHAR2,
```

```
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

223.5.109 TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

223.5.110 TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-83 TABLEDATA Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

223.5.111 TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.

Table 223-84 (Cont.) TABLEHEADER Procedure Parameters

Parameter	Description
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

223.5.112 TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-85 TABLEOPEN Procedure Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

223.5.113 TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

223.5.114 TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-86 TABLEROWOPEN Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

223.5.115 TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-87 TELETYPE Procedure Parameters

Parameter	Description
`ctext`	The text to render in a fixed width typewriter font.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

223.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(
   ctitle          IN       VARCHAR2);
```

Parameters

Table 223-88 TITLE Procedure Parameters

Parameter	Description
`ctitle`	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

223.5.117 ULISTCLOSE Procedure

This procedure generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

223.5.118 ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

223.5.119 UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
   ctext           IN       VARCHAR2,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.

Table 223-90 (Cont.) UNDERLINE Procedure Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

223.5.120 VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 223-91 VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

223.5.121 WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

224
OWA_CACHE

The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Constants
- Summary of OWA_CACHE Subprograms

224.1 OWA_CACHE Constants

OWA_CACHE defines several constants to use when specifying parameter values.

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

224.2 Summary of OWA_CACHE Subprograms

This table lists the OWA_CACHE subprograms and briefly describes them.

Table 224-1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure	Disables the cache for this particular request
GET_ETAG Function	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure	Sets up the headers for a surrogate-control header for Web cache

224.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

224.2.2 GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
  RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise `NULL`.

224.2.3 GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise `NULL`.

224.2.4 SET_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag        IN       VARCHAR2,
   p_level       IN       VARCHAR2);
```

Parameters

Table 224-2 *SET_CACHE Procedure Parameters*

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

224.2.5 SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
   p_expires      IN       NUMBER,
   p_level        IN       VARCHAR2);
```

Parameters

Table 224-3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

224.2.6 SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

VALUE_ERROR is thrown if If the etag was not passed in

224.2.7 SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
   p_value        IN       VARCHAR2);
```

Parameters

Table 224-4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

225
OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Overview
- Types
- Rules and Limits
- Summary of OWA_COOKIE Subprograms

225.1 OWA_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

225.2 OWA_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
   name           VARCHAR2(4000),
   vals           vc_arr,
   num_vals       INTEGER);
```

225.3 OWA_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

225.4 Summary of OWA_COOKIE Subprograms

This table lists the `OWA_COOKIE` subprograms and briefly describes them.

Table 225-1 *OWA_COOKIE Package Subprograms*

Subprogram	Description
GET Function	Gets the value of the specified cookie
GET_ALL Procedure	Gets all cookie name-value pairs
REMOVE Procedure	Removes the specified cookie
SEND procedure	Generates a "Set-Cookie" line in the HTTP header

225.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a `OWA_COOKIE.COOKIE DATA TYPE` .

Syntax

```
OWA_COOKIE.GET(
    name           IN       VARCHAR2)
  RETURN COOKIE;
```

Parameters

Table 225-2 GET Function Parameters

Parameter	Description
name	The name of the cookie.

Return Values

`OWA_COOKIE.COOKIE DATA TYPE`.

225.4.2 GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
   names          OUT      vc_arr,
   vals           OUT      vc_arr,
   num_vals       OUT      INTEGER);
```

Parameters

Table 225-3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

225.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
   name           IN       VARCHAR2,
   val            IN       VARCHAR2,
   path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 225-4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

225.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
   name           in       varchar2,
   value          in       varchar2,
   expires        in       date       DEFAULT NULL,
   path           in       varchar2   DEFAULT NULL,
   domain         in       varchar2   DEFAULT NULL,
   secure         in       varchar2   DEFAULT NULL);
```

Parameters

Table 225-5 SEND Procedure Parameters

Parameter	Description
`name`	The name of the cookie.
`value`	The value of the cookie.
`expires`	The date at which the cookie will expire
`path`	The value for the path field.
`domain`	The value for the domain field.
`secure`	If the value of this parameter is not `NULL`, the "secure" field is added to the line.

226
OWA_CUSTOM

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Constants
- Summary of OWA_CUSTOM Subprograms

226.1 OWA_CUSTOM Constants

OWA_CUSTOM defines several constants to use when specifying parameter values.

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

226.2 Summary of OWA_CUSTOM Subprograms

The AUTHORIZE function is the only subprogram in the OWA_CUSTOM package.

Table 226-1 *OWA_CUSTOM Package Subprograms*

Subprogram	Description
AUTHORIZE Function	Provides a Global PLSQL Agent Authorization callback function

226.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
  RETURN BOOLEAN;
```

227
OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- Overview
- Types
- Variables
- Examples
- Summary of OWA_IMAGE Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

227.1 OWA_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

227.2 OWA_IMAGE Types

This datatype (`point`) contain the `X` and `Y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

227.3 OWA_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

227.4 OWA_IMAGE Examples

This example shows use of OWA_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```

227.5 Summary of OWA_IMAGE Subprograms

This table lists the OWA_IMAGE subprograms and briefly describes them.

Table 227-1 *OWA_IMAGE Package Subprograms*

Subprogram	Description
GET_X Function	Gets the X value of a point type
GET_Y Function	Gets the Y value of a point type

227.5.1 GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
   p        IN        point)
 RETURN INTEGER;

OWA_IMAGE.GET_X(
   p        IN        point)
 RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 227-2 GET_X Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

227.5.2 GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER;

OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 227-3 GET_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

228
OWA_OPT_LOCK

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- Overview
- Types
- Summary of OWA_OPT_LOCK Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

228.1 OWA_OPT_LOCK Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

228.2 OWA_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the OWA_TEXT.VC_ARR DATA TYPE.

228.3 Summary of OWA_OPT_LOCK Subprograms

This table lists the OWA_OPT_LOCK subprograms and briefly describes them.

Table 228-1 OWA_OPT_LOCK Package Subprograms

Subprogram	Description
CHECKSUM Functions	Returns the checksum value
GET_ROWID Function	Returns the ROWID value
STORE_VALUES Procedure	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function	Verifies the stored values against modified values

228.3.1 CHECKSUM Functions

This function returns a checksum value for a specified string, or for a row in a table. For a row in a table, the function calculates the checksum value based on the values of the columns in the row. This function comes in two versions.

The first version returns a checksum based on the specified string. This is a "pure" 32-bit checksum executed by the database and based on the Internet 1 protocol.

The second version returns a checksum based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER PARALLEL_ENABLE DETERMINISTIC;

OWA_OPT_LOCK.CHECKSUM(
   p_owner       IN      VARCHAR2,
   p_tname       IN       VARCHAR2,
   p_rowid       IN       ROWID)
  RETURN NUMBER;
```

Parameters

Table 228-2 CHECKSUM Function Parameters

Parameter	Description
p_buff	The nstring where you want to calculate the checksum.
p_owner	The owner of the table.
p_tname	The table name.

Table 228-2 (Cont.) CHECKSUM Function Parameters

Parameter	Description
p_rowid	The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.

228.3.2 GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID;

OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 228-3 GET_ROWID Function Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

228.3.3 STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
   p_owner        IN       VARCHAR2,
   p_tname        IN       VARCHAR2,
   p_rowid        IN       ROWID);
```

Parameters

Table 228-4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

228.3.4 VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the STORE_VALUES Procedure.

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
 RETURN BOOLEAN;
```

Parameters

Table 228-5 *VERIFY_VALUES Function Parameters*

Parameter	Description
p_old_values	A PL/SQL table containing the following information: • p_old_values(1) specifies the owner of the table. • p_old_values(2) specifies the table. • p_old_values(3) specifies the rowid of the row to verify. The remaining indexes contain values for the columns in the table. Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.

Return Values

TRUE if no other update has been performed, otherwise FALSE.

229
OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

> **See Also:**
>
> For more information about implementation of this package, see the following:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Types
- Operational Notes
- Summary of OWA_PATTERN Subprograms

229.1 OWA_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

229.2 OWA_PATTERN Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards

- Quantifiers
- Flags

229.2.1 OWA_PATTERN Wildcards

Wildcard tokens match something other than themselves.

Table 229-1 *Wildcard tokens recognized by OWA_PATTERN package*

Token	Description
^	Matches newline or the beginning of the target
$	Matches newline or the end of the target
\n	Matches newline
.	Matches any character except newline
\t	Matches tab
\d	Matches digits [0-9]
\D	Matches non-digits [not 0-9]
\w	Matches word characters (0-9, a-z, A-Z, or _)
\W	Matches non-word characters (not 0-9, a-z, A-Z, or _)
\s	Matches whitespace characters (blank, tab, or newline).
\S	Matches non-whitespace characters (not blank, tab, or newline)
\b	Matches "word" boundaries (between \w and \W)
\x<HEX>	Matches the value in the current character set of the two hexadecimal digits
\<OCT>	Matches the value in the current character set of the two or three octal digits
\	Followed by any character not covered by another case matches that character
&	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures .

229.2.2 OWA_PATTERN Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

Table 229-2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly *n* occurrences
(n,}	At least *n* occurrences
{n,m}	At least *n*, but not more than *m*, occurrences

229.2.3 OWA_PATTERN Flags

In addition to targets and regular expressions, the `OWA_PATTERN` functions and procedures use flags to affect how they are interpreted.

Table 229-3 Flags

Flag	Description
`i`	This indicates a case-insensitive search.
`g`	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

229.3 Summary of OWA_PATTERN Subprograms

This table lists the OWA_PATTERN subprograms and briefly describes them.

Table 229-4 OWA_PATTERN Package Subprograms

Subprogram	Description
AMATCH Function	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure	Generates a pattern datatype from a VARCHAR2 type
MATCH Function	Determines if a string contains the specified pattern

229.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

> **Note:**
>
> If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            in       varchar2
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            IN OUT   PATTERN
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 229-5 AMATCH Function Parameters

Parameter	Description
line	The text to search in.
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.

229.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
   line           IN OUT    VARCHAR2,
   from_str       IN        VARCHAR2,
   to_str         IN        VARCHAR2,
   flags          IN        VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   line           IN OUT   VARCHAR2,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);

owa_pattern.change(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 229-6 CHANGE Procedure Parameters

Parameter	Description
`line`	The text to search in. The output value of this parameter is the altered string.
mline	The text to search in. This is a `owa_text.multi_line datatype`. The output value of this parameter is the altered string.
`from_str`	The regular expression to replace.
to_str	The substitution pattern.
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "`i`" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
   BEGIN
       theline := 'what is the goal?';
       num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
       HTP.PRINT(num_found); -- num_found is 1
       HTP.PRINT(theline); -- theline is 'what is the idea?'
   END;
/
SHOW ERRORS
```

229.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT(
   arg      IN          VARCHAR2,
   pat      IN OUT      pattern);
```

Parameters

Table 229-7 GETPAT Procedure Parameters

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

229.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   mline          IN       owa_text.multi_line,
   pat            IN       VARCHAR2,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   mline          IN       owa_text.multi_line,
   pat            IN OUT   pattern,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 229-8 MATCH Function Parameters

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a owa_text.multi_line datatype..
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext  VARCHAR2(256);
pat       VARCHAR2(256);

sometext    := 'what is the goal?'
pat         := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
   THEN
      HTP.PRINT('Match found');
   ELSE
     HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create AN OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.
- If the line is a string and not a multi_line, you can add an optional output parameter called backrefs. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.

230
OWA_SEC

The `OWA_SEC` package provides an interface for custom authentication.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Operational Notes
- Summary of OWA_SEC Subprograms

230.1 OWA_SEC Operational Notes

Parameters that have default values are optional.

230.2 Summary of OWA_SEC Subprograms

This table lists the OWA_SEC subprograms in alphabetical order and briefly describes them.

Table 230-1 *OWA_SEC Package Subprograms*

Subprogram	Description
GET_CLIENT_HOSTNAME Function	Returns the client's hostname
GET_CLIENT_IP Function	Returns the client's IP address
GET_PASSWORD Function	Returns the password that the user entered
GET_USER_ID Function	Returns the username that the user entered
SET_AUTHORIZATION Procedure	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure	Defines the realm that the page is in

230.2.1 GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
 RETURN VARCHAR2;
```

Return Values

The hostname.

230.2.2 GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
  RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address datatype` is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the owa_util.ip_address datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

230.2.3 GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
  RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

230.2.4 GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID
  RETURN VARCHAR2;
```

Return Values

The username.

230.2.5 SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN       INTEGER);
```

Parameters

Table 230-2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description

scheme	The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:
	• OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.
	• OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema.
	• OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called.
	• OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.
	The custom authorize function has the following signature:
	`FUNCTION AUTHORIZE`
	`  RETURN BOOLEAN;`
	If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.

Related Topics

- OWA_CUSTOM
  The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

230.2.6 SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
   realm      IN      VARCHAR2);
```

Parameters

Table 230-3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
`realm`	The realm where the page belongs. This string is displayed to the user.

231
OWA_TEXT

The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Types
- Summary of OWA_TEXT Subprograms

231.1 OWA_OPT_LOCK Types

There are three OWA_OPT_LOCK lock types.

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

231.1.1 MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
   rows           vc_arr,
   num_rows       INTEGER,
   partial_row    BOOLEAN);
```

231.1.2 ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
   rows           int_arr,
   num_rows       INTEGER);

int_arr IS DEFINED AS:

TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

231.1.3 VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics

- MULTI_LINE DATA TYPE
  This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

231.2 Summary of OWA_TEXT Subprograms

This table lists the `OWA_TEXT` subprograms and briefly describes them.

Table 231-1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure	Adds text to an existing `multi_line` type
NEW_ROW_LIST Function and Procedure	Creates a new `row_list`
PRINT_MULTI Procedure	Prints out the contents of a `multi_list`
PRINT_ROW_LIST Procedure	Prints out the contents of a `row_list`
STREAM2MULTI Procedure	Converts a varchar2 to a `multi_line` type

231.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi_Line Data Type

Syntax

```
OWA_TEXT.ADD2MULTI(
   stream          IN       VARCHAR2,
   mline           IN OUT   multi_line,
  continue      IN      BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 231-2 ADD2MULTI Procedure Parameters

Parameter	Description
`stream`	The text to add.
`mline`	The `OWA_TEXT.MULTI_LINE DATA TYPE`. The output of this parameter contains *stream*.
`continue`	If `TRUE`, the procedure appends *stream* within the previous final row (assuming it is less than 32K). If `FALSE`, the procedure places *stream* in a new row.

231.2.2 NEW_ROW_LIST Function and Procedure

This function or procedure creates a new `OWA_TEX.ROW_LIST DATA TYPE`.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

Table 231-3 *NEW_ROW_LIST Procedure Parameters*

Parameter	Description
`rlist`	This is an output parameter containing the new `row_list` datatype

Return Values

The function version returns the new `row_list` datatype.

231.2.3 PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_MULTI(
   mline       IN       multi_line);
```

Parameters

Table 231-4 PRINT_MULTI Procedure Parameters

Parameter	Description
`mline`	The multi_line datatype to print.

Return Values

The contents of the `multi_line`.

Related Topics

- PRINT Procedures
  These procedures generate the specified parameter as a string terminated with the `\n` newline character.

- PRN Procedures
  These procedures generate the specified parameter as a string.

231.2.4 PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
   rlist       IN       multi_line);
```

Parameters

Table 231-5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
`rlist`	The row_list datatype to print.

Return Values

The contents of the `row_list`.

Related Topics

- PRINT Procedures
  These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- PRN Procedures
  These procedures generate the specified parameter as a string.

231.2.5 STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

Syntax

```
OWA_TEXT.STREAM2MULTI(
   stream         IN       VARCHAR2
   mline          OUT      multi_line);
```

Parameters

Table 231-6 STREAM2MULTI Procedure Parameters

Parameter	Description
`stream`	The string to convert.
`mline`	The stream in `OWA_TEXT.MULTI_LINE DATA TYPE` format

232
OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Overview
- Types
- Summary of OWA_UTIL Subprograms

232.1 OWA_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

232.2 OWA_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- DATETYPE Datatype
- IDENT_ARR Datatype
- IP_ADDRESS Datatype

232.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

Related Topics

- TODATE Function
  This function converts the DATETYPE Datatype to the standard Oracle DATE type.
- CHOOSE_DATE Procedure
  This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

232.2.2 IDENT_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

232.2.3 IP_ADDRESS Datatype

This datatype is used by the GET_CLIENT_IP Function in the OWA_SEC package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Related Topics

- GET_CLIENT_IP Function
  This function returns the IP address of the client.
- OWA_SEC
  The OWA_SEC package provides an interface for custom authentication.

232.3 Summary of OWA_UTIL Subprograms

This table lists the OWA_UTIL subprograms and briefly describes them.

Table 232-1 ***OWA_UTIL Package Subprograms***

Subprogram	Description
BIND_VARIABLES Function	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures	Prints a calendar
CELLSPRINT Procedures	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function	Returns the full virtual path for the PL/SQL Gateway

Table 232-1 (Cont.) *OWA_UTIL Package Subprograms*

Subprogram	Description
GET_PROCEDURE Function	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure	Closes the HTTP header
LISTPRINT Procedure	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure	Generates the Location line in the HTTP header
SHOWPAGE Procedure	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure	Prints the source for the specified subprogram
SIGNATURE procedure	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure	Generates the Status line in the HTTP header
TABLEPRINT Function	Prints the data from a table in the database as an HTML table
TODATE Function	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure	Returns information on the caller of the procedure.

232.3.1 BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
   theQuery       IN       VARCHAR2   DEFAULT NULL,
   bv1Name        IN       VARCHAR2   DEFAULT NULL,
   bv1Value       IN       VARCHAR2   DEFAULT NULL,
   bv2Name        IN       VARCHAR2   DEFAULT NULL,
   bv2Value       IN       VARCHAR2   DEFAULT NULL,
   bv3Name        IN       VARCHAR2   DEFAULT NULL,
   bv3Value       IN       VARCHAR2   DEFAULT NULL,
        ...
   bv25Name       IN       VARCHAR2   DEFAULT NULL,
   bv25Value      IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 232-2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

232.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.CALENDARPRINT(
   p_query        IN       VARCHAR2,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
   p_cursor       IN       INTEGER,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');
```

Parameters

Table 232-3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.

- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

232.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the " HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT(
   p_colCnt          IN    INTEGER,
   p_resultTbl       IN    vc_arr,

  p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  iN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER      DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN,
   p_reccnt          OUT   NUMBER);
```

Parameters

Table 232-4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

232.3.4 CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
   p_name         IN       VARCHAR2,
   p_date         IN       DATE       DEFAULT SYSDATE);
```

Parameters

Table 232-5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.
- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE datatype.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
     ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
     ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
     ...
<OPTION value="2002">2002
</SELECT>
```

232.3.5 GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
   param_name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 232-6 GET_CGI_ENV Function Parameters

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

232.3.6 GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

232.3.7 GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

232.3.8 HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

232.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
   p_theQuery     IN       VARCHAR2,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
   p_theCursor    IN    INTEGER,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 232-7 LISTPRINT Procedure Parameters

Parameter	Description
`p_theQuery`	The SQL query.
`p_theCursor`	The cursor ID. This can be the return value from the BIND_VARIABLES Function.
`p_cname`	The name of the HTML form element.
`p_nsize`	The size of the form element (this controls how many items the user can see without scrolling).
`p_multiple`	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the `VALUE` attribute of the `OPTION` tag.
- The second column specifies the values that the user sees.

- The third column specifies whether or not the row is marked as `SELECTED` in the `OPTION` tag. If the value is not `NULL`, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
     ...
</SELECT>
```

232.3.10 MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any `HTP.PRINT` or `HTP.PRN` calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
   ccontent_type    IN       VARCHAR2   DEFAULT 'text/html',
   bclose_header    IN       BOOLEAN    DEFAULT TRUE,
   ccharset         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 232-8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use.The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

232.3.11 PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

232.3.12 REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(
   curl           IN       VARCHAR2
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 232-9 REDIRECT_URL Procedure Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

232.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

232.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
   cname      IN     VARCHAR2);
```

Parameters

Table 232-10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

232.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
   cname        IN        VARCHAR2);
```

Parameters

Table 232-11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

232.3.16 STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
   nstatus        IN       INTEGER,
   creason        IN       VARCHAR2   DEFAULT NULL,
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 232-12 STATUS_LINE Procedure Parameters

Parameter	Description
nstatus	The status code.
creason	The string for the status code.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

232.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
   ctable         IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL,
   ntable_type    IN       INTEGER    DEFAULT HTML_TABLE,
   ccolumns       IN       VARCHAR2   DEFAULT '*',
   cclauses       IN    VARCHAR2   DEFAULT NULL,
   ccol_aliases   IN       VARCHAR2   DEFAULT NULL,
   nrow_min       IN       NUMBER     DEFAULT 0,
   nrow_max       IN       NUMBER     DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 232-13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: • HTML_TABLE CONSTANT INTEGER := 1; • PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

```
http://myhost:7777/pls/hr/showemps
```

returns to the following to the client:

```
<PRE>
---------------------------------------------------------------------
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
---------------------------------------------------------------------
| 7369| SMITH  | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499| ALLEN  | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521| WARD   | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566| JONES  | MANAGER | 7839 | 02-APR-81 | 2975 |     | 20 |
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |     | 30 |
| 7782| CLARK  | MANAGER | 7839 | 09-JUN-81 | 2450 |     | 10 |
| 7788| SCOTT  | ANALYST | 7566 | 09-DEC-82 | 3000 |     | 20 |
| 7839| KING   | PRESIDENT |    | 17-NOV-81 | 5000 |     | 10 |
| 7844| TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0   | 30 |
| 7876| ADAMS  | CLERK   | 7788 | 12-JAN-83 | 1100 |     | 20 |
| 7900| JAMES  | CLERK   | 7698 | 03-DEC-81 | 950  |     | 30 |
| 7902| FORD   | ANALYST | 7566 | 03-DEC-81 | 3000 |     | 20 |
| 7934| MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |     | 10 |
---------------------------------------------------------------------
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showemps_10
```

would return the following to the client:

```
<PRE>
-------------------------------------
| Employee Number |Name    | Salary |
-------------------------------------
| 7782            | CLARK  | 2450   |
| 7839            | KING   | 5000   |
| 7934            | MILLER | 1300   |
-------------------------------------
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

232.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

Syntax

```
OWA_UTIL.TODATE(
   p_dateArray      IN     dateType)
 RETURN DATE;
```

Parameters

Table 232-14 TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

Related Topics

- DATETYPE Datatype
  The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

232.3.19 WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
   owner           OUT      VARCHAR2,
   name            OUT      VARCHAR2,
   lineno          OUT      NUMBER,
   caller_t        OUT      VARCHAR2);
```

Parameters

Table 232-15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

233
SDO_CS

The SDO_CS package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see SDO_CS in the *Oracle Spatial and Graph Developer's Guide*.

234
SDO_CSW_PROCESS

The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see SDO_CSW_PROCESS in the *Oracle Spatial and Graph Developer's Guide.*.

235
SDO_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in the *Oracle Spatial and Graph Developer's Guide*.

236
SDO_GEOM

The SDO_GEOM package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the *Oracle Spatial and Graph Developer's Guide*.

237
SDO_GEOR

The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

238
SDO_GEOR_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

239
SDO_GEOR_AGGR

The SDO_GEOR_AGGR package provides an interface to the SDO_GEOR_AGGR package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_AGGR in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

240
SDO_GEOR_RA

The SDO_GEOR_RA package provides an interface to the SDO_GEOR_RA package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_RA in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

241
SDO_GEOR_UTL

The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR_UTL in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

242
SDO_LRS

The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see SDO_LRS in the *Oracle Spatial and Graph Developer's Guide*.

243
SDO_MIGRATE

The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see SDO_MIGRATE in the *Oracle Spatial and Graph Developer's Guide*.

244
SDO_NET

The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see SDO_NET in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

245
SDO_NFE

The SDO_NFE package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see SDO_NFE in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

246
SDO_OLS

The SDO_OLS package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see SDO_OLS in the *Oracle Spatial and Graph Developer's Guide*.

247
SDO_PC_PKG

The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see SDO_PC_PKG in the *Oracle Spatial and Graph Developer's Guide*.

248
SDO_SAM

The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see SDO_SAM in the *Oracle Spatial and Graph Developer's Guide*.

249
SDO_TIN_PKG

The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see SDO_TIN_PKG in the

250
SDO_TOPO

The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

251
SDO_TOPO_MAP

The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO_MAP in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

252
SDO_TUNE

The SDO_TUNE package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see SDO_TUNE in the *Oracle Spatial and Graph Developer's Guide*.

253
SDO_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

254
SDO_WFS_LOCK

The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_LOCK in the *Oracle Spatial and Graph Developer's Guide*.

255
SDO_WFS_PROCESS

The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_PROCESS in the *Oracle Spatial and Graph Developer's Guide*.

256
SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

257
SEM_OLS

The SEM_OLS package provides an interface to the SEM_OLS package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see SEM_OLS in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

258
SEM_PERF

The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_PERF in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

259
SEM_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

260
SEM_RDFSA

The SEM_RDFSA package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_RDFSA in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

261
UTL_CALL_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- Overview
- Security Model
- UTL_CALL_STACK Operational Notes
- UTL_CALL_STACK Exceptions
- Data Structures
- Summary of UTL_CALL_STACK Subprograms

> **See Also:**
>
> - *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
> - *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

261.1 UTL_CALL_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

261.2 UTL_CALL_STACK Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list onlys shows program unit C.

261.3 UTL_CALL_STACK Operational Notes

Certain operational notes apply to UTL_CALL_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL_CALL_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL_CALL_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL_CALL_STACK.

261.4 UTL_CALL_STACK Exceptions

This table lists the exceptions raised by UTL_CALL_STACK.

Table 261-1 Exceptions Raised by UTL_CALL_STACK

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

261.5 UTL_CALL_STACK Data Structures

The UTL_CALL_STACK package defines a VARRAY type, UNIT_QUALIFIED_NAME.

VARRAY Type

- UNIT_QUALIFIED_NAME

261.5.1 UNIT_QUALIFIED_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
```

```
BEGIN
  ...
END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be `"__anonymous_block"`

261.6 Summary of UTL_CALL_STACK Subprograms

This table lists the subprograms in the `UTL_CALL_STACK` package.

Table 261-2 UTL_CALL_STACK Package Subprograms

Subprogram	Description
BACKTRACE_DEPTH Function	Returns the number of backtrace items in the backtrace
BACKTRACE_LINE Function	Returns the line number of the unit at the specified backtrace depth
BACKTRACE_UNIT Function	Returns the name of the unit at the specified backtrace depth
CURRENT_EDITION Function	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
CONCATENATE_SUBPROGRAM Function	Returns a concatenated form of a unit-qualified name
DYNAMIC_DEPTH Function	Returns the number of subprograms on the call stack
ERROR_DEPTH Function	Returns the number of errors on the error stack
ERROR_MSG Function	Returns the error message of the error at the specified error depth
ERROR_NUMBER Function	Returns the error number of the error at the specified error depth
LEXICAL_DEPTH Function	Returns the lexical nesting level of the subprogram at the specified dynamic depth
OWNER Function	Returns the owner name of the unit of the subprogram at the specified dynamic depth
UNIT_LINE Function	Returns the line number of the unit of the subprogram at the specified dynamic depth
SUBPROGRAM Function	Returns the unit-qualified name of the subprogram at the specified dynamic depth

261.6.1 BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

261.6.2 BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (
   backtrace_depth   IN   PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 261-3 *BACKTRACE_LINE Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The line number of the unit at the specified backtrace depth

261.6.3 BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
   backtrace_depth   IN   PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 261-4 *BACKTRACE_UNIT Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The name of the unit at the specified backtrace depth

261.6.4 CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 261-5 *CURRENT_EDITION Function Parameters*

Parameter	Description
`dynamic_depth`	Depth in the error stack

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

261.6.5 CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (
   qualified_name    IN    UNIT_QUALIFIED_NAME)
 RETURN VARCHAR2;
```

Parameters

Table 261-6 *CONCATENATE_SUBPROGRAM Function Parameters*

Parameter	Description
`qualified_name`	A unit-qualified name

Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`

261.6.6 DYNAMIC_DEPTH Function

This function returns the number of subprograms on the call stack.

Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of subprograms on the call stack

261.6.7 ERROR_DEPTH Function

This function returns the number of errors on the error stack.

Syntax

```
UTL_CALL_STACK.ERROR_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of errors on the error stack

261.6.8 ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_MSG (
   error_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 261-7 *ERROR_MSG Function Parameters*

Parameter	Description
`error_depth`	Depth in the error stack

Return Values

The error message of the error at the specified error depth.

261.6.9 ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (
   error_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 261-8 *ERROR_NUMBER Function Parameters*

Parameter	Description
error_depth	Depth in the call stack

Return Values

The error number of the error at the specified error depth

261.6.10 LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 261-9 *LEXICAL_DEPTH Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

261.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.OWNER (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 261-10 *OWNER Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

261.6.12 UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.UNIT_LINE (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 261-11 *UNIT_LINE Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The line number of the unit of the subprogram at the specified dynamic depth

261.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN UNIT_QUALIFIED_NAME;
```

Parameters

Table 261-12 *SUBPROGRAM Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

262
UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms

262.1 Summary of UTL_COLL Subprograms

The UTL_COLL package has one subprogram, the IS_LOCATOR function.

Table 262-1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function	Determines whether a collection item is actually a locator or not

262.1.1 IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
   coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

Table 262-2 *IS_LOCATOR Function Parameters*

Parameter	Description
coln	Nested table or varray item.

Return Values

Table 262-3 IS_LOCATOR Function Return Values

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno  number,
  ph   list_t );
/

CREATE TABLE phone_book OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

263
UTL_COMPRESS

The UTL_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- Constants
- Exceptions
- Operational Notes
- Summary of UTL_COMPRESS Subprograms

263.1 UTL_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE   CONSTANT  PLS_INTEGER := 5;
```

263.2 UTL_COMPRESS Exceptions

This table describes exceptions raised by UTL_COMPRESS subprograms.

Table 263-1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

263.3 UTL_COMPRESS Operational Notes

Certain operational notes apply to UTL_COMPRESS.

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.
- A BFILE passed into LZ_COMPRESS* or lZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.

263.4 Summary of UTL_COMPRESS Subprograms

This table lists the UTL_COMPRESS subprograms and briefly describes them.

Table 263-2 *UTL_COMPRESS Package Subprograms*

Subprogram	Description
ISOPEN Function	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure	Adds a piece of compressed data
LZ_COMPRESS_CLOSE	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure	Closes and finishes the piecewise uncompress

263.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(
   handle in binary_integer)
 RETURN BOOLEAN;
```

Parameters

Table 263-3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
   UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
   UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

263.4.2 LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a `RAW` as input, compress it and return the compressed `RAW` result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
   src       IN           RAW,
   quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN RAW;
```

This function accept a `BLOB` as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src       IN           BLOB,
  quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN            BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN            BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary `BLOB` for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   quality IN            BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   dst     IN OUT NOCOPY BLOB,
   quality IN            BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 263-4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- quality is an optional compression tuning value. It allows the UTL_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

263.4.3 LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB,
   src    IN             RAW);
```

Parameters

Table 263-5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

Exceptions

- invalid_handle - out of range invalid or unopened handle.
- invalid_argument - NULL handle, src, dst, or invalid dst.

263.4.4 LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB);
```

Parameters

Table 263-6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise compress context.
`dst`	The opened LOB from `LZ_COMPRESS_OPEN` to store compressed data.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, `dst`, or invalid `dst`.

263.4.5 LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
   dst       IN OUT NOCOPY BLOB,
   quality   IN            BINARY_INTEGER DEFAULT 6)
 RETURN BINARY_INTEGER;
```

Parameters

Table 263-7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
`dst`	User supplied LOB to store compressed data.
`quality`	Speed versus efficiency of resulting compressed output. • Valid values are the range 1..9, with a default value of 6. • 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.

- `invalid_argument` - `NULL` `dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

263.4.6 LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a `RAW`, `BLOB` or `BFILE` compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or `BLOB` result.

Syntax

This function returns uncompressed data as `RAW`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  RAW)
  RETURN RAW;
```

This function returns uncompressed data as a temporary `BLOB`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB)
  RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`, which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB,
   dst  IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`. The original `dst` data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BFILE,
   dst  IN OUT NOCOPY BLOB);
```

Parameters

Table 263-8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
`src`	Compressed data.

Table 263-8 (Cont.) LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
dst	Destination for uncompressed data.

263.4.7 LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
   handle  IN          BINARY_INTEGER,
   dst     OUT NOCOPY  RAW);
```

Parameters

Table 263-9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

Exceptions

- no_data_found - finished uncompress.
- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.

263.4.8 LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
   src  IN  BLOB)
  RETURN BINARY_INTEGER;
```

Parameters

Table 263-10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - `NULL src`.

Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

263.4.9 LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
   handle  IN   BINARY_INTEGER);
```

Parameters

Table 263-11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - `NULL` handle.

264
UTL_ENCODE

The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts.

You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms

264.1 Summary of UTL_ENCODE Subprograms

This table lists the UTL_ENCODE subprograms and briefly describes them.

Table 264-1 ***UTL_ENCODE Package Subprograms***

Subprogram	Description
BASE64_DECODE Function	Reads the base 64-encoded RAW input string and decodes it to its original RAW value
BASE64_ENCODE Function	Encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string
MIMEHEADER_DECODE Function	Decodes a string from mime header format
MIMEHEADER_ENCODE Function	Encodes a string into mime header format
QUOTED_PRINTABLE_DECODE Function	Reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string
QUOTED_PRINTABLE_ENCODE Function	Reads the RAW input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function	Decodes a character set sensitive text string
TEXT_ENCODE Function	Encodes a character set sensitive text string
UUDECODE Function	Reads the RAW uuencode format input string and decodes it to the corresponding RAW string
UUENCODE Function	Reads the RAW input string and encodes it to the corresponding uuencode format string

264.1.1 BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 264-2 BASE64_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 264-3 BASE64_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

264.1.2 BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 264-4 BASE64_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 264-5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

264.1.3 MIMEHEADER_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
   buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
  RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 264-6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 264-7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

264.1.4 MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 264-8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 264-9 MIMEHEADER_ENCODE Function Return Values

Return	Description
`string`	A VARCHAR2 encoded string with mime header format tags.

264.1.5 QUOTED_PRINTABLE_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 264-10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
`r`	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 264-11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
`RAW`	The decoded string

264.1.6 QUOTED_PRINTABLE_ENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

Table 264-12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 264-13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

264.1.7 TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each `encoding` parameter. If `NULL`, quoted-printable is selected as a default decoding format. If `encode_charset` is not `NULL`, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 264-14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`.

Return Values

Table 264-15 TEXT_DECODE Function Return Values

Return	Description
`string`	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
     'Here is some text',
      WE8ISO8859P1,
      UTL_ENCODE.BASE64);
```

264.1.8 TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 264-16 TEXT_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 264-17 TEXT_ENCODE Function Return Values

Return	Description
`string`	A VARCHAR2 encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
   'Here is some text',
   'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

264.1.9 UUDECODE Function

This function reads the `RAW` uuencode format input string and decodes it to the corresponding `RAW` string.

See "UUENCODE Function" for discussion of the cumulative nature of `UUENCODE` and `UUDECODE` for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 264-18 UUDECODE Function Parameters

Parameter	Description
`r`	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 264-19 UUDECODE Function Return Values

Return	Description
`RAW`	The decoded `RAW` string

264.1.10 UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
   r          IN RAW,
   type       IN PLS_INTEGER DEFAULT 1,
   filename   IN VARCHAR2 DEFAULT NULL,
   permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 264-20 UUENCODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 264-21 UUENCODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

265
UTL_FILE

With the UTL_FILE package, PL/SQL programs can read and write operating system text files. UTL_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Exceptions
- Examples
- Data Structures
- Summary of UTL_FILE Subprograms

265.1 UTL_FILE Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in the operating system directory described by USER_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

> **Note:**
>
> Use the CREATE DIRECTORY feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

> **WARNING:**
>
> The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.

265.2 UTL_FILE Operational Notes

Keep these notes in mind when using UTL_FILE.

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators.

UTL_FILE expects that files opened by UTL_FILE.FOPEN in text mode are encoded in the database character set. It expects that files opened by UTL_FILE.FOPEN_NCHAR in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should therefore be the same as the database character set.

265.3 UTL_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

> **Note:**
>
> The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

265.4 UTL_FILE Exceptions

This table describes exceptions raised by UTL_FILE subprograms.

Table 265-1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN( ) is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: • ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or • ABSOLUTE_OFFSET < 0, or • Either offset caused a seek past the end of the file

Table 265-1 (Cont.) UTL_FILE Package Exceptions

Exception Name	Description
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

265.5 UTL_FILE Examples

These two examples show use of the procedure.

Example 1

> **Note:**
>
> The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user'';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths

File Location	Filename	Invalid Because
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults to
1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1);
  UTL_FILE.FCLOSE(F1);
END;
```

265.6 UTL_FILE Data Structures

The UTL_FILE package defines a RECORD type.

Record Types

- FILETYPE Record Type

265.6.1 FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
   id          BINARY_INTEGER,
   datatype    BINARY_INTEGER,
   byte_mode   BOOLEAN);
```

Fields

Table 265-2 FILE_TYPE Fields

Field	Description
`id`	A numeric value indicating the internal file handle number
`datatype`	Indicates whether the file is a `CHAR` file, `Nchar` file or other (binary)
`byte_mode`	Indicates whether the file was open as a binary file, or as a text file

> **Caution:**
>
> Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have inderterminate outcomes.

265.7 Summary of UTL_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

Table 265-3 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure	Closes a file
FCLOSE_ALL Procedure	Closes all open file handles
FCOPY Procedure	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure	Physically writes all pending output to a file
FGETATTR Procedure	Reads and returns the attributes of a disk file
FGETPOS Function	Returns the current relative offset position within a file, in bytes
FOPEN Function	Opens a file for input or output
FOPEN_NCHAR Function	Opens a file in Unicode for input or output
FREMOVE Procedure	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure	Renames an existing file to a new name, similar to the UNIX `mv` function
FSEEK Procedure	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure	Reads text from an open file
GET_LINE_NCHAR Procedure	Reads text in Unicode from an open file
GET_RAW Procedure	Reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function	Determines if a file handle refers to an open file

Table 265-3 (Cont.) UTL_FILE Subprograms

Subprogram	Description
NEW_LINE Procedure	Writes one or more operating system-specific line terminators to a file
PUT Procedure	Writes a string to a file
PUT_LINE Procedure	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure	Writes a Unicode line to a file
PUT_NCHAR Procedure	Writes a Unicode string to a file
PUTF Procedure	A PUT procedure with formatting
PUTF_NCHAR Procedure	A PUT_NCHAR procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Procedure	Accepts as input a RAW data value and writes the value to the output buffer

265.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
   file IN OUT FILE_TYPE);
```

Parameters

Table 265-4 FCLOSE Procedure Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

265.7.2 FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

> **Note:**
>
> FCLOSE_ALL does not alter the state of the open file handles held by the user. This means that an IS_OPEN test on a file handle after an FCLOSE_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE_ALL.

Exceptions

WRITE_ERROR

265.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the start_line and end_line parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
   src_location    IN VARCHAR2,
   src_filename    IN VARCHAR2,
   dest_location   IN VARCHAR2,
   dest_filename   IN VARCHAR2,
   start_line      IN BINARY_INTEGER DEFAULT 1,
   end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 265-5 FCOPY Procedure Parameters

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be copied
dest_location	Destination directory where the destination file is created
dest_filename	Destination file created from the source file
start_line	Line number at which to begin copying. The default is 1 for the first line
end_line	Line number at which to stop copying. The default is NULL, signifying end of file

Exceptions

INVALID_FILENAME

INVALID_PATH

INVALID_OPERATION

INVALID_OFFSET

READ_ERROR

WRITE_ERROR

265.7.4 FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
   file  IN FILE_TYPE);
```

Parameters

Table 265-6 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Exceptions

INVALID_FILENAME

INVALID_MAXLINESIZE

INVALID_OPERATION

WRITE_ERROR

265.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   fexists      OUT BOOLEAN,
   file_length  OUT NUMBER,
   block_size   OUT BINARY_INTEGER);
```

Parameters

Table 265-7 FGETATTR Procedure Parameters

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

Exceptions

INVALID_PATH

INVALID_FILENAME

INVALID_OPERATION

READ_ERROR

ACCESS_DENIED

265.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (
   file IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

Parameters

Table 265-8 FGETPOS Parameters

Parameters	Description
file	Directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

265.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also FOPEN_NCHAR Function.

Syntax

```
UTL_FILE.FOPEN (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
  RETURN FILE_TYPE;
```

Parameters

Table 265-9 FOPEN Function Parameters

Parameter	Description
`location`	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the `UTL_FILE` user to run `FOPEN`.
`filename`	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by `FOPEN`. On Unix, the filename cannot end with /.
`open_mode`	Specifies how the file is opened. Modes include: • `r` -- read text • `w` -- write text • `a` -- append text • `rb` -- read byte mode • `wb` -- write byte mode • `ab` -- append byte mode If you try to open a file specifying 'a' or 'ab' for `open_mode` but the file does not exist, the file is created in `write` mode.
`max_linesize`	Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

`FOPEN` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

Table 265-10 FOPEN Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

INVALID_MAXILINESIZE

INVALID_MODE

INVALID_OPERATION

INVALID_PATH

INVALID_FILENAME

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

265.7.8 FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 265-11 FOPEN_NCHAR Function Parameters

Parameter	Description
location	Directory location of file
filename	File name (including extension)

Table 265-11 (Cont.) FOPEN_NCHAR Function Parameters

Parameter	Description
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

Return Values

FOPEN_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 265-12 FOPEN_NCHAR Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

INVALID_MAXILINESIZE

INVALID_MODE

INVALID_OPERATION

INVALID_PATH

265.7.9 FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (
   location IN VARCHAR2,
   filename IN VARCHAR2);
```

Parameters

Table 265-13 FREMOVE Procedure Parameters

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

Exceptions

ACCESS_DENIED

DELETE_FAILED

INVALID_FILENAME

INVALID_OPERATION

INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

265.7.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

Syntax

```
UTL_FILE.FRENAME (
   src_location     IN   VARCHAR2,
   src_filename     IN   VARCHAR2,
   dest_location    IN   VARCHAR2,
   dest_filename    IN   VARCHAR2,
   overwrite        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 265-14 FRENAME Procedure Parameters

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be renamed
dest_location	Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
dest_filename	New name of the file
overwrite	Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.

