Oracle Database PL/SQL Packages and Types Reference, 23ai

F46980-20

Copyright © 1996, 2024, Oracle and/or its affiliates.

Primary Author: Gunjan Jain

Contributing Authors: Louise Morin, Denis Raphaely, Lance Ashdown, Drue Baker, Donna Carver, Maitreyee Chaliha, Beethoven Cheng, Rhonda Day, Steve Fogel, Bryn Llewellyn, Paul Lane, David McDermid, Tony Morales, Anne Murphy, Chuck Murray, Sue Pelski, Kathy Rich, Antonio Romero, Vivian Schupmann, Cathy Shea, Margaret Taft, Kathy Taylor, Randy Urbano, Pat Huey, Drew Adams, Sarika Surumpudi, Rodney Ward, Rajesh Bhatiya, Tanmay Choudhury, Roopesh Ashok Kumar, Atif Chaudhry, Subha Vikram

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

Changes in this Release cl

1 Introduction to Oracle Supplied PL/SQL Packages & Types

1.1 Package Overview 1-1
1.1.1 Package Components 1-2
1.1.2 Using Oracle Supplied Packages 1-2
1.1.3 Creating New Packages 1-2
1.1.3.1 Separating the Specification and Body 1-3
1.1.4 Referencing Package Contents 1-5
1.2 Summary of Oracle Supplied PL/SQL Packages and Types 1-5

2 Oracle Application Express Packages APEX_APPLICATION Through APEX_ZIP

3 CTX_ADM

4 CTX_ANL

4.1 GET_COMPRESSION_RATIO Procedure 4-1

5 CTX_DDL

6 CTX_CLS

7 CTX_DOC

8 CTX_ENTITY

9 CTX_OUTPUT

10 CTX_QUERY

11 CTX_REPORT

12 CTX_THES

13 CTX_ULEXER

14 DBMS_ACTIVITY

14.1 Using DBMS_ACTIVITY 14-1
14.2 Summary of DBMS_ACTIVITY Subprograms 14-2
14.2.1 CONFIGURE Procedure 14-2
14.2.2 CREATE_SNAPSHOT Procedure 14-3
14.2.3 DELETE_SNAPSHOT Procedure 14-4
14.2.4 DELETE_SNAPSHOT Procedure 14-5

15 DBMS_ADDM

15.1 DBMS_ADDM Security Model 15-1
15.2 Summary of DBMS_ADDM Subprograms 15-1
15.2.1 ANALYZE_DB Procedure 15-3

15.2.2 ANALYZE_INST Procedure 15-4
15.2.3 ANALYZE_PARTIAL Procedure 15-5
15.2.4 COMPARE_CAPTURE_REPLAY_REPORT Function 15-7
15.2.5 COMPARE_DATABASES Function 15-8
15.2.6 COMPARE_INSTANCES Function 15-9
15.2.7 COMPARE_REPLAY_REPLAY_REPORT Function 15-10
15.2.8 DELETE Procedure 15-11
15.2.9 DELETE_FINDING_DIRECTIVE Procedure 15-12
15.2.10 DELETE_PARAMETER_DIRECTIVE Procedure 15-12
15.2.11 DELETE_SEGMENT_DIRECTIVE Procedure 15-13
15.2.12 DELETE_SQL_DIRECTIVE Procedure 15-13
15.2.13 FAILED_AUTO_TASKS_REPORT Function 15-14
15.2.14 GET_ASH_QUERY Function 15-14
15.2.15 GET_REPORT Function 15-15
15.2.16 INSERT_FINDING_DIRECTIVE Procedure 15-15
15.2.17 INSERT_PARAMETER_DIRECTIVE Procedure 15-16
15.2.18 INSERT_SEGMENT_DIRECTIVE Procedure 15-17
15.2.19 INSERT_SQL_DIRECTIVE Procedure 15-18
15.2.20 REAL_TIME_ADDM_REPORT Function 15-19
15.2.21 REEXECUTE_FAILED_AUTO_TASKS Procedure 15-20

16 DBMS_ADVANCED_REWRITE

16.1 DBMS_ADVANCED_REWRITE Security Model 16-1
16.2 Summary of DBMS_ADVANCED_REWRITE Subprograms 16-1
16.2.1 ALTER_REWRITE_EQUIVALENCE Procedure 16-2
16.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure 16-3
16.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures 16-3
16.2.4 DROP_REWRITE_EQUIVALENCE Procedure 16-5
16.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure 16-6

17 DBMS_ADVISOR

17.1 DBMS_ADVISOR Deprecated Subprograms 17-1
17.2 DBMS_ADVISOR Security Model 17-2
17.3 Summary of DBMS_ADVISOR Subprograms 17-2
17.3.1 ADD_SQLWKLD_REF Procedure 17-5
17.3.2 ADD_SQLWKLD_STATEMENT Procedure 17-6
17.3.3 ADD_STS_REF Procedure 17-8
17.3.4 CANCEL_TASK Procedure 17-9
17.3.5 COPY_SQLWKLD_TO_STS Procedure 17-10
17.3.6 CREATE_FILE Procedure 17-11

17.3.7 CREATE_OBJECT Procedure 17-12
17.3.8 CREATE_SQLWKLD Procedure 17-14
17.3.9 CREATE_TASK Procedures 17-15
17.3.10 DELETE_SQLWKLD Procedure 17-17
17.3.11 DELETE_SQLWKLD_REF Procedure 17-18
17.3.12 DELETE_SQLWKLD_STATEMENT Procedure 17-19
17.3.13 DELETE_STS_REF Procedure 17-20
17.3.14 DELETE_TASK Procedure 17-21
17.3.15 EXECUTE_TASK Procedure 17-21
17.3.16 GET_REC_ATTRIBUTES Procedure 17-23
17.3.17 GET_TASK_REPORT Function 17-24
17.3.18 GET_TASK_SCRIPT Function 17-25
17.3.19 IMPLEMENT_TASK Procedure 17-26
17.3.20 IMPORT_SQLWKLD_SCHEMA Procedure 17-27
17.3.21 IMPORT_SQLWKLD_SQLCACHE Procedure 17-28
17.3.22 IMPORT_SQLWKLD_STS Procedure 17-30
17.3.23 IMPORT_SQLWKLD_SUMADV Procedure 17-31
17.3.24 IMPORT_SQLWKLD_USER Procedure 17-33
17.3.25 INTERRUPT_TASK Procedure 17-34
17.3.26 MARK_RECOMMENDATION Procedure 17-35
17.3.27 QUICK_TUNE Procedure 17-36
17.3.28 RESET_SQLWKLD Procedure 17-38
17.3.29 RESET_TASK Procedure 17-39
17.3.30 SET_DEFAULT_SQLWKLD_PARAMETER Procedure 17-39
17.3.31 SET_DEFAULT_TASK_PARAMETER Procedure 17-40
17.3.32 SET_SQLWKLD_PARAMETER Procedure 17-41
17.3.33 SET_TASK_PARAMETER Procedure 17-43
17.3.34 TUNE_MVIEW Procedure 17-57
17.3.35 UPDATE_OBJECT Procedure 17-59
17.3.36 UPDATE_REC_ATTRIBUTES Procedure 17-61
17.3.37 UPDATE_SQLWKLD_ATTRIBUTES Procedure 17-62
17.3.38 UPDATE_SQLWKLD_STATEMENT Procedure 17-63
17.3.39 UPDATE_TASK_ATTRIBUTES Procedure 17-65

18 DBMS_AUTOIM

18.1 Using DBMS_AUTOIM 18-1
18.2 Summary of DBMS_AUTOIM Subprograms 18-1
18.2.1 SET_PARAMETER Procedure 18-1
18.2.2 ACTIVITY_REPORT Function 18-2

19 DBMS_ALERT

19.1 DBMS_ALERT Overview 19-1
19.2 DBMS_ALERT Security Model 19-1
19.3 DBMS_ALERT Constants 19-1
19.4 DBMS_ALERT Restrictions 19-2
19.5 DBMS_ALERT Exceptions 19-2
19.6 DBMS_ALERT Operational Notes 19-2
19.7 DBMS_ALERT Examples 19-3
19.8 Summary of DBMS_ALERT Subprograms 19-4
19.8.1 REGISTER Procedure 19-4
19.8.2 REMOVE Procedure 19-5
19.8.3 REMOVEALL Procedure 19-5
19.8.4 SET_DEFAULTS Procedure 19-5
19.8.5 SIGNAL Procedure 19-6
19.8.6 WAITANY Procedure 19-6
19.8.7 WAITONE Procedure 19-7