Exceptions

ACCESS_DENIED

INVALID_FILENAME

INVALID_PATH

RENAME_FAILED

265.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
   file             IN OUT  UTL_FILE.FILE_TYPE,
   absolute_offset  IN      PL_INTEGER DEFAULT NULL,
   relative_offset  IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 265-15 FSEEK Procedure Parameters

Parameters	Description
`file`	File handle
`absolute_offset`	Absolute location to which to seek; default = `NULL`
`relative_offset`	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = `NULL`

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OFFSET`

`INVALID_OPERATION`

`READ_ERROR`

Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset` > 0, or backward, if `relative_offset` < 0, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

265.7.12 GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to

the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
   file        IN  FILE_TYPE,
   buffer      OUT VARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 265-16 GET_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call. The file must be open for reading (mode `r`); otherwise an `INVALID_OPERATION` exception is raised.
`buffer`	Data buffer to receive the line read from the file
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, Oracle supplies the value of `max_linesize`.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure".

265.7.13 GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also GET_LINE Procedure

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
   file        IN  FILE_TYPE,
   buffer      OUT NVARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 265-17 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

NO_DATA_FOUND

READ_ERROR

265.7.14 GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```
UTL_FILE.GET_RAW (
   file       IN            UTL_FILE.FILE_TYPE,
   buffer     OUT NOCOPY    RAW,
   len        IN            PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 265-18 GET_RAW Procedure Parameters

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`LENGTH_MISMATCH`

`NO_DATA_FOUND`

`READ_ERROR`

Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
      h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
      Buf   RAW(32767);
      Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
      LOOP
        BEGIN
          Utl_File.Get_Raw(h, Buf, Amnt);
          -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
      END LOOP;
      UTL_FILE.FCLOSE (h);
    END;
```

265.7.15 IS_OPEN Function

This function tests a file handle to see if it identifies an open file.

`IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (
   file  IN FILE_TYPE)
  RETURN BOOLEAN;
```

Parameters

Table 265-19 IS_OPEN Function Parameters

Parameter	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call

Return Values

`TRUE` or `FALSE`

Exceptions

INVALID_FILEHANDLE

265.7.16 NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
   file     IN FILE_TYPE,
   lines    IN BINARY_INTEGER := 1);
```

Parameters

Table 265-20 NEW_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call
lines	Number of line terminators to be written to the file

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

265.7.17 PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure".

Syntax

```
UTL_FILE.PUT (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2);
```

Parameters

Table 265-21 PUT Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

265.7.18 PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure".

Syntax

```
UTL_FILE.PUT_LINE (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 265-22 PUT_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call
buffer	Text buffer that contains the lines to be written to the file
autoflush	Flushes the buffer to disk after the WRITE

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

265.7.19 PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
   file    IN FILE_TYPE,
   buffer  IN NVARCHAR2);
```

Parameters

Table 265-23 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. The file must be open for writing.
`buffer`	Text buffer that contains the lines to be written to the file

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

265.7.20 PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

Syntax

```
UTL_FILE.PUT_NCHAR (
   file      IN FILE_TYPE,
   buffer    IN NVARCHAR2);
```

Parameters

Table 265-24 PUT_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Related Topics

- PUT Procedure
  PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

265.7.21 PUTF Procedure

This procedure is a formatted PUT procedure.

It works like a limited printf().

Syntax

```
UTL_FILE.PUTF (
   file    IN FILE_TYPE,
   format  IN VARCHAR2,
   [arg1   IN VARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 265-25 PUTF Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

Character Sequence	Meaning
%s	Substitute this sequence with the string value of the next argument in the argument list.
\n	Substitute with the appropriate platform-specific line terminator.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
                my_world,
                'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

Related Topics

- PUTF_NCHAR Procedure
  This procedure is a formatted version of a PUT_NCHAR Procedure.

265.7.22 PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure.

Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
   file    IN FILE_TYPE,
   format  IN NVARCHAR2,
   [arg1   IN NVARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 265-26 PUTF_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s

Table 265-26 (Cont.) PUTF_NCHAR Procedure Parameters

Parameters	Description
`arg1..arg5`	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

Related Topics

- PUT_NCHAR Procedure
  This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

265.7.23 PUT_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
   file          IN    UTL_FILE.FILE_TYPE,
   buffer        IN    RAW,
   autoflush     IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 265-27 PUT_RAW Procedure Parameters

Parameters	Description
`file`	File handle
`buffer`	The `RAW` data written to the buffer
`autoflush`	If `TRUE`, then performs a flush after writing the value to the output buffer; default is `FALSE`.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

266
UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

> **Note:**
>
> Oracle Wallet Manager (OWM) is deprecated with Oracle Database 21c. Please ensure your wallets are using the strongest protections available.
>
> Instead of using Oracle Wallet Manager, Oracle recommends that you use the command line tools `orapki` and `mkstore`.
>
> Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Exceptions
- Examples
- Data Structures
- Operations
- Subprogram Groups
- Summary of UTL_HTTP Subprograms

> **See Also:**
>
> - UTL_URL
> - UTL_SMTP
> - *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

266.1 UTL_HTTP Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. UTL_HTTP also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

266.2 UTL_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the use-client-certificates or the use-passwords privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

> **Note:**
>
> For more information about managing fine-grained access, see *Oracle Database Security Guide*

266.3 UTL_HTTP Constants

The UTL_HTTP package defines several constants to use when specifying parameter values.

These are shown in following tables.

- Table 266-1
- Table 266-2
- Table 266-3

Table 266-1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP/1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP/1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

Table 266-2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 266-3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.
HTTP_NON_AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.

Table 266-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent- driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.

Table 266-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_REQUEST_TIME_OUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined `Content-Length`.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY_TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.

Table 266-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

266.4 UTL_HTTP Exceptions

Exceptions indicate that the UTL_HTTP package encountered issues.

The following table lists these exceptions . By default, `UTL_HTTP` raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

Table 266-4 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when `detailed_exception` is enabled
BAD_URL	29262	The requested URL is badly formed	`BEGIN_REQUEST`, when `detailed_exception` is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	`READ_RAW`, `READ_TEXT`, and `READ_LINE`, when `detailed_exception` is enabled
HEADER_NOT_FOUND	29265	The header is not found	`GET_HEADER`, `GET_HEADER_BY_NAME`, when `detailed_exception` is enabled
HTTP_CLIENT_ERROR	29268	From `GET_RESPONSE`, the response status code indicates that a client error has occurred (status code in 4xx range). Or from `begin_request`, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	`GET_RESPONSE`, `BEGIN_REQUEST` when `detailed_exception` is enabled
HTTP_SERVER_ERROR	29269	From `GET_RESPONSE`, the response status code indicates that a client error has occurred (status code in 5xx range). Or from `begin_request`, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	`GET_RESPONSE`, `BEGIN_REQUEST` when `detailed_exception` is enabled

Table 266-4 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when detailed_exception is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

> **Note:**
>
> The partial_multibyte_char and transfer_timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_TCP.

For REQUEST and REQUEST_PIECES, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.

266.5 UTL_HTTP Examples

These five examples demonstrate how to use UTL_HTTP.

- General Usage

- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

266.5.1 UTL_HTTP General Usage

This is an general example of UTL_HTTP usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  LOOP
    UTL_HTTP.READ_LINE(resp, value, TRUE);
    DBMS_OUTPUT.PUT_LINE(value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    UTL_HTTP.END_RESPONSE(resp);
END;
```

266.5.2 UTL_HTTP Retrieving HTTP Response Headers

This example shows how UTL_HTTP retrieves HTTP response headers.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  name  VARCHAR2(256);
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
  DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

266.5.3 UTL_HTTP Handling HTTP Authentication

This code sample indicates how UTL_HTTP handles HTTP authentication.

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                      username IN VARCHAR2 DEFAULT NULL,
                                      password IN VARCHAR2 DEFAULT NULL,
                                      realm    IN VARCHAR2 DEFAULT NULL) AS
  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  name      VARCHAR2(256);
  value     VARCHAR2(256);
BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen.
Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
    DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
    DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
     for the proxy server.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
    DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
    DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
     for the Web page.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

266.5.4 UTL_HTTP Retrieving and Restoring Cookies

This example show how UTL_HTTP can be used to retrieve and restore cookies.

```
CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
```

```
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  my_session_id  PLS_INTEGER;
  secure         VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  cookie         UTL_HTTP.COOKIE;
  i              PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name     := r.name;
    cookie.value    := r.value;
    cookie.domain   := r.domain;
    cookie.expire   := r.expire;
    cookie.path     := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

266.5.5 UTL_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```
SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req             UTL_HTTP.REQ;
  resp            UTL_HTTP.RESP;
  data            VARCHAR2(1024);

BEGIN

  -- Create a request context with its wallet and cookie table
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
                       wallet_path          => 'file:/oracle/wallets/test/wallet',
                       wallet_password      => '******',
                       enable_cookies       => TRUE,
                       max_cookies          => 300,
                       max_cookies_per_site => 20);

  -- Make a HTTP request using the private wallet and cookie
  -- table in the request context
  req := UTL_HTTP.BEGIN_REQUEST(
           url             => url,
           request_context => request_context);
  resp := UTL_HTTP.GET_RESPONSE(req);

  BEGIN
    LOOP
       UTL_HTTP.READ_TEXT(resp, data);
       DBMS_OUTPUT.PUT(data);
    END LOOP;
  EXCEPTION
      WHEN UTL_HTTP.END_OF_BODY THEN
         UTL_HTTP.END_RESPONSE(resp);
  END;

  -- Destroy the request context
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
  DISPLAY_PAGE('https://www.example.com/');
END;
/
```

266.6 UTL_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- REQ Type

- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type
- REQUEST_CONTEXT_KEY Type

266.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
   url           VARCHAR2(32767),
   method        VARCHAR2(64),
   http_version  VARCHAR2(64));
```

Parameters

Table 266-5 REQ Type Parameters

Parameter	Description
`url`	The URL of the HTTP request. It is set after the request is created by `BEGIN_REQUEST`.
`method`	The method to be performed on the resource identified by the URL. It is set after the request is created by `BEGIN_REQUEST`.
`http_version`	The HTTP protocol version used to send the request. It is set after the request is created by `BEGIN_REQUEST`.

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

266.6.2 REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, UTL_HTTP allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

266.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
   status_code    PLS_INTEGER,
   reason_phrase  VARCHAR2(256),
   http_version   VARCHAR2(64));
```

Parameters

Table 266-6 RESP Type Parameters

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

266.6.4 COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
   name  VARCHAR2(256),
   value  VARCHAR2(1024),
   domain  VARCHAR2(256),
   expire  TIMESTAMP WITH TIME ZONE,
```

```
   path  VARCHAR2(1024),
   secure  BOOLEAN,
   version  PLS_INTEGER,
   comment  VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 266-7 shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

Table 266-7 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
`name`	The name of the HTTP cookie
`value`	The value of the cookie
`domain`	The domain for which the cookie is valid
`expire`	The time by which the cookie will expire
`path`	The subset of URLs to which the cookie applies
`secure`	Should the cookie be returned to the Web server using secured means only.
`version`	The version of the HTTP cookie specification the cookie conforms. This field is `NULL` for Netscape cookies.
`comment`	The comment that describes the intended use of the cookie. This field is `NULL` for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies".

266.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was

previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `SSL` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
   host  VARCHAR2(256),
   port  PLS_INTEGER,
   proxy_host  VARCHAR2(256),
   proxy_port  PLS_INTEGER,
   ssl  BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

266.7 UTL_HTTP Operations

These topics provide information about how `UTL_HTTP` makes HTTP requests from SQL and PL/SQL.

- Operational Flow
- Simple HTTP Fetches
- HTTP Requests
- HTTP Responses
- HTTP Persistent Connections
- Error Conditions
- Session Settings
- Request Context
- External Password Store

266.7.1 UTL_HTTP Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 266-1 Flow of the Core UTL_HTTP Package

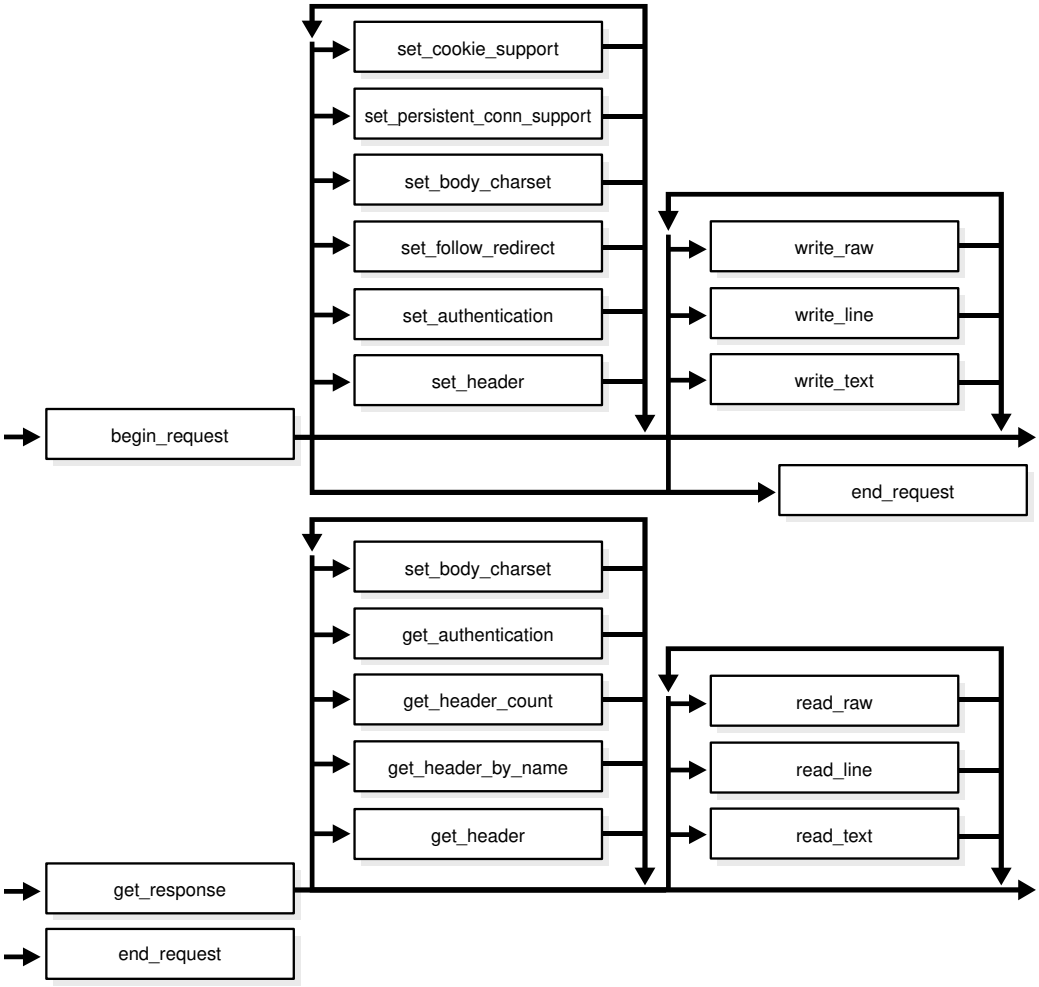

illustration: arpls006
release: 9
caption: The flow of the core UTL_HTTP Package API
date: 9/5/01
platform: pc

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET_COOKIE_COUNT
  - GET_COOKIES
  - ADD_COOKIES
  - CLEAR_COOKIES
- Persistent connections
  - GET_PERSISTENT_CONN_COUNT
  - GET_PERSISTENT_CONNS
  - CLOSE_PERSISTENT_CONN
  - CLOSE_PERSISTENT_CONNS
- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

> **Note:**
>
> Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

266.7.2 UTL_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

> **Note:**
>
> `UTL_HTTP` can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the `UTL_HTTP` package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

> **See Also:**
>
> Simple HTTP Fetches in a Single Call Subprograms

266.7.3 UTL_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

> **See Also:**
>
> HTTP Requests Subprograms

266.7.4 UTL_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

> **See Also:**
>
> HTTP Responses Subprograms

266.7.5 UTL_HTTP HTTP Cookies

The `UTL_HTTP` package provides subprograms to manipulate HTTP cookies.

> **See Also:**
>
> HTTP Cookies Subprograms

266.7.6 UTL_HTTP HTTP Persistent Connections

The `UTL_HTTP` package provides subprograms to manipulate persistent connections.

> **See Also:**
>
> HTTP Persistent Connections Subprograms

266.7.7 UTL_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

> **See Also:**
>
> Error Conditions Subprograms

266.7.8 UTL_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

> **See Also:**
>
> Session Settings Subprograms

266.7.9 UTL_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

> **See Also:**
>
> HTTP Requests Subprograms

266.7.10 UTL_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

> **See Also:**
>
> SET_AUTHENTICATION_FROM_WALLET Procedure

266.8 UTL_HTTP Subprogram Groups

This section describes the UTL_HTTP subprograms. They are grouped by function.

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms

266.8.1 UTL_HTTP Simple HTTP Fetches in a Single Call Subprograms

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 266-8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

266.8.2 UTL_HTTP Session Settings Subprograms

This table lists and briefly describes the UTL_HTTP Session Settings Subprograms.

Table 266-9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the UTL_HTTP package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value

Table 266-9 (Cont.) UTL_HTTP Subprograms—Session Settings

Subprogram	Description
SET_TRANSFER_TIMEOUT Procedure	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the `UTL_HTTP` package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function
SET_PERSISTENT_CONN_SUPPORT Procedure	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

266.8.3 UTL_HTTP HTTP Requests Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Requests.

Table 266-10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function	Begins a new HTTP request.`UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request

Table 266-10 (Cont.) UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)
WRITE_RAW Procedure	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure	Writes some text data in the HTTP request body

266.8.4 UTL_HTTP HTTP Request Contexts Subprograms

UTL_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL_HTTP HTTP Request Contexts.

Table 266-11 UTL_HTTP Subprograms—HTTP Request Contexts

Subprogram	Description
CREATE_REQUEST_CONTEXT Function	Creates a request context in UTL_HTTP for a wallet and a cookie table
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in UTL_HTTP

266.8.5 UTL_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL_HTTP.

Table 266-12 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure	Returns the nth HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.

Table 266-12 (Cont.) UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header

266.8.6 UTL_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

Table 266-13 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure	Add the cookies either to a request context or to the `UTL_HTTP` package's session state
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state
GET_COOKIE_COUNT Function	Returns the number of cookies maintained either in a request context or in the `UTL_HTTP` package's session states
GET_COOKIES Function	Returns all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

266.8.7 UTL_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

Table 266-14 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session
CLOSE_PERSISTENT_CONNS Procedure	Closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session
GET_PERSISTENT_CONN_COUNT Function	Returns the number of network connections currently kept persistent by the `UTL_HTTP` package to the Web servers
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers

266.8.8 UTL_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of `UTL_HTTP` .

Table 266-15 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function	Retrieves the detailed SQLERRM of the last exception raised

266.9 Summary of UTL_HTTP Subprograms

This table lists the `UTL_HTTP` subprograms and briefly describes them.

Table 266-16 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure	Add the cookies either to a request context or to the UTL_HTTP package's session state	HTTP Cookies Subprograms
BEGIN_REQUEST Function	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	HTTP Cookies Subprograms
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms
CLOSE_PERSISTENT_CONNS Procedure	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms
CREATE_REQUEST_CONTEXT Function	Creates a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms
END_REQUEST Procedure	Ends the HTTP request	HTTP Requests Subprograms
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms

Table 266-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms
GET_COOKIE_COUNT Function	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings	Session Settings Subprograms
GET_COOKIES Function	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms
GET_DETAILED_SQLCODE Function	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms
GET_DETAILED_SQLERRM Function	Retrieves the detailed SQLERRM of the last exception raised	Error Conditions Subprograms
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms
GET_HEADER Procedure	Returns the nth HTTP response header name and value returned in the response	HTTP Responses Subprograms
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response	HTTP Responses and HTTP Responses Subprograms
GET_PERSISTENT_CONN_COUNT Function	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms
GET_HEADER_COUNT Function	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms

Table 266-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_PERSISTENT_CONN_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms)	HTTP Persistent Connections Subprograms
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms
GET_PROXY Procedure	Retrieves the current proxy settings	Session Settings Subprograms
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or no	Session Settings Subprograms
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value	Session Settings Subprograms
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	HTTP Requests Subprograms

Table 266-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_BODY_CHARSET Procedures	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header	Session Settings Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header	HTTP Requests Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header	HTTP Responses Subprograms and Session Settings Subprograms
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the `UTL_HTTP` package to raise a detailed exception	Session Settings Subprograms
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the `GET_RESPONSE` function	HTTP Requests Subprograms
SET_HEADER Procedure	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function	Session Settings Subprograms
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings and Session Settings Subprograms

Table 266-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings and Session Settings Subprograms
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms
WRITE_LINE Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms
WRITE_RAW Procedure	Writes some binary data in the HTTP request body	HTTP Requests Subprograms
WRITE_TEXT Procedure	Writes some text data in the HTTP request body	HTTP Requests Subprograms

266.9.1 ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.ADD_COOKIES (
   cookies          IN  cookie_table,
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 266-17 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

266.9.2 BEGIN_REQUEST Function

This function begins a new HTTP request. `UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
   url               IN  VARCHAR2,
   method            IN  VARCHAR2 DEFAULT 'GET',
   http_version      IN  VARCHAR2 DEFAULT NULL,
   request_context   IN  request_context_key DEFAULT NULL,
   https_host        IN  VARCHAR2 DEFAULT NULL)
RETURN req;
```

Parameters

Table 266-18 BEGIN_REQUEST Function Parameters

Parameter	Description
`url`	The URL of the HTTP request
`method`	The method performed on the resource identified by the URL
`http_version`	The HTTP protocol version that sends the request. The format of the protocol version is `HTTP/major-version.minor-version`, where `major-version` and `minor-version` are positive numbers. If this parameter is set to `NULL`, `UTL_HTTP` uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is `NULL`.
`request_context`	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is `NULL`, the wallet and cookie table shared in the current database session will be used instead.

Table 266-18 (Cont.) BEGIN_REQUEST Function Parameters

Parameter	Description
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See UTL_URL for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the GET_RESPONSE Function will raise the PROTOCOL_ERROR exception.

  A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      =>  req,
                     name   =>  'Content-Type',
                     value  =>  'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      =>   req,
                     name   =>   'Content-Length',
                     value  =>'  <length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      =>   req,
                     data   =>   'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
                     (r     =>   req);
...
```

  The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.
- An Oracle wallet must be set before accessing Web servers over HTTPS. See the SET_WALLET Procedure procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the use-client-certificates privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.

- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

266.9.3 CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.CLEAR_COOKIES (
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 266-19 CLEAR_COOKIES Procedure Parameters

Parameter	Description
`request_context`	Request context to clear the cookies. If `NULL`, the cookies maintained in the `UTL_HTTP` package's session state will be cleared instead.

266.9.4 CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
   conn  IN connection);
```

Parameters

Table 266-20 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
conn	The HTTP persistent connection to close

266.9.5 CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 266-21 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed

Table 266-21 (Cont.) CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`port`	The port number for which persistent connections are to be closed
`proxy_host`	The proxy host for which persistent connections are to be closed
`proxy_port`	The proxy port for which persistent connections are to be closed
`ssl`	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

266.9.6 CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

> **See Also:**
>
> Request Context and HTTP Request Contexts Subprograms

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path          IN VARCHAR2 DEFAULT NULL,
 wallet_password      IN VARCHAR2 DEFAULT NULL,
 enable_cookies       IN BOOLEAN  DEFAULT TRUE,
 max_cookies          IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

Parameters

Table 266-22 CREATE_REQUEST_CONTEXT Function Parameters

Parameter	Description
wallet_path	Directory path that contains the Oracle wallet. The format is file:*directory-path*
wallet_password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the *Oracle Database Enterprise User Security Administrator's Guide* for detailed information about wallets.
enable_cookies	Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.
max_cookies	Sets the maximum total number of cookies that will be maintained in this request context
max_cookies_per_site	Sets the maximum number of cookies per each Web site that will be maintained in this request context

Return Values

The request context created.

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
  req              utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
       wallet_path          => 'file:/oracle/wallets/test_wallets',
       wallet_password      => NULL,
       enable_cookies       => TRUE,
       max_cookies          => 300,
       max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
       url                  => 'http://www.example.com/',
       request_context      => request_context);
END;
```

266.9.7 DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

> **See Also:**
>
> Request Context and HTTP Request Contexts Subprograms

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
   request_context    request_context_key);
```

Parameters

Table 266-23 DESTROY_REQUEST_CONTEXT Procedure Parameters

Parameter	Description
request_context	Request context to destroy

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(…);
  …
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

266.9.8 END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.END_REQUEST (
   r  IN OUT NOCOPY req);
```

Parameters

Table 266-24 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

266.9.9 END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.END_RESPONSE (
   r  IN OUT NOCOPY resp);
```

Parameters

Table 266-25 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

266.9.10 GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
   r          IN OUT NOCOPY resp,
   scheme     OUT VARCHAR2,
   realm      OUT VARCHAR2,
   for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 266-26 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication

Table 266-26 (Cont.) GET_AUTHENTICATION Procedure Parameters

Parameter	Description
`realm`	The realm for the required HTTP authentication
`for_proxy`	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

266.9.11 GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
   charset  OUT NOCOPY VARCHAR2);
```

Parameters

Table 266-27 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
`charset`	The default character set of the body of all future HTTP requests

266.9.12 GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
   request_context  IN  request_context_key DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 266-28 GET_COOKIE_COUNT Function Parameters

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

266.9.13 GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
   enable               OUT BOOLEAN,
   max_cookies          OUT PLS_INTEGER,
   max_cookies_per_site  OUT PLS_INTEGER);
```

Parameters

Table 266-29 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
enable	Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)

Table 266-29 (Cont.) GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`max_cookies`	Indicates the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Indicates the maximum number of cookies maintained in the current session for each Web site

266.9.14 GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.GET_COOKIES (
   cookies          IN  OUT NOCOPY cookie_table,
   request_context  IN             request_context_key DEFAULT NULL);
```

Parameters

Table 266-30 GET_COOKIES Function Parameters

Parameter	Description
`cookies`	The cookies returned
`request_context`	Request context to return the cookies for. If `NULL`, the cookies maintained in the `UTL_HTTP` package's session state will be returned instead.

266.9.15 GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the `UTL_HTTP` package will raise a detailed exception or not.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable  OUT BOOLEAN);
```

Parameters

Table 266-31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

266.9.16 GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

> **See Also:**
>
> Error Conditions andError Conditions Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

266.9.17 GET_DETAILED_SQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

> **See Also:**
>
> Error Conditions and Error Conditions Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

266.9.18 GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
   max_redirects  OUT PLS_INTEGER);
```

Parameters

Table 266-32 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
`max_redirects`	The maximum number of redirections for all future HTTP requests

266.9.19 GET_HEADER Procedure

This procedure returns the nth HTTP response header name and value returned in the response.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER (
   r      IN OUT NOCOPY resp,
   n      IN PLS_INTEGER,
   name   OUT NOCOPY VARCHAR2,
   value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 266-33 GET_HEADER Procedure Parameters

Parameter	Description
`r`	The HTTP response
`n`	The nth header to return
`name`	The name of the HTTP response header
`value`	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

266.9.20 GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 266-34 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The nth occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

266.9.21 GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
   r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

Table 266-35 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

266.9.22 GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

266.9.23 GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

Table 266-36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	TRUE if persistent connection support is enabled; otherwise FALSE
`max_conns`	the maximum number of persistent connections maintained in the current session

266.9.24 GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.get_persistent_conns (
   connections  IN OUT NOCOPY connection_table);
```

Parameters

Table 266-37 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`connections`	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

266.9.25 GET_PROXY Procedure

This procedure retrieves the current proxy settings.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_PROXY (
   proxy             OUT NOCOPY VARCHAR2,
   no_proxy_domains  OUT NOCOPY VARCHAR2);
```

Parameters

Table 266-38 GET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) currently used by the UTL_HTTP package
`no_proxy_domains`	The list of hosts and domains for which no proxy is used for all requests

266.9.26 GET_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_RESPONSE (
   r                        IN OUT NOCOPY req,
```

```
   return_info_response    IN BOOLEAN DEFAULT FALSE)
RETURN resp;
```

Parameters

Table 266-39 GET_RESPONSE Function Parameters

Parameter	Description
r	The HTTP response
return_info_response	Return 100 informational response or not. • TRUE means get_response should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned. • FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.

Exceptions

- When detailed-exception is disabled:

  ORA-29273 REQUEST_FAILED - the request fails to execute. Use the GET_DETAILED_EXCP_SUPPORT Procedure and the GET_DETAILED_SQLERRM Function to get the detailed error message.

- When detailed-exception is enabled:

  ORA-29261 BAD_ARGUMENT - some arguments passed are not valid

- When response error check is enabled:

  ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range

  ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the END_REQUEST Procedure.
- If URL redirection occurs, the URL and method fields in the req record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to GET_RESPONSE to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to GET_RESPONSE to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional EXPECT: 100-CONTINUE request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```
DECLARE
 data  VARCHAR2(1024) := '...';
 req   utl_http.req;
 resp  utl_http.resp;
BEGIN

 req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
 utl_http.set_header(req, 'Content-Length', length(data));
 -- Ask HTTP server to return "100 Continue" response
 utl_http.set_header(req, 'Expect', '100-continue');
 resp := utl_http.get_response(req, TRUE);

 -- Check for and dispose "100 Continue" response
 IF (resp.status_code <> 100) THEN
   utl_http.end_response(resp);
   raise_application_error(20000, 'Request rejected');
 END IF;
 utl_http.end_response(resp);

 -- Now, send the request body
 utl_http.write_text(req, data);

 -- Get the regular response
 resp := utl_http.get_response(req);
 utl_http.read_text(resp, data);

 utl_http.end_response(resp);

END;
```

266.9.27 GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
   enable  OUT BOOLEAN);
```

Parameters

Table 266-40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

266.9.28 GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
   timeout  OUT PLS_INTEGER);
```

Parameters

Table 266-41 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

266.9.29 READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_LINE(
   r            IN OUT NOCOPY resp,
   data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
   remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 266-42 READ_LINE Procedure Parameters

Parameter	Description
r	The HTTP response

Table 266-42 (Cont.) READ_LINE Procedure Parameters

Parameter	Description
`data`	The HTTP response body in text form
`remove_crlf`	Removes the newline characters if set to `TRUE`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

266.9.30 READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_RAW(
   r      IN OUT NOCOPY resp,
```

```
   data  OUT NOCOPY RAW,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 266-43 READ_RAW Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_raw waits for each data packet to be ready to read until timeout occurs. If it occurs, read_raw stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

266.9.31 READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The end_of_body exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_TEXT(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 266-44 READ_TEXT Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in text form
len	The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL.

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_text waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_text stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.

266.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:**
>
> Simple HTTP Fetches and Simple HTTP Fetches in a Single Call Subprograms

Syntax

```
UTL_HTTP.REQUEST (
   url              IN VARCHAR2,
   proxy            IN VARCHAR2 DEFAULT NULL,
   wallet_path      IN VARCHAR2 DEFAULT NULL,
   wallet_password  IN VARCHAR2 DEFAULT NULL,
   https_host       IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 266-45 REQUEST Function Parameters

Parameter	Description
`url`	Uniform resource locator
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of `wallet_path` on a PC is, for example, file:`c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets` When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet
`https_host`	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com')
FROM DUAL;
```

266.9.33 REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:**
>
> Simple HTTP Fetches and Simple HTTP Fetches in a Single Call Subprograms

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
   url             IN VARCHAR2,
   max_pieces      IN NATURAL DEFAULT 32767,
   proxy           IN VARCHAR2 DEFAULT NULL,
   wallet_path     IN VARCHAR2 DEFAULT NULL,
   wallet_password IN VARCHAR2 DEFAULT NULL,
   https_host      IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-46 REQUEST_PIECES Function Parameters

Parameter	Description
`url`	Uniform resource locator
`max_pieces`	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.

Table 266-46 (Cont.) REQUEST_PIECES Function Parameters

Parameter	Description
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles*username*\WALLETS, and in Unix is, for example, file:/home/*username*/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
   x   UTL_HTTP.HTML_PIECES;
   len PLS_INTEGER;
BEGIN
   x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
   DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
   DBMS_OUTPUT.PUT_LINE('with total length ');
   IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
  ELSE
   len := 0;
   FOR i in 1..x.count LOOP
      len := len + length(x(i));
   END LOOP;
   DBMS_OUTPUT.PUT_LINE(len);
  END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

266.9.34 SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
   r         IN OUT NOCOPY req,
```

```
   username  IN VARCHAR2,
   password  IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 266-47 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	HTTP request
username	Username for the HTTP authentication
password	Password for the HTTP authentication
scheme	HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

266.9.35 SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

> **See Also:**
>
> External Password Store on , and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
   r         IN OUT NOCOPY req,
   alias     IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 266-48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
r	The HTTP request

Table 266-48 (Cont.) SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore –wrl /oracle/wallets/test_wallet –createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl         => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
      acl          => 'wallet-acl.xml',
      wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req  UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(…);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  …
END;
```

266.9.36 SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

> **See Also:**
>
> - HTTP Responses and HTTP Responses Subprograms
> - Session Settings and Session Settings Subprograms

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "`ISO-8859-1`". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY req,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY resp,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 266-49 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
r	The HTTP response.
charset	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.

266.9.37 SET_COOKIE_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

> **See Also:**
>
> - HTTP Requests andHTTP Requests Subprograms
> - Session Settings and Session Settings Subprograms

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
   r       IN OUT NOCOPY REQ,
   enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
   enable       IN BOOLEAN,
   max_cookies  IN PLS_INTEGER DEFAULT 300,
   max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 266-50 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session

Table 266-50 (Cont.) SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`max_cookies_per_site`	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

266.9.38 SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLEERM` for more detailed information about the error.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 266-51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

266.9.39 SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

> **See Also:**
>
> - HTTP Requests and HTTP Requests Subprograms
> - Session Settings and Session Settings Subprograms

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
   r              IN OUT NOCOPY req,
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 266-52 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If max_redirects is set to a positive number, the GET_RESPONSE Function will automatically follow the redirected URL for the HTTP response status code 301, 302, and

307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

`The SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

266.9.40 SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.SET_HEADER (
   r      IN OUT NOCOPY req,
   name   IN VARCHAR2,
   value  IN VARCHAR2);
```

Parameters

Table 266-53 SET_HEADER Procedure Parameters

Parameter	Description
`r`	The HTTP request
`name`	The name of the HTTP request header
`value`	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the Transfer-Encoding header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW procedures`. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

266.9.41 SET_PERSISTENT_CONN_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   enable      IN BOOLEAN DEFAULT FALSE,
   max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   r           IN OUT NOCOPY req,
   enable      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 266-54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` to keep the network connection persistent. `FALSE` otherwise.
maximum_conns	Maximum number of connections
`r`	The HTTP request

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the

HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in `UTL_HTTP` may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the maximum_conns parameter prior to calling the BEGIN_REQUEST Function, otherwise persistent connections will not be enabled for the current request even if the other form of `SET_PERSISTENT_CONN_SUPPORT` is called.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
  pieces utl_http.html_pieces;
  conns  utl_http.connection_table;
BEGIN

  -- Turns on persistent connection support for the request_pieces call.
  utl_http.set_persistent_conn_support(true, 1);

  FOR i IN 1..10 LOOP

    pieces := utl_http.request_pieces('http://www.example.com/');

    -- Shows the active persistent connection
    utl_http.get_persistent_conns(conns);
    FOR j IN 1..conns.count LOOP
       dbms_output.put_line('Persistent connection '||j||': '||
conns(j).host||':'||conns(j).port);
    END LOOP;

  END LOOP;
```

```
  -- Turns off persistent connection support. Set active max persistent connection to
0 to close all active connections.
  utl_http.set_persistent_conn_support(false, 0);

END;
/
```

Using SET_PERSISTENT_CONN_SUPPORT in HTTP requets showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```
DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
  req  UTL_HTTP.REQ;
  resp UTL_HTTP.RESP;
  data VARCHAR2(1024);

BEGIN

  -- Set the proxy server
  UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

  FOR i IN 1..paths.count LOOP

    req := UTL_HTTP.BEGIN_REQUEST(paths(i));

    -- Use persistent connections except for the last request
    IF (i < paths.count) THEN
      -- Use a persistent connection for the current request
      UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
    END IF;

    resp := UTL_HTTP.GET_RESPONSE(req);

    -- Display the results of the response
    DBMS_OUTPUT.PUT_LINE('-');
    DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
    DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code:   ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Version:       ' || resp.http_version);

    BEGIN
      LOOP
        UTL_HTTP.READ_TEXT(resp, data);
        -- do something with the data
      END LOOP;
    EXCEPTION
      WHEN UTL_HTTP.END_OF_BODY THEN
        NULL;
    END;
    UTL_HTTP.END_RESPONSE(resp);
  END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent connections
```

```
-- off
   UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

   -- Create a list of URLs
   paths(1) := 'http://www.example.com/technetwork/index.html';
   paths(2) := 'http://www.example.com/us/products/index.html';

   fetch_pages(paths);
 END;
/
```

266.9.42 SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.SET_PROXY (
   proxy             IN VARCHAR2,
   no_proxy_domains  IN VARCHAR2);
```

Parameters

Table 266-55 SET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) to be used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com, eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

266.9.43 SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 266-56 SET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
`enable`	`TRUE` to check for response errors; otherwise `FALSE`

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

266.9.44 SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
   timeout  IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 266-57 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

266.9.45 SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

> **See Also:**
>
> - Session Settings and Session Settings Subprograms
> - *Oracle Database Security Guide* managing fine-grained access

Syntax

```
UTL_HTTP.SET_WALLET (
   path      IN VARCHAR2,
   password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 266-58 SET_WALLET Procedure Parameters

Parameter	Description
`path`	The directory path that contains the Oracle wallet. The format is `file:`*`directory-path`*. The format of wallet_path on a PC is, for example, `file:c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets`. When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
`password`	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to `NULL`. See *Oracle Database Advanced Security Guide* for information about using Oracle Wallet Manager and the `ORAPKI` utility to create an auto-login wallet.

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

> **See Also:**
>
> *Oracle Database Advanced Security Guide* for more information on Wallet Manager

266.9.46 WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.WRITE_LINE(
   r     IN OUT NOCOPY req,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 266-59 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

266.9.47 WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.WRITE_RAW(
   r     IN OUT NOCOPY REQ,
   data  IN            RAW);
```

Parameters

Table 266-60 WRITE_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

266.9.48 WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.WRITE_TEXT(
   r     IN OUT NOCOPY REQ,
   data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 266-61 WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

267
UTL_I18N

`UTL_I18N` is a set of services that provides additional globalization functionality for applications written in PL/SQL.

> **See Also:**
>
> *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of UTL_I18N Subprograms

267.1 UTL_I18N Overview

`UTL_I18N` services provide additional globalization functionality for applications written in PL/SQL.

The `UTL_I18N` PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

267.2 UTL_I18N Security Model

The functions of the UTL_I18N package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to PUBLIC by default

267.3 UTL_I18N Constants

UTL_I18N defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 267-1 UTL_I18N Constants

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with shift_status. Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2(30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2(30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2(30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2(30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Table 267-1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
HWKATAKANA_FWKATAKANA	VARCHAR2(30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2(30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_HWKATAKANA	VARCHAR2(30)	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.

267.4 Summary of UTL_I18N Subprograms

This table lists the UTL_I18N subprograms and briefly describes them.

Table 267-2 UTL_I18N Package Subprograms

Procedure	Description
ESCAPE_REFERENCE Function	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function	Returns the default ISO 4217 currency code for the specified territory.
GET_DEFAULT_LINGUISTIC_SORT Function	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function	Returns the local time zone IDs for the specified territory.
GET_MAX_CHARACTER_SIZE Function	Returns the maximum character size of a given character set.
GET_TRANSLATION Function	Returns the translation of the language and territory name in the specified translation language.

Table 267-2 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
MAP_CHARSET Function	• Maps an Oracle character set name to an IANA character set name. • Maps an IANA character set name to an Oracle character set name. • Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
RAW_TO_NCHAR Functions	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
STRING_TO_RAW Function	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.
TRANSLITERATE Function	Transliterates between Japanese hiragana and katakana.
UNESCAPE_REFERENCE Function	Converts an input string that contains character references to a text string.
VALIDATE_CHARACTER_ENCODING Function	Validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data.

267.4.1 ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str             IN VARCHAR2 CHARACTER SET ANY_CS,
```

```
   page_cs_name   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 267-3 ESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string
`page_cs_name`	Specifies the character set of the document. If `page_cs_name` is `NULL`, then the database character set is used for `CHAR` data and the national character set is used for `NCHAR` data.

Usage Notes

If the user specifies an invalid character set or a `NULL` string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns `'hello < å'`.

267.4.2 GET_COMMON_TIME_ZONES Function

This function returns a listing of the most coemmonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
 RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
BEGIN
   retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

267.4.3 GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

> **See Also:**
>
> "MAP_CHARSET Function" for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
   language  IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   iswindows IN BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 267-4 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT | MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

267.4.4 GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 267-5 GET_DEFAULT_ISO_CURRENCY Function Parameters

Parameter	Description
`territory`	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
   retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

267.4.5 GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 267-6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
  SELECT value INTO retval FROM nls_database_parameters
   WHERE parameter = 'NLS_LANGUAGE';
   retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

267.4.6 GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 267-7 GET_LOCAL_LANGUAGES Function Parameters

Parameter	Description
`territory`	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt    INTEGER;
BEGIN
   retval   :=  UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
   cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
   END LOOP;
END;
/
...
Count = 2
```

```
DUTCH
FRENCH
```

267.4.7 GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 267-8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the local linguistic sort names for `JAPANESE`.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
  retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
  DBMS_OUTPUT.PUT('Count = ');
  DBMS_OUTPUT.PUT_LINE(retval.COUNT);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

267.4.8 GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN STRING_ARRAY;
```

Parameters

Table 267-9 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
   retval  UTL_I18N.STRING_ARRAY;
   cnt     INTEGER;
BEGIN
   retval  := UTL_I18N.GET_LCOAL_TERRITORIIES('GERMAN');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt));
   END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

267.4.9 GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
   territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 267-10 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
`territory`	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

Examples

Creates a function that returns the list of time zones locally used in the territory `AZERBAIJAN` followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
  retval  utl_i18n.string_array;
  retval2 utl_i18n.string_array;
  stpos   INTEGER;
BEGIN
  retval  := utl_i18n.get_local_time_zones(
    territory);
  retval2 := utl_i18n.get_common_time_zones;
  stpos := retval.LAST + 1;
  retval(stpos) := '-----'; -- a separator
  FOR i IN retval2.FIRST..retval2.LAST LOOP
    stpos := stpos + 1;
    retval(stpos) := retval2(i);
  END LOOP;
  RETURN retval;
END;
/
```

Returns the list of local time zones for `AZERBAIJAN` followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
   DBMS_OUTPUT.ENABLE(100000);
   retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
   cnt := retval.FIRST;
  WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
  END LOOP;
END;
/

Asia/Baku
-----
```

```
Pacific/Pago_Pago

...
```

267.4.10 GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name       IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 267-11 GET_MAX_CHARACTER_SIZE Function Parameters

Parameter	Description
`charset_name`	Specifies a valid character set name. It is case-insensitive.