20 DBMS_APP_CONT

20.1 DBMS_APP_CONT Overview 20-1
20.2 DBMS_APP_CONT Security Model 20-2
20.3 Summary of DBMS_APP_CONT Subprograms 20-2
20.3.1 ADD_SQL_CONNECTION_TEST Procedure 20-2
20.3.2 APPLY_REPLAY_RULE Procedure 20-3
20.3.3 DELETE_SQL_CONNECTION_TEST Procedure 20-4
20.3.4 DISABLE_CONNECTION_TEST Procedure 20-4
20.3.5 ENABLE_CONNECTION_TEST Procedure 20-5
20.3.6 GET_LTXID_OUTCOME Procedure 20-6
20.3.7 GET_REPLAY_RULES Function 20-7
20.3.8 RESET_REPLAY_RULES Procedure 20-8

21 DBMS_APP_CONT_ADMIN

21.1 DBMS_APP_CONT_ADMIN Security Model 21-1
21.2 Summary of DBMS_APP_CONT_ADMIN Subprograms 21-1
21.2.1 ACCHK_CLEAR_FILTER Procedure 21-2
21.2.2 ACCHK_SET Procedure 21-3
21.2.3 ACCHK_SET_FILTER Procedure 21-5
21.2.4 ACCHK_SHOW_FILTERS Procedure 21-6
21.2.5 ADD_SQL_CONNECTION_TEST Procedure 21-6
21.2.6 DELETE_SQL_CONNECTION_TEST Procedure 21-7

21.2.7 DISABLE_CONNECTION_TEST Procedure 21-8
21.2.8 DISABLE_FAILOVER Procedure 21-8
21.2.9 ENABLE_AC Procedure 21-9
21.2.10 ENABLE_CONNECTION_TEST Procedure 21-10
21.2.11 ENABLE_RESET_STATE Procedure 21-11
21.2.12 ENABLE_TAC Procedure 21-11
21.2.13 MODIFY_SERVICE Procedure 21-12
21.2.14 SET_DRAINING Procedure 21-15
21.2.15 SET_LOAD_BALANCING Procedure 21-16

22 DBMS_APP_CONT_REPORT

22.1 DBMS_APP_CONT_REPORT Security Model 22-1
22.2 Summary of DBMS_APP_CONT_REPORT Subprograms 22-1
22.2.1 ACCHK_REPORT Procedure 22-1

23 DBMS_APPLICATION_INFO

23.1 DBMS_APPLICATION_INFO Overview 23-1
23.2 DBMS_APPLICATION_INFO Security Model 23-1
23.3 DBMS_APPLICATION_INFO Operational Notes 23-1
23.4 Summary of DBMS_APPLICATION_INFO Subprograms 23-2
23.4.1 READ_CLIENT_INFO Procedure 23-2
23.4.2 READ_MODULE Procedure 23-2
23.4.3 SET_ACTION Procedure 23-3
23.4.4 SET_CLIENT_INFO Procedure 23-4
23.4.5 SET_MODULE Procedure 23-5
23.4.6 SET_SESSION_LONGOPS Procedure 23-5

24 DBMS_APPLY_ADM

24.1 DBMS_APPLY_ADM Overview 24-1
24.2 DBMS_APPLY_ADM Security Model 24-2
24.3 DBMS_APPLY_ADM Deprecated Subprograms 24-3
24.4 Summary of DBMS_APPLY_ADM Subprograms 24-3
24.4.1 ALTER_APPLY Procedure 24-5
24.4.2 CLEAR_KEY_COLUMNS Procedure 24-10
24.4.3 COMPARE_OLD_VALUES Procedure 24-11
24.4.4 CREATE_APPLY Procedure 24-13
24.4.5 CREATE_OBJECT_DEPENDENCY Procedure 24-19
24.4.6 DELETE_ALL_ERRORS Procedure 24-20
24.4.7 DELETE_ERROR Procedure 24-20

24.4.8 DROP_APPLY Procedure 24-21
24.4.9 DROP_OBJECT_DEPENDENCY Procedure 24-22
24.4.10 EXECUTE_ALL_ERRORS Procedure 24-23
24.4.11 EXECUTE_ERROR Procedure 24-24
24.4.12 GET_ERROR_MESSAGE Function 24-26
24.4.13 HANDLE_COLLISIONS 24-28
24.4.14 SET_DML_CONFLICT_HANDLER Procedure 24-28
24.4.15 SET_DML_HANDLER Procedure 24-34
24.4.16 SET_ENQUEUE_DESTINATION Procedure 24-38
24.4.17 SET_EXECUTE Procedure 24-40
24.4.18 SET_GLOBAL_INSTANTIATION_SCN Procedure 24-41
24.4.19 SET_KEY_COLUMNS Procedures 24-45
24.4.20 SET_PARAMETER Procedure 24-48
24.4.21 SET_REPERROR_HANDLER Procedure 24-69
24.4.22 SET_SCHEMA_INSTANTIATION_SCN Procedure 24-70
24.4.23 SET_TABLE_INSTANTIATION_SCN Procedure 24-73
24.4.24 SET_UPDATE_CONFLICT_HANDLER Procedure 24-75
24.4.25 SET_VALUE_DEPENDENCY Procedure 24-79
24.4.26 START_APPLY Procedure 24-80
24.4.27 STOP_APPLY Procedure 24-81

25 DBMS_AQ

25.1 DBMS_AQ Security Model 25-1
25.2 DBMS_AQ Constants 25-2
25.3 DBMS_AQ Data Types 25-3
25.4 DBMS_AQ Operational Notes 25-5
25.5 Summary of DBMS_AQ Subprograms 25-5
25.5.1 BIND_AGENT Procedure 25-6
25.5.2 DEQUEUE Procedure 25-7
25.5.3 DEQUEUE_ARRAY Function 25-9
25.5.4 ENQUEUE Procedure 25-10
25.5.5 ENQUEUE_ARRAY Function 25-11
25.5.6 LISTEN Procedures 25-12
25.5.7 POST Procedure 25-13
25.5.8 REGISTER Procedure 25-14
25.5.9 SEEK Procedure 25-15
25.5.10 UNBIND_AGENT Procedure 25-16
25.5.11 UNREGISTER Procedure 25-16

26 DBMS_AQADM

26.1 DBMS_AQADM Security Model 26-1
26.2 DBMS_AQADM Constants 26-2
26.3 DBMS_AQADM Subprogram Groups 26-3
26.3.1 DBMS_AQADM Queue Table Subprograms 26-3
26.3.2 DBMS_AQADM Privilege Subprograms 26-4
26.3.3 DBMS_AQADM Queue Subprograms 26-4
26.3.4 DBMS_AQADM Subscriber Subprograms 26-5
26.3.5 DBMS_AQADM OKafka Subprograms 26-5
26.3.6 DBMS_AQADM Propagation Subprograms 26-5
26.3.7 DBMS_AQADM Miscellaneous Subprograms 26-6
26.3.8 DBMS_AQADM Agent Subprograms 26-6
26.3.9 DBMS_AQADM Alias Subprograms 26-7
26.4 Summary of DBMS_AQADM Subprograms 26-7
26.4.1 ADD_ALIAS_TO_LDAP Procedure 26-10
26.4.2 ADD_SUBSCRIBER Procedure 26-10
26.4.3 ALTER_AQ_AGENT Procedure 26-11
26.4.4 ALTER_PROPAGATION_SCHEDULE Procedure 26-12
26.4.5 ALTER_QUEUE Procedure 26-13
26.4.6 ALTER_QUEUE_TABLE Procedure 26-14
26.4.7 ALTER_SHARDED_QUEUE Procedure 26-15
26.4.8 ALTER_SUBSCRIBER Procedure 26-16
26.4.9 ALTER_TRANSACTIONAL_EVENT_QUEUE Procedure 26-16
26.4.10 CREATE_AQ_AGENT Procedure 26-17
26.4.11 CREATE_DATABASE_KAFKA_TOPIC Procedure 26-18
26.4.12 CREATE_NP_QUEUE Procedure 26-19
26.4.13 CREATE_QUEUE Procedure 26-20
26.4.14 CREATE_QUEUE_TABLE Procedure 26-21
26.4.15 CREATE_SHARDED_QUEUE Procedure 26-24
26.4.16 CREATE_EXCEPTION_QUEUE Procedure 26-25
26.4.17 CREATE_EQ EXCEPTION_QUEUE Procedure 26-26
26.4.18 CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure 26-26
26.4.19 DEL_ALIAS_FROM_LDAP Procedure 26-27
26.4.20 DISABLE_DB_ACCESS Procedure 26-28
26.4.21 DISABLE_PROPAGATION_SCHEDULE Procedure 26-28
26.4.22 DROP_AQ_AGENT Procedure 26-29
26.4.23 DROP_DATABASE_KAFKA_TOPIC Procedure 26-29
26.4.24 DROP_QUEUE Procedure 26-30
26.4.25 DROP_QUEUE_TABLE Procedure 26-30
26.4.26 DROP_SHARDED_QUEUE Procedure 26-31
26.4.27 DROP_TRANSACTIONAL_EVENT_QUEUE Procedure 26-31

26.4.28 ENABLE_DB_ACCESS Procedure 26-32
26.4.29 ENABLE_JMS_TYPES Procedure 26-32
26.4.30 ENABLE_PROPAGATION_SCHEDULE Procedure 26-33
26.4.31 GET_MAX_STREAMS_POOL Procedure 26-33
26.4.32 GET_MIN_STREAMS_POOL Procedure 26-34
26.4.33 GET_QUEUE_PARAMETER Procedure 26-34
26.4.34 GET_WATERMARK Procedure 26-37
26.4.35 GRANT_QUEUE_PRIVILEGE Procedure 26-37
26.4.36 GRANT_SYSTEM_PRIVILEGE Procedure 26-37
26.4.37 MIGRATE_QUEUE_TABLE Procedure 26-38
26.4.38 PURGE_QUEUE_TABLE Procedure 26-39
26.4.39 QUEUE_SUBSCRIBERS Function 26-40
26.4.40 REMOVE_SUBSCRIBER Procedure 26-41
26.4.41 REVOKE_QUEUE_PRIVILEGE Procedure 26-41
26.4.42 REVOKE_SYSTEM_PRIVILEGE Procedure 26-42
26.4.43 SCHEDULE_PROPAGATION Procedure 26-42
26.4.44 SET_QUEUE_PARAMETER Procedure 26-44
26.4.45 SET_MAX_STREAMS_POOL Procedure 26-47
26.4.46 SET_MIN_STREAMS_POOL Procedure 26-47
26.4.47 SET_WATERMARK Procedure 26-47
26.4.48 START_QUEUE Procedure 26-48
26.4.49 STOP_QUEUE Procedure 26-48
26.4.50 UNSCHEDULE_PROPAGATION Procedure 26-49
26.4.51 UNSET_QUEUE_PARAMETER Procedure 26-50
26.4.52 VERIFY_QUEUE_TYPES Procedure 26-52

27 DBMS_AQELM

27.1 DBMS_AQELM Security Model 27-1
27.2 Summary of DBMS_AQELM Subprograms 27-1
27.2.1 SET_MAILHOST Procedure 27-1
27.2.2 SET_MAILPORT Procedure 27-2
27.2.3 SET_SENDFROM Procedure 27-2

28 DBMS_AQIN

28.1 DBMS_AQIN Security Model 28-1

29 DBMS_AQMIGTOOL

29.1 DBMS_AQMIGTOOL Security Model 29-1
29.2 DBMS_AQMIGTOOL Constants 29-1

29.3 Summary of DBMS_AQMIGTOOL Subprograms 29-2
29.3.1 CANCEL_MIGRATION Procedure 29-3
29.3.2 CHECK_MIGRATED_MESSAGES Procedure 29-4
29.3.3 CHECK_MIGRATION_TO_TXEVENTQ Procedure 29-4
29.3.4 CHECK_STATUS Procedure 29-5
29.3.5 CLEAR_UNSUPPORTED_FEATURE_TABLE Procedure 29-7
29.3.6 COMMIT_MIGRATION Procedure 29-8
29.3.7 DISABLE_MIGRATION_CHECK Procedure 29-8
29.3.8 INIT_MIGRATION Procedure 29-9
29.3.9 PURGE_QUEUE_MESSAGES Procedure 29-11
29.3.10 RECOVER_MIGRATION Procedure 29-12
29.3.11 RENAME_QUEUE Procedure 29-13

30 DBMS_ASSERT

30.1 DBMS_ASSERT Operational Notes 30-1
30.2 Summary of DBMS_ASSERT Subprograms 30-1
30.2.1 ENQUOTE_LITERAL Function 30-2
30.2.2 ENQUOTE_NAME Function 30-2
30.2.3 NOOP Functions 30-4
30.2.4 QUALIFIED_SQL_NAME Function 30-4
30.2.5 SCHEMA_NAME Function 30-5
30.2.6 SIMPLE_SQL_NAME Function 30-5
30.2.7 SQL_OBJECT_NAME Function 30-6

31 DBMS_AUDIT_MGMT

31.1 DBMS_AUDIT_MGMT Overview 31-1
31.2 DBMS_AUDIT_MGMT Deprecated and Desupported Subprograms 31-2
31.3 DBMS_AUDIT_MGMT Security Model 31-3
31.4 DBMS_AUDIT_MGMT Constants 31-3
31.5 DBMS_AUDIT_MGMT Views 31-5
31.6 DBMS_AUDIT_MGMT Subprogram Groups 31-5
31.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms 31-5
31.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms 31-6
31.7 Summary of DBMS_AUDIT_MGMT Subprograms 31-7
31.7.1 ALTER_PARTITION_INTERVAL Procedure 31-8
31.7.2 CLEAN_AUDIT_TRAIL Procedure 31-8
31.7.3 CLEAR_AUDIT_TRAIL_PROPERTY Procedure 31-11
31.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure 31-12
31.7.5 CREATE_PURGE_JOB Procedure 31-14
31.7.6 DEINIT_CLEANUP Procedure 31-15

31.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure 31-16
31.7.8 DROP_PURGE_JOB Procedure 31-17
31.7.9 GET_AUDIT_COMMIT_DELAY Function 31-17
31.7.10 GET_ AUDIT_TRAIL_PROPERTY_VALUE Function 31-18
31.7.11 GET_LAST_ARCHIVE_TIMESTAMP Function 31-19
31.7.12 INIT_CLEANUP Procedure 31-20
31.7.13 IS_CLEANUP_INITIALIZED Function 31-22
31.7.14 LOAD_UNIFIED_AUDIT_FILES Procedure 31-23
31.7.15 SET_AUDIT_TRAIL_LOCATION Procedure 31-24
31.7.16 SET_AUDIT_TRAIL_PROPERTY Procedure 31-26
31.7.17 SET_LAST_ARCHIVE_TIMESTAMP Procedure 31-28
31.7.18 SET_PURGE_JOB_INTERVAL Procedure 31-30
31.7.19 SET_PURGE_JOB_STATUS Procedure 31-31
31.7.20 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure 31-32

32 DBMS_AUDIT_UTIL

32.1 DBMS_AUDIT_UTIL Overview 32-1
32.2 DBMS_AUDIT_UTIL Security Model 32-1
32.3 DBMS_AUDIT_UTIL Views 32-1
32.4 Summary of DBMS_AUDIT_UTIL Subprograms 32-2
32.4.1 DECODE_RLS_INFO_ATRAIL_FGA Function 32-2
32.4.2 DECODE_RLS_INFO_ATRAIL_STD Function 32-3
32.4.3 DECODE_RLS_INFO_ATRAIL_UNI Function 32-4
32.4.4 DECODE_RLS_INFO_ATRAIL_XML Function 32-5

33 DBMS_AUTO_CLUSTERING

33.1 DBMS_AUTO_CLUSTERING Overview 33-1
33.2 Summary of DBMS_AUTO_CLUSTERING Subprograms 33-1
33.2.1 CONFIGURE Procedure 33-2
33.2.2 RECOMMEND_CLUSTERING_METHOD Function 33-4
33.2.3 VERIFY_RECOMMENDATION Procedure 33-5
33.2.4 APPLY_RECOMMENDATION Procedure 33-6
33.2.5 GET_RECOMMENDATION Function 33-7
33.2.6 REPORT ACTIVITY Function 33-7
33.2.7 REPORT_LAST_ACTIVITY Function 33-8

34 DBMS_AUTO_SQLTUNE

34.1 DBMS_AUTO_SQLTUNE Overview 34-1
34.2 DBMS_AUTO_SQLTUNE Security Model 34-1

34.3 Summary of DBMS_AUTO_SQLTUNE Subprograms 34-1
34.3.1 EXECUTE_AUTO_TUNING_TASK Function and Procedure 34-2
34.3.2 REPORT_AUTO_TUNING_TASK Function 34-3
34.3.3 SET_AUTO_TUNING_TASK_PARAMETER Procedures 34-4

35 DBMS_AUTO_INDEX

35.1 DBMS_AUTO_INDEX Overview 35-1
35.2 Summary of DBMS_AUTO_INDEX Subprograms 35-1
35.2.1 CONFIGURE Procedure 35-1
35.2.2 DROP_AUTO_INDEXES Procedure 35-6
35.2.3 DROP_SECONDARY_INDEXES Procedure 35-7
35.2.4 REPORT_ACTIVITY Function 35-8
35.2.5 REPORT_LAST_ACTIVITY Function 35-10
35.2.6 RECOMMEND Function 35-12