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

267.4.11 GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
   parameter        IN VARCHAR2 CHARACTER SET ANY_CS,
   trans_language   IN VARCHAR2 'AMERICAN',
   flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 267-12 GET_TRANSLATION Function Parameters

Parameter	Description
`parameter`	Specifies a valid language name, territory name, or a combined string in the form of *`language_territory`*. It is case-insensitive.
`trans_language`	Specifies a translation language name. For example, `ITALIAN` is for the Italian language. The default is `AMERICAN`, which indicates American English.
`flag`	Specifies the translation type: • `LANGUAGE_TRANS`: The function returns the language translation. • `TERRITORY_TRANS`: The function returns the territory translation. • `LANGUAGE_TERRITORY_TRANS`: The function returns the language and territory translation. The default translation type is `LANGUAGE_TRANS`.

Usage Notes

If `VARCHAR2` is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using `NVARCHAR2` as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide `GUJARATI` translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
   CURSOR c1 IS
     SELECT value FROM V$NLS_VALID_VALUES
     WHERE parameter = 'LANGUAGE'
  ORDER BY value;
  retval NVARCHAR2(100);
BEGIN
   FOR item IN c1 LOOP
     retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
   END LOOP;
END;
```

267.4.12 MAP_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET(
   charset   IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 267-13 MAP_CHARSET Function Parameters

Parameter	Description
`charset`	Specifies the character set name to be mapped. The mapping is case-insensitive.
`context`	`GENERIC_CONTEXT	MAIL_CONTEXT` `GENERIC_CONTEXT`: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. `MAIL_CONTEXT`: The mapping is between an Oracle character set name and an email safe character set name.
`flag`	• `ORACLE_TO_IANA	IANA_TO_ORACLE` if `GENERIC_CONTEXT` is set `ORACLE_TO_IANA`: Map from an Oracle character set name to an IANA character set name. This is the default. `IANA_TO_ORACLE`: Map from an IANA character set name to an Oracle character set name. • `MAIL_GENERIC	MAIL_WINDOWS` if `MAIL_CONTEXT` is set `MAIL_GENERIC`: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. `MAIL_WINDOWS`: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the `MAP_CHARSET` function with the `ORACLE_TO_IANA` option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the `WE8DEC` character set, whose corresponding IANA name is `DEC-MCS`. If `WE8DEC` is passed to the

MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

> **Note:**
>
> Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context,  utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

267.4.13 MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
   language           IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 267-14 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```
DECLARE
   short_n VARCHAR2(10);
   ling_n VARCHAR2(50);
BEGIN
   SELECT nls_language INTO short
   FROM customers WHERE customer_id = 9000;
   ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
   DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

267.4.14 MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 267-15 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns `'American'`.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

267.4.15 MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
   ora_language   IN VARCHAR2,
   ora_territory  IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 267-16 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
`ora_language`	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns `'en_US'`.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

267.4.16 MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
  isolocale IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 267-17 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
`isolocale`	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns `'America'`.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

267.4.17 MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
   language    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 267-18 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE  retval VARCHAR2(100);BEGIN  retval :=
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');  DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

267.4.18 RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
   data          IN RAW,
   src_charset   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
   data            IN RAW,
   src_charset     IN VARCHAR2 DEFAULT NULL,
   scanned_length  OUT PLS_INTEGER,
   shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 267-19 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

Table 267-19 (Cont.) RAW_TO_CHAR Function Parameters

Parameter	Description
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde'||chr(170)
```

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
  nvalue VARCHAR2(1024);
  conversion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
```

```
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
END;
```

267.4.19 RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
   data         IN RAW,
   src_charset  IN VARCHAR2 DEFAULT NULL)
 RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
   data            IN RAW,
   src_charset      IN VARCHAR2 DEFAULT NULL,
   scanned_length   OUT PLS_INTEGER,
   shift_status     IN OUT PLS_INTEGER)
 RETURN NVARCHAR2;
```

Parameters

Table 267-20 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

Table 267-20 (Cont.) RAW_TO_NCHAR Function Parameters

Parameter	Description
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde'||chr(170)
```

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
  nvalue NVARCHAR2(1024);
  converstion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
```

```
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
  END;
```

267.4.20 STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
   data          IN VARCHAR2 CHARACTER SET ANY_CS,
   dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

Table 267-21 STRING_TO_RAW Function Parameters

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
  BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
  end;
/
```

This returns a hex value of '616263646566C2AA'.

267.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the `TRANSLITERATE` function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 267-22 TRANSLITERATE Function Parameters

Parameter	Description
`data`	Specifies the data to be converted. Either `CHAR` or `NCHAR` datatype can be specified.
`name`	Specifies the transliteration name string. For a list of valid names, see Table 267-23.

Constants

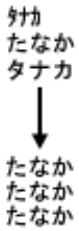
These options specify Japanese Kana conversions.

Table 267-23 TRANSLITERATE Function Constants

Constant Name	Value	Description
`KANA_FWKATAKANA`	`'kana_fwkatakana'`	Converts any type of Kana character to a fullwidth Katakana character.
`KANA_HWKATAKANA`	`'kana_hwkatakana'`	Converts any type of Kana character to a halfwidth Katakana character.
`KANA_HIRAGANA`	`'kana_hiragana'`	Converts any type of Kana character to a fullwidth Hiragana character.
`FWKATAKANA_HWKATAKANA`	`'fwkatakana_hwkatakana'`	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
`FWKATAKANA_HIRAGANA`	`'fwkatakana_hiragana'`	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
`HWKATAKANA_FWKATAKANA`	`'hwkatakana_fwkatakana'`	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
`HWKATAKANA_HIRAGANA`	`'hwkatakana_hiragana'`	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
`HIRAGANA_FWKATAKANA`	`'hiragana_fwkatakana'`	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
`HIRAGANA_HWKATAKANA`	`'hiragana_hwkatakana'`	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Usage Notes

The function returns the converted string.



Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

Figure 267-1 Loading Locale-Specific Data to the Database

The following statement normalizes one kana name to hiragana:

```
DECLARE
   Name  japanese_emp.ename%TYPE;
   Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
   SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
   name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
   UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
   WHEN  UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
   DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

267.4.22 UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

> **See Also:**
>
> "ESCAPE_REFERENCE Function" for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
   str IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 267-24 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns `'hello <'||chr(229)`.

267.4.23 VALIDATE_CHARACTER_ENCODING Functions

This function validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data. The validation is based on the database character set for VARCHAR2 and CLOB data and national character set for NVARCHAR2 and NCLOB data.

For Unicode character sets, such as AL32UTF8, AL16UTF16, AL16UTF16LE, UTF8, and UTFE, any byte sequences mapped to the following Unicode code points are considered invalid:

- Unpaired surrogate code point
- Non-character code point

In addition, any irregular or illegal UTF-8 byte sequence is considered invalid for AL32UTF8 and UTF8 character sets.

The `VALIDATE_CHARACTER_ENCODING` function is overloaded. One function is for validating VARCHAR2 and NVARCHAR2 data, while the other function is for validating CLOB and NCLOB data.

- **Validating VARCHAR2 and NVARCHAR2 data**

  A VARCHAR2 or NVARCHAR2 byte or its byte sequence is considered invalid for a character set, if it does not map to any of the characters defined in the character set.

- **Validating CLOB and NCLOB data**

  A LOB character is considered invalid for a character set if a byte (in case of a single-byte database character set) or a byte pair (in case of UTF-16 encoding used with a multibyte database character set) corresponding to the encoding of

the LOB character does not map to any of the characters defined in the character set.

Syntax

This function validates VARCHAR2 and NVARCHAR2 data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
   data IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

This function validates CLOB and NCLOB data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 267-25 VALIDATE_CHARACTER_ENCODING Function Parameters

Parameter	Description
`data`	VARCHAR2 or NVARCHAR2 data to validate.
`lob_loc`	CLOB or NCLOB data to validate.

Usage Notes

This function returns the offset of the first invalid byte for the VARCHAR2 or NVARCHAR2 data. It returns the offset of the first invalid character for the CLOB or NCLOB data. It returns 0, if all the bytes in the character data are valid. It returns `NULL`, if the value of the parameter `data` or `lob_loc` is `NULL`.

Examples

This example validates the character encoding of NVARCHAR2 and CLOB data where the database character set is AL32UTF8 while the national character set is AL16UTF16.

```
CREATE TABLE temp(col1 NVARCHAR2(20), col2 CLOB);
INSERT INTO temp VALUES(UNISTR('foo\D800bar'), UNISTR('foo\D800bar'));
COMMIT;
SELECT UTL_I18N.VALIDATE_CHARACTER_ENCODING(col1) invalid_offset_column1,
       UTL_I18N.VALIDATE_CHARACTER_ENCODING(col2) invalid_offset_column2
FROM temp;
```

The query returns:

```
INVALID_OFFSET_COLUMN1 INVALID_OFFSET_COLUMN2
---------------------- ----------------------
                     7                      4
```

Here, the surrogate code point `U+D800` is invalid. The number 7 is returned as `INVALID_OFFSET_COLUMN1`, because for `col1`, `'foo'` is encoded in 6 bytes in NVARCHAR2 and the invalid code point `U+D800` starts at offset 7. The number 4 is returned as `INVALID_OFFSET_COLUMN2`, because for `col2`, `'foo'` is encoded in 3 UTF-16 code points in CLOB and the invalid code point `U+D800` starts at offset 4.

268
UTL_IDENT

The UTL_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- Overview
- Security Model
- Constants

268.1 UTL_IDENT Overview

The UTL_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

268.2 UTL_IDENT Security Model

The UTL_IDENT package runs as the package owner SYS. The public synonym UTL_IDENT, and EXECUTE permission on this package is granted to PUBLIC.

268.3 UTL_IDENT Constants

The UTL_IDENT package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

Table 268-1 UTL_IDENT Constants

Constant	Type	Value	Description
IS_ORACLE_SERVER	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
IS_ORACLE_CLIENT	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
IS_TIMESTEN	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
IS_ORACLE_FORMS	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

269
UTL_INADDR

The UTL_INADDR package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Security Model
- Exceptions
- Examples
- Summary of UTL_INADDR Subprograms

269.1 UTL_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the connect privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

> **Note:**
>
> For more information about managing fine-grained access, see *Oracle Database Security Guide*.

269.2 UTL_INADDR Exceptions

This table describes cxceptions raised by UTL_INADDR subprograms.

Table 269-1 ***Exception - Internet Address Package***

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

269.3 UTL_INADDR Examples

This UTL_INADDR example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/
```

269.4 Summary of UTL_INADDR Subprograms

This table lists the `UTL_INADDR` subprograms and briefly describes them.

Table 269-2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function	Retrieves the name of the local or remote host given its IP address

269.4.1 GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
   host  IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

Parameters

Table 269-3 GET_HOST_ADDRESS Function Parameters

Parameter	Description
`host`	The name of the host to retrieve the IP address.

Return Values

Table 269-4 GET_HOST_ADDRESS Function Return Values

Parameter	Description
`host_address`	The IP address of the specified host, or that of the local host if host is `NULL`.

Exceptions

`UNKNOWN_HOST`: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

269.4.2 GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (
   ip  IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

Table 269-5 GET_HOST_NAME Function Parameters

Parameter	Description
`ip`	The IP address of the host used to determine its host name. If ip is not `NULL`, the official name of the host with its domain name is returned. If this is `NULL`, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 269-6 GET_HOST_NAME Function Return Values

Parameter	Description
`host_name`	The name of the local or remote host of the specified IP address.

Exceptions

`UNKNOWN_HOST`: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

270
UTL_LMS

`UTL_LMS` retrieves and formats error messages in different languages.

This chapter contains the following topics:

- Security Model
- Summary of UTL_LMS Subprograms

> **See Also:**
>
> *Oracle Database Globalization Support Guide*

270.1 UTL_LMS Security Model

This package must be created as the user `SYS`.

270.2 Summary of UTL_LMS Subprograms

This table lists the `UTL_LMS` subprograms and briefly describes them.

Table 270-1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function	Formats a retrieved error message
GET_MESSAGE Function	Retrieves an error message based on error number, product, facility, language, and message specified

270.2.1 FORMAT_MESSAGE Function

This function formats a message retrieved by the `GET_MESSAGE` function and returns the formatted message. If the function fails, then it returns a `NULL` result.

The following table shows special characters that can be used in the format string.

Special Character	Description
`'%s'`	Substitute the next string argument
`'%d'`	Substitute the next integer argument
`'%%'`	Represents the special character %

Syntax

```
UTL_LMS.FORMAT_MESSAGE (
   format IN VARCHAR2 CHARACTER SET ANY_CS,
   args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 270-2 FORMAT_MESSAGE Procedure Parameters

Parameter	Description
`format`	Specifies the string to format
`args`	Specifies the list of arguments

Examples

```
DECLARE
   s varchar2(200);
   i  pls_integer;
BEGIN
   i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
   dbms_output.put_line('before format, message is: '||s);
   dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

270.2.2 GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns `0` when it is successful. It returns `-1` when it fails.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

Syntax

```
UTL_LMS.GET_MESSAGE (
   errnum    IN PLS_INTEGER,
   product   IN VARCHAR2,
```

```
   facility  IN VARCHAR2,
   language  IN VARCHAR2,
   message   OUT NOCOPY VARCHAR2CHARCTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 270-3 GET_MESSAGE Function Parameters

Parameter	Description
`errnum`	Specifies the error number. Example: `'972'` (for `ORA-00972`)
`product`	Specifies the product to which the error message applies Example: '`rdbms`'
`facility`	Specifies the error message prefix Example: `'ora'`
`language`	Specifies the language of the message. The parameter is case-insensitive. The default is `NULL`, which causes `GET_MESSAGE` to use the value of the `NLS_LANGUAGE` session parameter.
`message`	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
   i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
   dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

271
UTL_MAIL

The UTL_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Summary of UTL_MAIL Subprograms

271.1 UTL_MAIL Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

> **Note:**
>
> For more information about managing fine-grained access, see *Oracle Database Security Guide*.

271.2 UTL_MAIL Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.

271.3 UTL_MAIL Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

271.4 Summary of UTL_MAIL Subprograms

This table lists the UTL_MAIL subprograms and briefly describes them.

Table 271-1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure	Represents the SEND Procedure overloaded for RAW attachments
SEND_ATTACH_VARCHAR2 Procedure	Represents the SEND Procedure overloaded for VARCHAR2 attachments

271.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
   sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message     IN    VARCHAR2 CHARACTER SET ANY_CS,
   mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
   priority    IN    PLS_INTEGER DEFAULT 3,
   replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 271-2 SEND Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas

Table 271-2 (Cont.) SEND Procedure Parameters

Parameter	Description
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

271.4.2 SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
   sender           IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type        IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                              DEFAULT 'text/plain; charset=us-ascii',
   priority         IN    PLS_INTEGER DEFAULT 3,
   attachment       IN    RAW,
   att_inline       IN    BOOLEAN DEFAULT TRUE,
   att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii',
   att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   replyto          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 271-3 *SEND_ATTACH_RAW Procedure Parameters*

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL

Table 271-3 (Cont.) *SEND_ATTACH_RAW Procedure Parameters*

Parameter	Description
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

271.4.3 SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
   sender           IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type        IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-
ascii',
   priority         IN    PLS_INTEGER DEFAULT 3,
   attachment       IN    VARCHAR2 CHARACTER SET ANY_CS, ,
   att_inline       IN    BOOLEAN DEFAULT TRUE,
   att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii,
   att_filename     IN    VARCHAR2CHARACTER SET ANY_CS DEFAULT NULL,
   replyto          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 271-4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL

Table 271-4 (Cont.) SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

272
UTL_MATCH

The UTL_MATCH package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of UTL_MATCH Subprograms

272.1 UTL_MATCH Overview

UTL_MATCH can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

The Edit Distance between strings shack*le*ford and shack*el*ford = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

Table 272-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

272.2 UTL_MATCH Security Model

The UTL_MATCH package runs with definer's rights. UTL_MATCH must be created under SYS. Operations provided by this package are performed with SYS privileges.

272.3 Summary of UTL_MATCH Subprograms

This table lists the `UTL_MATCH` subprograms and briefly describes them.

Table 272-2 UTL_MATCH Package Subprograms

Subprogram	Description
EDIT_DISTANCE Function	Calculates the number of changes required to transform string-1 into string-2
EDIT_DISTANCE_SIMILARITY Function	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
JARO_WINKLER Function	Calculates the measure of agreement between string-1 and string-2
JARO_WINKLER_SIMILARITY Function	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

272.3.1 EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 272-3 EDIT_DISTANCE Function Parameters

Parameter	Description
`s1`	The string to be transformed
`s2`	The string into which `s1` is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```

272.3.2 EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 272-4 EDIT_DISTANCE_SIMILARITY Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 82
```

272.3.3 JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```
UTL_MATCH.JARO_WINKLER (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN BINARY_DOUBLE;
```

Parameters

Table 272-5 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
--------------
returns 9.818E-001
```

272.3.4 JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 272-6 JARO_WINKLER_SIMILARITY Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 98
```

273
UTL_NLA

The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- Overview
- Rules and Limits
- Security Model
- Subprogram Groups
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- Summary of UTL_NLA Subprograms

273.1 UTL_NLA Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards

For more information on the BLAS and LAPACK standards see

```
http://www.netlib.org/blas/
http://www.netlib.org/lapack/
```

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, the BLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures.

Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

273.2 UTL_NLA Rules and Limits

Vectors and matrices are stored in `VARRAY`s with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.

273.3 UTL_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

273.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

273.4.1 UTL_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 1 Vector-Vector Operations subprograms.

Table 273-1 BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_ASUM Functions	Computes the sum of the absolute values of the vector components
BLAS_AXPY Procedures	Copies `alpha*X + Y` into vector `Y`
BLAS_COPY Procedures	Copies the contents of vector `X` to vector `Y`

Table 273-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_DOT Functions	Returns the dot (scalar) product of two vectors X and Y
BLAS_IAMAX Functions	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures	Returns the plane rotation of points
BLAS_ROTG Procedures	Returns the Givens rotation of points
BLAS_SCAL Procedures	Scales a vector by a constant
BLAS_SWAP Procedures	Swaps the contents of two vectors each of size n

273.4.2 UTL_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

Table 273-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_GBMV Procedures	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals
BLAS_GEMV Procedures	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix
BLAS_GER Procedures	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an `n` element vector and `A` is an `m` by `n` matrix
BLAS_SBMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SPMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR Procedures	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' +A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form

Table 273-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_SBMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SYMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix
BLAS_SYR Procedures	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix
BLAS_SYR2 Procedures	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' + A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix
BLAS_TBMV Procedures	Performs a matrix-vector operation `x := A*x` or `A'*x = b` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TBSV Procedures	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TPMV Procedures	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TPSV Procedures	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix

273.4.3 UTL_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

Table 273-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Subprogram	Description
BLAS_GEMM Procedures	Performs one of the matrix-vector operations `C := alpha*op(A)*op(B) + beta*C` where `op(X) is one of op(X) = X or op(X) = X'` where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix
BLAS_SYMM Procedures	Performs one of the matrix-vector operations `C := alpha*A*B + beta*C` or `C := alpha*B*A + beta*C` where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices
BLAS_SYR2K Procedures	Performs one of the symmetric rank2 `k` operations `C := alpha*A*B' + alpha*B*A' + beta*C` or `C := alpha*A'*B + alpha*B'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case
BLAS_SYRK Procedures	Performs one of the symmetric rank `k` operations `C := alpha*A*A' + beta*C` or `C := alpha*A'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case
BLAS_TRMM Procedures	Performs one of the matrix-vector operations `B := alpha*op(A)*B` or `B := alpha*B*op(A)` where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of two alternatives
BLAS_TRSM Procedures	Performs one of the matrix-vector operations `op(A)*X = alpha*B` or `X*op(A) = alpha*B` where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix, `op(A)` is one of two alternatives. The matrix `X` is overwritten on `B`

273.4.4 UTL_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

Table 273-4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GESV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.

Table 273-4 (Cont.) LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GTSV Procedures	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_POSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PPSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PTSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.
LAPACK_SPSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.
LAPACK_SYSV Procedures	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.

273.4.5 UTL_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

Table 273-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GEES Procedures	Computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues, the real Schur form `T`, and, optionally, the matrix of Schur vectors `Z`. This gives the Schur factorization `A = Z*T*(Z**T)`.
LAPACK_GEEV Procedures	Computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures	Solves overdetermined or underdetermined real linear systems involving an `m` by `n` matrix `A`, or its transpose, using a `QR` or `LQ` factorization of `A`. It is assumed that `A` has full rank.

Table 273-5 (Cont.) LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GESDD Procedures	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written `A = U * SIGMA * transpose(V)`.
LAPACK_SBEV Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix `A`
LAPACK_SBEVD Procedures	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage
LAPACK_SPEVD Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`
LAPACK_STEVD Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`
LAPACK_SYEVD Procedures	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

273.5 Summary of UTL_NLA Subprograms

This table lists the `UTL_NLA` subprograms and briefly describes them.

Table 273-6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures	Copies `alpha*X + Y` into vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures	Copies the contents of vector `X` to vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 273-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_DOT Functions	Returns the dot (scalar) product of two vectors X and Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an `n` element vector and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SBMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 273-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SPMV Procedures	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures	Swaps the contents of two vectors each of size `n`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures	Performs a matrix-vector operation where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures	Performs a symmetric rank 1 operation where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures	Performs one of the symmetric rank2 `k` operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 273-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SYRK Procedures	Performs one of the symmetric rank k operations where alpha and beta are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k + 1) diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TBSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k + 1) diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures	Performs one of the matrix-vector operations wherealpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMV Procedures	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRSM Procedures	Performs one of the matrix-vector operations op(A)*X = alpha*B or X*op(A) = alpha*B where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, op(A) is one of two alternatives. The matrix X is overwritten on B	BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 273-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TRSV Procedures	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
LAPACK_GBSV Procedures	This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GEES Procedures	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GEEV Procedures	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GELS Procedures	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GESDD Procedures	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GESV Procedures	This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n matrix and x and b are n by nrhs matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms

273.5.1 BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN)
 RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT)
 RETURN BINARY_FLOAT
```

Parameters

Table 273-7 BLAS_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

273.5.2 BLAS_AXPY Procedures

This procedure copies alpha*X + Y into vector Y.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_DBL,
   incy   IN       POSITIVEN);

   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_FLT,
   incy   IN       POSITIVEN);
```

Parameters

Table 273-8 BLAS_AXPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

273.5.3 BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
```

```
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 273-9 BLAS_COPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

273.5.4 BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors X and Y.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_DBL,
   incy  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_FLT,
```

```
  incy  IN   POSITIVEN)
 RETURN BINARY_FLOAT;
```

Parameters

Table 273-10 BLAS_DOT Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least `( 1 + ( n - 1 )*abs( incx ) )`
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least `( 1 + ( n - 1 )*abs( incy) )`
incy	Specifies the increment for the elements of y. incy must not be zero.

273.5.5 BLAS_GBMV Procedures

This procedure performs one of the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y`, where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals.

> **See Also:**

Parameters

Table 273-11 BLAS_GBMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: • trans = 'N' or 'n'y := alpha*A*x + beta*y • trans = 'T' or 't'y := alpha*A'*x + beta*y • trans = 'C' or 'c'y := alpha*A'*x + beta*y
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy 0. le. kl.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy 0 .le. ku.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row(ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1 + (m - 1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.

Table 273-11 (Cont.) BLAS_GBMV Procedure Parameters

Parameter	Description
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

y	UTL_NLA_ARRAY_FLT/DBL of dimension at least
	`( 1 + ( m - 1 )*abs( incy ) )`
	when trans = 'N' or 'n' and at least
	`(1+(n-1)*abs(incy))`
	otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.

incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.6 BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

```
C := alpha*op( A )*op( B ) + beta*C
```

where op(X) is one of

```
op(X) = X
```

or

```
op(X) = X'
```

where alpha and beta are scalars, and A, B and C are matrices, with op(A) an m by k matrix, op(B) a k by n matrix and C an m by n matrix.

```

Parameters

Table 273-12 BLAS_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: • transa = 'N' or 'n' : op(A) = 'A' • transa = 'T' or 't' : op(A) = 'A' • transa = 'C' or 'c' : op(A) = 'A'
transb	Specifies the form of op(B) to be used in the matrix multiplication as follows: • transb = 'N' or 'n' : op(B) = B • transb ='T' or 't' : op(B) = B' • transb = 'C' or 'c': op(B) = B'
m	Specifies the number of rows of the matrix op(A) and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix op(B) and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix op(A) and the number of columns of the matrix op(B). k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max (1,k).

Table 273-12 (Cont.) BLAS_GEMM Procedure Parameters

Parameter	Description
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = ''N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the arrayb must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.7 BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations: y := alpha*A*x + beta*y or y := alpha*A'*x + beta*y where alpha and beta are scalars, x and y are vectors and A is an m by n matrix.

> **See Also:**

```

Parameters

Table 273-13 BLAS_GEMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: • trans = 'N' or 'n',y := alpha*A*x + beta*y • trans = 'T' or 't'y := alpha*A'*x + beta*y • trans = 'C' or 'c'y := alpha*A'*x + beta*y
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1+(m-1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

Table 273-13 (Cont.) BLAS_GEMV Procedure Parameters

Parameter	Description

y	UTL_NLA_ARRAY_FLT/DBL of dimension at least
	`( 1 + ( m - 1 )*abs( incy ) )`
	when `trans` = `'N'` or `'n'` and at least
	`( 1 + ( n - 1 )*abs( incy ) )`
	otherwise. Before entry with `beta` nonzero, the incremented array Y must contain the vector `y`. On exit, Y is overwritten by the updated vector `y`.

incy	Specifies the increment for the elements of `y`. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.8 BLAS_GER Procedures

This procedure performs the rank 1 operation: `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an `n` element vector and `A` is an `m` by `n` matrix.

> **See Also:**

```

```
  lda    IN      POSITIVEN,
  pack   IN      flag DEFAULT 'C');
```

Parameters

Table 273-14 BLAS_GER Procedure Parameters

Parameter	Description
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least `( 1 + ( m - 1 )*abs( incx ) )` Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least `( 1 + ( n - 1 )*abs( incy ) )` Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least `max( 1, m )`
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.9 BLAS_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;

UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;
```

Parameters

Table 273-15 BLAS_IAMAX Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

273.5.10 BLAS_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 273-16 BLAS_NRM2 Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

273.5.11 BLAS_ROT Procedures

This procedure returns the plane rotation of points.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,

   y      IN OUT  UTL_NLA_ARRAY_FLT,
```

```
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);
```

Parameters

Table 273-17 BLAS_ROT Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)* abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

273.5.12 BLAS_ROTG Procedures

This procedure returns the Givens rotation of points.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_DOUBLE,
   b   IN OUT   SCALAR_DOUBLE,
   c   IN OUT   SCALAR_DOUBLE,
   s   IN OUT   SCALAR_DOUBLE);

UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_FLOAT,
   b   IN OUT   SCALAR_FLOAT,
   c   IN OUT   SCALAR_FLOAT,
   s   IN OUT   SCALAR_FLOAT);
```

Parameters

Table 273-18 BLAS_ROTG Procedure Parameters

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

273.5.13 BLAS_SCAL Procedures

This procedure scales a vector by a constant.

> **See Also:**
>
> BLAS Level 1 (Vector-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_DOUBLE,
   x      IN  OUT UTL_NLA_ARRAY_DBL,
   incx   IN  POSITIVEN);

UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_FLOAT,
   x      IN  OUT UTL_NLA_ARRAY_FLT,
   incx   IN  POSITIVEN);
```

Parameters

Table 273-19 BLAS_SCAL Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

273.5.14 BLAS_SPMV Procedures

This procedure performs the matrix-vector operation `y := alpha*A*x + beta*y`, where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form.

> **See Also:**
>
> BLAS Level 2 (Matrix-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DOUBLE,
   ap     IN      UTL_NLA_ARRAY_DBL,
   x      IN      UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLOAT,
   ap      IN     UTL_NLA_ARRAY_FLT,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 273-20 BLAS_SPMV Procedure Parameters

Parameter	Description
`uplo`	Specifies the upper or lower triangular part of the matrix A is supplied in the packed array AP: • `uplo` = `'U'` or `'u'`. The upper triangular part of A is supplied in AP. • `uplo` = `'L'` or `'l'`. The lower triangular part of A is supplied in AP.
`n`	Specifies the order of the matrix A. `n` must be at least zero.
`alpha`	`SCALAR_FLOAT/DOUBLE`. Specifies the scalar alpha.

Table 273-20 (Cont.) BLAS_SPMV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains, ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then Y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at leasT (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.15 BLAS_SPR Procedures

This procedure performs the rank 1 operation A := alpha*x*x' + A, where alpha is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form.

> **See Also:**
>
> BLAS Level 2 (Matrix-Vector Operations) Subprograms for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
```

```
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_DBL,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLT,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_FLT,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 273-21 BLAS_SPR Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap: • uplo = 'U' or 'u': The upper triangular part of A is supplied in ap. • uplo = 'L' or 'l' : The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n +1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.16 BLAS_SPR2 Procedures

This procedure performs the rank 2 operation `A := alpha*x*y' + alpha*y*x' +A`, where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form.

Parameters

Table 273-22 BLAS_SPR2 Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array `ap` : • `uplo` = `'U'` or `'u'` : The upper triangular part of A is supplied in `ap`. • `uplo` = `'L'` or `'l'` : The lower triangular part of A is supplied in `ap`.
`n`	Specifies the order of the matrix A. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.

Table 273-22 (Cont.) BLAS_SPR2 Procedure Parameters

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array X must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.17 BLAS_SBMV Procedures

This procedure performs the matrix-vector operation `y := alpha*A*x + beta*y`, where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals.

```

Parameters

Table 273-23 BLAS_SBMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the band matrix A is being supplied: • `uplo` = `'U'` or `'u'`. The upper triangular part of A is supplied. • `uplo` = `'L'` or `'l'`. The lower triangular part of A is supplied.
`n`	Specifies the order of the matrix A. `n` must be at least zero.

Table 273-23 (Cont.) BLAS_SBMV Procedure Parameters

Parameter	Description
k	Specifies the number of super-diagonals of the matrix A. k must satisfy 0 .le. k.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in rowk, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Unchanged on exit
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.18 BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

Syntax

```
UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
```

```
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 273-24 BLAS_SWAP Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

273.5.19 BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations C := alpha*A*B + beta*C or C := alpha*B*A + beta*C, where alpha and beta are scalars, A is a symmetric matrix, and B and C are m by n matrices.

> **See Also:**

   ldc    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 273-25 BLAS_SYMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: • side = 'L' or 'l' : C := alpha*A*B + beta*C • side = 'R' or 'r' : C := alpha*B*A + beta*C
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: • uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced. • uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.

Table 273-25 (Cont.) BLAS_SYMM Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise. Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max (1,m).
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.20 BLAS_SYMV Procedures

This procedure performs the matrix-vector operation `y := alpha*A*x + beta*y` , where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix.

Parameters

Table 273-28 BLAS_SYR2 Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: • uplo = 'U' or 'u' : Only the upper triangular part of A is to be referenced. • uplo = 'L' or 'l' : Only the lower triangular part of A is to be referenced.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n) With uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. With uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, n)
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.23 BLAS_SYR2K Procedures

It performs one of the symmetric rank2 k operations C := alpha*A*B' + alpha*B*A' + beta*C or C := alpha*A'*B + alpha*B'*A + beta*C, where alpha and beta are scalars, C is

an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case.

```

Parameters

Table 273-29 BLAS_SYR2K Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: • uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced. • uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.

Table 273-29 (Cont.) BLAS_SYR2K Procedure Parameters

Parameter	Description
trans	Specifies the operations to be performed: • trans = 'N' or 'n'C : C := alpha*A*B' + alpha*B*A' + beta*C • trans = 'T' or 't'C : C := alpha*A'*B + alpha*B'*A + beta*C • trans = 'C' or 'c'C : C := alpha*A'*B + alpha*B'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n byk part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at leastmax(1,n), otherwise lda must be at least max(1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n byk part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least max (1,n), otherwise ldb must be at least max (1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).

Table 273-29 (Cont.) BLAS_SYR2K Procedure Parameters

Parameter	Description
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.24 BLAS_SYRK Procedures

This procedure performs one of the symmetric rank k operations `C := alpha*A*A' + beta*C` or `C := alpha*A'*A + beta*C`, where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and`A` is an `n` by `k` matrix in the first case and a `k` byn matrix in the second case.

```

Parameters

Table 273-31 BLAS_TBMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the matrix is an upper or lower triangular matrix: • `uplo` = `'U'` or `'u'`. A is an upper triangular matrix. • `uplo` = `'L'` or `'l'`. A is a lower triangular matrix.
`trans`	Specifies the operation to be performed: • `trans` = `'N'` or `'n'` `x := A*x` • `trans` = `'T'` or `'t'` `x := A'*x` • `trans` = `'C'` or `'c'` `x := A'*x`

Table 273-31 (Cont.) BLAS_TBMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u'. A is assumed to be unit triangular. • diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: • with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. • with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row(k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = ''U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.26 BLAS_TBSV Procedures

This procedure solves one of the systems of equations `A*x = b` or `A'*x = b`, where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k+1)` diagonals.

Parameters

Table 273-34 BLAS_TPSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: • uplo = 'U' or 'u' : A is an upper triangular matrix. • uplo = 'L' or 'l' : A is a lower triangular matrix.
trans	Specifies the operation to be performed: • trans = 'N' or 'n' : A*x = b • trans = 'T' or 't' : A'*x = b • trans = 'C' or 'c' : A'*x = b
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u' : A is assumed to be unit triangular. • diag = 'N' or 'n' : 'A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

273.5.29 BLAS_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

```

Parameters

Table 273-35 BLAS_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: • side = 'L' or 'l' : B := alpha*op(A)*B • side = 'R' or 'r' : B := alpha*B*op(A)
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: • uplo = 'U' or 'u' : A is an upper triangular matrix. • uplo = 'L' or 'l'' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: • transa = 'N' or 'n' : op(A) = A • transa = 'T' or 't' : op(A) = A' • transa ='C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u'. A is assumed to be unit triangular. • diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side = ''R' or 'r'. Before entry with uplo = 'U' or 'u' , the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k byk lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = ''U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).

Table 273-35 (Cont.) BLAS_TRMM Procedure Parameters

Parameter	Description
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.30 BLAS_TRMV Procedures

This procedure performs the matrix-vector operations `x := A*x` or `x := A'*x`, where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 273-36 BLAS_TRMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: • `uplo = 'U'` or `'u'`. A is an upper triangular matrix. • `uplo = 'L'` or `'l'`. A is a lower triangular matrix.

Table 273-36 (Cont.) BLAS_TRMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: • trans = 'N' or 'n' x := A*x • trans= 'T' or 't' x := A'*x • trans = 'C' or 'c' x := A'*x
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u'. A is assumed to be unit triangular. • diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least(1+ (n-1)*as(incx)). Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.31 BLAS_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

```
op( A )*X = alpha*B
```

or

```
X*op( A ) = alpha*B
```

where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

The matrix X is overwritten on B.

Parameters

Table 273-37 BLAS_TRSM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: • side = 'L' or 'l' : op(A)*X = alpha*B • side = 'R' or 'r' : X*op(A) = alpha*B
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: • uplo = 'U' or 'u' : A is an upper triangular matrix. • uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: • transa = 'N' or 'n' : op(A) = A • transa = 'T' or 't' : op(A) = A' • transa = 'C' or 'c' : op(A) = A'

Table 273-37 (Cont.) BLAS_TRSM Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u'. A is assumed to be unit triangular. • diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max (1, n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.32 BLAS_TRSV Procedures

This procedure solves one of the systems of equations A*x = b or A'*x = b, where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 273-38 BLAS_TRSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: • uplo = 'U' or 'u'. A is an upper triangular matrix. • uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: • trans = 'N' or 'n'A*x = b • trans = 'T' or 't'A'*x = b • trans = 'C' or 'c'A'*x = b
diag	Specifies whether or not A is unit triangular: • diag = 'U' or 'u'. A is assumed to be unit triangular. • diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least max(1, n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.

Table 273-38 (Cont.) BLAS_TRSV Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

273.5.33 LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations `a * x = b`, where a is a band matrix of order n with kl sub diagonals and ku superdiagonals, and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

```
a = L * U
```

where L is a product of permutation and unit lower triangular matrices with kl sub diagonals, and U is upper triangular with kl+ku superdiagonals. The factored form of a is then used to solve the system of equations

```
a * x = b
```

```

Parameters

Table 273-39 LAPACK_GBSV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrixa .n >= 0
kl	The number of sub diagonals within the band of a. kl >= 0.
ku	The number of superdiagonals within the band of a . ku >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the matrix a in band storage, in rows kl+1 to 2*kl+ku+1; rows 1 to kl of the array need not be set. The j-th column of A is stored in the j-th column of the array ab: ab(kl+ku+1+i-j,j) = a(i,j) for max(1,j-ku)<=i<=min(n,j+kl) On exit, details of the factorization: U is stored as an upper triangular band matrix with kl+ku superdiagonals in rows 1 to KL+KU+1, and the multipliers used during the factorization are stored in rows: kl+ku+2 to 2*kl+ku+1
ldab	The leading dimension of the array ab. ldab >= 2*kl+ku+1
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, and the solution has not been computed
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.34 LAPACK_GEES Procedures

This procedure computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues, the real Schur form `T`, and, optionally, the matrix of Schur vectors `Z`.

This gives the Schur factorization `A = Z*T*(Z**T)`.

A matrix is in real Schur form if it is upper quasi-triangular with `1` by `1` and `2` by `2` blocks. `2` by `2` blocks will be standardized in the form

```
[ a b ]

[ c a ]
```

where `b*c < 0`. The eigenvalues of such a block are `a +- sqrt(bc)`.

> **See Also:**

   ldvs     IN       POSITIVEN,
   info     OUT      INTEGER,
   pack     IN       flag DEFAULT 'C');

UTL_NLA.LAPACK_GEES (
   jobvs    IN       flag,
   n        IN       POSITIVEN,
   a        IN OUT   UTL_NLA_ARRAY_FLT,
   lda      IN       POSITIVEN,
   wr       IN       OUT UTL_NLA_ARRAY_FLT,
   wi       IN       OUT UTL_NLA_ARRAY_FLT,
   vs       IN OUT   UTL_NLA_ARRAY_FLT,
   ldvs     IN       POSITIVEN,
   info     OUT      integer,
   pack     IN       flag DEFAULT 'C');
```

Parameters

Table 273-40 LAPACK_GEES Procedure Parameters

Parameter	Description
`jobz`	• `'N'`: Schur vectors are not computed. • `'V'`: Schur vectors are computed.

Table 273-40 (Cont.) LAPACK_GEES Procedure Parameters

Parameter	Description
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). • On entry, the n by n matrix A. • On exit, A has been overwritten by its real Schur form T.
lda	The leading dimension of the array a. lda >= max(1,n).
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vs	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). • If jobvs = 'V', vs contains the orthogonal matrix Z of Schur vectors. • If jobvs = 'N', vs is not referenced.
ldvs	The leading dimension of the array vs. VS. ldvs >= 1. If jobvs = 'V', ldvs >= N
info	• = 0 : successful exit • < 0 : if info = -i, the i-th argument had an illegal value • > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues. Elements 1:ILO-1 and i+1:N of wr and wi contain those eigenvalues which have converged. If jobvs = 'V', vs contains the matrix which reduces A to its partially converged Schur form.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.35 LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

1. If TRANS = 'N' and m >= n: find the least squares solution of an overdetermined system, that is, solve the least squares problem.

   minimize || B - A*X ||

2. If `TRANS = 'N'` and `m < n`: find the minimum norm solution of an underdetermined system `A * X = B`.
3. If `TRANS = 'T'` and `m >= n`: find the minimum norm solution of an undetermined system `A**T * X = B`.
4. If `TRANS = 'T'` and `m < n`: find the least squares solution of an overdetermined system, that is, solve the least squares problem `minimize || B - A**T * X ||`.

  b         IN OUT   UTL_NLA_ARRAY_FLT,
  ldb       IN       POSITIVEN,
  info      OUT      INTEGER,
  pack      IN       flag DEFAULT 'C');
```

Parameters

Table 273-41 LAPACK_GELS Procedure Parameters

Parameter	Description
`trans`	• `CHARACTER = 'N'`: The linear system involves `A`. • `CHARACTER = 'T'`: The linear system involves `A**T` .
`m`	The number of rows of the matrix `a. M >= 0`.
`n`	The number of columns of the matrix `a. N >= 0`.
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix band `x.nrhs >= 0`.