36 DBMS_AUTO_MV

36.1 Using DBMS_AUTO_MV 36-1
36.2 Summary of DBMS_AUTO_MV Subprograms 36-1
36.2.1 CONFIGURE Procedure 36-2
36.2.2 DROP_AUTO_MVS Procedure 36-4
36.2.3 RECOMMEND Function 36-5
36.2.4 REFRESH Procedure 36-7
36.2.5 REPORT_ACTIVITY Function 36-7
36.2.6 REPORT_LAST_ACTIVITY Function 36-8

37 DBMS_AUTO_REPORT

37.1 DBMS_AUTO_REPORT Overview 37-1
37.2 DBMS_AUTO_REPORT Security Model 37-1
37.3 Summary of DBMS_AUTO_REPORT Subprograms 37-1
37.3.1 FINISH_REPORT_CAPTURE Procedure 37-2
37.3.2 REPORT_REPOSITORY_DETAIL Function 37-2
37.3.3 REPORT_REPOSITORY_DETAIL_XML Function 37-3
37.3.4 REPORT_REPOSITORY_LIST_XML Function 37-3
37.3.5 START_REPORT_CAPTURE Procedure 37-5
37.3.6 PURGE_ALL_REPORTS Function 37-5
37.3.7 PURGE_REPORTS_BY_RETENTION Function 37-5

38 DBMS_AUTO_TASK_ADMIN

38.1 DBMS_AUTO_TASK_ADMIN Deprecated Subprograms 38-1
38.2 DBMS_AUTO_TASK_ADMIN Security Model 38-1
38.3 DBMS_AUTO_TASK_ADMIN Constants 38-1
38.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms 38-2
38.4.1 DISABLE Procedures 38-2
38.4.2 ENABLE Procedures 38-3
38.4.3 GET_CLIENT_ATTRIBUTES Procedure 38-4
38.4.4 GET_P1_RESOURCES Procedure 38-4
38.4.5 OVERRIDE_PRIORITY Procedures 38-5
38.4.6 SET_CLIENT_SERVICE Procedure 38-6
38.4.7 SET_P1_RESOURCES Procedure 38-6

39 DBMS_AUTO_ZONEMAP

39.1 DBMS_AUTO_TASK_ADMIN Security Model 39-1
39.2 Summary of DBMS_AUTO_ZONEMAP Subprograms 39-1
39.2.1 ACTIVITY_REPORT Function 39-1
39.2.2 CONFIGURE Procedure 39-4

40 DBMS_AVTUNE

40.1 DBMS_AVTUNE Overview 40-1
40.2 DBMS_AVTUNE Security Model 40-1
40.3 Summary of DBMS_AVTUNE Subprograms 40-1
40.3.1 AUTO_CACHE_CREATE Procedure 40-2
40.3.2 AUTO_CACHE_DISABLE Procedure 40-3
40.3.3 AUTO_CACHE_ENABLE Procedure 40-3
40.3.4 AUTO_CACHE_MODIFY Procedure 40-4
40.3.5 AUTO_CACHE_REFRESH Procedure 40-4
40.3.6 AUTO_CACHE_REMOVE Procedure 40-5
40.3.7 AUTO_CACHE_TUNE Procedure 40-5
40.3.8 AUTO_CACHE_STAR_DISABLE Procedure 40-6
40.3.9 AUTO_CACHE_STAR_ENABLE Procedure 40-6
40.3.10 AUTO_CACHE_STAR_MODIFY Procedure 40-7
40.3.11 AUTO_CACHE_STAR_REFRESH Procedure 40-7

41 DBMS_AW_STATS

41.1 Using DBMS_AW_STATS 41-1
41.2 Summary of DBMS_AW_STATS Subprograms 41-1
41.2.1 ANALYZE Procedure 41-1

41.2.2 CLEAR Procedure 41-4

42 DBMS_BLOCKCHAIN_TABLE

42.1 DBMS_BLOCKCHAIN_TABLE Overview 42-1
42.2 DBMS_BLOCKCHAIN_TABLE Security Model 42-2
42.3 Summary of DBMS_BLOCKCHAIN_TABLE Subprograms 42-2
42.3.1 ADD_INTERVAL_PARTITIONING Procedure 42-4
42.3.2 COUNTERSIGN_ROW Procedure 42-5
42.3.3 COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure 42-6
42.3.4 DELETE_EXPIRED_ROWS Procedure 42-7
42.3.5 GET_BLOCKCHAIN_DIGEST Function 42-8
42.3.6 GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function 42-9
42.3.7 GET_BYTES_FOR_ROW_HASH Procedure 42-10
42.3.8 GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS Procedure 42-12
42.3.9 GET_BYTES_FOR_ROW_SIGNATURE Procedure 42-13
42.3.10 GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS Procedure 42-14
42.3.11 GET_SIGNED_BLOCKCHAIN_DIGEST Function 42-15
42.3.12 GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function 42-16
42.3.13 SIGN_ROW Procedure 42-18
42.3.14 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure 42-20
42.3.15 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE Procedure 42-21
42.3.16 SIGN_ROW_WITH_COUNTERSIGNATURE Procedure 42-22
42.3.17 VERIFY_ROWS Procedure 42-24
42.3.18 VERIFY_TABLE_BLOCKCHAIN Procedure 42-25
42.3.19 VERIFY_USER_BLOCKCHAIN_ROWS Procedure 42-26

43 DBMS_BLOCKER_RESOLVER

43.1 DBMS_BLOCKER_RESOLVER Overview 43-1
43.2 DBMS_BLOCKER_RESOLVER Security Model 43-1
43.3 DBMS_BLOCKER_RESOLVER Constants 43-2
43.4 DBMS_BLOCKER_RESOLVER Exceptions 43-3
43.5 Summary of DBMS_BLOCKER_RESOLVER Subprograms 43-3
43.5.1 SET Procedure 43-3

44 DBMS_CAPTURE_ADM

44.1 DBMS_CAPTURE_ADM Overview 44-1
44.2 DBMS_CAPTURE_ADM Security Model 44-1
44.3 Summary of DBMS_CAPTURE_ADM Subprograms 44-2

44.3.1 ABORT_GLOBAL_INSTANTIATION Procedure 44-3
44.3.2 ABORT_SCHEMA_INSTANTIATION Procedure 44-4
44.3.3 ABORT_SYNC_INSTANTIATION Procedure 44-5
44.3.4 ABORT_TABLE_INSTANTIATION Procedure 44-5
44.3.5 ALTER_CAPTURE Procedure 44-6
44.3.6 ALTER_SYNC_CAPTURE Procedure 44-11
44.3.7 BUILD Procedure 44-12
44.3.8 CREATE_CAPTURE Procedure 44-13
44.3.9 CREATE_SYNC_CAPTURE Procedure 44-23
44.3.10 DROP_CAPTURE Procedure 44-25
44.3.11 INCLUDE_EXTRA_ATTRIBUTE Procedure 44-26
44.3.12 PREPARE_GLOBAL_INSTANTIATION Procedure 44-27
44.3.13 PREPARE_SCHEMA_INSTANTIATION Procedure 44-28
44.3.14 PREPARE_SYNC_INSTANTIATION Function 44-29
44.3.15 PREPARE_TABLE_INSTANTIATION Procedure 44-30
44.3.16 SET_PARAMETER Procedure 44-31
44.3.17 START_CAPTURE Procedure 44-46
44.3.18 STOP_CAPTURE Procedure 44-46

45 DBMS_CACHEUTIL

45.1 DBMS_CACHEUTIL Overview 45-1
45.2 DBMS_CACHEUTIL Security Model 45-2
45.3 Summary of DBMS_CACHEUTIL Subprograms 45-2
45.3.1 DISSOLVE_AFFINITY Procedure 45-3
45.3.2 DISSOLVE_READMOSTLY Procedure 45-3
45.3.3 GRAB_AFFINITY Procedure 45-4
45.3.4 GRAB_READMOSTLY Procedure 45-5
45.3.5 LIST_READMOSTLY Procedure 45-6
45.3.6 OBJECT_DOWNCONVERT Procedure 45-6
45.3.7 TRUE_CACHE_KEEP Procedure 45-7
45.3.8 TRUE_CACHE_UNKEEP Procedure 45-7

46 DBMS_CLOUD

46.1 DBMS_CLOUD Overview 46-1
46.2 Installing the DBMS_CLOUD Package 46-1
46.3 DBMS_CLOUD Security Model 46-2
46.4 DBMS_CLOUD Exceptions 46-2
46.5 Summary of DBMS_CLOUD Subprograms 46-2
46.5.1 COPY_DATA Procedure 46-4
46.5.2 COPY_DATA Procedure for Avro or Parquet Files 46-6

46.5.3 CREATE_CREDENTIAL Procedure 46-8
46.5.4 CREATE_EXTERNAL_TABLE Procedure 46-11
46.5.5 CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files 46-13
46.5.6 CREATE_EXTERNAL_PART_TABLE Procedure 46-15
46.5.7 CREATE_HYBRID_PART_TABLE Procedure 46-20
46.5.8 DELETE_ALL_OPERATIONS Procedure 46-21
46.5.9 DELETE_FILE Procedure 46-22
46.5.10 DELETE_OBJECT Procedure 46-22
46.5.11 DROP_CREDENTIAL Procedure 46-23
46.5.12 GET_OBJECT Procedure and Function 46-23
46.5.13 LIST_FILES Function 46-25
46.5.14 LIST_OBJECTS Function 46-26
46.5.15 PUT_OBJECT Procedure 46-27
46.5.16 UPDATE_CREDENTIAL Procedure 46-29
46.5.17 VALIDATE_EXTERNAL_TABLE Procedure 46-30
46.5.18 VALIDATE_EXTERNAL_PART_TABLE Procedure 46-31
46.5.19 VALIDATE_HYBRID_PART_TABLE Procedure 46-32
46.6 DBMS_CLOUD Package File URI Formats 46-33
46.6.1 Oracle Cloud Infrastructure Object Storage Native URI Format 46-33
46.6.2 Oracle Cloud Infrastructure Object Storage Swift URI Format 46-35
46.6.3 Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL 46-35
46.6.4 URI Format Using Public URL 46-36
46.6.5 Oracle Cloud Infrastructure Object Storage Classic URI Format 46-37
46.6.6 Amazon S3 URI Format 46-37
46.6.7 Azure Blob Storage URI Format 46-38
46.7 DBMS_CLOUD Package Format Options 46-38
46.8 DBMS_CLOUD Avro and Parquet Support 46-44
46.8.1 DBMS_CLOUD Package Format Options for Avro or Parquet 46-44
46.8.2 DBMS_CLOUD Package Avro to Oracle Data Type Mapping 46-45
46.8.3 DBMS_CLOUD Package Parquet to Oracle Data Type Mapping 46-46
46.8.4 DBMS_CLOUD Package Avro and Parquet Complex Types 46-47
46.8.5 DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping 46-48

47 DBMS_COMPARISON

47.1 DBMS_COMPARISON Overview 47-1
47.2 DBMS_COMPARISON Security Model 47-2
47.3 DBMS_COMPARISON Constants 47-3
47.4 DBMS_COMPARISON Views 47-5
47.5 DBMS_COMPARISON Operational Notes 47-5
47.6 DBMS_COMPARISON Data Structures 47-9

47.6.1 COMPARISON_TYPE Record Type 47-10
47.7 Summary of DBMS_COMPARISON Subprograms 47-10
47.7.1 COMPARE Function 47-11
47.7.2 CONVERGE Procedure 47-12
47.7.3 CREATE_COMPARISON Procedure 47-13
47.7.4 DROP_COMPARISON Procedure 47-17
47.7.5 PURGE_COMPARISON Procedure 47-18
47.7.6 RECHECK Function 47-18

48 DBMS_COMPRESSION

48.1 DBMS_COMPRESSION Overview 48-1
48.2 DBMS_COMPRESSION Security Model 48-1
48.3 DBMS_COMPRESSION Constants 48-1
48.4 DBMS_COMPRESSION Data Structures 48-3
48.4.1 COMPREC Record Type 48-3
48.4.2 COMPRECLIST Table Type 48-4
48.5 Summary of DBMS_COMPRESSION Subprograms 48-4
48.5.1 GET_COMPRESSION_RATIO Procedure 48-4
48.5.2 GET_COMPRESSION_TYPE Function 48-12

49 DBMS_CONNECTION_POOL

49.1 Summary of DBMS_CONNECTION_POOL Subprograms 49-1
49.1.1 ADD_POOL Procedure 49-2
49.1.2 ALTER_PARAM Procedure 49-4
49.1.3 CONFIGURE_POOL Procedure 49-5
49.1.4 REMOVE_POOL Procedure 49-7
49.1.5 RESTORE_DEFAULTS Procedure 49-8
49.1.6 START_POOL Procedure 49-8
49.1.7 STOP_POOL Procedure 49-9

50 DBMS_CQ_NOTIFICATION

50.1 DBMS_CQ_NOTIFICATION Overview 50-1
50.2 DBMS_CQ_NOTIFICATION Security Model 50-2
50.3 DBMS_CQ_NOTIFICATION Constants 50-2
50.4 DBMS_CQ_NOTIFICATION Operational Notes 50-3
50.5 DBMS_CQ_NOTIFICATION Examples 50-4
50.6 DBMS_CQ_NOTIFICATION Data Structures 50-10
50.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type 50-11
50.6.2 CQ_NOTIFICATION$_QUERY Object Type 50-11

50.6.3 CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type 50-12
50.6.4 CQ_NOTIFICATION$_TABLE Object Type 50-12
50.6.5 CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type 50-13
50.6.6 CQ_NOTIFICATION$_ROW Object Type 50-13
50.6.7 CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type 50-13
50.6.8 CQ_NOTIFICATION$_REG_INFO Object Type 50-14
50.7 Summary of DBMS_CQ_NOTIFICATION Subprograms 50-16
50.7.1 CQ_NOTIFICATION_QUERYID Function 50-17
50.7.2 DEREGISTER Procedure 50-17
50.7.3 ENABLE_REG Procedure 50-18
50.7.4 NEW_REG_START Function 50-18
50.7.5 REG_END Procedure 50-19
50.7.6 SET_ROWID_THRESHOLD Procedure 50-19

51 DBMS_CREDENTIAL

51.1 DBMS_CREDENTIAL Overview 51-1
51.2 DBMS_CREDENTIAL Security Model 51-1
51.3 DBMS_CREDENTIAL Operational Notes 51-2
51.4 Summary of DBMS_CREDENTIAL Subprograms 51-2
51.4.1 CREATE_CREDENTIAL Procedure 51-3
51.4.2 DISABLE_CREDENTIAL Procedure 51-4
51.4.3 DROP_CREDENTIAL Procedure 51-5
51.4.4 ENABLE_CREDENTIAL Procedure 51-6
51.4.5 UPDATE_CREDENTIAL Procedure 51-6

52 DBMS_CRYPTO

52.1 DBMS_CRYPTO Overview 52-2
52.2 DBMS_CRYPTO Security Model 52-3
52.3 DBMS_CRYPTO Constants 52-3
52.4 DBMS_CRYPTO Datatypes 52-5
52.5 DBMS_CRYPTO Algorithms 52-5
52.6 DBMS_CRYPTO Restrictions 52-8
52.7 DBMS_CRYPTO Exceptions 52-9
52.8 DBMS_CRYPTO Operational Notes 52-9
52.9 DBMS_CRYPTO Examples 52-11
52.10 Summary of DBMS_CRYPTO Subprograms 52-15
52.10.1 DECRYPT Functions 52-16
52.10.2 DECRYPT Procedures 52-17
52.10.3 ECDHDERIVE_SHAREDSECRET Function 52-18
52.10.4 ECDH_GENKEYPAIR Function 52-19

52.10.5 ENCRYPT Functions 52-19
52.10.6 ENCRYPT Procedures 52-21
52.10.7 HASH Function 52-22
52.10.8 HASH_LEN Function 52-23
52.10.9 MAC Function 52-24
52.10.10 KMACXOF Function 52-25
52.10.11 PKDECRYPT Function 52-25
52.10.12 PKENCRYPT Function 52-26
52.10.13 RANDOMBYTES Function 52-26
52.10.14 RANDOMINTEGER Function 52-27
52.10.15 RANDOMNUMBER Function 52-27
52.10.16 SIGN Function 52-27
52.10.17 VERIFY Function 52-29

53 DBMS_CSX_ADMIN

53.1 DBMS_CSX_ADMIN Overview 53-1
53.2 DBMS_CSX_ADMIN Security Model 53-1
53.3 DBMS_CSX_ADMIN Constants 53-1
53.4 Summary of DBMS_CSX_ADMIN Subprograms 53-2
53.4.1 GETTOKENTABLEINFO Procedure & Function 53-2
53.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure 53-3
53.4.3 NAMESPACEIDTABLE Function 53-4
53.4.4 PATHIDTABLE Function 53-4
53.4.5 QNAMEIDTABLE Function 53-4