Table 273-41 (Cont.) LAPACK_GELS Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the matrix b of right hand side vectors, stored columnwise; b is m by nrhs if TRANS = 'N', or n by nrhsif trans = 'T'. On exit, if m >= n, a is overwritten by details of its QR factorization as returned by SGEQRF. If m < n, A is overwritten by details of its LQ factorization as returned by SGELQF.
lda	The leading dimension of the array A. lda >= max(1,m).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the matrix b of right hand side vectors, stored columnwise. b is m bynrhs if trans = 'n', or n by nrhs if trans = 'T'. On exit, b is overwritten by the solution vectors, stored columnwise: • If trans = 'n' and m >= n, rows 1 to n of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements n+1 to m in that column. • If trans = 'n' and m < n, rows 1 to n of b contain the minimum norm solution vectors. • If trans = 'T' and m >= n, rows 1 to m of b contain the minimum norm solution vectors. • If trans = 'T' and m < n, rows 1 to m of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements m+1 to n in that column.
ldb	The leading dimension of the array b. ldb >= max(1,m,n)
info	• = 0 : successful exit • < 0 : if info = -i, the i-th argument had an illegal value
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.36 LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an m by n matrix which is zero except for its min(m,n) diagonal elements, U is anm by m orthogonal matrix, and V is ann by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in

descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 273-42 LAPACK_GESDD Procedure Parameters

Parameter	Description
jobz	Specifies options for computing all or part of the matrix U: • 'A': All m columns of u and all n rows of V**T are returned in arrays u and vt. • 'S': The first min(m,n) columns of u and the first min(m,n) rows of V**T are returned in the arrays u and vt. • 'O': The first min(m,n) columns of u (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O • 'N': No columns of u (no left singular vectors) are computed.
m	The order of the matrix a. m >= 0.
n	The order of the matrix a. n >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: • If jobz = 'O', a is overwritten with the first min(m,n) columns of u (the left singular vectors, stored columnwise). • If m >= n, a is overwritten with the first m rows of V**T (the right singular vectors, stored rowwise). • If jobz .ne. 'O', the contents of a are destroyed.
lda	The leading dimension of the array a. lda >= max(1,m).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n)). The singular values of a, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL. ucol = m if jobz = 'A' or jobz = 'O' and m < n; ucol = min(m,n) if jobz = 'S'. • If jobz = 'A' or jobz = 'O' and m < n, u contains the m by m orthogonal matrix u. • If jobz = 'S', u contains the first min(m,n) columns of u (the left singular vectors, stored columnwise). • If jobz = 'O' and m >= n, or jobz = 'n', u is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobz = 'S' or 'A',or jobz = 'O' and m < n, ldu >= m.
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). • If jobz = 'A' or jobz = 'O' and m >= n, vt contains the n by n orthogonal matrix V**T. • If jobz = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). • If jobz = 'O' and m < n, or jobz = 'N', vt is not referenced.
ldvt	The leading dimension of the array vt. ldvt >= 1. • If jobz = 'A', or jobz = 'O' and m >= n, ldvt >= n. • If jobz = 'S', ldvt >= min(m,n).
info	• = 0 : successful exit • < 0 : If info = -i, the i-th argument had an illegal value • > 0 : SBDSDC did not converge, updating process failed.

Table 273-42 (Cont.) LAPACK_GESDD Procedure Parameters

Parameter	Description
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.37 LAPACK_GESV Procedure

This procedure computes the solution to a real system of linear equations `a * x = b`, where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices.

The `LU` decomposition with partial pivoting and row interchanges is used to factor `A` as

```
a = P * L * U
```

where `P` is a permutation matrix, `L` is unit lower triangular, and `U` is upper triangular. The factored form of `a` is then used to solve the system of equations

```
a * x = b
```

Parameters

Table 273-43 LAPACK_GESV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrix a. n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n coefficient matrix a. On exit, the factors L and U from the factorization a = P*L*U; the unit diagonal elements of L are not stored.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.38 LAPACK_GESVD Procedures

This procedures computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors.

The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an m by n matrix which is zero except for its min(m,n) diagonal elements, U is anm by m orthogonal matrix, and V is ann by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in descending order. The first min(m,n) columns of U and V are the left and right singular vectors of A.

Note that the routine returns V**T, not V.

pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.39 LAPACK_GEEV Procedures

This procedures computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector v(j) of A satisfies A * v(j) = lambda(j) * v(j) where lambda(j) is its eigenvalue.
- The left eigenvector u(j) of A satisfies u(j)**H * A = lambda(j) * u(j)**H where u(j)**H denotes the conjugate transpose of u(j).

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Parameter	Description
n	The order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
dl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, dl must contain the (n-1) sub-diagonal elements of a. On exit, dl is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix U from the LU factorization of a, in dl(1), ..., dl(n-2).
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). On entry, d must contain the diagonal elements of a. On exit, d is overwritten by the n diagonal elements of U.
du	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, du must contain the (n-1)super-diagonal elements of a. On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max (1, n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.41 LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b, where a is an n by n symmetric positive definite band matrix and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

A = U**T*U if UPLO ='U'

or

A = L * L**T if UPLO = 'L'

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations A * X = B.

Parameters

Table 273-48 LAPACK_POSV Procedure Parameters

Parameter	Description
uplo	• uplo = 'U'. Upper triangular of A is stored. • uplo = 'L'. Lower triangular of A is stored.
n	The number of linear equations, that is, the order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). If uplo = 'U', the leading NRHS n by n upper triangular part of a contains the upper NRHS triangular part of the matrix A, and the strictly lower NRHS triangular part of A is not referenced. If uplo = ''L', then rhs leading n by n lower triangular part of a contains the lower nrhs triangular part of the matrix a, and the strictly upper nrhs triangular part of a is not referenced. On exit, if info = 0, the factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T.
lda	The leading dimension of the array a. lda >= max (1, n)

Table 273-48 (Cont.) LAPACK_POSV Procedure Parameters

Parameter	Description
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.43 LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

A = U**T* U if UPLO = 'U'

or

A = L * L**T if UPLO = 'L'

where **U** is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations A * X = B.

Parameter	Description
uplo	• uplo = 'U' . Upper triangular of A is stored. • uplo = 'L'. Lower triangular of A is stored.
n	The number of linear equations, that is, the order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a, packed columnwise in a linear array. The j-th column of a is stored in the array ap as follows: If uplo = 'U', AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j; If uplo = 'L', AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n; On exit, if info = 0, the factor U or 'L' from the Cholesky factorization A = U**T*U or A = L*L**T in the same storage format as A.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.44 LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations `a * x = b`, where `a` is an `n` by `n` symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.

`a` is factored as `A = L*D*L**T`, and the factored form of `a` is then used to solve the system of equations.

Parameters

Table 273-51 LAPACK_SBEV Procedure Parameters

Parameter	Description
jobz	• 'N': Compute eigenvalues only. • 'V': Compute eigenvalues and eigenvectors.
uplo	• 'U': Upper triangle of A is stored. • 'L': Lower triangle of A is stored.
n	The order of the matrix a. N >= 0.
kd	The number of superdiagonals of the matrix A if uplo = 'U', or the number of subdiagonals if uplo = 'L'. kd >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix A stored in the first kd+1 rows of the array. The j-th column of A is stored in the j-th column of the array ab: • If uplo = 'U', ab(kd+1+i-j,j) = a(i,j) for max(1,j-kd)<=i<=j. • If uplo = 'L', AB(1+i-j,j) = A(i,j) for j<=i<=min(n,j+kd). On exit, ab is overwritten by values generated during the reduction to tridiagonal form: • If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T are returned in rows kd and kd+1 of ab. • If uplo = 'L', the diagonal and first subdiagonal of T are returned in the first two rows of ab.
ldab	The leading dimension of the array ab. ldab >= kd + 1.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). • If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). • If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).

pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

273.5.49 LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b, where a is an n by n symmetric matrix stored in packed format, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

A = U * D * U**T, if UPLO = 'U'

or

A = L * D * L**T, if UPLO = 'L'

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations A * X = B.

```

Parameters

Table 273-55 LAPACK_SPSV Procedure Parameters

Parameter	Description
uplo	• uplo = 'U'. Upper triangular of A is stored. • uplo = 'L' . Lower triangular of A is stored.
n	The number of linear equations, which is the order of the matrix a. N >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows: • uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j • uplo = 'L' : AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.
ipiv	INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF. • If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. • If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. • If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.

Table 273-55 (Cont.) LAPACK_SPSV Procedure Parameters

Parameter	Description
`ldb`	The leading dimension of the array `b`. `ldb >= max(1,n)`
`info`	• `= 0` : successful exit • `< 0` : if `info = -i`, the `i`-th argument had an illegal value • `> 0` : if `info = i`, `d(i,i)` is exactly zero. The factorization has been completed, but the block diagonal matrix `d` is exactly singular, so the solution could not be computed.
`pack`	(Optional) Flags the packing of the matrices: • `'C'`: column-major (default) • `'R'`: row-major

273.5.50 LAPACK_STEV Procedures

This procedure computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`.

273.5.54 LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b, where a is an n by n symmetric matrix, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

   a      IN OUT   UTL_NLA_ARRAY_FLT,
   lda    IN       POSITIVEN,
   ipiv   IN OUT   UTL_NLA_ARRAY_INT,
   b      IN OUT   UTL_NLA_ARRAY_FLT,
   ldb    IN       POSITIVEN,
   info   OUT      INTEGER,
   pack   IN       flag DEFAULT 'C');
```

Parameters

Table 273-60 LAPACK_SYSV Procedure Parameters

Parameter	Description
`uplo`	• `uplo = 'U'`. Upper triangular of A is stored. • `uplo = 'L'` . Lower triangular of A is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 273-60 (Cont.) LAPACK_SYSV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, the symmetric matrix a. If UPLO = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced. On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSYTRF.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (ldb, nrhs). Details of the interchanges and the block structure of d, as determined by SSYTRF. • If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. • If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. • If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	• = 0 : successful exit • < 0 : if info = -i , the i-th argument had an illegal value • > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: • 'C': column-major (default) • 'R': row-major

274
UTL_RAW

The UTL_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of UTL_RAW Subprograms

274.1 UTL_RAW Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

274.2 UTL_RAW Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

> **Note:**
>
> Notes on datatypes:
>
> - The PLS_INTEGER and BINARY_INTEGER datatypes are identical. This document uses BINARY_INTEGER to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
> - The INTEGER and NUMBER(38) datatypes are also identical. This document uses INTEGER throughout.

274.3 Summary of UTL_RAW Subprograms

This table lists the UTL_RAW subprograms and briefly describes them.

Table 274-1 ***UTL_RAW Package Subprograms***

Subprogram	Description
BIT_AND Function	Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW
BIT_COMPLEMENT Function	Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW
BIT_OR Function	Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW
BIT_XOR Function	Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function	Returns the RAW binary representation of a BINARY_DOUBLE value
CAST_FROM_BINARY_FLOAT Function	Returns the RAW binary representation of a BINARY_FLOAT value
CAST_FROM_BINARY_INTEGER Function	Returns the RAW binary representation of a BINARY_INTEGER value
CAST_FROM_NUMBER Function	Returns the RAW binary representation of a NUMBER value
CAST_TO_BINARY_DOUBLE Function	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
CAST_TO_NUMBER Function	Casts the RAW binary representation of a NUMBER into a NUMBER
CAST_TO_NVARCHAR2 Function	Converts a RAW value into a VARCHAR2 value
CAST_TO_RAW Function	Converts a VARCHAR2 value into a RAW value
CAST_TO_VARCHAR2 Function	Converts a RAW value into a VARCHAR2 value
COMPARE Function	Compares RAW r1 against RAW r2
CONCAT Function	Concatenates up to 12 RAWs into a single RAW
CONVERT Function	Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW
COPIES Function	Returns n copies of r concatenated together
LENGTH Function	Returns the length in bytes of a RAW r
OVERLAY Function	Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes
REVERSE Function	Reverses a byte sequence in RAW r from end to end
SUBSTR Function	Returns len bytes, starting at pos from RAW r
TRANSLATE Function	Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set

Table 274-1 (Cont.) *UTL_RAW Package Subprograms*

Subprogram	Description
TRANSLITERATE Function	Converts the bytes in the input RAW `r` according to the bytes in the transliteration RAWs `from_set` and `to_set`
XRANGE Function	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value `start_byte` and ending with the value `end_byte`

274.3.1 BIT_AND Function

This function performs bitwise logical "and" of the values in `RAW r1` with `RAW r2` and returns the "anded" result `RAW`.

Syntax

```
UTL_RAW.BIT_AND (
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-2 BIT_AND Function Parameters

Parameter	Description
`r1`	RAW to "and" with `r2`
`r2`	RAW to "and" with `r1`

Return Values

Table 274-3 BIT_AND Function Return Values

Return	Description
`RAW`	Containing the "and" of `r1` and `r2`
`NULL`	Either `r1` or `r2` input parameter was `NULL`

Usage Notes

If `r1` and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two `RAW`s, and the unprocessed portion of the longer `RAW` is appended to the partial result. The result length equals the longer of the two input `RAW`s.

274.3.2 BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in `RAW r` and returns the complemented result `RAW`. The result length equals the input `RAW r` length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-4 BIT_COMPLEMENT Function Parameters

Parameter	Description
`r`	`RAW` to perform "complement" operation

Return Values

Table 274-5 BIT_COMPLEMENT Function Return Values

Return	Description
`RAW`	The "complement" of `r1`
`NULL`	If `r` input parameter was `NULL`

274.3.3 BIT_OR Function

This function performs bitwise logical "or" of the values in `RAW r1` with `RAW r2` and returns the or'd result `RAW`.

Syntax

```
UTL_RAW.BIT_OR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

Return Values

Table 274-7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

274.3.4 BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-8 BIT_XOR Function Parameters

Parameter	Description
r1	RAW to "xor" with r2
r2	RAW to "xor" with r1

Return Values

Table 274-9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of r1 and r2
NULL	If either r1 or r2 input parameter was NULL

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

274.3.5 CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
   n          IN BINARY_DOUBLE,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	BINARY_DOUBLE value
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

  ```
  byte 0: bit 63 ~ bit 56
  byte 1: bit 55 ~ bit 48
  ```

```
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

endianess	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

274.3.6 CAST_FROM_BINARY_FLOAT Function

This function returns the RAW binary representation of a BINARY_FLOAT value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
   n          IN BINARY_FLOAT,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
n	BINARY_FLOAT value
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

Endianess	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

274.3.7 CAST_FROM_BINARY_INTEGER Function

This function returns the RAW binary representation of a BINARY_INTEGER value.

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
   n          IN BINARY_INTEGER
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-12 CAST_FROM_BINARY_INTEGER Function Parameters

Parameter	Description
n	BINARY_INTEGER value.
endianess	A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

Return Values

The binary representation of the BINARY_INTEGER value.

274.3.8 CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-13 CAST_FROM_NUMBER Function Parameters

Parameter	Description
n	NUMBER value

Return Values

The binary representation of the NUMBER value.

274.3.9 CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

Architecture	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY_DOUBLE return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

274.3.10 CAST_TO_BINARY_FLOAT Function

This function casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
r	Binary representation of a BINARY_FLOAT

Table 274-15 (Cont.) CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

Endianness	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

274.3.11 CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-16 CAST_TO_BINARY_INTEGER Function Parameters

Parameter	Description
r	Binary representation of a BINARY_INTEGER
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_INTEGER value

274.3.12 CAST_TO_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
   r  IN RAW)
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-17 CAST_TO_NUMBER function Parameters

Parameter	Description
r	Binary representation of a NUMBER

Return Values

The NUMBER value.

274.3.13 CAST_TO_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

> **Note:**
>
> When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
   r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-18 CAST_TO_NVARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2)

Return Values

Table 274-19 CAST_TO_NVARCHAR2 Function Return Values

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

274.3.14 CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
   c  IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-20 CAST_TO_RAW Function Parameters

Parameter	Description
c	VARCHAR2 to be changed to a RAW

Return Values

Table 274-21 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If c input parameter was NULL

274.3.15 CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

> **Note:**
>
> When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
   r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-22 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2

Return Values

Table 274-23 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

274.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```
UTL_RAW.COMPARE (
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
  RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-24 COMPARE Function Parameters

Parameter	Description
r1	1st RAW to be compared, may be NULL or 0 length
r2	2nd RAW to be compared, may be NULL or 0 length
pad	This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'

Return Values

Table 274-25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

274.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
   r1  IN RAW DEFAULT NULL,
   r2  IN RAW DEFAULT NULL,
   r3  IN RAW DEFAULT NULL,
   r4  IN RAW DEFAULT NULL,
   r5  IN RAW DEFAULT NULL,
   r6  IN RAW DEFAULT NULL,
   r7  IN RAW DEFAULT NULL,
   r8  IN RAW DEFAULT NULL,
   r9  IN RAW DEFAULT NULL,
```

```
   r10 IN RAW DEFAULT NULL,
   r11 IN RAW DEFAULT NULL,
   r12 IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

`r1`....`r12` are the `RAW` items to concatenate.

Return Values

Table 274-26 CONCAT Function Return Values

Return	Description
`RAW`	Containing the items concatenated

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a `RAW`, which is 32767 bytes.

274.3.18 CONVERT Function

This function converts `RAW` `r` from character set `from_charset` to character set `to_charset` and returns the resulting `RAW`.

Both `from_charset` and `to_charset` must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
   r            IN RAW,
   to_charset   IN VARCHAR2,
   from_charset IN VARCHAR2)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-27 CONVERT Function Parameters

Parameter	Description
`r`	`RAW` byte-string to be converted
`to_charset`	Name of the character set to which `r` is converted
`from_charset`	Name of the character set in which `r` is supplied

Return Values

Table 274-28 CONVERT Function Return Values

Return	Description
RAW	Byte string r converted according to the specified character sets.

Exceptions

Table 274-29 CONVERT Function Exceptions

Error	Description
ORA-06502	PL/SQL: numeric or value error
ORA-12703	This character set conversion is not supported
ORA-12705	Cannot access NLS data files or invalid environment specified

Usage Notes

- The NLS_LANG parameter form *language_territory.character set* is also accepted for to_charset and from_charset. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than floor(32767/4) = 8191 bytes if you want to avoid this truncation for all possible combinations of to_charset and from_charset. You can use the maximum character width of the target character set to_charset, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is floor(32767/2) = 16383 bytes. For single-byte target character sets, no truncation is ever necessary.

274.3.19 COPIES Function

This function returns n copies of r concatenated together.

Syntax

```
UTL_RAW.COPIES (
   r IN RAW,
   n IN NUMBER)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-30 COPIES Function Parameters

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive)

Return Values

This returns the RAW copied n times.

Exceptions

Table 274-31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

274.3.20 LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

```
UTL_RAW.LENGTH (
   r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-32 LENGTH Function Parameters

Parameter	Description
r	RAW byte stream to be measured

Return Values

Table 274-33 LENGTH Function Return Values

Return	Description
NUMBER	Current length of the RAW

274.3.21 OVERLAY Function

This function overlays the specified portion of target `RAW` with `overlay_str RAW`, starting from byte position `pos` of `target` and proceeding for `len` bytes.

Syntax

```
UTL_RAW.OVERLAY (
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-34 OVERLAY Function Parameters

Parameters	Description
`overlay_str`	Byte-string used to overlay target
`target`	Byte-string which is to be overlaid
`pos`	Position in target (numbered from 1) to start overlay
`len`	The number of target bytes to overlay
`pad`	Pad byte used when overlay `len` exceeds `overlay_str` length or `pos` exceeds `target` length

Defaults and Optional Parameters

Table 274-35 OVERLAY Function Optional Parameters

Optional Parameter	Description
`pos`	1
`len`	To the length of `overlay_str`
`pad`	x'00'

Return Values

Table 274-36 OVERLAY Function Return Values

Return	Description
`RAW`	The target `byte_string` overlaid as specified.

Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

`If len` is specified, it must be greater than or equal to `0`. If `pos` is specified, it must be greater than or equal to `1`. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

Exceptions

Table 274-37 OVERLAY Function Exceptions

Error	Description
VALUE_ERROR	Either: - `Overlay_str` is `NULL` or has 0 length - Target is missing or undefined - Length of target exceeds maximum length of a `RAW` - `len` < 0 - `pos` < 1

274.3.22 REVERSE Function

This function reverses a byte sequence in `RAW r` from end to end.

For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'.The result length is the same as the input `RAW` length.

Syntax

```
UTL_RAW.REVERSE (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-38 REVERSE Function Parameters

Parameter	Description
r	RAW to reverse

Return Values

Table 274-39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of r

Exceptions

Table 274-40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

274.3.23 SUBSTR Function

This function returns len bytes, starting at pos from RAW r.

Syntax

```
UTL_RAW.SUBSTR (
   r   IN RAW,
   pos IN BINARY_INTEGER,
   len IN BINARY_INTEGER DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-41 SUBSTR Function Parameters

Parameter	Description
r	RAW byte-string from which a portion is extracted
pos	Byte position in r at which to begin extraction
len	Number of bytes from pos to extract from r (optional)

Defaults and Optional Parameters

Table 274-42 SUBSTR Function Optional Parameter

Optional Parameter	Description
len	Position pos through to the end of r

Return Values

Table 274-43 SUBSTR Function Return Values

Return	Description
portion of r	Beginning at pos for len bytes long
NULL	r input parameter was NULL

Usage Notes

- If pos is positive, then SUBSTR counts from the beginning of r to find the first byte. If pos is negative, then SUBSTR counts backward from the end of the r. The value pos cannot be 0.
- If len is omitted, then SUBSTR returns all bytes to the end of r. The value len cannot be less than 1.

Exceptions

Table 274-44 SUBSTR Function Exceptions

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: • pos = 0 or > length of r • len < 1 or > length of r - (pos-1)

274.3.24 TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set.

If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
  RETURN RAW;
```

> **Note:**
>
> Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLITERATE.

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-45 TRANSLATE Function Parameters

Parameter	Description
r	RAW source byte-string to be translated
from_set	RAW byte-codes to be translated, if present in r
to_set	RAW byte-codes to which corresponding from_str bytes are translated

Return Values

Table 274-46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding translation bytes. Bytes from the input RAW that match any such from_set bytes are not translated or included in the result. They are effectively translated to NULL.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.

> **Note:**
>
> Differences from the TRANSLITERATE Function:
>
> - The from_set parameter comes before the to_set parameter in the calling sequence.
> - Bytes from r that appear in from_set but have no corresponding values in to_set are not translated or included in the result.
> - The resulting RAW value may be shorter than the input RAW value.
>
> Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.

Exceptions

Table 274-47 TRANSLATE Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is NULL or has 0 length - from_set is NULL or has 0 length - to_set is NULL or has 0 length

274.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set.

Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```
UTL_RAW.TRANSLITERATE (
   r        IN RAW,
   to_set   IN RAW DEFAULT NULL,
   from_set IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
  RETURN RAW;
```

> **Note:**
>
> Be aware that *to_set* and *from_set* are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-48 TRANSLITERATE Function Parameters

Parameter	Description
r	RAW input byte-string to be converted
to_set	RAW byte-codes to which corresponding from_set bytes are converted (any length)

Table 274-48 (Cont.) TRANSLITERATE Function Parameters

Parameter	Description
from_set	RAW byte-codes to be converted, if presenting r (any length)
pad	1 byte used when to-set is shorter than the from_set

Defaults and Optional Parameters

Table 274-49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
to_set	To the NULL string and effectively extended with pad to the length of from_set as necessary
from_set	x'00' through x'fff'
pad	x'00'

Return Values

Table 274-50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such from_set bytes are converted in the result to the pad byte instead.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.

> **Note:**
>
> Differences from the TRANSLATE Function:
>
> - The to_set parameter comes before the from_set parameter in the calling sequence.
> - Bytes from r that appear in from_set but have no corresponding values in to_set are replaced by pad in the result.
> - The resulting RAW value always has the same length as the input RAW value.
>
> Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.

Exceptions

Table 274-51 TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

274.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the start_byte value is greater than the end_byte value, then the succession of resulting bytes begins with start_byte, wraps through x'FF' back to x'00', then ends at end_byte.

Syntax

```
UTL_RAW.XRANGE (
   start_byte IN RAW DEFAULT NULL,
   end_byte   IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 274-52 XRANGE Function Parameters

Parameters	Description
start_byte	Beginning byte-code value of resulting sequence. The default is x'00'.
end_byte	Ending byte-code value of resulting sequence. The default is x'FF'.

Return Values

Table 274-53 XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings

275
UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- Overview
- Operational Notes
- Examples
- Summary of UTL_RECOMP Subprograms

275.1 UTL_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

275.2 UTL_RECOMP Operational Notes

`UTL_RECOMP` has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with VALID status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM` (`dbmsrand.sql`)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

275.3 UTL_RECOMP Examples

These examples show various ways that UTL_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

275.4 Summary of UTL_RECOMP Subprograms

This table lists the UTL_RECOMP subprograms and briefly describes them.

Table 275-1 *UTL_RECOMP Package Subprograms*

Subprogram	Description
RECOMP_PARALLEL Procedure	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure	Recompiles invalid objects in a given schema or all invalid objects in the database

275.4.1 RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
   threads  IN   PLS_INTEGER DEFAULT NULL,
   schema   IN   VARCHAR2    DEFAULT NULL,
   flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 275-2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.

Table 275-2 (Cont.) RECOMP_PARALLEL Procedure Parameters

Parameter	Description
`flags`	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

275.4.2 RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
   schema   IN   VARCHAR2    DEFAULT NULL,
   flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 275-3 RECOMP_SERIAL Procedure Parameters

Parameter	Description
`schema`	The schema in which to recompile invalid objects. If `NULL`, all invalid objects in the database are recompiled.
`flags`	Flag values are intended for internal testing and diagnosability only.

276
UTL_REF

The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Overview
- Security Model
- Types
- Exceptions
- Summary of UTL_REF Subprograms

276.1 UTL_REF Overview

UTL_REF procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

276.2 UTL_REF Security Model

The procedural option is needed to use this package. This package must be created under SYS (CONNECT /AS SYSDBA). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

> **Note:**
>
> This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

276.3 UTL_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type employee_type using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
   name    VARCHAR2(20),
   id      NUMBER,

member function GET_ID
    (name VARCHAR2)
   RETURN MEMBER);
```

The object type employee_type is a user-defined type that contains two attributes, name and id, and a member function, GET_ID().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

276.4 UTL_REF Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

Table 276-1 *UTL_REF Exceptions*

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

276.5 Summary of UTL_REF Subprograms

This table lists the UTL_REF subprograms and briefly describes them.

Table 276-2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure	Deletes an object given a reference
LOCK_OBJECT Procedure	Locks an object given a reference
SELECT_OBJECT Procedure	Selects an object given a reference
UPDATE_OBJECT Procedure	Updates an object given a reference

276.5.1 DELETE_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
   reference IN REF "<typename>");
```

Parameters

Table 276-3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
   name    VARCHAR2(64),
   gender  CHAR(1),
```

```
   address Address_t,
   MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
   BEGIN
      address := addr;
   END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under `Person_t`: Simulate implementation of inheritance using a `REF` to `Person_t` and delegation of `setAddress` to it.

```
   thePerson  REF Person_t,
   empno      NUMBER(5),
   deptREF    Department_t,
   mgrREF     Employee_t,
   reminders  StringArray_t,
   MEMBER PROCEDURE setAddress(addr IN Address_t),
   MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
      myMgr Employee_t;
      meAsPerson Person_t;
   BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the Person object from the reference, and also select it:

```
      UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
      meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN
```

Give the manager a reminder:

```
         UTL_REF.LOCK_OBJECT(mgr);
         UTL_REF.SELECT_OBJECT(mgr, myMgr);
         myMgr.addReminder
         ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
         UTL_REF.UPDATE_OBJECT(mgr, myMgr);
      END IF;
   EXCEPTION
      WHEN OTHERS THEN
      errnum := SQLCODE;
      errmsg := SUBSTR(SQLERRM, 1, 200);
```

276.5.2 LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 276-4 LOCK_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to lock.
`object`	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

276.5.3 SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 276-5 SELECT_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference to the object to select or retrieve.
`object`	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

276.5.4 UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
   reference IN REF "<typename>",
   object    IN     "<typename>");
```

Parameters

Table 276-6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to update.
`object`	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

277
UTL_RPADV

The UTL_RPADV package provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment. This package uses the Oracle Replication Performance Advisor to gather statistics.

This chapter contains the following topic:

- UTL_RPADV Overview
- DBMS_COMPARISON Security Model
- UTL_RPADV Operational Notes
- Summary of UTL_RPADV Subprograms

277.1 UTL_RPADV Overview

This package enables you to collect and analyze statistics about the performance or Oracle Replication components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Replication performance.

When this package is used on an Oracle Database 11*g* Release 2 (11.2) database, it can monitor Oracle Database 10*g* Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

277.2 DBMS_COMPARISON Security Model

Security on this package can be controlled by either granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Replication administrator and connect as the Oracle Replication administrator when using this package.

277.3 UTL_RPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Replication administrator and run the utlrpadv.sql script in the rdbms/admin directory in ORACLE_HOME.

The utlrpadv.sql script creates the following tables:

- STREAMS$_PA_COMPONENT Table
- STREAMS$_PA_COMPONENT_LINK Table
- STREAMS$_PA_COMPONENT_PROP Table

- STREAMS$_PA_COMPONENT_STAT Table
- STREAMS$_PA_CONTROL Table
- STREAMS$_PA_DATABASE Table
- STREAMS$_PA_DATABASE_PROP Table
- STREAMS$_PA_MONITORING Table
- STREAMS$_PA_PATH_BOTTLENECK Table
- STREAMS$_PA_PATH_STAT Table
- STREAMS$_PA_SHOW_COMP_STAT Table
- STREAMS$_PA_SHOW_PATH_STAT Table

The Oracle Replication Performance Advisor populates these tables when it is run.

STREAMS$_PA_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Replication components at each database.

Table 277-1 STREAMS$_PA_COMPONENT Table

Column	Datatype	NULL	Description
`COMPONENT_ID`	`NUMBER`	`NOT NULL`	Identification number assigned to the component by the Oracle Replication Performance Advisor
`COMPONENT_NAME`	`VARCHAR2(194)`		Name of the component
`COMPONENT_DB`	`VARCHAR2(128)`		Name of the database that contains the component
`COMPONENT_TYPE`	`VARCHAR2(20)`		Type of the component The following types are possible: • `CAPTURE` for a capture process • `PROPAGATION SENDER` for a propagation sender • `PROPAGATION RECEIVER` for a propagation receiver • `APPLY` for an apply process • `QUEUE` for a queue
`COMPONENT_CHANGED_TIME`	`DATE`		Time when the component was last changed

STREAMS$_PA_COMPONENT_LINK Table

The `STREAMS$_PA_COMPONENT_LINK` table displays information about how information flows between Oracle Replication components.

Table 277-2 STREAMS$_PA_COMPONENT_LINK Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

STREAMS$_PA_COMPONENT_PROP Table

The STREAMS$_PA_COMPONENT_PROP table displays information about capture processes and apply processes necessary for analysis by the Replication Performance Advisor.

Table 277-3 STREAMS$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Replication Performance Advisor

Table 277-3 (Cont.) STREAMS$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2(30)		Property name For a capture process, the component properties include the following: • SOURCE_DATABASE - The source database for the changes captured by the capture process • PARALLELISM - The setting for the parallelism capture process parameter • OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0) For an apply process, the component properties include the following: • SOURCE_DATABASE - The source database for the messages applied by the apply process • PARALLELISM - The setting for the parallelism apply process parameter • APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO) • MESSAGE_DELIVERY_MODE - Either buffered or persistent
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_COMPONENT_STAT Table

The STREAMS$_PA_COMPONENT_STAT table displays performance statistics and session statistics about each Oracle Replication component.

Table 277-4 STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run

Table 277-4 (Cont.) STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic
SUB_COMPONENT_TYPE	VARCHAR2(64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: • LOGMINER READER for a builder server of a capture process • LOGMINER PREPARER for a preparer server of a capture process • LOGMINER BUILDER for a reader server of a capture process • CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: • PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database • APPLY READER for a reader server of an apply process • APPLY COORDINATOR for a coordinator process of an apply process • APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.

STREAMS$_PA_CONTROL Table

The STREAMS$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

Table 277-5 STREAMS$_PA_CONTROL Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PARAM_NAME	VARCHAR2(30)		The name of the parameter
PARAM_VALUE	VARCHAR2(4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2(30)		The unit of the parameter

STREAMS$_PA_DATABASE Table

The STREAMS$_PA_DATABASE table displays information about each database that contains Oracle Replication components.

Table 277-6 STREAMS$_PA_DATABASE Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2(4000)		The error message of the error encountered when the database was last queried

STREAMS$_PA_DATABASE_PROP Table

The STREAMS$_PA_DATABASE_PROP table displays Oracle Replication database property information necessary for analysis by the Replication Performance Advisor.

Table 277-7 STREAMS$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor

Table 277-7 (Cont.) STREAMS$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2(30)		Property name The database properties include the following: • VERSION • COMPATIBILITY • MANAGEMENT_PACK_ACCESS • DB_UNIQUE_NAME
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_MONITORING Table

The STREAMS$_PA_MONITORING table displays information about each monitoring job running in a database.

Table 277-8 STREAMS$_PA_MONITORING Table

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2(30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2(30)		Name of the client that submitted the job **See Also:** "Full Monitoring Job Names"
QUERY_USER_NAME	VARCHAR2(30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2(30)		Name of the table used by the SHOW_STATS procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2(30)		State of the monitoring job, either ENABLED or STOPPED

STREAMS$_PA_PATH_BOTTLENECK Table

The STREAMS$_PA_PATH_BOTTLENECK table displays information about Oracle Replication components that might be slowing down the flow of messages.

Table 277-9 STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
ADVISOR_RUN_REASON	VARCHAR2(4000)		Reason for the bottleneck

Table 277-9 (Cont.) STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V$SESSION view for information about the session.
ACTION_NAME	VARCHAR2(32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2(30)		Whether a bottleneck was identified

STREAMS$_PA_PATH_STAT Table

The STREAMS$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 277-10 STREAMS$_PA_PATH_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_COMP_STAT Table

The STREAMS$_PA_SHOW_COMP_STAT table displays statistics for Oracle Replication components.

Table 277-11 STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_TYPE	VARCHAR2(30)		Type of the component The following types are possible: • CAPTURE for a capture process • PROPAGATION SENDER for a propagation sender • PROPAGATION RECEIVER for a propagation receiver • APPLY for an apply process • QUEUE for a queue

Table 277-11 (Cont.) STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
SUB_COMPONENT_TYPE	VARCHAR2(30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: • LOGMINER READER for a builder server of a capture process • LOGMINER PREPARER for a preparer server of a capture process • LOGMINER BUILDER for a reader server of a capture process • CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: • PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database • APPLY READER for a reader server of an apply process • APPLY COORDINATOR for a coordinator process of an apply process • APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2(30)		Name of the statistic
STATISTIC_NAME	VARCHAR2(128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(128)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_PATH_STAT Table

The STREAMS$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Replication configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 277-12 STREAMS$_PA_SHOW_PATH_STAT Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
SETTING	VARCHAR2(2000)		Setting for the Oracle Replication Performance Advisor Run
STATISTICS	VARCHAR2(4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2(4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization 0 (zero) means that the path does not use the combined capture and apply optimization. 1 means that the path uses the combined capture and apply optimization.

277.4 Summary of UTL_RPADV Subprograms

This table lists the UTL_RPADV subprograms and briefly describes them.

Table 277-13 UTL_RPADV Package Subprograms

Subprogram	Description
ALTER_MONITORING Procedure	Alters the monitoring job submitted by the current user.
COLLECT_STATS Procedure	Uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.
IS_MONITORING Function	Checks whether a monitoring job is currently running.
SHOW_STATS Procedure	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.
SHOW_STATS_HTML Procedure	Generates HTML output that includes the statistics gathered by the COLLECT_STATS procedure.
START_MONITORING Procedure	Starts a monitoring job.
STOP_MONITORING Procedure	Stops a monitoring job.

277.4.1 ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```
UTL_RPADV.ALTER_MONITORING(
   interval                      IN NUMBER  DEFAULT NULL,
   top_event_threshold           IN NUMBER  DEFAULT NULL,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
   retention_time                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 277-14 ALTER_MONITORING Procedure Parameters

Parameter	Description
`interval`	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If `NULL`, then the current value is not changed.
`top_event_threshold`	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If `NULL`, then the current value is not changed.
`bottleneck_idle_threshold`	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its `IDLE` percentage. The `IDLE` percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if `50` is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If `NULL`, then the current value is not changed.
`bottleneck_flowctrl_threshold`	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its `FLOW CONTROL` percentage. The `FLOW CONTROL` percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if `50` is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If `NULL`, then the current value is not changed.

Table 277-14 (Cont.) ALTER_MONITORING Procedure Parameters

Parameter	Description
retention_time	The number of hours to retain monitoring results. If NULL, then the current value is not changed.

Exceptions

Table 277-15 ALTER_MONITORING Procedure Exceptions

Exception	Description
ORA-20113	no active monitoring job found

277.4.2 COLLECT_STATS Procedure

This procedure uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

> **Note:**
>
> This procedure commits.

Syntax

```
UTL_RPADV.COLLECT_STATS(
   interval                      IN NUMBER  DEFAULT 60,
   num_runs                      IN NUMBER  DEFAULT 10,
   comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   top_event_threshold           IN NUMBER  DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

Parameters

Table 277-16 *COLLECT_STATS Procedure Parameters*

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Replication Performance Advisor is run by the procedure.

Table 277-16 (Cont.) *COLLECT_STATS Procedure Parameters*

Parameter	Description
`comp_stat_table`	The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as *`[schema_name.]object_name`*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table `STREAMS$_ADVISOR_COMP_STAT`. See "Usage Notes" for more information about this parameter.
`path_stat_table`	The name of the table that stores the statistics collected for stream paths. Specify the table name as *`[schema_name.]object_name`*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table `STREAMS$_ADVISOR_PATH_STAT`. See "Usage Notes" for more information about this parameter.
`top_event_threshold`	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if `15` is specified, then only wait events with a value larger than 15% are collected.
`bottleneck_idle_threshold`	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its `IDLE` percentage. The `IDLE` percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if `50` is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
`bottleneck_flowctrl_threshold`	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its `FLOW CONTROL` percentage. The `FLOW CONTROL` percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if `50` is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.

Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

277.4.3 IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

> **See Also:**
>
> "START_MONITORING Procedure"

Syntax

```
UTL_RPADV.IS_MONITORING(
   job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 277-17 IS_MONITORING Function Parameters

Parameter	Description
`job_name`	The name of the job for which to check.
`client_name`	The name of the client that submitted the job.

277.4.4 SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

> **Note:**
>
> This procedure does not commit.

> **See Also:**
>
> - "COLLECT_STATS Procedure"
> - "START_MONITORING Procedure"

Syntax

```
UTL_RPADV.SHOW_STATS(
   path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   path_id           IN NUMBER    DEFAULT NULL,
   bgn_run_id        IN NUMBER    DEFAULT -1,
   end_run_id        IN NUMBER    DEFAULT -10,
   show_path_id      IN BOOLEAN   DEFAULT TRUE,
   show_run_id       IN BOOLEAN   DEFAULT TRUE,
   show_run_time     IN BOOLEAN   DEFAULT TRUE,
   show_optimization IN BOOLEAN   DEFAULT TRUE,
   show_setting      IN BOOLEAN   DEFAULT FALSE,
   show_stat         IN BOOLEAN   DEFAULT TRUE,
   show_sess         IN BOOLEAN   DEFAULT FALSE,
   show_legend       IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 277-18 *SHOW_STATS Procedure Parameters*

Parameter	Description
`path_stat_table`	The name of the table that contains the stream path statistics. Specify the table name as *`[schema_name.]object_name`*. If the schema is not specified, then the current user is the default. When you gather statistics using the `COLLECT_STATS` procedure, this table is specified in the `path_stat_table` parameter in the `COLLECT_STATS` procedure. The default table is `STREAMS$_ADVISOR_PATH_STAT`. When you gather statistics using the `START_MONITORING` procedure, you can determine the name for this table by querying the `SHOW_STATS_TABLE` column in the `STREAMS$_PA_MONITORING` view. The default table for a monitoring job is `STREAMS$_PA_SHOW_PATH_STAT`.
`path_id`	A stream path ID. If non-`NULL`, then the procedure shows output for the specified stream path only. If `NULL`, then the procedure shows output for all active stream paths.
`bgn_run_id`	The first Oracle Replication Performance Advisor run ID to show in the range of runs. See "Usage Notes" for more information about this parameter.
`end_run_id`	The last Oracle Replication Performance Advisor run ID to show in the range of runs. See "Usage Notes" for more information about this parameter.

Table 277-18 (Cont.) *SHOW_STATS Procedure Parameters*

Parameter	Description
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Replication Performance Advisor run ID is included in the output. If FALSE, then the Oracle Replication Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Replication Performance Advisor run time is included in the output. If FALSE, then the Oracle Replication Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if bgn_run_id is set to -1 and end_run_id is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

277.4.5 SHOW_STATS_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

> **Note:**
>
> This procedure does not commit.