54 DBMS_CUBE

54.1 Using DBMS_CUBE 54-1
54.1.1 DBMS_CUBE Security Model 54-2
54.2 Using SQL Aggregation Management 54-2
54.2.1 Subprograms in SQL Aggregation Management 54-3
54.2.2 Requirements for the Relational Materialized View 54-3
54.2.3 Permissions for Managing and Querying Cube Materialized Views 54-4
54.2.4 Example of SQL Aggregation Management 54-4
54.3 Upgrading 10g Analytic Workspaces 54-8
54.4 Summary of DBMS_CUBE Subprograms 54-13
54.4.1 BUILD Procedure 54-13
54.4.2 CREATE_EXPORT_OPTIONS Procedure 54-25
54.4.3 CREATE_IMPORT_OPTIONS Procedure 54-28
54.4.4 CREATE_MVIEW Function 54-29
54.4.5 DERIVE_FROM_MVIEW Function 54-34

54.4.6 DROP_MVIEW Procedure 54-35
54.4.7 EXPORT_XML Procedure 54-37
54.4.8 EXPORT_XML_TO_FILE Procedure 54-39
54.4.9 IMPORT_XML Procedure 54-40
54.4.10 INITIALIZE_CUBE_UPGRADE Procedure 54-43
54.4.11 REFRESH_MVIEW Procedure 54-44
54.4.12 UPGRADE_AW Procedure 54-46
54.4.13 VALIDATE_XML Procedure 54-47

55 DBMS_CUBE_ADVISE

55.1 DBMS_CUBE_ADVISE Security Model 55-1
55.2 Summary of DBMS_CUBE_ADVISE Subprograms 55-1
55.2.1 MV_CUBE_ADVICE Function 55-1
55.2.2 SET_CNS_EXCEPTION_LOG Procedure 55-4
55.2.3 TRACE Procedure 55-5

56 DBMS_CUBE_LOG

56.1 Using DBMS_CUBE_LOG 56-1
56.1.1 DBMS_CUBE_LOG — Logging Types 56-2
56.1.2 DBMS_CUBE_LOG — Logging Targets 56-2
56.1.3 DBMS_CUBE_LOG — Verbosity Levels 56-3
56.1.4 DBMS_CUBE_LOG Security Model 56-3
56.1.5 DBMS_CUBE_LOG — Creating Cube Logs 56-3
56.1.6 DBMS_CUBE_LOG — Cube Build Log 56-4
56.1.7 DBMS_CUBE_LOG — Cube Dimension Compile Log 56-5
56.1.8 DBMS_CUBE_LOG — Cube Operations Log 56-6
56.1.9 DBMS_CUBE_LOG — Cube Rejected Records Log 56-7
56.2 Summary of DBMS_CUBE_LOG Subprograms 56-7
56.2.1 DEFAULT_NAME Function 56-8
56.2.2 DISABLE Procedure 56-9
56.2.3 ENABLE Procedure 56-10
56.2.4 FLUSH Procedure 56-11
56.2.5 GET_LOG Procedure 56-12
56.2.6 GET_LOG_SPEC Function 56-13
56.2.7 GET_PARAMETER Function 56-14
56.2.8 LEVEL_HIGH Function 56-14
56.2.9 LEVEL_HIGHEST Function 56-15
56.2.10 LEVEL_LOW Function 56-15
56.2.11 LEVEL_LOWEST Function 56-16
56.2.12 LEVEL_MEDIUM Function 56-16

56.2.13 SET_LOG_SPEC Procedure 56-17
56.2.14 SET_PARAMETER Procedure 56-17
56.2.15 TABLE_CREATE Procedure 56-19
56.2.16 TARGET_FILE Function 56-20
56.2.17 TARGET_LOB Function 56-20
56.2.18 TARGET_TABLE Function 56-20
56.2.19 TARGET_TRACE Function 56-21
56.2.20 TYPE_BUILD Function 56-21
56.2.21 TYPE_DIMENSION_COMPILE Function 56-22
56.2.22 TYPE_OPERATIONS Function 56-22
56.2.23 TYPE_REJECTED_RECORDS Function 56-23
56.2.24 VERSION Function 56-23

57 DBMS_DATA_MINING

57.1 DBMS_DATA_MINING Overview 57-1
57.2 DBMS_DATA_MINING Security Model 57-3
57.3 DBMS_DATA_MINING — Machine Learning Functions 57-3
57.4 DBMS_DATA_MINING — Model Settings 57-5
57.4.1 DBMS_DATA_MINING — Algorithm Names 57-5
57.4.2 DBMS_DATA_MINING — Automatic Data Preparation 57-6
57.4.3 DBMS_DATA_MINING — Machine Learning Function Settings 57-7
57.4.4 DBMS_DATA_MINING — Global Settings 57-13
57.5 DBMS_DATA_MINING — Algorithm Specific Model Settings 57-18
57.5.1 DBMS_DATA_MINING — Algorithm Settings: ALGO_EXTENSIBLE_LANG 57-18
57.5.2 DBMS_DATA_MINING — Algorithm Settings: CUR Matrix Decomposition 57-20
57.5.3 DBMS_DATA_MINING — Algorithm Settings: Decision Tree 57-20
57.5.4 DBMS_DATA_MINING — Algorithm Settings: Expectation Maximization 57-22
57.5.5 DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis 57-25
57.5.6 DBMS_DATA_MINING — Algorithm Settings: Exponential Smoothing 57-27
57.5.7 DBMS_DATA_MINING — Algorithm Settings: Generalized Linear Model 57-32
57.5.8 DBMS_DATA_MINING — Algorithm Settings: k-Means 57-35
57.5.9 DBMS_DATA_MINING - Algorithm Settings: Multivariate State Estimation Technique - Sequential Probability Ratio Test 57-37
57.5.10 DBMS_DATA_MINING — Algorithm Settings: Naive Bayes 57-38
57.5.11 DBMS_DATA_MINING — Algorithm Settings: Neural Network 57-39
57.5.12 DBMS_DATA_MINING — Algorithm Settings: Non-Negative Matrix Factorization 57-42
57.5.13 DBMS_DATA_MINING — Algorithm Settings: O-Cluster 57-42
57.5.14 DBMS_DATA_MINING — Algorithm Settings: Random Forest 57-43
57.5.15 DBMS_DATA_MINING — Algorithm Constants and Settings: Singular Value Decomposition 57-44
57.5.16 DBMS_DATA_MINING — Algorithm Settings: Support Vector Machine 57-45
57.5.17 DBMS_DATA_MINING — Algorithm Settings: XGBoost 57-47

57.6 DBMS_DATA_MINING — Solver Settings 57-57
57.6.1 DBMS_DATA_MINING - Solver Settings: Adam 57-57
57.6.2 DBMS_DATA_MINING — Solver Settings: ADMM 57-58
57.6.3 DBMS_DATA_MINING — Solver Settings: LBFGS 57-59
57.7 DBMS_DATA_MINING Datatypes 57-59
57.7.1 Deprecated Types 57-60
57.8 Summary of DBMS_DATA_MINING Subprograms 57-65
57.8.1 ADD_COST_MATRIX Procedure 57-67
57.8.2 ADD_PARTITION Procedure 57-70
57.8.3 ALTER_REVERSE_EXPRESSION Procedure 57-71
57.8.4 APPLY Procedure 57-74
57.8.5 COMPUTE_CONFUSION_MATRIX Procedure 57-77
57.8.6 COMPUTE_CONFUSION_MATRIX_PART Procedure 57-83
57.8.7 COMPUTE_LIFT Procedure 57-89
57.8.8 COMPUTE_LIFT_PART Procedure 57-94
57.8.9 COMPUTE_ROC Procedure 57-99

77.4.2 SET_EDITIONING_VIEWS_READ_ONLY Procedure 77-2
77.4.3 SET_NULL_COLUMN_VALUES_TO_EXPR Procedure 77-3

78 DBMS_EPG

78.1 DBMS_EPG Overview 78-1
78.2 DBMS_EPG Security Model 78-1
78.3 DBMS_EPG Exceptions 78-1
78.4 DBMS_EPG Data Structures 78-2
78.5 DBMS_EPG Subprogram Groups 78-2
78.5.1 DBMS_EPG Configuration Subprograms 78-2
78.5.2 DBMS_EPG Authorization Subprograms 78-3
78.6 Summary of DBMS_EPG Subprograms 78-3
78.6.1 AUTHORIZE_DAD Procedure 78-4
78.6.2 CREATE_DAD Procedure 78-5
78.6.3 DEAUTHORIZE_DAD Procedure 78-5
78.6.4 DELETE_DAD_ATTRIBUTE Procedure 78-6
78.6.5 DELETE_GLOBAL_ATTRIBUTE Procedure 78-6
78.6.6 DROP_DAD Procedure 78-7
78.6.7 GET_ALL_DAD_ATTRIBUTES Procedure 78-7
78.6.8 GET_ALL_DAD_MAPPINGS Procedure 78-8
78.6.9 GET_ALL_GLOBAL_ATTRIBUTES Procedure 78-9
78.6.10 GET_DAD_ATTRIBUTE Function 78-9
78.6.11 GET_DAD_LIST Procedure 78-10
78.6.12 GET_GLOBAL_ATTRIBUTE Function 78-10
78.6.13 MAP_DAD Procedure 78-11
78.6.14 SET_DAD_ATTRIBUTE Procedure 78-12
78.6.15 SET_GLOBAL_ATTRIBUTE Procedure 78-14
78.6.16 UNMAP_DAD Procedure 78-15