> **See Also:**
>
> - "COLLECT_STATS Procedure"
> - "START_MONITORING Procedure"

Syntax

```
UTL_RPADV.SHOW_STATS_HTML(
   directory       IN VARCHAR2,
   reportname      IN VARCHAR2  DEFAULT 'RPADVREPORT.HTML',
   comp_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_id         IN NUMBER    DEFAULT NULL,
   bgn_run_id      IN NUMBER    DEFAULT -1,
   end_run_id      IN NUMBER    DEFAULT -10,
   detailed        IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 277-19 SHOW_STATS_HTML Procedure Parameters

Parameter	Description
directory	The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes the procedure must have READ and WRITE privilege on each one.
reportname	The name of the HTML report

Table 277-19 (Cont.) SHOW_STATS_HTML Procedure Parameters

Parameter	Description
comp_stat_table	The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the comp_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_COMP_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT. Oracle recommends that you start a monitoring job with the START_MONITORING procedure in this package and use the appropriate the STREAMS$_PA_SHOW_PATH_STAT table.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Replication Performance Advisor run ID to show in the range of runs. See "Usage Notes" for more information about this parameter.
end_run_id	The last Oracle Replication Performance Advisor run ID to show in the range of runs. See "Usage Notes" for more information about this parameter.
detailed	If TRUE, then the procedure generates component-level statistics. If FALSE, then the procedure does not generate component-level statistics.

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if bgn_run_id is set to -1 and end_run_id is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

277.4.6 START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

> **Note:**
>
> This procedure commits.

> **See Also:**
>
> - "COLLECT_STATS Procedure"

Syntax

```
UTL_RPADV.START_MONITORING(
   job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name                   IN VARCHAR2  DEFAULT NULL,
   query_user_name               IN VARCHAR2  DEFAULT NULL,
   interval                      IN NUMBER    DEFAULT 60,
   top_event_threshold           IN NUMBER    DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER    DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER    DEFAULT 50,
   retention_time                IN NUMBER    DEFAULT 24);
```

Parameters

Table 277-20 START_MONITORING Procedure Parameters

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.

Table 277-20 (Cont.) START_MONITORING Procedure Parameters

Parameter	Description
bottleneck_idle_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

Exceptions

Table 277-21 START_MONITORING Procedure Exceptions

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Replication monitoring job Stop the Replication monitoring job, and run the START_MONITORING procedure again.

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- Requirements for the User Running the Procedure
- Full Monitoring Job Names
- Restrictions on Monitoring Jobs

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Replication components.

- The user must have been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for client_name Parameter	Setting for job_name parameter	Full Monitoring Job Name
`NULL`	`STREAMS$_MONITORING_JOB`	`STREAMS$_MONITORING_JOB`
`EM`	`STREAMS$_MONITORING_JOB`	`EMSTREAMS$_MONITORING_JOB`
`strm`	`STREAMS$_MONITORING_JOB`	`strmSTREAMS$_MONITORING_JOB`
`strm`	`mjob1`	`strmmjob1`

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

277.4.7 STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```
UTL_RPADV.STOP_MONITORING(
   purge IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 277-22 STOP_MONITORING Procedure Parameters

Parameter	Description
`purge`	If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.

278
UTL_SMTP

The UTL_SMTP package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Types
- Reply Codes
- UTL_SMTP Operational Notes
- Exceptions
- Rules and Limits
- Examples
- Summary of UTL_SMTP Subprograms

> **See Also:**
>
> *Oracle Database Development Guide*

278.1 UTL_SMTP Overview

The UTL_SMTP protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

278.2 UTL_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the connect privilege granted in the access control list assigned to the remote network host to which the user must connect.

> **Note:**
>
> For more information on managing fine-grained access, see *Oracle Database Security Guide*

278.3 UTL_SMTP Constants

UTL_SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 278-1 UTL_SMTP Constants

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2(256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2(256)	'CRAM-MD5'	List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

278.4 UTL_SMTP Types

UTL_SMTP uses a CONNECTION record type and REPLY_REPLIES record types.

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
    host              VARCHAR2(255),
    port              PLS_INTEGER,
    tx_timeout        PLS_INTEGER,
    private_tcp_con   utl_tcp.connection,
    private_state     PLS_INTEGER);
```

Fields

Table 278-2 CONNECTION Record Type Fields

Field	Description
host	Name of the remote host when connection is established. NULL when no connection is established.
port	Port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the OPEN_CONNECTION Functions. Changing the values of these fields has no effect on the connection. The fields private_tcp_con and private_state for implementation use only. You should not modify these fields.

REPLY_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,
```

```
  text    VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

Fields

Table 278-3 REPLY, REPLIES Record Type Fields

Field	Description
code	3-digit reply code
text	Text message of the reply

278.5 UTL_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

Table 278-4 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF.CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason

Table 278-4 (Cont.) SMTP Reply Codes

Reply Code	Meaning
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

278.6 UTL_SMTP Operational Notes

An SMTP connection is initiated by a call to OPEN_CONNECTION Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

HELO Function and Procedure - identify the domain of the sender

MAIL Function and Procedure- start a mail, specify the sender

RCPT Function - specify the recipient

OPEN_DATA Function and Procedure- start the mail body

WRITE_RAW_DATA Procedure - write the mail body (multiple calls allowed)

CLOSE_DATA Function and Procedure - close the mail body and send the mail

The SMTP connection is closed by calling the QUIT Function and Procedure.

Related Topics

- OPEN_CONNECTION Functions
  These functions open a connection to an SMTP server.
- QUIT Function and Procedure
  This subprogram terminates an SMTP session and disconnects from the server.

278.7 UTL_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the `UTL_SMTP` package.

The network error is transferred to a reply code of 421- service not available.

Table 278-5 UTL_SMTP Exceptions

Exception	Description
`INVALID_OPERATION`	Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure, the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling `WRITE_DATA, WRITE_RAW_DATA` or `CLOSE_DATA` without first calling `OPEN_DATA.`
`TRANSIENT_ERROR`	Raised when receiving a reply code in 400 range
`PERMANENT_ERROR`	Raised when receiving a reply code in 500 range

278.8 UTL_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL_SMTP subprograms.

Table 278-6 SMTP Size Limitation

Element	Size Limitation
`user`	Maximum total length of a user name is 64 characters
`domain`	Maximum total length of a domain name or number is 64 characters
`path`	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
`command line`	Maximum total length of a command line including the command word and the <CRLF> is 512 characters
`reply line`	Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters
`text line`	Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency)
`recipients buffer`	Maximum total number of recipients that must be buffered is 100 recipients

278.9 UTL_SMTP Examples

This example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',    '"Sender" <sender@foo.com>');
  send_header('To',      '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
              -- a connection to the server. The QUIT call raises an
              -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

278.10 Summary of UTL_SMTP Subprograms

This table lists the UTL_SMTP subprograms and briefly describes them.

Table 278-7 UTL_SMTP Package Subprograms

Subprogram	Description
AUTH Function and Procedure	Sends the AUTH command to authenticate to the SMTP server
CLOSE_CONNECTION Procedure	Closes the SMTP connection, causing the current SMTP operation to terminate
CLOSE_DATA Function and Procedure	Closes the data session
COMMAND Function and Procedure	Performs a generic SMTP command

Table 278-7 (Cont.) UTL_SMTP Package Subprograms

Subprogram	Description
COMMAND_REPLIES Function	Performs a generic SMTP command and retrieves multiple reply lines
DATA Function and Procedure	Sends the e-mail body
EHLO Function and Procedure	Performs the initial handshake with SMTP server using the EHLO command
HELO Function and Procedure	Performs the initial handshake with SMTP server using the HELO command
HELP Function	Sends HELP command
MAIL Function and Procedure	Initiates an e-mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure	NULL command
OPEN_CONNECTION Functions	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure	Sends the DATA command
QUIT Function and Procedure	Terminates an SMTP session and disconnects from the server
RCPT Function	Specifies the recipient of an e-mail message
RSET Function and Procedure	Terminates the current e-mail transaction
STARTTLS Function and Procedure	Sends STARTTLS command to secure the SMTP connection using SSL/TLS
VRFY Function	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure	Writes a portion of the e-mail message with RAW data

278.10.1 AUTH Function and Procedure

This subprogram sends the AUTH command to authenticate to the SMTP server. The UTL_SMTP package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its EHLO reply, the user must call the EHLO Function and Procedure. Otherwise, UTL_SMTP uses the first scheme in the list.

Syntax

```
UTL_SMTP.AUTH (
   c          IN OUT NOCOPY connection,
   username   IN            VARCHAR2,
   password   IN            VARCHAR2,
   schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
 RETURN reply;

UTL_SMTP.AUTH (
```

```
   c          IN OUT NOCOPY connection,
   username   IN            VARCHAR2,
   password   IN            VARCHAR2,
   schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);
```

Parameters

Table 278-8 AUTH Function and Procedure Parameters

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.

Return Values

Table 278-9 AUTH Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the EHLO Function and Procedure again for UTL_SMTP to update the list after the STARTTLS Function and Procedure is called.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
      host => 'smtp.example.com',
      port => 25,
      wallet_path => 'file:/oracle/wallets/smtp_wallet',
      wallet_password => 'password',
      secure_connection_before_smtp => FALSE);
  UTL_SMTP.STARTTLS(c);
  UTL_SMTP.AUTH(
      c => c,
      username => 'scott',
      password => 'password'
      schemes  => utl_smtp.all_schemes);
END;
```

278.10.2 CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 278-10 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	SMTP connection

278.10.3 CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 278-11 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection

Return Values

Table 278-12 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTI_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

278.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 278-13 COMMAND Function and Procedure Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

Return Values

Table 278-14 COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

278.10.5 COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 278-15 COMMAND_REPLIES Function Parameters

Parameter	Description
`c`	SMTP connection
`cmd`	SMTP command to send to the server
`arg`	Optional argument to the SMTP argument. A space is inserted between `cmd` and `arg`.

Return Values

Table 278-16 COMMAND_REPLIES Function Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY_ REPLIES Record Types in UTI_SMTP Types)

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

278.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 278-17 DATA Function and Procedure Parameters

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

Return Values

Table 278-18 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.

278.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

Syntax

```
UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN)
RETURN replies;

UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN);
```

Parameters

Table 278-19 EHLO Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection
`domain`	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 278-20 EHLO Function and Procedure Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types).

Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

Related Functions

HELO Function and Procedure

278.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

Syntax

```
UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2);
```

Parameters

Table 278-21 HELO Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection
`domain`	Domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 278-22 HELO Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO Function and Procedure

278.10.9 HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
   c         IN OUT NOCOPY   connection,
```

```
   command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 278-23 HELP Function Parameters

Parameter	Description
c	SMTP connection
command	Command to get the help message

Return Values

Table 278-24 HELP Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types)

278.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 278-25 MAIL Function and Procedure Parameters

Parameter	Description
c	SMTP connection
sender	E-mail address of the user sending the message.
parameters	Additional parameters to `mail` command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 278-26 MAIL Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

278.10.11 NOOP Function and Procedure

This subprogram issues the `NULL` command.

Syntax

```
UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 278-27 NOOP Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection

Return Values

Table 278-28 NOOP Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.

- This command replies with a single line beginning with status code 250.

278.10.12 OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
   host                            IN  VARCHAR2,
   port                            IN  PLS_INTEGER DEFAULT 25,
   c                               OUT connection,
   tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
   wallet_path                     IN  VARCHAR2 DEFAULT NULL,
   wallet_password                 IN  VARCHAR2 DEFAULT NULL,
   secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE,
   secure_host                     IN  VARCHAR2 DEFAULT NULL)
 RETURN reply;

UTL_SMTP.OPEN_CONNECTION (
   host                            IN  VARCHAR2,
   port                            IN  PLS_INTEGER DEFAULT 25,
   tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
   wallet_path                     IN  VARCHAR2 DEFAULT NULL,
   wallet_password                 IN  VARCHAR2 DEFAULT NULL,
   secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE,
   secure_host                     IN  VARCHAR2 DEFAULT NULL)
RETURN connection;
```

Parameters

Table 278-29 OPEN_CONNECTION Functions Parameters

Parameter	Description
host	Name of the SMTP server host
port	Port number on which SMTP server is listening (usually 25)
c	SMTP connection
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.
secure_connection_before_smtp	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.
secure_host	The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like "*.example.com". If NULL, the SMTP host name to connect to will be used.

Return Values

Table 278-30 OPEN_CONNECTION Functions Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of `OPEN_CONNECTION` that returns `UTL_SMTP.CONNECTION` record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of `OPEN_CONNECTION` that returns `REPLY`.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
   host => 'smtp.example.com',
   port => 465,
   wallet_path => 'file:/oracle/wallets/smtp_wallet',
   wallet_password => 'password',
   secure_connection_before_smtp => TRUE);
END;
```

278.10.13 OPEN_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 278-31 OPEN_DATA Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection

Table 278-31 (Cont.) OPEN_DATA Function and Procedure Parameters

Parameter	Description
`data`	Portion of the text of the message to be sent, including headers, in RFC822 format.

Return Values

Table 278-32 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- `OPEN_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

278.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 278-33 QUIT Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection

Return Values

Table 278-34 QUIT Function and Procedure Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

Related Functions

RSET Function and Procedure

278.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL);
```

Table 278-35 RCPT Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection
`recipient`	E-mail address of the user to which the message is being sent
`parameters`	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 278-36 RCPT Function and Procedure Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

278.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection);
```

Parameters

Table 278-37 RSET Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection

Return Values

Table 278-38 RSET Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTl_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

Related Functions

QUIT Function and Procedure

278.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Functions.

Syntax

```
UTL_SMTP.STARTTLS (
   c            IN OUT NOCOPY  connection,
   secure_host  IN     VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.STARTTLS (
   c            IN OUT NOCOPY connection,
   secure_host  IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 278-39 STARTTLS Function and Procedure Parameters

Parameter	Description
`c`	SMTP connection
`secure_host`	The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like `"*.example.com"`. If `NULL`, the SMTP host name to connect to will be used.

Return Values

Table 278-40 STARTTLS Function and Procedure Return Values

Return Value	Description
`reply`	SMTP reply

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
     host => 'smtp.example.com',
     port => 25,
     wallet_path => 'file:/oracle/wallets/smtp_wallet',
     wallet_password => 'password',
     secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

278.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
   c          IN OUT NOCOPY connection
   recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

Table 278-41 VRFY Function Parameters

Parameter	Description
`c`	SMTP connection
`recipient`	E-mail address to be verified

Return Values

Table 278-42 VRFY Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY_ REPLIES Record Types in UTI_SMTP Types). In cases where there are multiple replies, the last reply is returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the

server must have already been established by means of OPEN_CONNECTION and HELO or EHLO before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

278.10.19 WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
   c     IN OUT NOCOPY connection,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 278-43 WRITE_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.
- Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is

negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

278.10.20 WRITE_RAW_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
   c     IN OUT NOCOPY connection
   data  IN RAW);
```

Parameters

Table 278-44 WRITE_RAW_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.

279
UTL_TCP

With the UTL_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- Overview
- Security Model
- Types
- Exceptions
- Rules and Limits
- Examples
- Summary of UTL_TCP Subprograms

279.1 UTL_TCP Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

279.2 UTL_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

> **Note:**
>
> For more information about managing fine-grained access, see *Oracle Database Security Guide*

279.3 UTL_TCP Types

The UTL_TCP package includes a CONNECTION type and a carriage-return line-feed (CRLF) type.

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```
TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);
```

Fields

Table 279-1 Connection Record Type Fields

Field	Description
`remote_host`	Name of the remote host when connection is established. `NULL` when no connection is established.
`remote_port`	Port number of the remote host connected. `NULL` when no connection is established.
`local_host`	Name of the local host used to establish the connection. `NULL` when no connection is established.
`local_port`	Port number of the local host used to establish the connection. `NULL` when no connection is established.
`charset`	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
`newline`	Newline character sequence. This newline character sequence is appended to the text line sent by `WRITE_LINE` API.
`tx_timeout`	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. `NULL` indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for WRITE_LINE, specified when a connection is opened. While such protocols use <CR><LF> to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

279.4 UTL_TCP Exceptions

UTL_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

Table 279-2 ***TCP/IP Exceptions***

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input

279.5 UTL_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

279.6 UTL_TCP Examples

Some possible uses for UTL_TCP include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c  utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                               remote_port =>  80,
                               charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender    IN VARCHAR2,
                     recipient IN VARCHAR2,
                   message   IN VARCHAR2) IS
    mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
    smtp_error  EXCEPTION;
    mail_conn   utl_tcp.connection;
    PROCEDURE smtp_command(command IN VARCHAR2,
                           ok      IN VARCHAR2 DEFAULT '250')
    IS
        response varchar2(3);
        len pls_integer;
    BEGIN
        len := utl_tcp.write_line(mail_conn, command);
        response := substr(utl_tcp.get_line(mail_conn), 1, 3);
        IF (response <> ok) THEN
            RAISE smtp_error;
        END IF;
    END;

BEGIN
    mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                         remote_port => 25,
                                         charset     => 'US7ASCII');
    smtp_command('HELO ' || mailhost);
    smtp_command('MAIL FROM: ' || sender);
    smtp_command('RCPT TO: ' || recipient);
    smtp_command('DATA', '354');
    smtp_command(message);
    smtp_command('QUIT', '221');
    utl_tcp.close_connection(mail_conn);
EXCEPTION
    WHEN OTHERS THEN
        -- Handle the error
END;
```

279.7 Summary of UTL_TCP Subprograms

This table lists the UTL_TCP subprograms and briefly describes them.

Table 279-3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_CONNECTIONS Procedure	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure	Closes an open TCP/IP connection
FLUSH Procedure	Transmits immediately to the server all data in the output buffer, if a buffer is used
GET_LINE Function	Returns the line of data read
GET_LINE_NCHAR Function	Returns the line of data read in NCHAR form
GET_RAW Function	Return the data read instead of the amount of data read
GET_TEXT Function	Returns the text data read
GET_TEXT_NCHAR Function	Returns the text data read in NCHAR form
OPEN_CONNECTION Function	Opens a TCP/IP connection to a specified service
READ_LINE Function	Receives a text line from a service on an open connection
READ_RAW Function	Receives binary data from a service on an open connection
READ_TEXT Function	Receives text data from a service on an open connection
SECURE_CONNECTION Procedure	Secures a TCP/IP connection using SSL/TLS
WRITE_LINE Function	Transmits a text line to a service on an open connection
WRITE_RAW Function	Transmits a binary message to a service on an open connection
WRITE_TEXT Function	Transmits a text message to a service on an open connection

279.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (
   c        IN OUT NOCOPY connection,
   timeout  IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

Parameters

Table 279-4 AVAILABLE Function Parameters

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
   c   utl_tcp.connection
   data VARCHAR2(256);
   len  PLS_INTEGER;
BEGIN
   c := utl_tcp.open_connection(...);
   LOOP
      IF (utl_tcp.available(c) > 0) THEN
         len := utl_tcp.read_text(c, data, 256);
      ELSE
         ---do some other things
        . . . .
      END IF
   END LOOP;
END;
```

279.7.2 CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

279.7.3 CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (
   c IN OUT NOCOPY connection);
```

Parameters

Table 279-5 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection to close

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

279.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

```
UTL_TCP.FLUSH (
   c IN OUT NOCOPY connection);
```

Parameters

Table 279-6 FLUSH Procedure Parameters

Parameter	Description
c	TCP connection to which to send data

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

279.7.5 GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 279-7 GET_LINE Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

279.7.6 GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 279-8 GET_LINE_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

279.7.7 GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
   c     IN OUT NOCOPY connection,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN RAW;
```

Parameters

Table 279-9 GET_RAW Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

Table 279-9 (Cont.) GET_RAW Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

279.7.8 GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 279-10 GET_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

Table 279-10 (Cont.) GET_TEXT Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

279.7.9 GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 279-11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

Table 279-11 (Cont.) GET_TEXT_NCHAR Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

279.7.10 OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (
   remote_host          IN VARCHAR2,
   remote_port          IN PLS_INTEGER,
   local_host           IN VARCHAR2 DEFAULT NULL,
   local_port           IN PLS_INTEGER DEFAULT NULL,
   in_buffer_size       IN PLS_INTEGER DEFAULT NULL,
   out_buffer_size      IN PLS_INTEGER DEFAULT NULL,
   charset              IN VARCHAR2 DEFAULT NULL,
   newline              IN VARCHAR2 DEFAULT CRLF,
   tx_timeout           IN PLS_INTEGER DEFAULT NULL,
   wallet_path          IN  VARCHAR2 DEFAULT NULL,
   wallet_password      IN  VARCHAR2 DEFAULT NULL,
  RETURN connection;
```

Parameters

Table 279-12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	Name of the host providing the service. When remote_host is NULL, it connects to the local host.
remote_port	Port number on which the service is listening for connections

Table 279-12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
local_host	Name of the host providing the service. NULL means does not care.
local_port	Port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file:*directory-path*
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to NULL.

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL

record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
   host            => 'www.example.com',
   port            => 443,
   wallet_path     => 'file:/oracle/wallets/smtp_wallet',
   wallet_password => '*****');
  UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

279.7.11 READ_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
   c           IN OUT NOCOPY connection,
   data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 279-13 READ_LINE Function Parameters

Parameter	Description
`c`	TCP connection from which to receive data
`data`	Data received.
`remove_crlf`	If TRUE, then one ore more trailing CRLF characters are removed from the received message.

Table 279-13 (Cont.) READ_LINE Function Parameters

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

279.7.12 READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
   c     IN OUT NOCOPY connection,
   data  IN OUT NOCOPY RAW,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 279-14 READ_RAW Function Parameters

Parameter	Description
c	TCP connection from which to receive data
data (IN OUT COPY)	Data received
len	Number of bytes of data to receive
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

279.7.13 READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (
   c    IN OUT NOCOPY connection,
   data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 279-15 READ_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data

Table 279-15 (Cont.) READ_TEXT Function Parameters

Parameter	Description
data	Data received
len	Number of characters of data to receive
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

279.7.14 SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Function.

Syntax

```
UTL_TCP.SECURE_CONNECTION (
   c    IN OUT NOCOPY connection);
```

Parameters

Table 279-16 SECURE_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection from which to receive data

279.7.15 WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (
   c    IN OUT NOCOPY connection,
   data IN           VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
  RETURN PLS_INTEGER;
```

Parameters

Table 279-17 WRITE_LINE Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

279.7.16 WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (
   c    IN OUT NOCOPY connection,
   data IN            RAW,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 279-18 WRITE_RAW Function Parameters

Parameter	Description
`c`	TCP connection to which to send data
`data`	Buffer containing the data to be sent
`len`	The number of bytes of data to transmit. When `len` is `NULL`, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

279.7.17 WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN num_chars PLS_INTEGER;
```

Parameters

Table 279-19 WRITE_TEXT Function Parameters

Parameter	Description
`c`	TCP connection to which to send data
`data`	Buffer containing the data to be sent

Table 279-19 (Cont.) WRITE_TEXT Function Parameters

Parameter	Description
`len`	The number of characters of data to transmit. When `len` is `NULL`, the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

280
UTL_URL

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

This chapter contains the following topics:

- Overview
- Exceptions
- Examples
- Summary of UTL_URL Subprograms

> **See Also:**
>
> UTL_HTTP

280.1 UTL_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis (( ), right parenthesis ( ))

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a

Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

http://www.w3.org/TR/html

280.2 UTL_URL Exceptions

UTL_URL raises an exception when it encounter a processing issue.

The following table lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 280-1 UTL_URL Exceptions

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_WIDTH_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

280.3 UTL_URL Examples

UTL_URL can be used for encoding and decoding.

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decording scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(
     replace(data, '+', ' '),
     charset);
END;
```

280.4 Summary of UTL_URL Subprograms

This table lists and briefly describes the UTL_URL subprograms.

Table 280-2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function	Returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format
UNESCAPE Function	Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters

280.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format.

Syntax

```
UTL_URL.ESCAPE (
   url                  IN VARCHAR2 CHARACTER SET ANY_CS,
   escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,
   url_charset          IN VARCHAR2 DEFAULT  utl_http.body_charset)
 RETURN VARCHAR2;
```

Parameters

Table 280-3 ESCAPE Function Parameters

Parameter	Description
`url`	The original URL
`escape_reserved_chars`	Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.
`url_charset`	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If `url_charset` is `NULL`, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is `ISO-8859-1`. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- `A` through `Z`, `a` through `z`, and `0` through `9`
- Hyphen (`-`), underscore (_), period (`.`), exclamation point (`!`), tilde (~), asterisk (*), accent (`'`), left parenthesis (( ), right parenthesis ( ))

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign ($), and space characters in `'Is the use of the "$" sign okay?'` but not the `?` after `search` in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

280.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
   url             IN VARCHAR2 CHARACTER SET ANY_CS,
   url_charset     IN VARCHAR2 DEFAULT utl_http.body_charset)
                   RETURN VARCHAR2;
```

Parameters

Table 280-4 UNESCAPE Function Parameters

Parameter	Description
`url`	The URL to unescape
`url_charset`	After a character is unescaped, the character is assumed to be in the `source_charset` character set and it will be converted from the `source_charset` to the database character set before the URL is returned. If `source_charset` is `NULL`, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

281
WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILEs.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Constants
- Summary of WPG_DOCLOAD Subprograms

281.1 WPG_DOCLOAD Constants

WPG_DOCLOAD defines several constants to use when specifying parameter values.

The WPG_DOCLOAD constants are listed below:

- NAME_COL_LEN
- MIMET_COL_LEN
- MAX_DOCTABLE_NAME_LEN

NAME_COL_LEN

The NAME column in your document table must be the same as the value of name_col_len.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The MIME_TYPE column in your document table must be the same as the value of mimet_col_len.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than max_doctable_name_len.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

281.2 Summary of WPG_DOCLOAD Subprograms

The WPG_DOCLOAD package uses one subprogram, the DOWNLOAD_FILE procedure.

Table 281-1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures	Downloads files, BLOBS and BFILES

281.2.1 DOWNLOAD_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that p_filename is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that p_blob is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that p_bfile is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
   p_filename      IN             VARCHAR2,
   p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_bfile         IN OUT         BFILE);
```

Parameters

Table 281-2 DOWNLOAD_FILE Procedure Parameters

Parameter	Description
p_filename	The file to download from the document table.
p_blob	The BLOB to download.
p_bfile	The BFILE to download (see Usage Notes).
p_bcaching	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status

message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

282
ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- Restrictions
- Operational Notes
- Summary of ANYDATA Subprograms

282.1 ANYDATA TYPE Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILEs is not currently supported.

282.2 ANYDATA TYPE Operational Notes

This section contains notes related to ANYDATA TYPE construction and access.

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
   DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
   DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
   TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
   TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

282.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

Table 282-1 *ANYDATA Type Subprograms*

Subprogram	Description
BEGINCREATE Static Procedure	Begins creation process on a new ANYDATA
ENDCREATE Member Procedure	Ends creation of an ANYDATA
GET* Member Functions	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function	Gets the Type of the ANYDATA
GETTYPENAME Member Function	Get the fully qualified type name for the ANYDATA
PIECEWISE Member Procedure	Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)
SET* Member Procedures	Sets the current data value.

282.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
   dtype          IN OUT NOCOPY AnyType,
   adata          OUT NOCOPY ANYDATA);
```

Parameters

Table 282-2 BEGINCREATE Procedure Parameters

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.

282.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 282-3 ENDCREATE Procedure Parameter

Parameter	Description
self	An ANYDATA.

282.3.3 GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
   self         IN ANYDATA,
   dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
   self         IN ANYDATA,
   b            OUT NOCOPY BFILE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
   self         IN ANYDATA,
   fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
   self         IN ANYDATA,
   b            OUT NOCOPY BLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
   self         IN ANYDATA,
   c            OUT NOCOPY CHAR)
```

```
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
   self         IN ANYDATA,
   c            OUT NOCOPY CLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
   self         IN ANYDATA,
   col          OUT NOCOPY "<collection_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetDate(
   self         IN ANYDATA,
   dat          OUT NOCOPY DATE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNchar(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCHAR)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNClob(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCLOB)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNumber(
   self         IN ANYDATA,
   num          OUT NOCOPY NUMBER)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
   self         IN ANYDATA,
   nc           OUT NOCOPY NVARCHAR2)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
   self         IN ANYDATA,
   obj          OUT NOCOPY "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
   self         IN ANYDATA,
   r            OUT NOCOPY RAW)
   RETURN       PLS_INTEGER;

MMEMBER FUNCTION GetRef(
   self         IN ANYDATA,
   rf           OUT NOCOPY REF "<object_type>")
   RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GetTimestamp(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR2)
   RETURN       PLS_INTEGER;
```

Parameters

Table 282-4 GET* Function Parameter

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

282.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self          IN ANYDATA,
   typ           OUT NOCOPY AnyType)
   RETURN        PLS_INTEGER;
```

Parameters

Table 282-5 GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

282.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name*.*type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self         IN ANYDATA)
   RETURN       VARCHAR2;
```

Parameters

Table 282-6 GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

282.3.6 PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 282-7 PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

282.3.7 SET* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self        IN OUT NOCOPY ANYDATA,
   dbl         IN BINARY_DOUBLE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BFILE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
```

```
   self        IN OUT NOCOPY ANYDATA,
   fl          IN            BINARY_FLOAT,
   last_elem   IN            boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self        IN OUT NOCOPY ANYDATA,
   col         IN "<collectyion_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self        IN OUT NOCOPY ANYDATA,
   dat         IN DATE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL DAY TO SECOND,
   last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL YEAR TO MONTH,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NClob,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self        IN OUT NOCOPY ANYDATA,
   num         IN NUMBER,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NVarchar2,
   last_elem   IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETOBJECT(
   self        IN OUT NOCOPY ANYDATA,
```

```
   obj         IN "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self        IN OUT NOCOPY ANYDATA,
   r           IN RAW,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self        IN OUT NOCOPY ANYDATA,
   rf          IN REF "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self       IN OUT NOCOPY ANYDATA,
   ts         IN TIMESTAMP,
   last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
   ts          IN TIMESTAMP WITH TIME ZONE,
   last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self IN OUT NOCOPY ANYDATA,
   ts IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR2,
   last_elem   IN boolean DEFAULT FALSE);
```

Parameters

Table 282-8 SET* Procedure Parameters

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.

283
ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms

283.1 ANYDATASET TYPE Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

283.2 Summary of ANYDATASET TYPE Subprograms

This table lists the ANYDATASET Type subprograms and briefly describes them.

Table 283-1 ***ANYDATASET Type Subprograms***

Subprogram	Description
ADDINSTANCE Member Procedure	Adds a new data instance to an ANYDATASET.
BEGINCREATE Static Procedure	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Table 283-1 (Cont.) *ANYDATASET Type Subprograms*

Subprogram	Description
ENDCREATE Member Procedure	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function	Gets the next instance in an ANYDATASET.
GETTYPE Member Function	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
GETTYPENAME Member Function	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures	Sets the current data value.

283.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(
   self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 283-2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

```
DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.
```

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

283.2.2 BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```
STATIC PROCEDURE BeginCreate(
   typecode     IN PLS_INTEGER,
   rtype        IN OUT NOCOPY AnyType,
   aset         OUT NOCOPY ANYDATASET);
```

Parameters

Table 283-3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

283.2.3 ENDCREATE Member Procedure

This procedure ends creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self              IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 283-4 ENDCREATE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

283.2.4 GET* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the MODE used for accessing it (depending on how the PIECEWISE call is invoked). If PIECEWISE has not been called, the instance is

accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(
   self        IN ANYDATASET,
   dbl         OUT NOCOPY BINARY_DOUBLE)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
   self        IN ANYDATASET,
   fl          OUT NOCOPY BINARY_FLOAT)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
   self        IN ANYDATASET,
   b           OUT NOCOPY BFILE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
   self        IN ANYDATASET,
   b           OUT NOCOPY BLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY CHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
   self        IN ANYDATASET,
   c           OUT NOCOPY CLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
   self        IN ANYDATASET,
   col         OUT NOCOPY "<collection_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
   self        IN ANYDATASET,
   dat         OUT NOCOPY DATE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
   self        IN ANYDATASET,
   inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALYM(
   self        IN ANYDATASET,
   inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
   self        IN ANYDATASET,
```

```
   nc          OUT NOCOPY NCHAR)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCLOB)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
   self        IN ANYDATASET,
   num         OUT NOCOPY NUMBER)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NVARCHAR2)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
   self        IN ANYDATASET,
   obj         OUT NOCOPY "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETRAW(
   self        IN ANYDATASET,
   r           OUT NOCOPY RAW)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETREF(
   self        IN ANYDATASET,
   rf          OUT NOCOPY REF "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
   self        IN ANYDATASET,
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPLTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
   self        IN ANYDATASET,
   rid         OUT NOCOPY UROWID)
 RETURN PLS_INTEGER

MEMBER FUNCTION GETVARCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR2)
   RETURN      PLS_INTEGER;
```

Parameters

Table 283-5 GET* Function Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERs: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

283.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
   self        IN ANYDATASET)
   RETURN      PLS_INTEGER;
```

Parameter

Table 283-6 GETCOUNT Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

283.2.6 GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed.

After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(
   self           IN OUT NOCOPY ANYDATASET)
   RETURN         PLS_INTEGER;
```

Parameters

Table 283-7 GETINSTANCE Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

283.2.7 GETTYPE Member Function

This function gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self           IN ANYDATASET,
   typ            OUT NOCOPY AnyType)
   RETURN         PLS_INTEGER;
```

Parameters

Table 283-8 GETTYPE Function Parameter

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the ANYDATA.

283.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema_name*.*type_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self           IN ANYDATASET)
   RETURN         VARCHAR2;
```

Parameter

Table 283-9 GETTYPENAME Function Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Return Values

Type name of the ANYDATASET.

283.2.9 PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 283-10 PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

283.2.10 SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self              IN OUT NOCOPY ANYDATASET,
   dbl               IN BINARY_DOUBLE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self              IN OUT NOCOPY ANYDATASET,
   fl                IN BINARY_FLOAT,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BFILE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
```

```
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self              IN OUT NOCOPY ANYDATASET,
   col               IN "<collection_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self              IN OUT NOCOPY ANYDATASET,
   dat               IN DATE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self              IN OUT NOCOPY ANYDATASET,
   inv               IN INTERVAL DAY TO SECOND,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self              IN OUT NOCOPY ANYDATASET,
   inv               IN INTERVAL YEAR TO MONTH,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   nc                IN NCHAR,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
  self              IN OUT NOCOPY ANYDATASET,
  nc                IN NClob,
  last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self              IN OUT NOCOPY ANYDATASET,
   num               IN NUMBER,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self             IN OUT NOCOPY ANYDATASET,
   nc               IN NVarchar2,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
   self              IN OUT NOCOPY ANYDATASET,
   obj               IN "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self              IN OUT NOCOPY ANYDATASET,
   r                 IN RAW,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self              IN OUT NOCOPY ANYDATASET,
   rf                IN REF "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self              IN OUT NOCOPY ANYDATASET,
```

```
   ts                IN TIMESTAMP,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP WITH TIME ZONE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
   self               IN OUT NOCOPY ANYDATASET,
   rid                IN UROWID,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR(
   self               IN OUT NOCOPY ANYDATASET,
   c                  IN VARCHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self               IN OUT NOCOPY ANYDATASET,
   c                  IN VARCHAR2,
   last_elem BOOLEAN DEFAULT FALSE);
```

Parameters

Table 283-11 SET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if PIECEWISE has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

284
ANYTYPE TYPE

An ANYTYPE TYPE can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the CREATE TYPE statement. Only new transient types can be constructed using the ANYTYPE interfaces.

Starting with Oracle Database 19c, the GETANYTYPEFROMPERSISTENT function replaces the GETPERISTENT static function.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms

284.1 Summary of ANYTYPE Subprograms

This table lists the ANYTYPE subprograms in alphabetical order and briefly describes them.

Table 284-1 *ANYTYPE Subprograms*

Subprogram	Description
BEGINCREATE Static Procedure	Creates a new instance of ANYTYPE which can be used to create a transient type description.
SETINFO Member Procedure	Sets any additional information required for constructing a COLLECTION or builtin type.
ADDATTR Member Procedure	Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).
ENDCREATE Member Procedure	Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.
GETINFO Member Function	Gets the type information for the ANYTYPE.
GETATTRELEMINFO Member Function	Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.
GETANYTYPEFROMPERSISTENT Function	This standalone function replaces the old static function GETPERSISTENT. This returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

284.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
   typecode       IN          PLS_INTEGER,
   atype          OUT NOCOPY  ANYTYPE);
```

Parameters

Table 284-2 BEGINCREATE Procedure Parameters

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: • DBMS_TYPES.TYPECODE_OBJECT • DBMS_TYPES.TYPECODE_VARRAY or • DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: • DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

284.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO(
   self           IN OUT NOCOPY ANYTYPE,
   prec           IN PLS_INTEGER,
   scale          IN PLS_INTEGER,
   len            IN PLS_INTEGER,
   csid           IN PLS_INTEGER,
   csfrm          IN PLS_INTEGER,
   atype          IN ANYTYPE DEFAULT NULL,
   elem_tc        IN PLS_INTEGER DEFAULT NULL,
   elem_count     IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 284-3 SETINFO Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.

Table 284-3 (Cont.) SETINFO Procedure Parameters

Parameter	Description
scale	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 284-4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if *self* represents a VARRAY.

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

284.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
   self          IN OUT NOCOPY ANYTYPE,
   aname         IN VARCHAR2,
   typecode      IN PLS_INTEGER,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
```

```
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

Table 284-5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

284.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self           IN OUT NOCOPY ANYTYPE);
```

Parameter

Table 284-6 ENDCREATE Procedure Parameter

Parameter	Description
self	The transient ANYTYPE that is being constructed.

284.1.5 GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
   self        IN ANYTYPE,
   prec        OUT PLS_INTEGER,
   scale       OUT PLS_INTEGER,
   len         OUT PLS_INTEGER,
   csid        OUT PLS_INTEGER,
   csfrm       OUT PLS_INTEGER,
   schema_name OUT VARCHAR2,
   type_name   OUT VARCHAR2,
   version     OUT varchar2,
   numelems    OUT PLS_INTEGER)
   RETURN      PLS_INTEGER;
```

Parameters

Table 284-7 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
numelems	If *self* is a TYPECODE_VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

284.1.6 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
   self           IN ANYTYPE,
   pos            IN PLS_INTEGER,
   prec           OUT PLS_INTEGER,
   scale          OUT PLS_INTEGER,
   len            OUT PLS_INTEGER,
   csid           OUT PLS_INTEGER,
   csfrm          OUT PLS_INTEGER,
   attr_elt_type  OUT ANYTYPE
   aname          OUT VARRCHAR2)
   RETURN         PLS_INTEGER;
```

Parameters

Table 284-8 GETATTRELEMINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
pos	If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.
prec	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
scale	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid, csfrm	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.
attr_elt_type	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the *attr_elt_type*.
aname	Attribute name (if it is an attribute of an object type, NULL otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

284.1.7 GETANYTYPEFROMPERSISTENT Function

This standalone function returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement. Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERISTENT` static function.

Syntax

```
GETANYTYPEFROMPERSISTENT(
   schema_name      IN VARCHAR2,
   type_name        IN VARCHAR2)
RETURN           ANYTYPE;
```

Parameters

Table 284-9 GETANYTYPEFROMPERSISTENT Function Parameters

Parameter	Description
`schema_name`	Schema name of the type.
`type_name`	Type name.

Return Values

An `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement.

285

Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- Security Model
- Summary of Types

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for information about using Oracle Database Advanced Queuing.

285.1 Advanced Queuing (AQ)Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

285.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_NTFN_MSGID_ARRAY Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type

- ENQUEUE_OPTIONS_T Type
- QUEUE_PROPS_T Type
- SEEK_INPUT_T Type
- SEEK_OUTPUT_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

285.2.1 AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
   name       VARCHAR2(512),
   address    VARCHAR2(1024),
   protocol   NUMBER);
```

Attributes

Table 285-1 AQ$_AGENT Attributes

Attribute	Description
`name`	Name of a producer or consumer of a message. The name must follow object name guidelines in the *Oracle Database SQL Language Reference* with regard to reserved characters.
`address`	Protocol-specific address of the recipient. If the protocol is `0`, then the address is of the form [*schema.*]*queue*[*@dblink*]. For example, a queue named `emp_messages` in the `HR` queue at the site `dbs1.net` has the address: hr.emp_messages@dbs1.net
`protocol`	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.

285.2.2 AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

> **See Also:**
>
> "AQ$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY INTEGER;
```

285.2.3 AQ$_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

> **See Also:**
>
> "MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
   queue_name      VARCHAR2(261),
   consumer_name   VARCHAR2(512),
   msg_id          RAW(16),
   msg_prop        MSG_PROP_T,
   gen_desc        AQ$_NTFN_DESCRIPTOR,
   msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
   ntfnsRecdInGrp  NUMBER);
```

Attributes

Table 285-2 AQ$_DESCRIPTOR Attributes

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

285.2.4 AQ$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(   ntfn_flags   NUMBER)
```

Attributes

Table 285-3 AQ$_NTFN_DESCRIPTOR Attributes

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

285.2.5 AQ$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2^{30} which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY   AS VARRAY(1073741824)OF RAW(16);
```

285.2.6 AQ$_POST_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
   name        VARCHAR2(512),
   namespace   NUMBER,
   payload     RAW(32767));
```

Attributes

Table 285-4 AQ$_POST_INFO Attributes

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS
payload	The payload to be posted to the anonymous subscription

285.2.7 AQ$_POST_INFO_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

> **See Also:**
>
> AQ$_POST_INFO Type

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

285.2.8 AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

> **See Also:**
>
> PURGE_QUEUE_TABLE Procedure.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
   block           BOOLEAN       DEFAULT FALSE
   delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

Table 285-5 AQ$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
`block`	`TRUE/FALSE`. • If `block` is `TRUE`, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if `block` is `TRUE`. • The default for `block` is `FALSE`. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
`delivery_mode`	Kind of messages to purge, either `DBMS_AQ.BUFFERED` or `DBMS_AQ.PERSISTENT`

285.2.9 AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

> **See Also:**
>
> "AQ$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

285.2.10 AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
   name                           VARCHAR2(512),
   namespace                      NUMBER,
   callback                       VARCHAR2(4000),
   context                        RAW(2000)  DEFAULT NULL,
   anyctx                         ANYDATA,
   ctxtype                        NUMBER,
   payloadcbk                     VARCHAR2(4000),
   timeout                        NUMBER,
   ntfn_grouping_class            NUMBER,
   ntfn_grouping_value            NUMBER    DEFAULT 600,
   ntfn_grouping_type             NUMBER,
   ntfn_grouping_start_time       TIMESTAMP(6) WITH TIME ZONE,
   ntfn_grouping_repeat_count     NUMBER);
```

Attributes

Table 285-6 AQ$_REG_INFO Type Attributes

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form *schema.queue* if the registration is for a single consumer queue or *schema.queue:consumer_name* if the registration is for a multiconsumer queues.

Table 285-6 (Cont.) AQ$_REG_INFO Type Attributes

Attribute	Description
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be DBMS_AQ.NAMESPACE_AQ. To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS.
callback	Specifies the action to be performed on message notification. For HTTP notifications, use http://www.company.com:8080. For e-mail notifications, use mailto://xyz@company.com. For raw message payload for the PLSQLCALLBACK procedure, use plsql://*schema.procedure?*PR=0. For user-defined type message payload converted to XML for the PLSQLCALLBACK procedure, use plsql://*schema.procedure?*PR=1
context	Specifies the context that is to be passed to the callback function
anyctx	Specifies the ANYDATA type context that is passed to the callback function
ctxtype	Specifies the context type. Valid values are 0 (RAW) or 1 (ANYDATA)
payloadcbk	Specifies payload for the callback function
timeout	Specifies the time in seconds
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntfn_grouping_class is 0, all other notification grouping attributes must be 0. • NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntfn_grouping_repeat_count is exhausted.
ntfn_grouping_type	• NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default) • NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.

Table 285-6 (Cont.) AQ$_REG_INFO Type Attributes

Attribute	Description
`ntfn_grouping_start_time`	Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If `ntfn_grouping_start_time` is not specified when using grouping, the default is to current timestamp with time zone
`ntfn_grouping_repeat_count`	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to • `NTFN_GROUPING_FOREVER` - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 285-7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 285-8 shows the actions performed when XML presentation is specified.

Table 285-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
`RAW`	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
`Oracle object type`	Not supported	Not supported	Not supported

Table 285-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
`RAW`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
`Oracle object type`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

285.2.11 AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

> **See Also:**
>
> "AQ$_REG_INFO Type"

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

285.2.12 AQ$_SUBSCRIBER_LIST_T Type

This type identifies the list of subscribers that subscribe to a queue.

> **See Also:**
>
> "AQ$_AGENT Type"

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

285.2.13 DEQUEUE_OPTIONS_T Type

`DEQUEUE_OPTIONS_T` specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
   consumer_name     VARCHAR2(30)    DEFAULT NULL,
   dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,
   navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
   visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
   wait              BINARY_INTEGER  DEFAULT FOREVER,
   msgid             RAW(16)         DEFAULT NULL,
   correlation       VARCHAR2(128)   DEFAULT NULL,
   deq_condition     VARCHAR2(4000)  DEFAULT NULL,
   signature         aq$_sig_prop    DEFAULT NULL,
   transformation    VARCHAR2(61)    DEFAULT NULL,
   delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

Table 285-9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.
dequeue_mode	Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are: NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue. FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups. NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.

Table 285-9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
visibility	Specifies whether the new message is dequeued as part of the current transaction.The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are: ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default. IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.
wait	Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are: FOREVER: Wait forever. This setting is the default. NO_WAIT: Do not wait. NUMBER: Wait time in seconds.
msgid	Specifies the message identifier of the message to be dequeued.
correlation	Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.
deq_condition	A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

285.2.14 ENQUEUE_OPTIONS_T Type

`ENQUEUE_OPTIONS_T Type` specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
   visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
   relative_msgid        RAW(16)         DEFAULT NULL,
   sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
   transformation        VARCHAR2(61)    DEFAULT NULL,
   delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 285-10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
`visibility`	Specifies the transactional behavior of the enqueue request. Possible settings are: `ON_COMMIT`: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. `IMMEDIATE`: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.
`relative_msgid`	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if `BEFORE` is specified in `sequence_deviation`. This parameter is ignored if sequence deviation is not specified.
`sequence_deviation`	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: `BEFORE`: The message is enqueued ahead of the message specified by `relative_msgid.` `TOP`: The message is enqueued ahead of any other messages.
`transformation`	Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.
`delivery_mode`	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be `BUFFERED` or `PERSISTENT`. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

285.2.15 QUEUE_PROPS_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

Syntax

```
TYPE QUEUE_PROPS_T IS RECORD (
  retry_delay     NUMBER         DEFAULT 0,
  retention_time  NUMBER         DEFAULT 0,
  sort_list       VARCHAR2(30)   DEFAULT NULL,
  cache_hint      BINARY_INTEGER DEFAULT AUTO,
  retention_type  BINARY_INTEGER DEFAULT DBMS_AQ.DEQUEUE_TIME
  );
```

Attributes

Table 285-11 QUEUE_PROPS_T Attributes

Attribute	Description
retry_delay	Specifies the number of seconds after which this message is scheduled for processing again after an application rollback
retention_time	Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue
sort_list	Sharded queues can be sorted by ENQ_TIME or PRIORITY, ENQ_TIME .
cache_hint	Specifies a hint to sharded queue whether to cache messages or not. User can specify following: • UNCACHED: Message cache will not cache messages • CACHED: Message cache will cache messages and give preference to those queues with CACHED hint. • AUTO: Message cache does best effort based on available memory
retention_type	Specifies the type of retention. DBMS_AQ.DEQUEUE_TIME (default): The retention time starts after a subshard is dequeued by all the subscribers. If a new subscriber seeks back before or to this subshard, then the retention clock is reset.

285.2.16 SEEK_INPUT_T Type

This type specifies the seek input per shard.

Syntax

```
TYPE SEEK_INPUT_T IS RECORD(
               shard            binary_integer DEFAULT DBMS_AQ.ALL_SHARDS,
               priority         binary_integer DEFAULT DBMS_AQ.ALL_PRIORITIES,
               seek_msgid       raw(16)        DEFAULT NULL,
               seek_time        TIMESTAMP WITH TIME ZONE DEFAULT NULL
             );
```

Attributes

Table 285-12 SEEK_INPUT_T Attributes

Attribute	Description
shard	Shard identifier on which seek operation needs to be performed. Possible values are DBMS_AQ.ALL_SHARDS or a specific shard on which seek is to be performed If value is DBMS_AQ.ALL_SHARDS, then seek is performed on requested shards, otherwise it is performed on the specific shard mentioned in this field.
priority	Seek is performed on all priorities of the shard individually. If value is DBMS_AQ.ALL_PRIORITIES, then seek is performed on all priorities, otherwise it is performed on the specific priority mentioned in this field
seek_msgid	Input message id when seek_type is DBMS_AQ.MESSAGE.
seek_time	Specifies the input time when seek_type is DBMS_AQ.TIME.

285.2.17 SEEK_OUTPUT_T Type

This type specifies the seek output of a seek call.

Syntax

```
TYPE SEEK_OUTPUT_T IS RECORD(
           shard             binary_integer,
           priority          binary_integer,
           seeked_from       raw(16),
           seeked_to         raw(16));
```

Attributes

Table 285-13 SEEK_OUTPUT_T Attributes

Attribute	Description
shard	Specifies the shard identifier on which the seek operation is performed for the subscriber.
priority	Specifies the priority of the shard, which is applicable only for priority queues, else value is null.
seeked_from	Secifies the message id of dequeue position before seek. NULL value signifies seeking from end of shard.
seeked_to	Specifies the message id of dequeue position after seek. NULL value signifies seeking to end of shard.

285.2.18 SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
   priority         NUMBER,
   delay            NUMBER,
   expiration       NUMBER,
   correlation      VARCHAR2(128),
   attempts         NUMBER,
   exception_queue  VARCHAR2(51),
   enqueue_time     DATE,
   state            NUMBER,
   sender_id        aq$_agent,
   original_msgid   RAW(16),
   delivery_mode    NUMBER);
```

Parameters

Table 285-14 SYS.MSG_PROP_T Type Attributes

Parameter	Description
`priority`	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
`delay`	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by `msgid` overrides the delay specification. A message enqueued with delay set is in the `WAITING` state, and when the delay expires, the message goes to the `READY` state. `DELAY` processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: `NO_DELAY`: The message is available for immediate dequeuing number: The number of seconds to delay the message
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 285-14 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: • RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. • A message was not dequeued before the expiration time elapsed. • Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: • DBMS_AQ.READY: The message is ready to be processed. • DBMS_AQ.WAITING: The message delay has not yet been reached. • DBMS_AQ.PROCESSED: The message has been processed and is retained. • DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 285-14 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

285.2.19 MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

> **See Also:**
>
> AQ$_RECIPIENT_LIST_T Type

Syntax

```
TYPE message_properties_t IS RECORD (
   priority               BINARY_INTEGER  NOT NULL DEFAULT 1,
   delay                  BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,
   expiration             BINARY_INTEGER  NOT NULL DEFAULT NEVER,
   correlation            VARCHAR2(128)   DEFAULT NULL,
   attempts               BINARY_INTEGER,
   recipient_list         AQ$_RECIPIENT_LIST_T,
   exception_queue        VARCHAR2(61)    DEFAULT NULL,
   enqueue_time           DATE,
   state                  BINARY_INTEGER,
   sender_id              SYS.AQ$_AGENT   DEFAULT NULL,
   original_msgid         RAW(16)         DEFAULT NULL,
   signature              aq$_sig_prop    DEFAULT NULL,
   transaction_group      VARCHAR2(30)    DEFAULT NULL,
   user_property          SYS.ANYDATA     DEFAULT NULL
   delivery_mode          PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

Table 285-15 MESSAGE_PROPERTIES_T Attributes

Attribute	Description
`priority`	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
`delay`	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by `msgid` overrides the delay specification. A message enqueued with delay set is in the `WAITING` state, and when the delay expires, the message goes to the `READY` state. `DELAY` processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: `NO_DELAY`: The message is available for immediate dequeuing number: The number of seconds to delay the message
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
`recipient_list`	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the "AQ$_AGENT Type".

Table 285-15 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: • RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. • A message was not dequeued before the expiration time elapsed. • Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	The enqueue_time attribute specifies the time the message was enqueued. This value is always in Universal Coordinated Time (UTC), and is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: • DBMS_AQ.READY: The message is ready to be processed. • DBMS_AQ.WAITING: The message delay has not yet been reached. • DBMS_AQ.PROCESSED: The message has been processed and is retained. • DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 285-15 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.

285.2.20 MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by dbms_aq.enqueue_array and dbms_aq.dequeue_array calls to hold the set of message properties.

Each element in the payload_array should have a corresponding element in the MESSAGE_PROPERTIES_ARRAY_T VARRAY.

> **See Also:**
>
> "MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
   OF MESSAGE_PROPERTIES_T;
```

285.2.21 MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

286
DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- Overview
- Security Model
- Data Structures

Related Topics

- DBMS_DBFS_CONTENT
  The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

286.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

286.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

286.3 DBFS Content Interface Types —Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types

- DBMS_DBFS_CONTENT_CONTEXT_T Object Type
- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
- DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types

- DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
- DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
- DBMS_DBFS_CONTENT_RAW_T Table Type

286.3.1 DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
    AUTHID DEFINER
AS OBJECT (
    principal     VARCHAR2(32),
    acl           VARCHAR2(1024),
    owner         VARCHAR2(32),
    asof          TIMESTAMP,
    read_only     INTEGER);
```

Fields

Table 286-1 DBMS_DBFS_CONTENT_CONTEXT_T Fields

Field	Description
`principal`	File system user
`acl`	Access control list
`owner`	Path item owner
`asof`	Timestamp
`read_only`	Nonzero if the path item is read-only

286.3.2 DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
    AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);
```

Fields

Table 286-2 DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
`path`	Path to the path item
`item_name`	Name of the path item

Table 286-2 (Cont.) DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
item_type	Type of path item. (See Table 57-4

286.3.3 DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
    AUTHID DEFINER
AS OBJECT (
    propname     VARCHAR2(32),
    propvalue    VARCHAR2(1024),
    typecode     INTEGER);
```

Fields

Table 286-3 DBMS_DBFS_CONTENT_PROPERTY_T Fields

Field	Description
prop_name	Name of property
prop_value	Value of property
typecode	Property type (See Constants in DBMS_TYPES)

286.3.4 DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
    TABLE OF dbms_dbfs_content_list_item_t;
```

Related Topics

- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
  This type describes a type to assist in listing the contents of a directory.
- DBMS_DBFS_CONTENT
  The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

286.3.5 DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
    TABLE OF dbms_dbfs_content_property_t;
```

Related Topics

- DBMS_DBFS_CONTENT_PROPERTY_T Object Type
  This type describes a single (`name`, `value`, `typecode`) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

286.3.6 DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
    TABLE OF RAW(32767);
```

Related Topics

- DBMS_DBFS_CONTENT
  The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

287
Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE, XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprogams
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

287.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 287-1 URITYPE Type Subprograms

Method	Description
GETBLOB	Returns the `BLOB` located at the address specified by the URL.
GETCLOB	Returns the `CLOB` located at the address specified by the URL.

Table 287-1 (Cont.) URITYPE Type Subprograms

Method	Description
GETCONTENTTYPE	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETURL	Returns the URL, in non-escaped format, stored inside the `UriType` instance.
GETXML	Returns the `XMLType` located at the address specified by the URL.

287.1.1 UriType Supertype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `BLOB` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
  RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
  RETURN BLOB;
```

Table 287-2 UriType Supertype GETBLOB Parameters

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.
`csid`	`(IN)`	Character set id of the document. Must be a valid Oracle id and greater than `0`; otherwise returns an error

287.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 287-3 UriType Supertype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

287.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

287.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

287.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 287-4 UriType Supertype GETXML Parameters

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

287.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 287-5 HTTPURITYPE Type Subprorgams

Method	Description
CREATEURI	Creates an instance of HTTPURITYPE from the given URI.
GETBLOB	Returns the BLOB located at the address specified by the URL.
GETCLOB	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the UriType instance.
GETURL	Returns the URL, in non-escaped format, stored inside the UriType instance.
GETXML	Returns the XMLType located at the address specified by the URL
HTTPURITYPE	Creates an instance of HTTPURITYPE from the given URI.

287.2.1 HttpUriType Subtype CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN HTTPURITYPE;
```

Table 287-6 HttpUriType Subtype CREATEURI Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL; escaped format.

287.2.2 HttpUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

The subprograms of the URI Subtype ATTPURITYPE member subprogram GETBLOB are described below.

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getBlob()
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
  RETURN BLOB;
```

Table 287-7 HttpUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

287.2.3 HttpUriType Subtype GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the CLOB located at the address specified by the HTTP URL.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

Returns the CLOB located at the address specified by the HTTP URL and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 287-8 HttpUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

287.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function.

The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

287.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

287.2.7 HttpUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype HttpUriType member subprogram GETXML are described below.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 287-9 HttpUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
   url IN VARCHAR2);
```

Table 287-10 HttpUriType Subtype HTTPURITYPE Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

287.3 Summary of DBURITYPE Subtype Subprogams

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

Table 287-11 DBURITYPE Type Subprograms

Method	Description
CREATEURI	Constructs a DBURITYPE instance.
DBURITYPE	Creates an instance of DBURITYPE from the given URI.
GETBLOB	Returns the BLOB located at the address specified by the DBURITYPE instance.
GETCLOB	Returns the CLOB located at the address specified by the DBURITYPE instance.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the DBURITYPE instance.
GETURL	Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Table 287-11 (Cont.) DBURITYPE Type Subprograms

Method	Description
GETXML	Returns the XMLType located at the address specified by the URL

287.3.1 DBUriType Subtype CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN DBURITYPE;
```

Table 287-12 DBUriType Subtype CREATEURI Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid DBURITYPE.

287.3.2 DBUriType Subtype DBURITYPE

This constructs a DBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
   url IN varchar2);
```

Table 287-13 DBUriType Subtype DBURITYPE Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

287.3.3 DBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the URL.

The subprograms of the URI Subtype DBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
  RETURN BLOB;
```

Table 287-14 DBUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

287.3.4 DBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance.

If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the CLOB located at the address specified by the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

The following function returns the CLOB located at the address specified by the DBURITYPE instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
RETURN CLOB;
```

Table 287-15 DBUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

287.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBUri servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in Web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

287.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

287.3.8 DBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype DBPURITYPE member subprogram GETXML are described below. The options are described in the following table.

This function returns the XMLType located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 287-16 DBUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.4 Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 287-17 XDBURITYPE Type Subprograms

Method	Description
CREATEURI	Returns the UriType corresponding to the specified URL.
GETBLOB	Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCLOB	Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCONTENTTYPE	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL	Returns the URL, in escaped format, stored inside the XDBURITYPE instance.
GETURL	Returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.
GETXML	Returns the XMLType corresponding to the contents of the document specified by the URL.
XDBURITYPE	Creates an instance of XDBURITYPE from the given URI.

287.4.1 XDBUriType Subtype CREATEURI

This static function constructs a XDBURITYPE instance. It parses the given URL and creates a XDBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

287.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getBlob()
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
  RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

```
FUNCTION getBlob(csid IN NUMBER)
  RETURN BLOB;
```

Table 287-18 XDBUriType Subtype GETBLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

287.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.

Syntax

```
MEMBER FUNCTION getClob()
  RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the `XDBUriType` instance and the content type.

Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
  RETURN CLOB;
```

Table 287-19 XDBUriType Subtype GETCLOB Parameters

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

287.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

287.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

287.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

287.4.7 XDBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETXML are described below.The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

Syntax

```
MEMBER FUNCTION getXML()
  RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;
```

Table 287-20 XDBUriType Subtype GETXML Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

287.4.8 XDBUriType subtype XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
   url     IN   VARCHAR2,
   flags   IN   RAW := NULL)
 RETURN self AS RESULT;
```

Table 287-21 XDBUriType subtype XDBURITYPE Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: • 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. • 2 - Indicates that any errors during document retrieval should be suppressed • 3 - Both flag bits (1, 2) are enabled

287.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 287-22 URIFACTORY Type Subprograms

Method	Description
GETURI	Returns the correct URL handler for the given URL string.
ESCAPEURI	Returns a URL in escaped format.
UNESCAPEURI	Returns a URL in unescaped format.
REGISTERURLHANDLER	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER	Unregisters a URL handler.

287.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

```
FUNCTION getUri(
   url IN Varchar2)
RETURN UriType;
```

Table 287-23 UriFactory Package GETURI Parameters

Parameter	IN / OUT	Description
`uri`	`(IN)`	The URL string, in escaped format, containing a valid HTTP URL.

287.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this

reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the UriType.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Table 287-24 UriFactory Package ESCAPEURI Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in escaped format.

287.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Table 287-25 UriFactory Package UNESCAPEURI Parameters

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

287.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the UriType or one of its subtypes. It must also implement the createUri static member function. This function is called by the GETURI function to generate an instance of the type. The stripprefix parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
   prefix IN varchar2,
   schemaName IN varchar2,
   typename IN varchar2,
   ignoreCase IN boolean := true,
   stripprefix IN boolean := true);
```

Table 287-26 UriFactory Package REGISTERURLHANDLER Parameters

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to handle; for example, http://.
schemaName	(IN)	Name of the schema where the type resides; case sensitive.
typename	(IN)	The name of the type to handle the URL; case sensitive.
ignoreCase	(IN)	Ignore case when matching prefixes.
stripprefix	(IN)	Strip prefix before generating the instance of the type.

287.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as http://.

Syntax

```
PROCEDURE unregisterUrlHandler(
   prefix IN VARCHAR2);
```

Table 287-27 UriFactory Package UNREGISTERURLHANDLER Parameters

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

288

JMS Types

PL/SQL users can use the DBMS_AQ package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- Overview
- Security Model
- Java Versus PL/SQL Datatypes
- More on Bytes_ Stream and Map Messages
- Upcasting and Downcasting Between General and Specific Messages
- JMS Types Error Reporting
- Oracle JMS Type Constants
- JMS Types Error Reporting
- Oracle JMS Type Constants
- CONVERT_JMS_SELECTOR
- Summary of JMS Types

288.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the DBMS_AQ package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- aq$_jms_header
- aq$_jms_message
- aq$_jms_text_message
- aq$_jms_bytes_message
- aq$_jms_map_message
- aq$_jms_stream_message

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between aq$_jms_message and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

288.2 JMS Types Security Model

PUBLIC is granted EXECUTE privilege in these JMS types.

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

288.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as BYTE and SHORT, are not present in PL/SQL. PL/SQL type INT was chosen to represent these types. If a PL/SQL INT value intended to hold a Java BYTE or SHORT value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both VARCHAR2 and CLOB, but VARCHAR2 has a maximum limit of 4000 bytes. When retrieving TEXT data from map, stream, and bytes message types, a CLOB is always returned. When updating the map, stream and bytes message types, users can submit either a VARCHAR2 or CLOB.

Similarly, a Java BYTE ARRAY can be represented by both RAW and BLOB, with RAW having a maximum size of 32767. When retrieving BYTE ARRAY data from map, stream, and bytes message types, a BLOB is always returned. When updating the map, stream and bytes message types, users can submit either a RAW or BLOB.

>
> JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage

New JMS Support in Oracle Database 10*g*

In Oracle Database 10*g*, a new AQ$_JMS_VALUE ADT has been added in the SYS schema for OJMS PL/SQL users. It is specifically used to implement the read_object procedure of aq$_jms_stream_message and get_object procedure of

aq$_jms_map_message, to mimic the Java general object class Object. AQ$_JMS_VALUE ADT can represent any datatype that JMS StreamMessage and MapMessage can hold.

The collection ADT AQ$_JMS_NAMEARRAY was added for the getNames method of MapMessage. It holds an array of names.

In this release the ADT AQ$_JMS_EXCEPTION was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

288.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of AQ$_MAP_MESSAGE, AQ$_JMS_STREAM_MESSAGE, and AQ$_JMS_BYTES_MESSAGE types. These types have some common functionality that are different from AQ$_JMS_TEXT_MESSAGE type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the Jserv Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- aq$_jms_bytes_message
- aq$_jms_map_message
- aq$_jms_stream_message

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

> **Note:**
>
> It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

   This call also gives you an operation ID if you do not specify one.

2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

   For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.
- Stream and bytes messages

  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the Jserv static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is

why the read_bytes member procedure of aq$_bytes_message also requires a length parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods get_unsigned_byte and get_unsigned_short are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods read_string and write_string methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods read_utf and write_utf which support utf-8 encoding.

> **Note:**
>
> All data written by bytes messages use DataOutputStream as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9*i* Release 2 (9.2).

288.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT aq$_jms_message is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of aq$_jms_message by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an aq$_jms_message, you must first downcast it to a specific message type according to its message_type field

To populate an aq$_jms_message, you must first populate a specific message and upcast it to aq$_jms_message. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

288.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

Table 288-1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT; set_byte and set_short of aq$_jms_map_message ADT; write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.

288.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

DBMS_AQ Package Constants

`DBMS_AQ` package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

`SYS.DBMS_JMS_PLSQL` package constants are new in Oracle Database 10*g*.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE           CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT          CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER        CONSTANT PLS_INTEGER;
DATA_TYPE_LONG           CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT          CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE         CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN        CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER      CONSTANT PLS_INTEGER;
DATA_TYPE_STRING         CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES          CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE  CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
```

```
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION  CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;
```

288.8 CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
   selector IN VARCHAR2,
   dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(
   selector         IN  VARCHAR2,
   dest_pload_type  IN  PLS_INTEGER,
   compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

288.9 Summary of JMS Types

This lists shows the JMS types.

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

288.9.1 SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_MESSAGE AS OBJECT(
 header        aq$_jms_header,
 senderid      varchar2(100),
 message_type  INT,
 text_len      INT,
 bytes_len     INT,
 text_vc       varchar2(4000),
 bytes_raw     raw(2000),
 text_lob      clob,
 bytes_lob     blob,
 STATIC FUNCTION  construct (mtype      IN  INT)
   RETURN aq$_jms_message,
 STATIC FUNCTION  construct (text_msg   IN  aq$_jms_text_message)
   RETURN aq$_jms_message,

 MEMBER PROCEDURE get_text     (payload  OUT CLOB),
 MEMBER PROCEDURE get_bytes    (payload  OUT RAW),
 MEMBER PROCEDURE get_bytes    (payload  OUT BLOB));
```

CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.
The `mtype` parameter must be one of the following constants described in "Oracle JMS Type Constants":

```
DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE
```

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_jms_message;
Creates an `aq$_jms_message` from an `aq$_jms_bytes_message`.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;
Creates an `aq$_jms_message` from an `aq$_jms_stream_message`.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;
Creates an `aq$_jms_message` from an `aq$_jms_map_message`.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;
Creates an `aq$_jms_message` from an `aq$_jms_object_message`.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an `aq$_jms_message` to an `aq$_jms_bytes_message`. Returns an `aq$_jms_bytes_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_BYTES_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_BYTES_MESSAGE`.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an `aq$_jms_message` to an `aq$_jms_map_message`. Returns an `aq$_jms_map_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_MAP_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_MAP_MESSAGE`.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an `aq$_jms_message` to an `aq$_jms_object_message`. Returns an `aq$_jms_object_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_OBJECT_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_OBJECT_MESSAGE`.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an `aq$_jms_message` to an `aq$_jms_stream_message`. Returns an `aq$_jms_stream_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_STREAM_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_STREAM_MESSAGE`.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an `aq$_jms_message` to an `aq$_jms_text_message`. Returns an `aq$_jms_text_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_TEXT_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_TEXT_MESSAGE`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo`.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to `JMSType`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

288.9.2 SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT aq$_jms_text_message Function

```

CONSTRUCT aq$_jms_text_message Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty `aq$_jms_text_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR)
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

288.9.3 SYS.AQ$_JMS_BYTES_MESSAGE Type

The `SYS.AQ$_JMS_BYTES_MESSAGE` type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT aq$_jms_bytes_message Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```

```

CONSTRUCT aq$_jms_bytes_message Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty `aq$_jms_bytes_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the aq$_jms_bytes_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.
This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY or SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if

the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER
Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT
Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in

PL/SQL, PLS_INTEGER is used to represent a SHORT. Although PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1. The value false is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a byte to the bytes message. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a BYTE. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter offset is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises

exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-

only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

288.9.4 SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT aq$_jms_map_message Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_map_message AS object(
 header     aq$_jms_header,
 bytes_len  int,
 bytes_raw  raw(2000),
 bytes_lob  blob,
 STATIC FUNCTION  construct   RETURN aq$_jms_map_message,

  RETURN BOOLEAN);
```

CONSTRUCT aq$_jms_map_message Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty `aq$_jms_map_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in

the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW))
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte

array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB))
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored

procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.
The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.
Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned.Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception

ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

288.9.5 SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT aq$_jms_stream_message Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_stream_message AS object(

```

CONSTRUCT aq$_jms_stream_message Function

STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty `aq$_jms_stream_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in MESSAGE_ACCESS_READONLY mode.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to aq$_jms_stream_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.
This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either SYS.dbms_aqjms.READ_ONLY or SYS.dbms_aqjms.WRITE_ONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java

stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See Table 288-2 for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.
Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)
Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only

mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.
Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.
Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

288.9.6 SYS.AQ$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

Syntax

```
TYPE aq$_jms_object_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob);
```

288.9.7 SYS.AQ$_JMS_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

288.9.8 SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type      number(2),
 num_val   number,
 char_val  char(1),
 text_val  clob,
 bytes_val blob);
```

Table 288-2 AQ$_JMS_VALUE Type Fields and Java Fields

Type	Java Type	aq$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

288.9.9 SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
   id          number, -- Reserved and not used. Right now always return 0.
   exp_name    varchar(200),
   err_msg     varchar(500),
   stack       varchar(4000));
```

289

JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- JSON_ELEMENT_T Object Type
- JSON_OBJECT_T Object Type
- JSON_ARRAY_T Object Type
- JSON_SCALAR_T Object Type
- JSON_KEY_LIST Type

> **Note:**
>
> The time component in the `DATE` value of the `get_Date` function is truncated. If you want to preserve the time component, use `get_Timestamp` and then use `CAST AS DATE` to convert to a SQL date with the time component.

289.1 JSON_ELEMENT_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

Description

Note the following:

- To create an instance of JSON_ELEMENT_T, use the `parse` or `load` function. See the "Constructors" section below for details.
- You cannot create an empty JSON_ELEMENT_T instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a JSON_ELEMENT_T into a subtype (for example, JSON_OBJECT_T), you need to perform an explicit cast using TREAT AS. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

Constructors

You create a JSON_ELEMENT_T instance using the `parse` or `load` function. The `parse` function takes as input VARCHAR2, CLOB, or BLOB data, and returns a JSON_ELEMENT_T instance. Similarly, the `load` function takes JSON type as an input.

```
STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn CLOB)     RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB)     RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION load(jsn JSON)      RETURN JSON_Element_T,
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition. The input for the `load` function is a JSON type, therefore, no JSON syntax check is needed.

Serialization and Conversions

A `JSON_ELEMENT_T` instance (and all subtypes) can be serialized to a JSON string, converted to a JSON type or (if it is a scalar value) converted to a SQL value like Date or Number. Serialization is the inverse of the parse function: a string representation of the in-memory representation of the JSON data is being generated and returned as an appropriate SQL type.

The serialization and conversion functions are:

```
MEMBER FUNCTION to_String    RETURN VARCHAR2
MEMBER FUNCTION stringify    RETURN VARCHAR2

MEMBER FUNCTION to_Clob      RETURN CLOB
MEMBER FUNCTION to_Blob      RETURN BLOB
MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)

MEMBER FUNCTION to_Json      RETURN JSON

MEMBER FUNCTION to_Number    RETURN NUMBER
MEMBER FUNCTION to_Date      RETURN DATE
MEMBER FUNCTION to_Timestamp RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean   RETURN BOOLEAN
```

The FUNCTION stringify is synonym of to_String. It has the same functionality.

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be `NULL`.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp LOB.

`to_Blob` serializes to UTF8 format only.

Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN,
```

```
MEMBER FUNCTION is_Object         RETURN BOOLEAN
MEMBER FUNCTION is_Array          RETURN BOOLEAN
MEMBER FUNCTION is_Scalar         RETURN BOOLEAN
MEMBER FUNCTION is_String         RETURN BOOLEAN
MEMBER FUNCTION is_Number         RETURN BOOLEAN
MEMBER FUNCTION is_Boolean        RETURN BOOLEAN
MEMBER FUNCTION is_True           RETURN BOOLEAN
MEMBER FUNCTION is_False          RETURN BOOLEAN
MEMBER FUNCTION is_Null           RETURN BOOLEAN
MEMBER FUNCTION is_Date           RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp      RETURN BOOLEAN
MEMBER FUNCTION get_Size          RETURN NUMBER
```

The has function checks if a given name exists in the JSON_OBJECT_T object.

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that textual JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. You can use the JSON type to preserve dates and timestamps natively. The Document Object Model (DOM) interface enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a get call.

The default is to not raise an error but to return NULL instead.

You invoke `On_error` on a JSON_ELEMENT_T instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

Table 289-1 Values for the value Parameter in the ON_ERROR Procedure

Value	Description
0	Reset to the default behavior, which is to return NULL instead of raising an error.
1	Raise all errors.
2	Raise an error if no value is detected.

Table 289-1 (Cont.) Values for the value Parameter in the ON_ERROR Procedure

Value	Description
3	Raise an error if the data types do not match, for example, if you call GET_NUMBER on a string value.
4	Raise an error if the input is invalid, for example, if the array is out of bounds.

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of “a” is “xyz”, which cannot be converted to a number. If the `on_Error` procedure had not been called, then NULL would be returned, and no error would be raised.

```
declare
     jo JSON_OBJECT_T;
begin
     jo := JSON_OBJECT_T.parse('{a:"xyz"}');
     jo.On_error(1);
     dbms_output.put_line(jo.get_Number('a'));
end;
/
```

289.2 JSON_OBJECT_T Object Type

`JSON_OBJECT_T` is a subtype of the JSON_ELEMENT_T object type. It corresponds to the JSON object structure.

Constructors

You can create an empty JSON_OBJECT_T instance using the following constructor.

```
   CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON_OBJECT_T instance using one of the following `parse` functions:

```
STATIC FUNCTION parse(jsn VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn CLOB)     RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB)     RETURN JSON_OBJECT_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2) RETURN JSON_OBJECT_T
```

You can also create a JSON_OBJECT_T instance using one of the following constructors:

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Object_T(jsn BLOB, FORMAT IN VARCHAR2) RETURN SELF AS
RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn JSON) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```
MEMBER FUNCTION get(key VARCHAR2)           RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2)    RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2)    RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2)      RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(key VARCHAR2)   RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2)      RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2)      RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2)    RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2)     RETURN JSON_ARRAY_T
MEMBER FUNCTION get_Json(key NUMBER)        RETURN JSON

MEMBER PROCEDURE get_Json(key NUMBER, j OUT NOCOPY JSON)
MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

Note:

- The get function has reference semantics. This means that if the returned JSON_ELEMENT_T is modified, then the containing JSON_ELEMENT_T is also changed. See the Reference Semantics section below for details.
- The GET_STRING function converts the value to a string if it is not already a string. Thus, the GET_STRING function returns a non-null value even if IS_STRING returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what ON_ERROR is set to.

The GET_CLOB and GET_BLOB *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, EMPTY_LOB can be provided. If you use the GET_CLOB *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the GET_CLOB or GET_BLOB functions, which take no parameter and generates a temp LOB.

GET_BLOB serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```
MEMBER PROCEDURE put(key VARCHAR2, val JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, val VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, val BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, val DATE)
MEMBER PROCEDURE put(key VARCHAR2, val TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val JSON)
```

Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION has(key VARCHAR2)      RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Keys               RETURN JSON_KEY_LIST
```

The get_Keys function returns an object type of JSON_KEY_LIST, which is a varray of VARCHAR2(4000). The varray contains the names of keys in the JSON object. The get_Keys function returns at most 32767 field names for a given JSON object. An error is raised if it is applied to an object with more than 32767 fields.

The example below walks through the items of the varray to build a JSON_ARRAY_T object that contains all key names.

```
declare
  jo JSON_OBJECT_T;
  ja JSON_ARRAY_T;
  keys JSON_KEY_LIST;
  keys_string VARCHAR2(100);

begin
  ja := new JSON_ARRAY_T;
  jo := JSON_OBJECT_T.parse('{"name":"fred",
                             "jobTitle":"codemonkey",
                             "projects":["json", "xml"]}');
  keys := jo.get_keys;
  for i in 1..keys.count loop
     ja.append(keys(i));
  end loop;

  keys_string := ja.to_string;
  dbms_output.put_line(keys_string);
end;
/
```

The output is:

```
["name","jobTitle","projects"]
```

Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

```
MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)
```

Duplicate key names are not supported and will raise an error.

Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_OBJECT_T
```

Reference Semantics

Calling the `get` function that returns a JSON_ELEMENT_T object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
  data    JSON_OBJECT_T;
  address JSON_OBJECT_T;
  zip     number;

begin

  data := new JSON_OBJECT_T('{
    "first": "John",
    "last": "Doe",
    "address": {
        "country": "USA",
        "zip": "94065"
    }
  }');

  address := data.get_object('address');
  dbms_output.put_line(address.to_string);

  -- 1) VALUE SEMANTICS for scalar values
  -- (changing the value has no effect on container)
  zip := address.get_number('zip');
  dbms_output.put_line(zip);
  zip := 12345;
  dbms_output.put_line(zip);
  -- address is still the same
  dbms_output.put_line(address.to_string);

  -- 2) REFERENCE SEMANTICS for complex values
  --    'address' is a reference to the complex address values inside 'data'
  address.put('zip', 12345);
  address.put('street', 'Detour Road');
  dbms_output.put_line(data.to_string);
end;
/
```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address with have no effect on the value of the ‘data’ containing object.

Update Example

The following example updates the price of an item by 10%.

```
WITH
  FUNCTION updatePrice(jsonTxt in VARCHAR2 ) RETURN VARCHAR2 IS
  jo JSON_OBJECT_T;
  oldPrice NUMBER;

  BEGIN
    jo := new JSON_OBJECT_T(jsonTxt);
    oldPrice := jo.get_number('price');
    jo.put('price', oldPrice * 1.1);
    RETURN jo.to_string();
  END;
SELECT updatePrice(col)
FROM   t1;
```

289.3 JSON_ARRAY_T Object Type

JSON_ARRAY_T is a subtype of the JSON_ELEMENT_T object type. JSON_ARRAY_T corresponds to the JSON array structure.

Constructors

You can create an empty JSON_ARRAY_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT
```

You can create a JSON_ARRAY_T instance using one the following parse functions:

```
STATIC FUNCTION parse(jsn VARCHAR2)                  RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn CLOB)                      RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB)                      RETURN JSON_ARRAY_T
STATIC FUNCTION parse(jsn BLOB, FORMAT IN VARCHAR2)  RETURN JSON_ARRAY_T
```

You can also create a JSON_ARRAY_T instance using one the following constructors:

```
CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

```
MEMBER FUNCTION get(pos NUMBER)           RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(pos NUMBER)    RETURN VARCHAR2
MEMBER FUNCTION get_Number(pos NUMBER)    RETURN NUMBER
MEMBER FUNCTION get_Date(pos NUMBER)      RETURN DATE
MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(pos NUMBER)   RETURN BOOLEAN
MEMBER FUNCTION get_Clob(pos NUMBER)      RETURN CLOB
MEMBER FUNCTION get_Blob(pos NUMBER)      RETURN BLOB
```

```
MEMBER FUNCTION get_Json(pos NUMBER)      RETURN JSON

MEMBER PROCEDURE get_Json(pos NUMBER, j IN OUT NOCOPY JSON)
MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned JSON_ELEMENT_T is modified, then the containing JSON_ELEMENT_T is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a `CLOB` or `BLOB` as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new `CLOB` will be created implicitly. The input `LOB` cannot be NULL. If you do not want to create a `BLOB` or `CLOB` first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```
MEMBER PROCEDURE put(pos NUMBER, val VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val JSON, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, val TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(val JSON_ELEMENT_T)
MEMBER PROCEDURE append(val VARCHAR2)
MEMBER PROCEDURE append(val NUMBER)
MEMBER PROCEDURE append(val BOOLEAN)
MEMBER PROCEDURE append(val DATE)
MEMBER PROCEDURE append(val JSON)
MEMBER PROCEDURE append(val TIMESTAMP)
MEMBER PROCEDURE append_Null
```

Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_ARRAY_T
```

289.4 JSON_SCALAR_T Object Type

`JSON_SCALAR_T` is a subtype of the `JSON_ELEMENT_T` object type.

Description

A `JSON_SCALAR_T` instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from `JSON_ELEMENT_T`. You cannot create an instance of this type directly.

289.5 JSON_KEY_LIST Type

`JSON_KEY_LIST` is a varray of `VARCHAR2(4000)`.

Description

This type is used by the `get_Keys` function in the JSON_OBJECT_T Object Type.

290

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- Overview
- Security Model
- Summary of Logical Change Record Types
- Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

290.1 Logical Change Record TYPEs Overview

In Replication (Oracle GoldenGate and XStream), logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Replication (Oracle GoldenGate and XStream), the capture process captures changes in the form of LCRs and enqueues them into a queue. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

290.2 Logical Change Record Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

290.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

Table 290-1 Logical Change Record (LCR) Types

Type	Description
LCR$_DDL_RECORD Type	Represents a data definition language (DDL) change to a database object
LCR$_ROW_RECORD Type	Represents a data manipulation language (DML) change to a database object
LCR$_ROW_LIST Type	Identifies a list of column values for a row in a table
LCR$_ROW_UNIT Type	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- `DBMS_APPLY_ADM`

- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

290.3.1 LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

> **Note:**
>
> - When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
> - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR$_DDL_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   object_type           IN  VARCHAR2,
   ddl_text              IN  CLOB,
   logon_user            IN  VARCHAR2,
   current_schema        IN  VARCHAR2,
   base_table_owner      IN  VARCHAR2,
   base_table_name       IN  VARCHAR2,
   tag                   IN  RAW       DEFAULT NULL,
   transaction_id        IN  VARCHAR2  DEFAULT NULL,
   scn                   IN  NUMBER    DEFAULT NULL,
   position              IN  RAW       DEFAULT NULL,
   edition_name          IN  VARCHAR2  DEFAULT NULL,
   root_name             IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR$_DDL_RECORD Constructor Function Parameters

Table 290-2 Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
`source_database_name`	The database where the DDL statement occurred If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify `DBS1` and the local domain is `EXAMPLE.COM`, then the function specifies `DBS1.EXAMPLE.COM` automatically. Set this parameter to a non-`NULL` value.

`command_type`	The type of command executed in the DDL statement
	Set this parameter to a non-`NULL` value.
	See Also: The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types
	The following command types *are not supported* in DDL LCRs:
	`ALTER MATERIALIZED VIEW`
	`ALTER MATERIALIZED VIEW LOG`
	`ALTER SUMMARY`
	`CREATE SCHEMA`
	`CREATE MATERIALIZED VIEW`
	`CREATE MATERIALIZED VIEW LOG`
	`CREATE SUMMARY`
	`DROP MATERIALIZED VIEW`
	`DROP MATERIALIZED VIEW LOG`
	`DROP SUMMARY`
	`RENAME`
	The snapshot equivalents of the materialized view command types are also not supported.

`object_owner`	The user who owns the object on which the DDL statement was executed
`object_name`	The database object on which the DDL statement was executed

Table 290-2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
object_type	The type of object on which the DDL statement was executed The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.
ddl_text	The text of the DDL statement Set this parameter to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text. Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.
base_table_name	If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR.

Table 290-2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. **See Also:** *Oracle Database XStream Guide*
edition_name	The name of the edition in which the DDL statement was executed
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR$_DDL_RECORD Subprograms

Table 290-3 LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
EXECUTE Member Procedure	Executes the LCR under the security domain of the current user
GET_BASE_TABLE_NAME Member Function	Gets the base (dependent) table name
GET_BASE_TABLE_OWNER Member Function	Gets the base (dependent) table owner
GET_CURRENT_SCHEMA Member Function	Gets the default schema (user) name
GET_DDL_TEXT Member Procedure	Gets the DDL text in a CLOB
GET_EDITION_NAME Member Function	Gets the name of the edition in which the DDL statement was executed
GET_LOGON_USER Member Function	Gets the logon user name
GET_OBJECT_TYPE Member Function	Gets the type of the object involved for the DDL
SET_BASE_TABLE_NAME Member Procedure	Sets the base (dependent) table name
SET_BASE_TABLE_OWNER Member Procedure	Sets the base (dependent) table owner
SET_CURRENT_SCHEMA Member Procedure	Sets the default schema (user) name
SET_DDL_TEXT Member Procedure	Sets the DDL text
SET_EDITION_NAME Member Procedure	Sets the name of the edition in which the DDL statement was executed
SET_LOGON_USER Member Procedure	Sets the logon user name
SET_OBJECT_TYPE Member Procedure	Sets the object type
Common Subprograms	See "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" for a list of subprograms common to the SYS.LCR$_ROW_RECORD and SYS.LCR$_DDL_RECORD types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

Syntax

```
MEMBER PROCEDURE EXECUTE;
```

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a `CLOB`.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text   CLOB;
BEGIN
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

> **Note:**
>
> `GET_DDL_TEXT` is a member procedure and not a member function to make it easier for you to manage the space used by the `CLOB`. Notice that the previous example creates temporary space for the `CLOB` and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(
  ddl_text  IN/OUT  CLOB);
```

Parameter

Table 290-4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
`ddl_text`	The DDL text in the DDL LCR

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

> **See Also:**
>
> *Oracle Database Development Guide*

Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name  IN  VARCHAR2);
```

Parameter

Table 290-5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
   base_table_owner  IN  VARCHAR2);
```

Parameter

Table 290-6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
base_table_owner	The name of the base table owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
   current_schema  IN  VARCHAR2);
```

Parameter

Table 290-7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
current_schema	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
   ddl_text  IN  CLOB);
```

Parameter

Table 290-8 SET_DDL_TEXT Procedure Parameter

Parameter	Description
`ddl_text`	The DDL text Set this parameter to a non-`NULL` value.