79 DBMS_ERRLOG

79.1 DBMS_ERRLOG Security Model 79-1
79.2 Summary of DBMS_ERRLOG Subprograms 79-1
79.2.1 CREATE_ERROR_LOG Procedure 79-1

80 DBMS_FGA

80.1 DBMS_FGA Security Model 80-1
80.2 DBMS_FGA Operational Notes 80-1
80.3 Summary of DBMS_FGA Subprograms 80-1
80.3.1 ADD_POLICY Procedure 80-2
80.3.2 DISABLE_POLICY Procedure 80-5
80.3.3 DROP_POLICY Procedure 80-6

80.3.4 ENABLE_POLICY Procedure 80-7

81 DBMS_FILE_TRANSFER

81.1 DBMS_FILE_TRANSFER Overview 81-1
81.2 DBMS_FILE_TRANSFER Security Model 81-1
81.3 DBMS_FILE_TRANSFER Operational Notes 81-1
81.4 Summary of DBMS_FILE_TRANSFER Subprograms 81-2
81.4.1 COPY_FILE Procedure 81-2
81.4.2 GET_FILE Procedure 81-4
81.4.3 PUT_FILE Procedure 81-6

82 DBMS_FLASHBACK

82.1 DBMS_FLASHBACK Overview 82-1
82.2 DBMS_FLASHBACK Security Model 82-1
82.3 DBMS_FLASHBACK Types 82-2
82.4 DBMS_FLASHBACK Exceptions 82-2
82.5 DBMS_FLASHBACK Operational Notes 82-2
82.6 DBMS_FLASHBACK Examples 82-3
82.7 Summary of DBMS_FLASHBACK Subprograms 82-5
82.7.1 DISABLE Procedure 82-5
82.7.2 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure 82-6
82.7.3 ENABLE_AT_TIME Procedure 82-6
82.7.4 GET_SYSTEM_CHANGE_NUMBER Function 82-7
82.7.5 TRANSACTION_BACKOUT Procedures 82-7

83 DBMS_FLASHBACK_ARCHIVE

83.1 DBMS_FLASHBACK_ARCHIVE Overview 83-2
83.2 DBMS_FLASHBACK_ARCHIVE Security Model 83-2
83.3 DBMS_FLASHBACK_ARCHIVE Constants 83-2
83.4 Summary of DBMS_FLASHBACK_ARCHIVE Subprograms 83-3
83.4.1 ADD_TABLE_TO_APPLICATION Procedure 83-4
83.4.2 CREATE_TEMP_HISTORY_TABLE Procedure 83-4
83.4.3 DISABLE_APPLICATION Procedure 83-5
83.4.4 DISABLE_ASOF_VALID_TIME Procedure 83-5
83.4.5 DISASSOCIATE_FBA Procedure 83-5
83.4.6 DROP_APPLICATION Procedure 83-6
83.4.7 ENABLE_APPLICATION Procedure 83-6
83.4.8 ENABLE_AT_VALID_TIME Procedure 83-6
83.4.9 EXTEND_MAPPINGS Procedure 83-7

83.4.10 GET_CURRENT_LIFESPAN_DIGEST Function 83-7
83.4.11 GET_SYS_CONTEXT Function 83-8
83.4.12 IMPORT_HISTORY Procedure 83-9
83.4.13 LOCK_DOWN_APPLICATION Procedure 83-10
83.4.14 PURGE_CONTEXT Procedure 83-10
83.4.15 REASSOCIATE_FBA Procedure 83-10
83.4.16 REGISTER_APPLICATION Procedure 83-11
83.4.17 REMOVE_TABLE_FROM_APPLICATION Procedure 83-12
83.4.18 SET_CONTEXT_LEVEL Procedure 83-12
83.4.19 VERIFY_BLOCKCHAIN_LIFESPAN Procedure 83-12

84 DBMS_FLASHBACK_ARCHIVE_MIGRATE

84.1 DBMS_FLASHBACK_ARCHIVE_MIGRATE Overview 84-1
84.2 DBMS_FLASHBACK_ARCHIVE_MIGRATE Security Model 84-1
84.3 DBMS_FLASHBACK_ARCHIVE_MIGRATE Operational Notes 84-2
84.4 DBMS_FLASHBACK_ARCHIVE_MIGRATE Examples 84-3
84.5 Summary of DBMS_FLASHBACK Subprograms 84-4
84.5.1 EXPORT Procedure 84-5
84.5.2 EXPORT_ANALYZE Procedure 84-5
84.5.3 IMPORT Procedure 84-6

85 DBMS_FREQUENT_ITEMSET

85.1 Summary of DBMS_FREQUENT_ITEMSET Subprograms 85-1
85.1.1 FI_HORIZONTAL Function 85-1
85.1.2 FI_TRANSACTIONAL Function 85-3

86 DBMS_FS

86.1 DBMS_FS Overview 86-1
86.2 DBMS_FS Security Model 86-1
86.3 Summary of DBMS_FS Subprograms 86-1
86.3.1 DESTROY_ORACLE_FS Procedure 86-2
86.3.2 FS_EXISTS Procedure 86-3
86.3.3 LIST_FILES Procedure 86-3
86.3.4 MAKE_ORACLE_FS Procedure 86-4
86.3.5 MOUNT_ORACLE_FS Procedure 86-5
86.3.6 UNMOUNT_ORACLE_FS Procedure 86-9

87 DBMS_GOLDENGATE_ADM

87.1 Using DBMS_GOLDENGATE_ADM 87-1
87.1.1 DBMS_GOLDENGATE_ADM Overview 87-1
87.1.2 DBMS_GOLDENGATE_ADM Security Model 87-2
87.2 Summary of DBMS_GOLDENGATE_ADM Subprograms 87-2
87.2.1 ADD_AUTO_CDR Procedure 87-3
87.2.2 ADD_AUTO_CDR_COLUMN_GROUP Procedure 87-5
87.2.3 ADD_AUTO_CDR_DELTA_RES Procedure 87-6
87.2.4 ALTER_AUTO_CDR Procedure 87-7
87.2.5 ALTER_AUTO_CDR_COLUMN_GROUP Procedure 87-10
87.2.6 DELETE_PROCREP_EXCLUSION_OBJ Procedure 87-10
87.2.7 GG_PROCEDURE_REPLICATION_ON Function 87-11
87.2.8 INSERT_PROCREP_EXCLUSION_OBJ Procedure 87-11
87.2.9 PURGE_TOMBSTONES Procedure 87-12
87.2.10 REMOVE_AUTO_CDR Procedure 87-12
87.2.11 REMOVE_AUTO_CDR_COLUMN_GROUP Procedure 87-13
87.2.12 REMOVE_AUTO_CDR_DELTA_RES Procedure 87-13

88 DBMS_GOLDENGATE_AUTH

88.1 DBMS_GOLDENGATE_AUTH Overview 88-1
88.2 DBMS_GOLDENGATE_AUTH Security Model 88-1
88.3 Summary of DBMS_GOLDENGATE_AUTH Subprograms 88-2
88.3.1 GRANT_ADMIN_PRIVILEGE Procedure 88-2
88.3.2 REVOKE_ADMIN_PRIVILEGE Procedure 88-5

89 DBMS_HADOOP

89.1 DBMS_HADOOP Overview 89-1
89.2 DBMS_HADOOP Security Model 89-1
89.3 Summary of DBMS_HADOOP Subprograms 89-1
89.3.1 CREATE_EXTDDL_FOR_HIVE Procedure 89-2
89.3.2 CREATE_HYBRID_PARTNED_TABLE Procedure 89-3
89.3.3 SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure 89-3

90 DBMS_HEAT_MAP

90.1 DBMS_HEAT_MAP Overview 90-1
90.2 DBMS_HEAT_MAP Security Model 90-1
90.3 Summary of DBMS_HEAT_MAP Subprograms 90-1
90.3.1 BLOCK_HEAT_MAP Function 90-2
90.3.2 EXTENT_HEAT_MAP Function 90-3