SET_EDITION_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

> **See Also:**
>
> *Oracle Database Development Guide*

Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(
   edition_name  IN  VARCHAR2);
```

Parameter

Table 290-9 SET_EDITION_NAME Procedure Parameter

Parameter	Description
`edition_name`	Name of the edition

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
   logon_user  IN  VARCHAR2);
```

Parameter

Table 290-10 SET_LOGON_USER Procedure Parameter

Parameter	Description
`logon_user`	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
   object_type  IN  VARCHAR2);
```

Parameter

Table 290-11 SET_OBJECT_TYPE Procedure Parameter

Parameter	Description

`object_type`	The object type
	The following are valid object types:
	`CLUSTER`
	`FUNCTION`
	`INDEX`
	`LINK`
	`OUTLINE`
	`PACKAGE`
	`PACKAGE BODY`
	`PROCEDURE`
	`SEQUENCE`
	`SYNONYM`
	`TABLE`
	`TRIGGER`
	`TYPE`
	`USER`
	`VIEW`
	`LINK` represents a database link.
	`NULL` is also a valid object type. Specify `NULL` for all object types not listed. The `GET_OBJECT_TYPE` member procedure returns `NULL` for object types not listed.

290.3.2 LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the `LCR$_ROW_LIST` type.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 20c. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

> **Note:**
>
> - When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
> - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

> **See Also:**
>
> LCR$_ROW_LIST Type

LCR$_ROW_RECORD Constructor

Creates a `SYS.LCR$_ROW_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   tag                   IN  RAW                DEFAULT NULL,
   transaction_id        IN  VARCHAR2           DEFAULT NULL,
   scn                   IN  NUMBER             DEFAULT NULL,
   old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   position              IN  RAW                DEFAULT NULL,

   statement             IN  VARCHAR2           DEFAULT NULL,

   bind_variables        IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,

   bind_by_position      IN  VARCHAR2           DEFAULT 'N',

   root_name             IN  VARCHAR2           DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

LCR$_ROW_RECORD Constructor Function Parameters

Table 290-12 Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
source_database_name	The database where the row change occurred If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.
command_type	The type of command executed in the DML statement Set this parameter to a non-NULL value. Valid values are the following: INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection. If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty. If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty. If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.
object_owner	The user who owns the table on which the row change occurred Set this parameter to a non-NULL value.
object_name	The table on which the DML statement was executed Set this parameter to a non-NULL value.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record was written to the redo log The SCN value is meaningless for a user-created LCR.

Table 290-12 (Cont.) Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
old_values	The column values for the row before the DML change If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.
new_values	The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. **See Also:** *Oracle Database XStream Guide*
statement	This parameter is reserved for internal use only.
bind_variables	This parameter is reserved for internal use only.
bind_by_position	This parameter is reserved for internal use only.
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

Summary of LCR$_ROW_RECORD Subprograms

Table 290-13 LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
ADD_COLUMN Member Procedure	Adds the value as old or new, depending on the value type specified, for the column
CONVERT_LONG_TO_LOB_CHUNK Member Procedure	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
DELETE_COLUMN Member Procedure	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
EXECUTE Member Procedure	Executes the LCR under the security domain of the current user
GET_JSON_INFORMATION Member Function	Gets JSON information.
GET_LOB_INFORMATION Member Function	Gets the LOB information for the column
GET_LOB_OFFSET Member Function	Gets the LOB offset for the specified column

Table 290-13 (Cont.) LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
GET_LOB_OPERATION_SIZE Member Function	Gets the operation size for the LOB column
GET_LONG_INFORMATION Member Function	Gets the LONG information for the column
GET_ROW_TEXT Member Procedure	Gets the SQL statement for the change that is encapsulated in the LCR
GET_VALUE Member Function	Gets the old or new value for the specified column, depending on the value type specified
GET_VALUES Member Function	Gets a list of old or new values, depending on the value type specified
GET_WHERE_CLAUSE Member Procedure	Gets a WHERE clause for the change that is encapsulated in the row LCR
GET_XML_INFORMATION Member Function	Gets the XML information for the specified column
IS_STATEMENT_LCR Member Function	Reserved for internal use only
KEEP_COLUMNS Member Procedure	Keeps a list of columns a row LCR
RENAME_COLUMN Member Procedure	Renames a column in an LCR
SET_JSON_INFORMATION Member Procedure	Sets the JSON information for a column.
SET_LOB_INFORMATION Member Procedure	Sets LOB information for the column
SET_LOB_OFFSET Member Procedure	Sets the LOB offset for the specified column
SET_LOB_OPERATION_SIZE Member Procedure	Sets the operation size for the LOB column
SET_ROW_TEXT Member Procedure	Reserved for internal use only
SET_VALUE Member Procedure	Overwrites the value of the specified column
SET_VALUES Member Procedure	Replaces the existing old or new values for the LCR, depending on the value type specified
SET_XML_INFORMATION Member Procedure	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD for a list of subprograms common to the SYS.LCR$_ROW_RECORD and SYS.LCR$_DDL_RECORD types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

> **Note:**
>
> To set a column value that already exists, run SET_VALUE.

> **See Also:**
>
> SET_VALUE Member Procedure

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

> **Note:**
>
> - Database compatibility must be `10.2.0` or higher to use LOB assembly.
> - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
> - When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 290-14 ADD_COLUMN Procedure Parameters

Parameter	Description
`value_type`	The type of value to add for the column Specify `old` to add the old value of the column. Specify `new` to add the new value of the column.

Table 290-14 (Cont.) ADD_COLUMN Procedure Parameters

Parameter	Description
column_name	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
column_value	The value of the column If NULL, then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A NULL column value can be specified by encapsulating the NULL value in an ANYDATA wrapper.

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure can change the operation code from LONG WRITE to LOB WRITE for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
   column_name  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 290-15 DELETE_COLUMN Procedure Parameters

Parameter	Description
`column_name`	The column name An error is raised if the column does not exist in the LCR.
`value_type`	The type of value to delete for the column Specify `old` to delete the old value of the column. Specify `new` to delete the new value of the column. If `*` is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

> **Note:**
>
> Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
   conflict_resolution  IN  BOOLEAN);
```

Parameters

Table 290-16 EXECUTE Procedure Parameters

Parameter	Description
conflict_resolution	If TRUE, then any conflict resolution defined for the table using the SET_UPDATE_CONFLICT_HANDLER procedure in the DBMS_APPLY_ADM package is used to resolve conflicts resulting from the execution of the LCR. If FALSE, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to NULL.

GET_JSON_INFORMATION Member Function

Gets JSON information.

The return value can be one of the following:

```
DBMS_LCR.NOT_OSON CONSTANT NUMBER := 1;
DBMS_LCR.OSON_DOC CONSTANT NUMBER := 2;
```

> **Note:**
>
> OSON is Oracle binary format for JSON column.

They represent either a column not containing OSON data or full OSON document.

Syntax

```
MEMBER FUNCTION GET_JSON_INFORMATION(
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 290-17 GET_JSON_INFORMATION Member Function Parameter

Parameter	Description
column_name	Name of column to obtain JSON information.

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 290-18 GET_LOB_INFORMATION Function Parameters

Parameter	Description
`value_type`	The type of value to return for the column, either `old` or `new`
`column_name`	The name of the column
`use_old`	If `Y` and `value_type` is `new`, and no new value exists, then the function returns the corresponding old value. If `N` and `value_type` is `new`, then the function does not return the old value if no new value exists. If `value_type` is `old` or if the `command_type` of the row LCR is not `UPDATE`, then the function ignores the value of the `use_old` parameter. `NULL` is not a valid specification for the `use_old` parameter.

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-`NULL` value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is `DBMS_LCR.LAST_LOB_CHUNK` or `DBMS_LCR.LOB_CHUNK`
- The command type is `LOB ERASE` or `LOB WRITE`

Otherwise, returns `NULL`.

Syntax

```
GET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 290-19 GET_LOB_OFFSET Function Parameters

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameters

Table 290-20 GET_LOB_OPERATION_SIZE Function Parameters

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG         CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG          CONSTANT NUMBER := 2;
```

```
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 290-21 GET_LONG_INFORMATION Function Parameters

Parameter	Description
`value_type`	The type of value to return for the column, either `old` or `new`
`column_name`	The name of the column
`use_old`	If `Y` and `value_type` is `new`, and no new value exists, then the function returns the corresponding old value. If `N` and `value_type` is `new`, then the function does not return the old value if no new value exists. If `value_type` is `old` or if the `command_type` of the row LCR is not `UPDATE`, then the function ignores the value of the `use_old` parameter. `NULL` is not a valid specification for the `use_old` parameter.

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text         IN/OUT  CLOB,
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

> **See Also:**
>
> "LCR$_ROW_LIST Type"

Parameters

Table 290-22 GET_ROW_TEXT Procedure Parameters

Parameter	Description
`row_text`	The SQL statement for the change that is encapsulated in the LCR
`variable_list`	The values for the bind variables in the order of the bind variables
`bind_var_syntax`	The syntax for the bind variables One of the following values is valid: • Specify `:`, the default, for bind values to be in the form `:1`, `:2`, and so on. • Specify ? for bind values to be in the form ?.

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 290-23 GET_VALUE Function Parameters

Parameter	Description
`value_type`	The type of value to return for the column Specify `old` to get the old value for the column. Specify `new` to get the new value for the column.
`column_name`	The column name If the column is present and has a `NULL` value, then the function returns an `ANYDATA` instance containing a `NULL` value. If the column value is absent, then the function returns a `NULL`.

Table 290-23 (Cont.) GET_VALUE Function Parameters

Parameter	Description
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
   value_type  IN  VARCHAR2,
   use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 290-24 GET_VALUES Function Parameters

Parameter	Description
value_type	The type of values to return Specify old to return a list of old values. Specify new to return a list of new values.
use_old	If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values. If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by GET_WHERE_CLAUSE instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Therefore, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the hr.departments table:

```
INSERT INTO hr.departments (
   department_id, department_name, manager_id, location_id)
   VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE executes. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the hr.departments table:

```
UPDATE hr.departments SET department_name='Management'
 WHERE department_name='Administration' AND location_id = 20 AND
       manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause  IN/OUT  CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause     IN/OUT  CLOB,
```

```
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

> **See Also:**
>
> LCR$_ROW_LIST Type

Parameters

Table 290-25 GET_WHERE_CLAUSE Procedure Parameters

Parameter	Description
`where_clause`	The `WHERE` clause of the SQL statement for the change that is encapsulated in the LCR
`variable_list`	The values for the bind variables in the order of the bind variables
`bind_var_syntax`	The syntax for the bind variables One of the following values is valid: • Specify `:`, the default, for bind values to be in the form `:1`, `:2`, and so on. • Specify ? for bind values to be in the form ?.

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML   CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;

DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

`DBMS_LCR.NOT_XML` indicates that the column is not an `XMLType` column.

`DBMS_LCR.XML_DOC` indicates that the column contains an XML document.

`DBMS_LCR.XML_DIFF` indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

`DBMS_LCR.XML_DIFF` indicates that the column contains differences between old and new XML documents for an update operation.

Returns `NULL` if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameter

Table 290-26 GET_XML_INFORMATION Function Parameter

Parameter	Description
column_name	The column name

IS_STATEMENT_LCR Member Function

This function is reserved for internal use only.

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
   column_list  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 290-27 KEEP_COLUMNS Procedure Parameters

Parameter	Description
column_list	The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns Specify old to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify new to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If * is specified, then the procedure keeps both the old and the new columns.

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 290-28 RENAME_COLUMN Procedure Parameters

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_JSON_INFORMATION Member Procedure

Sets the JSON information for a column.

Syntax

```
MEMBER PROCEDURE SET_JSON_INFORMATION(
  self             IN OUT NOCOPY LCR$_ROW_RECORD,
  value_type       IN VARCHAR2,
  column_name      IN  VARCHAR2,
  json_information IN NUMBER);
```

Parameters

Table 290-29 SET_JSON_INFORMATION Procedure Parameters

Parameter	Description
self	
value_type	The type of value to set for the column. The supported values are: • NEW • OLD
column_name	The name of the column. An exception is raised if the column does not exists in the LCR.
json_information	The supported values are: • DBMS_LCR.NOT_OSON • DBMS_LCR.OSON_DOC

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

> **Note:**
>
> When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type       IN  VARCHAR2,
  column_name      IN  VARCHAR2,
  lob_information  IN  NUMBER);
```

Parameters

Table 290-30 SET_LOB_INFORMATION Procedure Parameters

Parameter	Description
`value_type`	The type of value to set for the column, either `old` or `new` Specify `old` only if `lob_information` is set to `DBMS_LCR.NOT_A_LOB`.
`column_name`	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.

`lob_information`	Specify one of the following values:
	`DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;`
	`DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;`
	`DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;`
	`DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;`
	`DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;`
	`DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;`

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns.

> **Note:**
>
> When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   lob_offset   IN  NUMBER);
```

Parameters

Table 290-31 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

> **Note:**
>
> When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type          IN  VARCHAR2,
  column_name         IN  VARCHAR2,
  lob_operation_size  IN  NUMBER);
```

Parameters

Table 290-32 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The name of the LOB column An exception is raised if the column value does not exist in the LCR.
lob_operation_size	If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.

SET_ROW_TEXT Member Procedure

This procedure is reserved for internal use only.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

> **Note:**
>
> To add a column to a row LCR, run `ADD_COLUMN`.

> **See Also:**
>
> ADD_COLUMN Member Procedure

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value an `XMLType` column, specify the `XMLType` for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` column is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `11.1.0` or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 290-33 SET_VALUE Procedure Parameters

Parameter	Description
value_type	The type of value to set Specify old to set the old value of the column. Specify new to set the new value of the column.
column_name	The column name An error is raised if the specified column_value does not exist in the LCR for the specified column_type.
column_value	The new value of the column If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), then you can use this member procedure in the handler procedure. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

> **Note:**
>
> - Database compatibility must be `10.2.0` or higher to use LOB assembly.
> - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
> - When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

> **Note:**
>
> - Database compatibility must be `11.1.0` or higher to process row LCRs with `XMLType` columns.
> - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
   value_type  IN  VARCHAR2,
   value_list  IN  SYS.LCR$_ROW_LIST);
```

Parameters

Table 290-34 SET_VALUES Procedure Parameters

Parameter	Description
value_type	The type of values to replace Specify old to replace the old values. Specify new to replace the new values.
value_list	List of values to replace the existing list Use a NULL or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
   column_name      IN  VARCHAR2,
   xml_information  IN  NUMBER);
```

Parameters

Table 290-35 SET_XML_INFORMATION Procedure Parameters

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.

xml_information	Specify one of the following values:
	`DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;`
	`DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;`
	`DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;`
	`DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;`
	DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.
	DBMS_LCR.XML_DOC indicates that the column contains an XML document.
	DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.
	DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

290.3.3 Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

These functions and procedures are common to both the `LCR$_DDL_RECORD` and `LCR$_ROW_RECORD` type.

> **See Also:**
>
> For descriptions of the subprograms for these types that are exclusive to each type:
>
> - "LCR$_DDL_RECORD Type"
> - "LCR$_ROW_RECORD Type"

Table 290-36 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_COMMAND_TYPE Member Function	Gets the command type of the logical change record (LCR)
GET_COMMIT_SCN Member Function	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
GET_COMMIT_SCN_FROM_POSITION Static Function	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
GET_COMMIT_TIME	Gets the commit time of the transaction to which the current LCR belongs
GET_COMPATIBLE Member Function	Gets the minimal database compatibility required to support the LCR
GET_EXTRA_ATTRIBUTE Member Function	Gets the value for the specified extra attribute in the LCR
GET_OBJECT_NAME Member Function	Gets the name of the object that is changed by the LCR
GET_OBJECT_OWNER Member Function	Gets the owner of the object that is changed by the LCR
GET_POSITION Member Function	Gets the position of the current LCR
GET_ROOT_NAME Member Function	Gets the global name of the root for a CDB.
GET_SCN Member Function	Gets the SCN of the LCR
GET_SCN_FROM_POSITION Static Function	Gets the SCN from the input position, which is generated by an XStream outbound server
GET_SOURCE_DATABASE_NAME Member Function	Gets the source database name.
GET_SOURCE_TIME Member Function	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
GET_TAG Member Function	Gets the tag for the LCR
GET_THREAD_NUMBER Member Function	Gets the thread number of the database instance that made the change that is encapsulated in the LCR

Table 290-36 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
GET_TRANSACTION_ID Member Function	Gets the transaction identifier of the LCR
IS_NULL_TAG Member Function	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
SET_COMMAND_TYPE Member Procedure	Sets the command type in the LCR
SET_EXTRA_ATTRIBUTE Member Procedure	Sets the value for the specified extra attribute in the LCR
SET_OBJECT_NAME Member Procedure	Sets the name of the object that is changed by the LCR
SET_OBJECT_OWNER Member Procedure	Sets the owner of the object that is changed by the LCR
SET_ROOT_NAME Member Procedure	Sets the global name of the root in a CDB.
SET_SOURCE_DATABASE_NAME Member Procedure	Sets the source database name of the object that is changed by the LCR
SET_TAG Member Procedure	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

> **See Also:**
>
> The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
   position  IN  RAW)
RETURN NUMBER;
```

Parameters

Table 290-37 GET_COMMIT_SCN_FROM_POSITION Function Parameter

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You can use the following functions in the DBMS_STREAMS package for constant compatibility return values:

- The COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
- The COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.
- The COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.
- The COMPATIBLE_11_2 function returns DBMS_STREAMS.COMPATIBLE_11_2 constant.
- The MAX_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

See Also:

- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also:

INCLUDE_EXTRA_ATTRIBUTE Procedure

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
   attribute_name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 290-38 GET_EXTRA_ATTRIBUTE Function Parameter

Parameter	Description
attribute_name	The name of the extra attribute to return Valid names are: • row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. • serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. • session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. • thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. • tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. • username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_ROOT_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
   position  IN  RAW)
RETURN NUMBER;
```

Parameters

Table 290-39 GET_SCN_FROM_POSITION Function Parameter

Parameter	Description
`position`	The position You can obtain the position by using the `GET_POSITION` member function or by querying the `DBA_XSTREAM_OUTBOUND_PROGRESS` data dictionary view.

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

> **See Also:**
>
> *Oracle Real Application Clusters Administration and Deployment Guide*

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`.

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

> **See Also:**
>
> - The description of the `command_type` parameter in LCR$_DDL_RECORD Constructor Function Parameters
> - The description of the command_type parameter in LCR$_ROW_RECORD Type
> - The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
   command_type  IN  VARCHAR2);
```

Parameter

Table 290-40 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
command_type	The command type Set this parameter to a non-NULL value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

> **See Also:**
>
> INCLUDE_EXTRA_ATTRIBUTE Procedure

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  ANYDATA);
```

Parameters

Table 290-41 SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
attribute_name	The name of the extra attribute to set Valid names are: • row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2. • serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. • session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. • thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. • tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. • username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user
attribute_value	The value to which the specified extra attribute is set If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
   object_name  IN  VARCHAR2);
```

Parameter

Table 290-42 SET_OBJECT_NAME Procedure Parameter

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
   object_owner  IN  VARCHAR2);
```

Parameter

Table 290-43 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
object_owner	The schema that contains the object

SET_ROOT_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
   root_name  IN  VARCHAR2);
```

Parameter

Table 290-44 SET_ROOT_NAME Procedure Parameter

Parameter	Description
root_name	The global name of the root.

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
   source_database_name  IN  VARCHAR2);
```

Parameter

Table 290-45 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

Syntax

```
MEMBER PROCEDURE SET_TAG(
   tag  IN  RAW);
```

Parameter

Table 290-46 SET_TAG Procedure Parameter

Parameter	Description
`tag`	The binary tag for the LCR The size limit for a tag value is two kilobytes.

290.3.4 LCR$_ROW_LIST Type

This type identifies a list of column values for a row in a table.

It uses the `LCR$_ROW_UNIT` type and is used in the `LCR$_ROW_RECORD` type.

> **See Also:**
>
> - LCR$_ROW_UNIT Type
> - LCR$_ROW_RECORD Type

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

290.3.5 LCR$_ROW_UNIT Type

This type identifies the value for a column in a row.

It is used in the `LCR$_ROW_LIST` type.

> **See Also:**
>
> LCR$_ROW_LIST Type

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name         VARCHAR2(4000),
  data                ANYDATA,
  lob_information     NUMBER,
  lob_offset          NUMBER,
  lob_operation_size  NUMBER
  long_information    NUMBER);
/
```

Attributes

Table 290-47 LCR$_ROW_UNIT Attributes

Attribute	Description
column_name	The name of the column
data	The data contained in the column

lob_information	Contains the LOB information for the column and contains one of the following values:
	`DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;`
	`DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;`
	`DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;`
	`DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;`
	`DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;`
	`DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;`

lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.

long_information	Contains the LONG information for the column and contains one of the following values:
	`DBMS_LCR.not_a_long CONSTANT NUMBER := 1;`
	`DBMS_LCR.null_long CONSTANT NUMBER := 2;`
	`DBMS_LCR.inline_long CONSTANT NUMBER := 3;`
	`DBMS_LCR.long_chunk CONSTANT NUMBER := 4;`
	`DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;`

291
MGD_ID Package Types

The MGD_ID package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The MGD_ID package contains several predefined types.

> **See Also:**
>
> *Oracle Database Development Guide* for more information.

This chapter contains the following topics:

- Security Model
- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

291.1 MGD_ID Package Types Security Model

You must run the catmgd.sql script to load the DBMS_MGD_ID_UTL package and create the required Identity Code Package schema objects in the MGDSYS schema.

MGD_ID is a MGDSYS-owned object type. Any MGD_ID subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the MGD_ID object type and its subprograms.

EXECUTE privilege is granted to PUBLIC for this ADT: MGD_ID.

A public synonym, by the same name, is created for this ADT: MGD_ID.

291.2 Summary of Types

This table lists and briefly describes the MGD_ID Package object types.

Table 291-1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

291.2.1 MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
MGD_ID_COMPONENT as object (name  VARCHAR2(256),
                            value VARCHAR2(1024));
```

Attributes

Table 291-2 MGD_ID_COMPONENT Attributes

Attribute	Description
name	Name of component
value	Value of the component as a character

Examples

See the MGD_ID Constructor Function for an example.

291.2.2 MGD_ID_COMPONENT_VARRAY Object Type

The MGD_ID_COMPONENT_VARRAY type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Examples

See the MGD_ID Constructor Function for an example.

291.2.3 MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
MGD_ID as object (category_id  VARCHAR2(256),
                  components   MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 291-3 MGD_ID Object Type Attributes

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

Methods

Table 291-5 describes the methods of the MGD_ID object type.

Table 291-4 MGD_ID Methods

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

Examples

See the Summary of MGD_ID Subprograms section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.

291.3 Summary of MGD_ID Subprograms

This table describes the subprograms in the MGD_ID object type.

All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 291-5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the MGD_ID object in the specified format
GET_COMPONENT Function	Returns the string value of the specified MGD_ID component
TO_STRING Function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

291.3.1 MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```
MGD_ID (
   category_id      IN VARCHAR2,
   components       IN MGD_ID_COMPONENT_VARRAY)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
   category_id        VARCHAR2,
   identifier         VARCHAR2,
   parameter_list      VARCHAR2)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```
MGD_ID (
   category_name      VARCHAR2,
   category_version   VARCHAR2,
   components         MGD_ID_COMPONENT_VARRAY)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
   category_name      VARCHAR2,
   category_version   VARCHAR2,
   identifier         VARCHAR2,
   parameter_list      VARCHAR2)
 RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

Table 291-6 MGD_ID Constructor Function Parameters

Parameter	Description
category_id	Category identifier
components	List of component name value pairs
category_name	Category name, such as EPC
category_version	Category version. If NULL, the latest version for the specified category name will be used.
identifier	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Usage Notes

- Use MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID as category_id.
- If the category is not already registered, an error is raised.
- If the bit_length parameter is NULL, the bit_length is 8* the length of bit_encoding.
- If the component list does not contain all required components, an exception MGD_ID_UTL.e_LackComponent will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
```

```
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

Constructs an `MGD_ID` object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

Construct an `MGD_ID` object (SGTIN-64) passing in the category name, category version (if `NULL`, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
```

```
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

Constructs an `MGD_ID` object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

291.3.2 FORMAT Function

This function returns the string representation of the `MGD_ID` object in the specified format.

Syntax

```
FORMAT (parameter_list  IN VARCHAR2,
        output_format   IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 291-7 FORMAT Function Parameters

Parameter	Description
`parameter_list`	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: `filter=3;companyprefixlength=7;taglength=96`
`output_format`	One of the supported output formats into which an `MGD_ID` component is formatted: • `BINARY` • `LEGACY` • `TAG_ENCODING` • `PURE_IDENTITY` • `ONS_HOSTNAME`

Examples

See the example for the GET_COMPONENT Function.

291.3.3 GET_COMPONENT Function

This function returns the value of the specified `MGD_ID` component.

Syntax

```
GET_COMPONENT (
   component_name  IN  VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 291-8 GET_COMPONENT Function Parameter

Parameter	Description
`component_name`	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, `NULL` is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id  MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    ---------------
    --PURE_IDENTIT
    ---------------
    dbms_output.put_line('..Testing constructor with pure identity');
    ------------------------------------------------------------------------
    -- PURE_IDENTITY representation can be translated to BINARY and
    -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
    ------------------------------------------------------------------------
    id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
    dbms_output.put_line(id.to_string);
    dbms_output.put_line('filter         = ' || id.get_component('filter'));
    dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
    dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
    dbms_output.put_line('serial         = ' || id.get_component('serial'));
    dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
    dbms_output.put_line('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));
    dbms_output.put_line('TAG_ENCODING format   = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @get_component.sql

PL/SQL procedure successfully completed.
.
.
.
```

291.3.4 TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the `MGD_ID` object.

Syntax

```
TO_STRING
 RETURN VARCHAR2;
```

Examples

The following example converts the `MGD_ID` object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```

291.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an `MGD_ID` object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
   category_name    IN VARCHAR2,
   identifier       IN VARCHAR2,
   parameter_list   IN VARCHAR2,
   output_format    IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
   category_name    IN VARCHAR2,
   category_version IN VARCHAR2,
   identifier       IN VARCHAR2,
   parameter_list   IN VARCHAR2,
   output_format    IN VARCHAR2)
 RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 291-9 TRANSLATE Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version. If `NULL`, the latest version of the specified category name will be used.
`identifier`	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters `0` and `1`, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as `gtin=00037000302414;serial=10419703` for a SGTIN coding scheme.
`parameter_list`	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: `filter=3;companyprefixlength=7;taglength=96`
`output_format`	One of the supported output formats into which an `MGD_ID` component shall be converted: • `BINARY` • `LEGACY` • `TAG_ENCODING` • `PURE_IDENTITY` • `ONS_HOSTNAME`

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',

292
Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of Rule Types

292.1 Rule TYPEs Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

> **See Also:**
>
> - DBMS_RULE
> - DBMS_RULE_ADM

292.2 Rule TYPEs Security Model

`PUBLIC` is granted `EXECUTE` privilege on these RULE types.

> **See Also:**
>
> *Oracle Database Security Guide* for more information about user group `PUBLIC`

292.3 Summary of Rule Types

This table lists the `Rule Types` and briefly describes them.

Table 292-1 Rule Types

Type	Description
RE$ATTRIBUTE_VALUE Type	Specifies the value of a variable attribute
RE$ATTRIBUTE_VALUE_LIST Type	Identifies a list of attribute values
RE$COLUMN_VALUE Type	Specifies the value of a table column
RE$COLUMN_VALUE_LIST Type	Identifies a list of column values

Table 292-1 (Cont.) Rule Types

Type	Description
RE$NAME_ARRAY Type	Identifies a list of names
RE$NAME_ARRAY Type	Identifies a list of name-value pairs
RE$NV_LIST Type	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
RE$NV_NODE Type	Identifies a name-value pair
RE$RULE_HIT Type	Specifies a rule found because of evaluation
RE$RULE_HIT_LIST Type	Identifies a list of rules found because of evaluation
RE$RULE_NAME Type	Allows users to pass a list of rule as argument.
RE$RULE_NAME_LIST Type	Identifies a list of Rule Name values
RE$TABLE_ALIAS Type	Provides the table corresponding to an alias used in a rule evaluation context
RE$TABLE_ALIAS_LIST Type	Identifies a list of table aliases used in a rule evaluation context
RE$TABLE_VALUE Type	Specifies the value of a table row using a `ROWID`
RE$TABLE_VALUE_LIST Type	Identifies a list of table values
RE$VALUE Type	Represents one datapoint value element
RE$VALUE_LIST Type	Defines a list of `RE$VALUE` type
RE$VARIABLE_TYPE Type	Provides the type of a variable used in a rule evaluation context
RE$VARIABLE_TYPE_LIST Type	Identifies a list of variables and their types used in a rule evaluation context
RE$VARIABLE_VALUE Type	Specifies the value of a variable
RE$VARIABLE_VALUE_LIST Type	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Replication (Oracle GoldenGate and XStream), rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Replication (Oracle GoldenGate and XStream) packages use rules:

- `DBMS_APPLY_ADM`
- `DBMS_CAPTURE_ADM`
- `DBMS_PROPAGATION_ADM`

292.3.1 RE$ATTRIBUTE_VALUE Type

RE$ATTRIBUTE_VALUE type specifies the value of a variable attribute.

> **Note:**
>
> Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
   variable_name    VARCHAR2(32),
   attribute_name   VARCHAR2(4000),
   attribute_value  ANYDATA);
```

Attributes

Table 292-2 RE$ATTRIBUTE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable used in a rule
attribute_name	Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.
attribute_value	Specifies the attribute value

292.3.2 RE$ATTRIBUTE_VALUE_LIST Type

The RE$ATTRIBUTE_VALUE_LIST type identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

292.3.3 RE$COLUMN_VALUE Type

RE$COLUMN_VALUE type specifies the value of a table column.

> **Note:**
>
> Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
   table_alias    VARCHAR2(32),
```

```
   column_name   VARCHAR2(4000),
   column_value  ANYDATA);
```

Attributes

Table 292-3 RE$COLUMN_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

292.3.4 RE$COLUMN_VALUE_LIST Type

RE$COLUMN_VALUE_LIST type identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

292.3.5 RE$NAME_ARRAY Type

RE$NAME_ARRAY type identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

292.3.6 RE$NV_ARRAY Type

RE$NV_ARRAY type identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

292.3.7 RE$NV_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
   actx_list  SYS.RE$NV_ARRAY);
```

Attributes

Table 292-4 RE$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

> **Note:**
>
> Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
   name   IN  VARCHAR2,
   value  IN  ANYDATA);
```

Parameters

Table 292-5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

> **Note:**
>
> Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 292-6 GET_VALUE Function Parameters

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

> **Note:**
>
> Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
   name  IN  VARCHAR2);
```

Parameters

Table 292-7 REMOVE_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

292.3.8 RE$NV_NODE Type

`RE$COLUMN_VALUE` type identifies a name-value pair.

> **Note:**
>
> Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (
   nvn_name   VARCHAR2(30),
   nvn_value  ANYDATA);
```

Attributes

Table 292-8 RE$NV_NODE Attributes

Attribute	Description
`nvn_name`	Specifies the name in the name-value pair
`nvn_value`	Specifies the value in the name-value pair

292.3.9 RE$RULE_HIT Type

The `RE$RULE_HIT` type specifies a rule found because of an evaluation.

> **See Also:**
>
> - CREATE_RULE Procedure
> - ALTER_RULE Procedure

Syntax

```
TYPE SYS.RE$RULE_HIT (
   rule_name            VARCHAR2(65),
   rule_action_context  RE$NV_LIST);
```

Attributes

Table 292-9 RE$RULE_HIT Attributes

Attribute	Description
rule_name	The rule name in the form *schema_name.rule_name*. For example, a rule named employee_rule in the hr schema is returned in the form "hr"."employee_rule".
rule_action_context	The rule action context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package

292.3.10 RE$RULE_HIT_LIST Type

The RE$RULE_HIT_LIST type identifies a list of rules found because of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

292.3.11 RE$RULE_NAME Type

The RE$RULE_HIT type is create to allow use to pass a list of rule as argument.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT(
  rule_name            IN       varchar2,
  evaluation_context   IN       varchar2);
```

Attributes

Table 292-10 RE$RULE_NAME Attributes

Attribute	Description
rule_name	The rule name in the form *SCHEMA_NAME.RULE_NAME*. For example, a rule named employee_rule in the hr schema is returned in the form "hr"."employee_rule".
Evaluation_context	The evaluation context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package

292.3.12 RE$RULE_NAME_LIST Type

RE$RULE_HIT_LIST type Identifies a list of Rule Name values.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

292.3.13 RE$TABLE_ALIAS Type

RE$TABLE_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

> **Note:**
>
> Enclose the table name in double quotation marks (") if the name contains special characters.

> **See Also:**
>
> *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
   table_alias  VARCHAR2(32),
   table_name   VARCHAR2(194));
```

Attributes

Table 292-11 RE$TABLE_ALIAS Attributes

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: *schema_name.table_name* *table_name* For example, if the *schema_name* is hr and the *table_name* is employees, then enter the following: hr.employees

292.3.14 RE$TABLE_ALIAS_LIST Type

The RE$TABLE_ALIAS_LIST type identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

292.3.15 RE$TABLE_VALUE Type

The RE$TABLE_VALUE type specifies the value of a table row using a ROWID.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(
   table_alias  VARCHAR2(32),
   table_rowid  VARCHAR2(18));
```

Attributes

Table 292-12 RE$TABLE_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

292.3.16 RE$TABLE_VALUE_LIST Type

The RE$TABLE_VALUE_LIST type identifies a list of table values.

> **Note:**
>
> Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

292.3.17 RE$VALUE Type

The RE$VALUE type represents one datapoint value element.

Syntax

```
TYPE SYS.RE$VALUE  (
     table_values          IN       SYS.RE$TABLE_VALUE_LIST:= NULL,
     column_values         IN       SYS.RE$COLUMN_VALUE_LIST:=NULL,
     variable_values       IN       SYS.RE$VARIABLE_VALUE_LIST:=NULL,
     attribute_values      IN       SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

Attributes

Table 292-13 RE$VALUE Attributes

Attribute	Description
table_values	ROWID of table row for expression evaluation
column_ values	Values of columns referred in the expression
variable_values	Values of variables referred in expressio
attribute_values	Values of attributes referred in expression

292.3.18 RE$VALUE_LIST Type

RE$TABLE_VALUE_LIST type is a varray for defining a list of RE$VALUE type. It represents a list of datapoint element.

Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE _LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

292.3.19 RE$VARIABLE_TYPE Type

The RE$VARIABLE_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

> **Note:**
>
> Enclose the variable name in double quotation marks (") if the name contains special characters.

> **See Also:**
>
> *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
   variable_name             VARCHAR2(32),
   variable_type             VARCHAR2(4000),
   variable_value_function   VARCHAR2(228),
   variable_method_function  VARCHAR2(228));
```

Attributes

Table 292-14 RE$VARIABLE_TYPE Attributes

Attribute	Description
`variable_name`	The variable name used in a rule
`variable_type`	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the *Oracle Database SQL Language Reference* for more information about these types.
`variable_value_function`	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.
`variable_method_function`	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.

Usage Notes

The functions for both the for the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

`schema_name.package_name.function_name@dblink`

Any of the following parts of the format can be omitted: *`schema_name`*, *`package_name`*, and *`@dblink`*.

For example, if the *`schema_name`* is `hr`, the *`package_name`* is `var_pac`, the *`function_name`* is `func_value`, and the *`dblink`* is `dbs1.net`, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for variable_value_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_name              IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_value             IN SYS.RE$VARIABLE_VALUE,
  method_name                IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

292.3.20 RE$VARIABLE_TYPE_LIST Type

The RE$VARIABLE_TYPE_LIST type identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

292.3.21 RE$VARIABLE_VALUE Type

The RE$VARIABLE_VALUE type specifies the value of a variable.

> **Note:**
>
> Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
   variable_name  VARCHAR2(32),
   variable_data  ANYDATA);
```

Attributes

Table 292-15 RE$VARIABLE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

292.3.22 RE$VARIABLE_VALUE_LIST Type

The RE$VARIABLE_VALUE_LIST type identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

293

SODA Types

There are several SODA types: SODA_DOCUMENT_T, SODA_COLLECTION_T, SODA_OPERATION_T, and SODA_CURSOR_T. SODA_DOCUMENT_T and SODA_COLLECTION_T represent two primary abstractions provided by SODA: document and collections. SODA_OPERATION_T is used for specifying condition of operations on the collection. SODA_CURSOR_T is a cursor over results of read operations on the collection.

This chapter contains the following topics:

- SODA Types Overview
- SODA Types Security Model

293.1 SODA Types Overview

There are several SODA types: SODA_DOCUMENT_T, SODA_COLLECTION_T, SODA_OPERATION_T, and SODA_CURSOR_T. SODA_DOCUMENT_T and SODA_COLLECTION_T represent two primary abstractions provided by SODA: document and collections. SODA_OPERATION_T is used for specifying condition of operations on the collection. SODA_CURSOR_T is a cursor over results of read operations on the collection.

> **See Also:**
>
> - *Oracle Database SODA for PL/SQL Developer's Guide*
> - DBMS_SODA

293.2 SODA Types Security Model

The SODA Types are available to users with the SODA_APP role.

All SODA types are SYS types. PUBLIC is granted EXECUTE privilege on the SODA types described in this chapter:

- TYPE SODA_Collection_T
- TYPE SODA_Document_T
- TYPE SODA_Operation_T
- TYPE SODA_Cursor_T

293.3 Summary of SODA Types

This chapter lists the SODA types and describes them.

Table 293-1 SODA Types

Type	Description
SODA_Collection_T Type	This SODA type represents a SODA collection. This type is not persistable.
SODA_Document_T Type	This SODA type represents a document with content, usually in JSON format. This type is not persistable.
SODA_OPERATION_T Type	This SODA type performs read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection. This type is not persistable.
SODA_Cursor_T Type	This SODA type represents the result set of documents. This type is not persistable.

293.3.1 SODA_Collection_T Type

This SODA type represents a SODA collection. A reference of SODA collection can only be obtained by either calling DBMS_SODA.CREATE_COLLECTION() or DBMS_SODA.OPEN_COLLECTION().

Table 293-2 SODA_Collection_T Type Subprograms

Subprogram	Description
CREATE_INDEX Function	Creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.
CREATE_VIEW_FROM_DG Function	Creates a view with relational columns, using scalar JSON fields as specified in the data guide.
DROP_INDEX Function	Drops the named index.
FIND Function	Returns the SODA_OPERATION_T object. This is the only way to get the reference of SODA_Operation_T as there is no constructor.
FIND_ONE Function	Fetches the document matching the key.
GET_DATA_GUIDE Function	Returns the JSON data guide as a CLOB.
GET_INDEX Function	This function returns the specification for the supplied index created on the collection.
GET_METADATA Function	Returns the metadata of the collection in JSON format.

Table 293-2 (Cont.) SODA_Collection_T Type Subprograms

Subprogram	Description
GET_NAME Function	Returns the name of the collection.
INSERT_ONE Function	Inserts a document into the collection.
INSERT_ONE_AND_GET Function	Inserts a document into the collection and returns a result document with all components except for content.
LIST_INDEXES Function	This function returns the specifications for all the indexes created on the collection.
REMOVE_ONE Function	Removes the document matching the key.
REPLACE_ONE Function	Replaces the content and (optionally) the media type of the document matching the key.
REPLACE_ONE_AND_GET Function	Replaces the content and (optionally) the media type of the document matching the key and returns a result document with all components (except content).
SAVE Function	Saves a document into the collection.
SAVE_AND_GET Function	Saves a document into the collection.
TRUNCATE Function	Deletes all documents in the collection.

293.3.1.1 CREATE_INDEX Function

This function creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.

Syntax

```
CREATE_INDEX (
     specification VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 293-3 CREATE_INDEX Function Parameters

Parameter	Description
`specification`	The index specification.

Example 293-1 Return Values

The function returns:

- `1`—if the index was successfully created
- `0`—if the index was not created

Exceptions

`Error`—If an error occurs creating the index.

> **See Also:**
>
> For more information about SODA Index specifications, see:
>
> - Overview of SODA Indexing
> - SODA Index Specifications (Reference)

293.3.1.2 CREATE_VIEW_FROM_DG Function

This function creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide enabled JSON search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.

This procedure is available only for Autonomous Database starting 19c release.

Syntax

```
CREATE_VIEW_FROM_DG (
   data_guide               IN   CLOB,
   view_name                IN   VARCHAR2,
   materialize              IN   BOOLEAN DEFAULT FALSE,
   mv_refresh_mode          IN   NUMBER DEFAULT 1,
   path                     IN   VARCHAR2 DEFAULT '$',
   resolve_name_conflicts   IN   BOOLEAN   DEFAULT FALSE,
   col_name_prefix          IN   VARCHAR2 DEFAULT NULL,
   mixed_case_columns       IN   BOOLEAN DEFAULT FALSE)
  RETURN NUMBER;
```

Parameters

Table 293-4 CREATE_VIEW_FROM_DG Function Parameters

Parameter	Description
data_guide	Data guide of the collection.
view_name	Name of the view to be created.
materialize	A boolean value to indicate if the view should be materialized or not. The default value is FALSE.
mv_refresh_mode	The materialized view refresh mode. Possible values are: • DBMS_SODA.MV_REFRESH_ON_STATEMENT (default) • DBMS_SODA.MV_REFRESH_ON_COMMIT • DBMS_SODA.MV_REFRESH_ON_DEMAND

Table 293-4 (Cont.) CREATE_VIEW_FROM_DG Function Parameters

Parameter	Description
`path`	The path of the JSON field to be expanded. It uses JSON path expression syntax. For example: • $ will create a view starting from the JSON document root • `$.purchaseOrder` will create a view starting from purchaseOrder. It expands the children or descendants under `purchaseOrder`, and create view columns for every scalar value. The default value is $.
`resolve_name_conflicts`	By default, if there are conflicts among `o:preferred_column_name`, an error is raised. If you set this parameter to `TRUE`, the procedure automatically resolves the view column name conflicts by appending a sequence number. The default value is `FALSE`.
`col_name_prefix`	By default, the view column name is the same as the JSON field name. This parameter allows you to provide a prefix to prepend to the view column names. The default value is `NULL`.
`mixed_case_columns`	By default, the view column names are case sensitive. This parameter allows you to change the behavior to case insensitive. The default value is FALSE.

Return Values

The function returns:

- `1`—if the procedure is successfully completed
- `0`—if the procedure could not be successfully completed

Exceptions

`Error`—If an error occurs if the function was unable to create a view.

> **See Also:**
>
> For more info on the JSON data guide, see JSON Data Guide

293.3.1.3 DROP_INDEX Function

This function drops the named index.

Syntax

```
DROP_INDEX (
     index_Name IN VARCHAR2,
     force      IN BOOLEAN DEFAULT FALSE)
  RETURN NUMBER;
```

Example 293-2 Parameters

Table 293-5 DROP_INDEX Function Parameters

Parameter	Description
`index_Name`	The name of the index.
`force`	The force parameter can be `TRUE` or `FALSE`. Should only be set to `TRUE` for dropping a `JSON` search index or spatial index (not B-tree index). For more information, see DROP INDEX

Return Values

The function returns:

- `1`—If the index was successfully dropped
- `0`—If the index was not dropped. For example, if there was no existing index with the specified name.

Exceptions

`Error`—if an error occurs while dropping the index.

293.3.1.4 FIND Function

This function returns the operation type for the collection. The operation type allows building and executing various read/write operations. This is the only way to get the reference of `SODA_Operation_T` as there is no constructor.

Syntax

```
FIND ()
 RETURN SODA_Operation_T;
```

Return Values

This function returns `SODA_OPERATION_T` object.

Exceptions

This function does not throw any exception.

293.3.1.5 FIND_ONE Function

This function fetches the document matching the given key.

Syntax

```
FIND_ONE (
     key         IN VARCHAR2)
 RETURN SODA_Document_T;
```

Parameters

Table 293-6 FIND_ONE Function Parameters

Parameter	Description
key	The key of the document to be fetched.

Return Values

This function returns the document that matches the key. Returns `NULL` if no match is found.

Exceptions

`Error`—If an error occurs while finding the document.

293.3.1.6 GET_DATA_GUIDE Function

This function fetches the JSON data guide as a CLOB. The JSON data guide is essentially inferred schema for the JSON documents in the collection. In order to be able to return the JSON data guide, a collection must have a JSON Search Index defined on it, with the data guide enabled.

Syntax

```
GET_DATA_GUIDE ()
 RETURN CLOB;
```

Return Values

The function returns the JSON data guide as a CLOB.

> **See Also:**
>
> For more info on the JSON data guide, see JSON Data Guide

Exceptions

`Error`—If an error occurs while fetching the data guide.

293.3.1.7 GET_INDEX Function

This function returns the specification for the supplied index created on the collection.

Syntax

```
GET_INDEX (
     index_name           IN VARCHAR2,
     schema_name          IN VARCHAR2 DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 293-7 GET_INDEX Function Parameters

Parameter	Description
`index_name`	The name of the index to be described.
`schema_name`	Name of the schema containing the index. This parameter is optional. If this parameter is not set, the method will look for the specified index in the schema from which this method is called.

Return Values

The function returns the index specification in `JSON` format.

Exceptions

`Error`—If an error occurs while returning the index specification.

293.3.1.8 GET_METADATA Function

This function returns the metadata of the collection in `JSON` format.

Syntax

```
GET_METADATA ()
  RETURN VARCHAR2;
```

Return Values

This function returns the metadata of the collection in `JSON` format.

293.3.1.9 GET_NAME Function

This function returns the name of the collection.

Syntax

```
GET_NAME ()
 RETURN NVARCHAR2;
```

Return Values

This function returns the name of the collection.

293.3.1.10 INSERT_ONE Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE (
     document      IN SODA_Document_T)
 RETURN NUMBER;
```

Parameters

Table 293-8 INSERT_ONE Function Parameters

Parameter	Description
`document`	The input document.

Return Values

The function returns a number– `1` if the doc was inserted successfully, `0` otherwise.

Exceptions

`Error`—If an error occurs while inserting the document into the collection.

293.3.1.11 INSERT_ONE_AND_GET Function

This function inserts a document into the collection.

Syntax

```
INSERT_ONE_AND_GET (
     document      IN SODA_Document_T,
     hint          IN VARCHAR2 DEFAULT NULL)
 RETURN SODA_Document_T;
```

Parameters

Table 293-9 INSERT_ONE_AND_GET Function Parameters

Parameter	Description
`document`	The input document.
`hint`	A hint string in Oracle SQL format, without the enclosing `/*+` and `*/`. This parameter is optional.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

`Error`—If an error occurs while inserting the document into the collection.

293.3.1.12 LIST_INDEXES Function

This function returns the specifications for all the indexes created on the collection.

Syntax

```
LIST_INDEXES ( )
  RETURN SODA_Index_List_T;
```

Return Values

The function returns index specifications in `JSON` format as an instance of `SODA_Index_List_T`.

Exceptions

`Error`—If an error occurs while returning the index specification.

293.3.1.13 REMOVE_ONE Function

This function removes the document matching the given key.

Syntax

```
REMOVE_ONE (
     key       IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 293-10 REMOVE_ONE Function Parameters

Parameter	Description
`key`	The key of the document.

Return Values

This function returns the following values:

- `1`–If the document was successfully removed.
- `0`–If the document with the specified key was not found.

Exceptions

`Error`—If an error occurs while deleting the document from the collection.

293.3.1.14 REPLACE_ONE Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (
     key            IN VARCHAR2,
     document       IN SODA_Document_T)
 RETURN NUMBER;
```

Parameters

Table 293-11 REPLACE_ONE Parameters

Parameter	Description
`key`	The key of the document.
`document`	The document with the new content and media type to replace the old one.

Return Values

This function returns a number—`1` if the document was replaced, `0` otherwise.

Exceptions

`Error`—If an error occurs while replacing the document in the collection.

293.3.1.15 REPLACE_ONE_AND_GET Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (
     key            IN VARCHAR2,
     document       IN SODA_Document_T)
 RETURN SODA_Document_T;
```

Parameters

Table 293-12 REPLACE_ONE_AND_GET Function Parameters

Parameter	Description
`key`	The key of the document.
`document`	The document with the new content and media type to replace the old one.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

`Error`—If an error occurs while replacing the document in the collection.

293.3.1.16 SAVE Function

This function saves a document into the collection. This function is equivalent to `INSERT_ONE(document) Function` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key is automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE (
     document IN  SODA_Document_T)
  RETURN NUMBER;
```

Parameters

Table 293-13 SAVE Parameters

Parameter	Description
`document`	The input document. This cannot be null.

Return Values

The function returns a number- `1` if the function successfully completed, `0` otherwise.

Exceptions

`Error`—If an error occurs while saving the document.

293.3.1.17 SAVE_AND_GET Function

This function saves a document into the collection. This method is equivalent to `INSERT_ONE_AND_GET(document)` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key will be automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

Syntax

```
SAVE_AND_GET (
     document      IN SODA_Document_T,
     hint          IN VARCHAR2 DEFAULT NULL)
  RETURN SODA_Document_T;
```

Parameters

Table 293-14 SAVE_AND_GET Function Parameters

Parameter	Description
`document`	The input document. This cannot be null.
`hint`	A hint string in Oracle SQL format, without the enclosing `/*+` and `*/`. This parameter is optional.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

Exceptions

`Error`—If an error occurs while saving or getting the document.

293.3.1.18 TRUNCATE Function

This function deletes all documents in the collection.

Syntax

```
TRUNCATE ( )
  RETURN Number;
```

Return Values

The function returns:

- `1`—if the function is successfully completed
- `0`—if the function could not be successfully completed

Exceptions

`Error`—if an error occurs while deleting the documents in the collection.

293.3.2 SODA_Document_T Type

This `SODA` type represents a document with content, that is usually in `JSON` format.

This type is not persistable `pl/sql` type. However, `SODA` is a system that basically provides persistence — it has read and write operations. So you do not persist `SODA_DOCUMENT_T` directly, but you pass it to a write operation (like `insert` or `replace`), which is defined on `SODA_COLLECTION_T`, in order to write the document content and other components to the database.

A document has the following components:

- key
- content
- created-on timestamp

- last-modified timestamp
- version
- media type

Table 293-15 SODA_Document_T Type Subprograms

Subprogram	Description
GET_BLOB Function	Fetches the BLOB content of a BLOB-based document.
GET_CLOB Function	Fetches the CLOB content of a CLOB-based document.
GET_CREATED_ON Function	Fetches the created-on timestamp in VARCHAR2.
GET_DATA_TYPE Function	Fetches the SQL datatype of the document content with which it was created.
GET_JSON Function	Fetches the JSON content of a JSON-based document.
GET_KEY Function	Fetches the document key in VARCHAR2.
GET_LAST_MODIFIED Function	Fetches the last modified timestamp in VARCHAR2.
GET_MEDIA_TYPE Function	Fetches the media type of the document content in VARCHAR2.
GET_VARCHAR2 Function	Fetches the VARCHAR2 content of a VARCHAR2-based document.
GET_VERSION Function	Fetches the version of the document in VARCHAR2.
SODA_Document_T Function	There are three different SODA_DOCUMENT_T constructor functions. Each constructor function instantiates a document object using key, content, and media type.

293.3.2.1 GET_BLOB Function

This functions fetches the BLOB content of the document. It assumes that the document was constructed with BLOB content, or was returned from a collection with BLOB content. Otherwise, an error is returned.

Syntax

```
GET_BLOB ()
 RETURN BLOB;
```

Return Values

This function returns the BLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with BLOB content.

293.3.2.2 GET_CLOB Function

The function fetches CLOB content of the document. It assumes that the document was constructed with CLOB content, or was returned from a collection with CLOB content. Otherwise, an error is returned.

Syntax

```
GET_CLOB ()
 RETURN CLOB;
```

Return Values

This function returns the CLOB content of a document.

Exceptions

SODA Error: If the document was initially not created with CLOB content.

293.3.2.3 GET_CREATED_ON Function

This function fetches the created-on timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the Z at the end, timestamps are returned in UTC (Z indicates zero UTC offset).

Syntax

```
GET_CREATED_ON ()
 RETURN VARCHAR2;
```

Return Values

This function returns the created-on timestamp.

293.3.2.4 GET_DATA_TYPE Function

This function fetches the SQL datatype of the document content with which it was created.

Syntax

```
GET_DATA_TYPE ()
 RETURN PLS_INTEGER;
```

Return Values

Table 293-16 GET_DATA_TYPE Return Values

Constant	Value	Description
DOC_VARCHAR2 CONSTANT PLS_INTEGER	1	VARCHAR2
DOC_BLOB CONSTANT PLS_INTEGER	2	BLOB
DOC_CLOB CONSTANT PLS_INTEGER	3	CLOB

Table 293-16 (Cont.) GET_DATA_TYPE Return Values

Constant	Value	Description
DOC_JSON CONSTANT PLS_INTEGER	4	JSON

293.3.2.5 GET_JSON Function

This functions fetches the JSON content of the document. It assumes that the document was constructed with JSON type content, or was returned from a collection with JSON type content. Otherwise, an error is returned.

Syntax

```
GET_JSON ()
 RETURN JSON;
```

Return Values

This function returns the JSON content of a document.

Exceptions

SODA Error: If the document was initially not created with JSON content.

293.3.2.6 GET_KEY Function

This function fetches the document key.

Syntax

```
GET_KEY ()
 RETURN VARCHAR2;
```

Return Values

This function returns the document key.

293.3.2.7 GET_LAST_MODIFIED Function

This function fetches the last modified timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the Z at the end, timestamps are returned in UTC (Z indicates zero UTC offset).

Syntax

```
GET_LAST_MODIFIED ()
 RETURN VARCHAR2;
```

Return Values

This function returns the last modified timestamp.

293.3.2.8 GET_MEDIA_TYPE Function

This function fetches the media type of the document content.

Syntax

```
GET_MEDIA_TYPE ()
 RETURN VARCHAR2;
```

Return Values

This function returns the media type of the document content. `application/JSON` is the media type for `JSON` documents (default).

293.3.2.9 GET_VARCHAR2 Function

This function fetches the `VARCHAR2` content of the document. It assumes that the document was constructed with `VARCHAR2` content, or was returned from a collection with `VARCHAR2` content. Otherwise, an error is returned.

Syntax

```
GET_VARCHAR2 ()
 RETURN VARCHAR2;
```

Return Values

This function returns the `VARCHAR2` content of a document.

Exceptions

`SODA Error`: If the document was initially not created with `VARCHAR2` content.

293.3.2.10 GET_VERSION Function

This function fetches the version of the document.

Syntax

```
GET_VERSION ()
 RETURN VARCHAR2;
```

Return Values

This function returns the version of the document.

293.3.2.11 SODA_Document_T Function

This function instantiates a document object using key, content, and media type. There are three different `SODA_DOCUMENT_T` constructor functions. The second parameter (`<v|b|c>_Content`) is different in each constructor. It is `VARCHAR2` in the first variant, `BLOB` in the second, and `CLOB` in the third.

Key and media type are optional parameters (will be defaulted to `NULL`). All three parameters can be set to `NULL`. If `media_Type` is set to `NULL`, it will be defaulted to `application/json`.

Use `key` and `j_Content` with the constructor to instantiate a document object using key and content. Media type parameter is not present in this constructor as the data is of `JSON` type. Therefore, media type is understood to be `application/json`.

Syntax

```
SODA_DOCUMENT_T (
     key           IN VARCHAR2 DEFAULT NULL,
     v_Content     IN VARCHAR2,
     media_Type    IN VARCHAR2 DEFAULT NULL)
 RETURN SODA_Document_T;

SODA_DOCUMENT_T (
     key           IN VARCHAR2 DEFAULT NULL,
     b_Content     IN BLOB,
     media_Type    IN VARCHAR2 DEFAULT NULL)
 RETURN SODA_Document_T;

SODA_DOCUMENT_T (
     key           IN VARCHAR2 DEFAULT NULL,
     c_Content     IN CLOB,
     media_Type    IN VARCHAR2 DEFAULT NULL)
 RETURN SODA_Document_T;

SODA_DOCUMENT_T (
     key           IN VARCHAR2 DEFAULT NULL,
     j_Content     IN JSON)
 RETURN SODA_Document_T;
```

Parameters

Table 293-17 SODA_Document_T Parameters

Parameter	Description
`key`	The key of the document.
`v_Content`	The content of the document in `VARCHAR2` format.
`b_Content`	The content of the document in `BLOB` format.
`c_Content`	The content of the document in `CLOB` format.
`j_Content`	The content of the document as `JSON` type instance.
`media_Type`	The media type of the document. The media type could be `application/json` for `JSON` documents.

> **Note:**
>
> `v_Content`, `b_Content`, and `c_Content` are not all parameters of a single `SODA_DOCUMENT_T` constructor function. Each one corresponds to a particular variant of the constructor function as shown in the `Syntax` section.

Return Values

This function returns a document of type `SODA_Document_T`.

293.3.3 SODA_OPERATION_T Type

This `SODA` type is used to perform read/write operations, such as document finds with filtering and pagination, removes, and replaces on a `SODA` collection.

Table 293-18 SODA_OPERATION_T Type Subprograms

Subprogram	Description
ACQUIRE_LOCK Function	This function ensures that the document(s) affected by a `read` operation are locked for update (which is equivalent to SQL '`select for update`').
AS_OF_SCN Function	This function sets the SCN value for the operation.
AS_OF_TIMESTAMP Function	This function sets the the timestamp value for the operation.
COUNT Function	Returns a count of the number of documents in the collection that match the criteria. If skip(...) or limit(...) were chained together with this count(), an exception is raised.
FILTER Function	Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be chained together if required.
GET_CURSOR Function	Returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the criteria.
GET_DATA_GUIDE Function	This function gets the data guide.
GET_ONE Function	Returns a single `SODA_DOCUMENT_T` object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.
HINT Function	This function sets the hint attribute of the operation.
KEY Function	Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and `KEYS(...)`, when they appear in the same chain, to be ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Table 293-18 (Cont.) SODA_OPERATION_T Type Subprograms

Subprogram	Description
KEYS Function	Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and KEY(...), when they appear in the same chain, to be ignored. Returns the same SODA_OPERATION_T object, so that further operation criteria can be chained together, if needed.
LIMIT Function	Sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as GET_CURSOR. For write operations, any value set using this method is ignored. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.
REMOVE Function	Removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.
REPLACE_ONE Function	Replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function KEY(...) to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.
REPLACE_ONE_AND_GET Function	Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, NULL otherwise. Currently, before calling this function, you must call the function KEY(...) to uniquely identify the document being replaced. This function is similar to REPLACE_ONE. The only difference is that REPLACE_ONE_AND_GET also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.
SAMPLE Function	Sets the sampling parameters to be used for the operation.

Table 293-18 (Cont.) SODA_OPERATION_T Type Subprograms

Subprogram	Description
SKIP Function	Sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as GET_CURSOR. For write operations, any value set using this method is ignored. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.
VERSION Function	Specifies that only documents with the supplied version should be returned. Typically, this is chained together with KEY(...) to implement optimistic locking for write operations such as REMOVE and REPLACE. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.

293.3.3.1 ACQUIRE_LOCK Function

This function sets the lock attribute of the operation to TRUE.

Syntax

```
ACQUIRE_LOCK ( )
 RETURN SODA_Operation_T;
```

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.2 AS_OF_SCN Function

This function sets the SCN value for the operation.

Syntax

```
AS_OF_SCN (
     scn         IN NUMBER)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-19 AS_OF_SCN Function Parameters

Parameter	Description
scn	The input value for SCN. This cannot be NULL.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

293.3.3.3 AS_OF_TIMESTAMP Function

This function sets the the timestamp value for the operation.

Syntax

```
AS_OF_TIMESTAMP (
     timestamp         IN VARCHAR2)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-20 AS_OF_TIMESTAMP Function Parameters

Parameter	Description
`timestamp`	The input timestamp. This cannot be `NULL`.

Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

293.3.3.4 COUNT Function

This function returns a count of the number of documents in the collection that match the criteria. If skip(...) or limit(...) were chained together with this count(), an exception is raised.

Syntax

```
COUNT ()
 RETURN NUMBER;
```

Return Values

This function returns the number of documents matching the criteria specified in the operation.

Exceptions

`Error`—If an error occurs while finding the count.

293.3.3.5 FILTER Function

Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be attached if needed.

Syntax

```
FILTER (
     qbe         IN VARCHAR2)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-21 FILTER Function Parameters

Parameter	Description
qbe	The string representing the query by example.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

> **See Also:**
>
> - Overview of SODA Filter Specifications (QBEs)
> - SODA Filter Specifications (Reference)

293.3.3.6 GET_CURSOR Function

Returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the criteria.

Syntax

(Optional) Enter syntax information here.

```
GET_CURSOR ()
 RETURN SODA_Cursor_T;
```

Return Values

This function returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the read operation criteria.

Exceptions

`SODA Error`: If an error occurs while fetching the cursor.

293.3.3.7 GET_DATA_GUIDE Function

This function gets the data guide.

Syntax

```
GET_DATA_GUIDE (
  format    IN PLS_INTEGER DEFAULT 1,
```

```
  flag      IN PLS_INTEGER DEFAULT 0)
 RETURN CLOB;
```

Parameters

Table 293-22 GET_DATA_GUIDE Function Parameters

Parameter	Description
format	The format of the data guide. This parameter can have one of the following values: • DBMS_SODA.DATAGUIDE_FORMAT_HIERARCHICAL CONSTANT PLS_INTEGER := 1; • DBMS_SODA.DATAGUIDE_FORMAT_FLAT CONSTANT PLS_INTEGER := 2; The default value is 1.
flag	This parameter can have one of the following values: • DBMS_SODA.DATAGUIDE_PRETTY CONSTANT PLS_INTEGER := 1; • DBMS_SODA.DATAGUIDE_GEOJSON CONSTANT PLS_INTEGER := 2; • DBMS_SODA.DATAGUIDE_GATHER_STATS CONSTANT PLS_INTEGER := 4; The default value is 0.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.8 GET_ONE Function

Returns a single SODA_DOCUMENT_T object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.

Syntax

```
GET_ONE ()
 RETURN SODA_Document_T;
```

Return Values

The first matching document.

Exceptions

Error—If an error occurs while fetching the document.

293.3.3.9 HINT Function

This function sets the hint attribute of the operation.

Syntax

```
HINT (
     hint        IN VARCHAR2)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-23 HINT Function Parameters

Parameter	Description
hint	A hint string in Oracle SQL format, with out the enclosing /*+ and */.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.10 KEY Function

Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and KEYS(...), when they appear in the same chain, to be ignored. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.

Syntax

```
KEY (
     key         IN VARCHAR2)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-24 KEY Function Parameters

Parameter	Description
key	The key to be used for the operations.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.11 KEYS Function

Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and key(...), when they appear in the

same chain, to be ignored. Returns the same SODA_OPERATION_T object, so that further operation criteria can be chained together, if needed.

Syntax

```
KEYS (
     key_List  IN SODA_Key_List_T)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-25 KEYS Function Parameters

Parameter	Description
key_List	The parameter is a SODA_Key_List_T which is a list of VARCHAR2 values representing keys. Assuming key_list is a variable of type SODA_Key_List_T, it can be initialized as follows: key_list := SODA_Key_List_T('key1', 'key2', 'key3', etc);

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.12 LIMIT Function

This function sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as GET_CURSOR. For write operations, any value set using this method is ignored. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.

Syntax

```
LIMIT (
     limit         IN NUMBER)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-26 LIMIT Function Parameters

Parameter	Description
limit	A limit on the number of results returned by read operations.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on.

293.3.3.13 REMOVE Function

This function removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

Syntax

```
REMOVE ()
 RETURN NUMBER;
```

Return Values

This function returns the number of matching documents that were removed in the operation.

Exceptions

`Error`—If an error occurs while removing the documents.

293.3.3.14 REPLACE_ONE Function

This function replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE (
      document IN SODA_Document_T)
 RETURN NUMBER;
```

Parameters

Table 293-27 REPLACE_ONE Function Parameters

Parameter	Description
`document`	The document object with the new content and media type to be used for replacement.

Return Values

This function returns a number—`1` if the document was replaced, `0` otherwise.

Exceptions

`Error`—If an error occurs while updating the collection.

293.3.3.15 REPLACE_ONE_AND_GET Function

Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, `NULL` otherwise. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. This function is similar to `REPLACE_ONE`. The only difference is that `REPLACE_ONE_AND_GET` also returns the result document with updated components, such as version and last-modified

timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

Syntax

```
REPLACE_ONE_AND_GET (
     document         IN SODA_Document_T)
 RETURN SODA_Document_T;
```

Parameters

Table 293-28 REPLACE_ONE_AND_GET Function Parameters

Parameter	Description
`document`	The document object with the new content and media type to be used for replacement.

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

`Error`—If an error occurs while updating the collection

293.3.3.16 SAMPLE Function

This function sets the sampling parameters to be used for the operation.

Syntax

```
SAMPLE (
     pct     IN   DOUBLE,
     seed    IN   NUMBER      DEFAULT NULL,
     method  IN   PLS_INTEFER DEFAULT DBMS_SODA.SAMPLE_ROW)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-29 SAMPLE Function Parameters

Parameter	Description
`pct`	The percentage of the total documents or block count to be included in the sample. The value must be in the range `.000001` to, but not including, `100`. This percentage indicates the probability of each row or each cluster of rows in the case of block sampling, being selected as part of the sample. It does not mean that the database will retrieve exactly the percentage of documents in the collection.
`seed`	Specify this attribute to instruct the database to attempt to return the same sample from one execution to the next. The seed value must be an integer between `0` and `4294967295`. If you omit this attribute, then the resulting sample will change from one execution to the next.
`method`	The type of sampling method to be used. Valid values are: • `DBMS_SODA.SAMPLE_ROW` • `DBMS_SODA.SAMPLE_BLOCK`

Return Values

This function returns the `SELF` operation object.

293.3.3.17 SKIP Function

This function sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

Syntax

```
SKIP (
     offset         IN NUMBER)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-30 SKIP Function Parameters

Parameter	Description
`offset`	The number of documents to skip.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on

293.3.3.18 VERSION Function

This function specifies that only documents with the supplied version should be returned. Typically, this is chained together with KEY(...) to implement optimistic locking for write operations such as REMOVE and REPLACE. Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed.

Syntax

```
VERSION (
     version         IN VARCHAR2)
 RETURN SODA_Operation_T;
```

Parameters

Table 293-31 VERSION Function Parameters

Parameter	Description
version	Document version to be used for the operation.

Return Values

This function returns the same SODA_OPERATION_T object it was invoked on

293.3.4 SODA_Cursor_T Type

This SODA type is used to represent a result set of documents.

Table 293-32 SODA_Cursor_T Type Subprograms

Subprogram	Description
CLOSE Function	Closes the cursor.
HAS_NEXT Function	Returns TRUE, if the next document is available for the cursor. Otherwise, returns FALSE.
NEXT Function	Returns the next SODA documented pointed by the cursor.

293.3.4.1 CLOSE Function

This function closes the cursor.

Syntax

```
CLOSE ()
 RETURN BOOLEAN;
```

Example 293-3 Return Values

This function returns a boolean value.

293.3.4.2 HAS_NEXT Function

This function returns `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Syntax

```
HAS_NEXT ()
 RETURN BOOLEAN;
```

Return Values

This function returns a boolean value. `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

Exceptions

`Error`—If an error occurs while checking if the next document is available.

293.3.4.3 NEXT Function

This function returns the next `SODA` documented pointed by the cursor.

Syntax

```
NEXT ()
 RETURN SODA_Document_T;
```

Return Values

This function returns the next `SODA` documented pointed by the cursor. Returns `NULL` when the `HAS_NEXT function` returns `FALSE`.

Exceptions

`Error`—If an error occurs while getting the next document.

294
UTL Streams Types

`UTL Streams Types` describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by `PUBLIC` and are described in the following sections.

This chapter contains the following topics:

- Security Model
- Summary of UTL Binary Streams Types

> **See Also:**
>
> For more information, see Oracle XML DB Developer's Guide

294.1 UTL Streams Types Security Model

`EXECUTE` on UTL Streams Types is granted to `PUBLIC`.

294.2 Summary of UTL Binary Streams Types

This table lists the `UTL Binary Streams Types` and briefly describes them.

Table 294-1 UTL Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type	Writes chars and closes a stream.

294.2.1 UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
```

```
  MEMBER FUNCTION available (
       self    IN OUT NOCOPY  Utl_BinaryInputStream)
    RETURN INTEGER,

  MEMBER FUNCTION read (                                  -- #1
     self      IN OUT NOCOPY  Utl_BinaryInputStream,
     numBytes  IN             INTEGER DEFAULT 1)
   RETURN RAW,

 MEMBER PROCEDURE read (                                  -- #2
    self       IN OUT NOCOPY   Utl_BinaryInputStream,
    bytes      IN OUT NOCOPY  RAW,
    numBytes   IN OUT         INTEGER),

 MEMBER PROCEDURE read (                                  -- #3
    self       IN OUT NOCOPY   Utl_BinaryInputStream,
    bytes      IN OUT NOCOPY   RAW,
    offset     IN INTEGER,
    numBytes   IN OUT          INTEGER),

 member function close (
    self       In Out Nocopy   Utl_BinaryInputStream)

) NOT FINAL;
```

Attributes

Table 294-2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	• #1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. • #2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read. • #3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

294.2.2 UTL_BINARYOUTPUTSTREAM Type

This type is similar to java.io.OutputStream in that it can only write and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                 -- #1
       self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
```

```
      bytes      IN              RAW,
      numBytes   IN              INTEGER DEFAULT 1)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                  -- #2
      self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
      bytes      IN NOCOPY      RAW,
      numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE write (                                  -- #3
      self       IN OUT NOCOPY  utl_BinaryOutputStream,        bytes      IN
NOCOPY      RAW,
      offset     IN             INTEGER,
      numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE flush (
      self       IN OUT NOCOPY  utl_BinaryOutputStream),

  MEMBER PROCEDURE close (
      self       IN OUT NOCOPY utl_BinaryOutputStream)

 ) NOT FINAL;
```

Attributes

Table 294-3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	• #1 - Writes the number of bytes specified by numBytes (default is 1) from RAW into the stream. The actual number of bytes written is returned. • #2 - Writes the number of bytes specified in parameter numBytes from parameter bytes to the stream. The actual number of bytes written is returned in parameter numBytes. • #3 - Writes the number of bytes specified by numBytes to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter numBytes.
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

294.2.3 UTL_CHARACTERINPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

   MEMBER FUNCTION available (
       self       IN OUT NOCOPY   utl_CharacterInputStream)
   RETURN INTEGER,

   MEMBER FUNCTION read (                                   -- #1
       self       IN OUT NOCOPY   utl_CharacterInputStream,
       numChars   IN              INTEGER DEFAULT 1,
       lineFeed   IN              BOOLEAN DEFAULT FALSE)
```

```
  RETURN VARCHAR2,

  MEMBER PROCEDURE read (                                  -- #2
      self       IN OUT NOCOPY    utl_CharacterInputStream,
      chars      IN OUT NOCOPY    VARCHAR2,
      numChars   IN OUT           INTEGER,
      lineFeed   IN BOOLEAN DEFAULT FALSE),

  MEMBER PROCEDURE read (                                  -- #3
      self       IN OUT NOCOPY   utl_CharacterInputStream,
      chars      IN OUT NOCOPY    VARCHAR2,
      offset     IN               INTEGER,
      numChars   IN OUT           INTEGER,
      lineFeed   IN               BOOLEAN DEFAULT FALSE),

  MEMBER PROCEDURE close (
     self       IN OUT NOCOPY    utl_CharacterInputStream)
) NOT FINAL;
```

Attributes

Table 294-4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	• #1 - Returns the number of characters remaining to be read • #2 - Reads the number of characters specified by `numChars` (default value is 1) and returns the characters as a VARCHAR2. If the value of `lineFeed` is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of `NULL` is returned. • #3 - Reads reads the number of characters specified by parameter `numChars` into the parameter chars. Additionally, the actual number of characters read is returned in parameter `numChars`. If this value is 0, then there are no more characters to be read. If the value of `lineFeed` is `TRUE` (default is FALSE), then reading stops if a linefeed character is encountered.
CLOSE	Releases all resources held by the stream

294.2.4 UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream  AS OBJECT (

 MEMBER FUNCTION write (                                  -- #1
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN              VARCHAR2,
     numChars  IN              INTEGER DEFAULT 1,
     lineFeed  IN              BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

 MEMBER PROCEDURE write (                                  -- #2
```

```
    self      IN OUT NOCOPY   utl_CharacterOutputStream,
    chars     IN OUT NOCOPY   VARCHAR2,
    numChars  IN OUT          INTEGER,
    lineFeed  IN              BOOLEAN DEFAULT FALSE),

 member procedure write (                                  -- #3
    self     IN OUT NOCOPY    utl_CharacterOutputStream,
    chars    IN  NOCOPY       varchar2,
    offset   IN               integer,
    numChars IN OUT           integer,
   lineFeed  IN               boolean default false),

 MEMBER PROCEDURE flush (
    self     IN OUT NOCOPY    utl_CharacterOutputStream),

MEMBER PROCEDURE close (
    self     IN OUT NOCOPY utl_CharacterOutputStream)

 ) NOT FINAL;
```

Attributes

Table 294-5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	• #1 - Writes the number of characters specified by numChars (default is 1) from parameter chars into the stream and returns the actual number of characters written. If the value of lineFeed is TRUE (default is FALSE) a lineFeed character is inserted after the last character. • #2 - writes the number of characters specified by parameter numChars, from parameter chars into the stream. The actual number of characters written is returned in parameter numChars. If the value of lineFeed is true (default is FALSE) a lineFeed character is inserted after the last character. • #3 - Writes the number of characters specified by parameter numChars, from parameter chars, beginning at offset specified by parameter offset. The actual number of characters written is returned in parameter numChars. If the value of lineFeed is true (default is FALSE) a lineFeed character is inserted after the last character .
FLUSH	Copies all characters that may be contained within buffers to the node value
CLOSE	Releases all resources held by the stream

295
XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG SQL` function.

This chapter contains the following topics:

- Summary of XMLType Subprograms

> **See Also:**
>
> – *Oracle XML DB Developer's Guide*

295.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

Table 295-1 XMLTYPE Subprograms

Method	Description
CREATENONSCHEMABASEDXML	Creates a non schema based XML from the input schema based instance.
CREATESCHEMABASEDXML	Creates a schema based `XMLType` instance from the non-schema based instance using the input schema URL.
CREATEXML	Static function for creating and returning an `XMLType` instance.
EXISTSNODE	Takes a `XMLType` instance and a `XPath` and returns `1` or `0` indicating if applying the `XPath` returns a non-empty set of nodes.
EXTRACT	Takes a `XMLType` instance and an `XPath`, applies the XPath expression and returns the results as an `XMLType`.
GETBLOBVAL	Returns the value of the `XMLType` instance as a `BLOB`
GETCLOBVAL	Returns the value of the `XMLType` instance as a `CLOB`.
GETNAMESPACE	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL	Returns the value of the `XMLType` instance as a `NUMBER`. This is only valid if the input `XMLType` instance contains a simple text node and is convertible to a number.
GETROOTELEMENT	Returns the root element of the input instance. Returns `NULL` if the instance is a fragment
GETSCHEMAURL	Returns the XML schema URL if the input is an XML Schema based.

Table 295-1 (Cont.) XMLTYPE Subprograms

Method	Description
GETSTRINGVAL	Returns the value of the XMLType instance as a string.
ISFRAGMENT	Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED	Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.
ISSCHEMAVALID	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT	Converts the XMLType instance to an object type.
TRANSFORM	Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.
XMLTYPE	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.

295.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

295.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Table 295-2 CREATESCHEMABASEDXML Subprogram Parameters

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema.

295.1.3 CREATEXML

This static function creates and returns an XMLType instance. The string and CLOB parameters used to pass in the date must contain well-formed and valid XML documents.

The options are described in the following table.

Table 295-3 CREATEXML Subprograms

Syntax	Description

`STATIC FUNCTION createXML(`
`  xmlData IN varchar2)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a string.

`STATIC FUNCTION createXML(`
`  xmlData IN clob)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a CLOB.

`STATIC FUNCTION createXML (`
`  xmlData IN clob,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0 )`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN varchar2,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN "<ADT_1>",`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN NUMBER := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from an instance of an user-defined type.

Table 295-3 (Cont.) CREATEXML Subprograms

Syntax	Description

`STATIC FUNCTION createXML (`
`xmlData IN SYS_REFCURSOR,`
`schema in varchar2 := NULL,`
`element in varchar2 := NULL,`
`validated in number := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a `CURSOR`.

`STATIC FUNCTION createXML (`
`xmlData IN AnyData,`
`schema in varchar2 := NULL,`
`element in varchar2 := NULL,`
`validated in number := 0)`
`RETURN sys.XMLType deterministic`
`parallel_enable`
	Creates an XML instance from `ANYDATA`.If the `ANYDATA`instance contains an ADT, the `XMLType`returned is the same as would be returned for a call directly on the ADT. If the `ANYDATA`contains a scalar, the `XMLType` contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "`ANYDATA`" if it is not.

`STATIC FUNCTION createXML (`
`xmlData IN blob,`
`csid IN number,`
`schema IN varchar2,`
`validated IN number := 0,`
`wellformed IN number := 0)`
`return sys.XMLType deterministic`
	Creates an XML instance from a `BLOB`.

`STATIC FUNCTION createXML (`
`xmlData IN bfile,`
`csid IN number,`
`Schema IN varchar2,`
`validated IN number := 0,`
`wellformed IN number := 0)`
`return sys.XMLType deterministic`
	Creates an XML instance from a `BFILE`.

Table 295-4 CREATEXML Parameters

Parameter	Description
`xmlData`	The actual data in the form of a `BFILE`, `BLOB`, `CLOB`, `REF` cursor, `VARCHAR2` or object type.
`schema`	Optional Schema URL to be used to make the input conform to the given schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`validated`	Flag to indicate that the instance is valid according to the given XML Schema. (Default is `0`)
`wellformed`	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is `0`)

Table 295-4 (Cont.) CREATEXML Parameters

Parameter	Description
`element`	Optional element name in the case of the `ADT_1` or `REF CURSOR` constructors. (Default is `NULL`). **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`csid`	The character set id of input XML data.

295.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION existsNode(`
`  xpath IN varchar2)`
`RETURN number deterministic;`
	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.

`MEMBER FUNCTION existsNode(`
`  xpath in varchar2,`
`  nsmap in varchar2)`
`RETURN number deterministic;`
	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Table 295-5 EXISTSNODE Subprogram Parameters

Parameter	Description
`xpath`	The XPath expression to test.
`nsmap`	Optional namespace mapping.

295.1.5 EXTRACT

This member function extracts an `XMLType` fragment and returns an `XMLType` instance containing the result nodes. If the XPath does not result in any nodes, it then returns `NULL`.

The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION extract(`
`  xpath IN varchar2)`
`RETURN XMLType deterministic;`
	Given an XPath expression, applies the XPath to the document and returns the fragment as an `XMLType`.

Syntax	Description

`MEMBER FUNCTION extract(`
`  xpath IN varchar2,`
`  nsmap IN varchar2)`
`RETURN XMLType deterministic;`
	This member function applies the XPath expression and namespace mapping, over the XML data to return a `XMLType` instance containing the resultant fragment.

Table 295-6 EXTRACT Subprogram Parameters

Parameter	Description
`xpath`	The XPath expression to apply.
`nsmap`	Optional prefix to namespace mapping information.

295.1.6 GETBLOBVAL

This member function returns a `BLOB` containing the serialized XML representation. If the `BLOB` returned is temporary, it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal(
   csid   IN   NUMBER)
 RETURN BLOB DETERMINISTIC;
```

Table 295-7 GETBLOBVAL Subprogram Parameters

Parameter	Description
`csid`	The desired character set ID of output `BLOB`

295.1.7 GETCLOBVAL

This member function returns a `CLOB` containing the serialized XML representation. If the `CLOB` returned is temporary, it must be freed after use. The CLOBs returned by this function are `read-only`.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

295.1.8 GETNAMESPACE

`GETNAMESPACE` is a member function. It returns the namespace of the top level element in the instance. It returns `NULL` if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

295.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value.

The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

295.1.10 GETROOTELEMENT

this member function gets the root element of the XMLType instance. It returns NULL if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

295.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise, it returns NULL.

Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

295.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the seralized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the VARCHAR2 maximum size (4000), then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

295.1.13 ISFRAGMENT

`ISFRAGMENT` determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

295.1.14 ISSCHEMABASED

This member function determines whether the `XMLType` instance is schema-based or not. It returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

295.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. I does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the `XMLType` instance's own schema.

Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

Table 295-8 ISSCHEMAVALID Subprogram Parameters

Parameter	IN / OUT	Description
`schurl`	`(IN)`	The URL of the XML Schema against which to check conformance.
`elem`	`(IN)`	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

295.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the XMLType instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

295.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);
```

Table 295-9 SCHEMAVALIDATE Subprogram Parameters

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

295.1.18 SETSCHEMAVALIDATED

This member function sets the VALIDATION state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
   flag IN BINARY_INTEGER := 1);
```

Table 295-10 SERTSSCHEMAVALIDATED Subprogram Parameters

Parameter	IN / OUT	Description
self	(OUT)	XML instance.
flag	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

295.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses cannonical mapping between elements and object type attributes.

Syntax

```
MEMBER PROCEDURE toObject(
SELF in XMLType,
object OUT "<ADT_1>",
schema in varchar2 := NULL,
element in varchar2 := NULL);
```

Table 295-11 TOOBJECT Subprogram Parameters

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).

295.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is NULL, then a NULL is returned.

Syntax

```
MEMBER FUNCTION transform(
xsl IN XMLType,
parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Table 295-12 TRANSFORM Subprogram Parameters

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

295.1.21 XMLTYPE

This is an `XMLType` constructor.

The options are described in the following table.

Table 295-13 XMLTYPE Member Subprogram Parameters

Syntax	Description

`constructor function XMLType(`
`  xmlData IN clob,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN Number := 0)`
`return self as result deterministic;`
	This constructor function creates an optionally schema-based `XMLType` instance using the specified schema and xml data parameters.

`constructor function XMLType(`
`  xmlData IN varchar2,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic;`
	This constructor function creates an optionally schema-based `XMLType` instance using the specified schema and xml data parameters.

`constructor function XMLType (`
`  xmlData IN "w<ADT_1>",`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN number := 0)`
`return self as result deterministic;`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified object type parameter.

`constructor function XMLType(`
`  xmlData IN SYS_REFCURSOR,`
`  schema in varchar2 := NULL,`
`  element in varchar2 := NULL,`
`  validated in number := 0)`
`return self as result deterministic;`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `REF CURSOR` parameter.

`constructor function XMLType(`
`  xmlData IN AnyData,`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN number := 0)`
`return self as result deterministic`
`  parallel_enable`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `ANYDATA` parameter.If the `ANYDATA` instance contains an ADT, the `XMLType` returned is the same as would be returned for a call directly on the ADT. If the `ANYDATA` contains a scalar, the `XMLType` contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "`ANYDATA`" if it is not.

Table 295-13 (Cont.) XMLTYPE Member Subprogram Parameters

Syntax	Description

`constructor function XMLType(`
`  xmlData IN blob, csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BLOB` parameter.

`constructor function XMLType(`
`  xmlData IN bfile,`
`  csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BFILE` parameter.

Table 295-14 XMLTYPE Constructor Subprogram Parameters

Parameter	Description
`xmlData`	The data in the form of a `BFILE`, `BLOB`, `CLOB`, `REF`s, `VARCHAR2` or object type.
`schema`	Optional Schema URL to be used to make the input conform to the given schema. **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`validated`	Indicates that the instance is valid to the given XML Schema.
`wellformed`	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
`element`	Optional element name in the case of the `ADT_1` or `REF CURSOR` constructors. (Default is `NULL`). **Caution**: Oracle does not support use of types generated by Schema Registration (see *Oracle XML DB Developer's Guide*).
`csid`	The character set id of input XML data.