90.3.3 OBJECT_HEAT_MAP Function 90-4
90.3.4 SEGMENT_HEAT_MAP Procedure 90-5
90.3.5 TABLESPACE_HEAT_MAP Function 90-6

91 DBMS_HIERARCHY

91.1 DBMS_HIERARCHY Overview 91-1
91.2 DBMS_HIERARCHY Security Model 91-1
91.3 Summary of DBMS_HIERARCHY Subprograms 91-2
91.3.1 CREATE_VALIDATE_LOG_TABLE Procedure 91-3
91.3.2 CREATE_VIEW_FOR_FACT_ROWS Procedure 91-4
91.3.3 CREATE_VIEW_FOR_STAR_ROWS Procedure 91-5
91.3.4 GET_MV_SQL_FOR_AV_CACHE Function 91-6
91.3.5 GET_MV_SQL_FOR_STAR_CACHE Function 91-6
91.3.6 UPGRADE_VALIDATE_LOG_TABLE Procedure 91-7
91.3.7 VALIDATE_ANALYTIC_VIEW Function 91-7
91.3.8 VALIDATE_CHECK_SUCCESS Function 91-9
91.3.9 VALIDATE_HIERARCHY Function 91-10

92 DBMS_HM

92.1 DBMS_HM Security Model 92-1
92.2 Summary of DBMS_HM Subprograms 92-1
92.2.1 GET_RUN_REPORT Function 92-1
92.2.2 RUN_CHECK Procedure 92-2

93 DBMS_HPROF

93.1 DBMS_HPROF Security Model 93-1
93.2 Summary of DBMS_HPROF Subprograms 93-1
93.2.1 ANALYZE Function 93-2
93.2.2 CREATE_TABLES Procedure 93-4
93.2.3 START_PROFILING Procedure 93-4
93.2.4 STOP_PROFILING Procedure 93-5

94 DBMS_HS_PARALLEL

94.1 Using the DBMS_HS_PARALLEL Subprogram 94-1
94.2 Summary of DBMS_HS_PARALLEL Subprograms 94-1
94.2.1 CREATE_OR_REPLACE_VIEW Procedure 94-1
94.2.2 CREATE_TABLE_TEMPLATE Procedure 94-3
94.2.3 DROP_VIEW Procedure 94-3

94.2.4 LOAD_TABLE Procedure 94-4

95 DBMS_HS_PASSTHROUGH

95.1 DBMS_HS_PASSTHROUGH Overview 95-1
95.2 DBMS_HS_PASSTHROUGH Operational Notes 95-1
95.3 Summary of DBMS_HS_PASSTHROUGH Subprograms 95-1
95.3.1 BIND_INOUT_VARIABLE Procedure 95-2
95.3.2 BIND_INOUT_VARIABLE_RAW Procedure 95-3
95.3.3 BIND_OUT_VARIABLE Procedure 95-4
95.3.4 BIND_OUT_VARIABLE_RAW Procedure 95-5
95.3.5 BIND_VARIABLE Procedure 95-6
95.3.6 BIND_VARIABLE_RAW Procedure 95-7
95.3.7 CLOSE_CURSOR Procedure 95-8
95.3.8 EXECUTE_IMMEDIATE Procedure 95-9
95.3.9 EXECUTE_NON_QUERY Function 95-10
95.3.10 FETCH_ROW Function 95-10
95.3.11 GET_VALUE Procedure 95-11
95.3.12 GET_VALUE_RAW Procedure 95-12
95.3.13 OPEN_CURSOR Function 95-13
95.3.14 PARSE Procedure 95-14

96 DBMS_HYBRID_VECTOR

96.1 SEARCH 96-1

97 DBMS_ILM

97.1 DBMS_ILM Overview 97-1
97.2 DBMS_ILM Security Model 97-2
97.3 DBMS_ILM Constants 97-2
97.4 DBMS_ILM Exceptions 97-2
97.5 Summary of DBMS_ILM Subprograms 97-3
97.5.1 ADD_TO_ILM Procedure 97-3
97.5.2 ARCHIVESTATENAME Function 97-4
97.5.3 EXECUTE_ILM Procedure 97-4
97.5.4 EXECUTE_ILM_TASK Procedure 97-5
97.5.5 PREVIEW_ILM Procedure 97-6
97.5.6 REMOVE_FROM_ILM Procedure 97-6
97.5.7 STOP_ILM Procedure 97-7

98 DBMS_ILM_ADMIN

98.1 DBMS_ILM_ADMIN Overview 98-1
98.2 DBMS_ILM_ADMIN Security Model 98-1
98.3 DBMS_ILM_ADMIN Constants 98-1
98.4 Summary of DBMS_ILM_ADMIN Subprograms 98-4
98.4.1 CLEAR_HEAT_MAP_ALL Procedure 98-5
98.4.2 CLEAR_HEAT_MAP_TABLE Procedure 98-5
98.4.3 CUSTOMIZE_ILM Procedure 98-6
98.4.4 DISABLE_AUTO_OPTIMIZE Procedure 98-6
98.4.5 DISABLE_ILM Procedure 98-6
98.4.6 ENABLE_AUTO_OPTIMIZE Procedure 98-7
98.4.7 ENABLE_ILM Procedure 98-7
98.4.8 IGNORE_AUTO_OPTIMIZE_CRITERIA Procedure 98-7
98.4.9 SET_HEAT_MAP_ALL Procedure 98-7
98.4.10 SET_HEAT_MAP_START Procedure 98-8
98.4.11 SET_HEAT_MAP_TABLE Procedure 98-8

99 DBMS_IMMUTABLE_TABLE

99.1 DBMS_IMMUTABLE_TABLE Overview 99-1
99.2 DBMS_IMMUTABLE_TABLE Security Model 99-1
99.3 Summary of DBMS_IMMUTABLE_TABLE Subprograms 99-1
99.3.1 ADD_INTERVAL_PARTITIONING Procedure 99-2
99.3.2 DELETE_EXPIRED_ROWS Procedure 99-2

100 DBMS_INMEMORY

100.1 DBMS_INMEMORY Overview 100-1
100.2 DBMS_INMEMORY Security Model 100-2
100.3 Summary of DBMS_INMEMORY Subprograms 100-2
100.3.1 IME_DROP_EXPRESSIONS Procedure 100-2
100.3.2 POPULATE Procedure 100-3
100.3.3 REPOPULATE Procedure 100-4
100.3.4 SEGMENT_DEALLOCATE_VERSIONS Procedure 100-4

101 DBMS_INMEMORY_ADMIN

101.1 DBMS_INMEMORY_ADMIN Overview 101-1
101.2 DBMS_INMEMORY_ADMIN Security Model 101-3
101.3 DBMS_INMEMORY_ADMIN Operational Notes 101-3
101.4 Summary of DBMS_INMEMORY_ADMIN Subprograms 101-3
101.4.1 AIM_GET_PARAMETER Procedure 101-4

101.4.2 AIM_SET_PARAMETER Procedure 101-5
101.4.3 FASTSTART_DISABLE Procedure 101-6
101.4.4 FASTSTART_ENABLE Procedure 101-7
101.4.5 FASTSTART_MIGRATE_STORAGE Procedure 101-9
101.4.6 GET_FASTSTART_TABLESPACE Function 101-10
101.4.7 IME_CAPTURE_EXPRESSIONS Procedure 101-11
101.4.8 IME_CLOSE_CAPTURE_WINDOW Procedure 101-13
101.4.9 IME_DROP_ALL_EXPRESSIONS Procedure 101-14
101.4.10 IME_GET_CAPTURE_STATE Procedure 101-14
101.4.11 IME_OPEN_CAPTURE_WINDOW Procedure 101-15
101.4.12 IME_POPULATE_EXPRESSIONS Procedure 101-16
101.4.13 POPULATE_WAIT Function 101-16

102 DBMS_INMEMORY_ADVISE

102.1 DBMS_INMEMORY_ADVISE Overview 102-1
102.2 Summary of DBMS_INMEMORY_ADVISE Subprograms 102-1
102.3 IS_INMEMORY_ELIGIBLE Procedure 102-1

103 DBMS_IOT

103.1 Summary of DBMS_IOT Subprograms 103-1
103.1.1 BUILD_CHAIN_ROWS_TABLE Procedure 103-1
103.1.2 BUILD_EXCEPTIONS_TABLE Procedure 103-2

104 DBMS_JAVA

105 DBMS_JOB

105.1 DBMS_JOB Security Model 105-1
105.2 DBMS_JOB Operational Notes 105-1
105.3 Summary of DBMS_JOB Subprograms 105-3
105.3.1 BROKEN Procedure 105-3
105.3.2 CHANGE Procedure 105-4
105.3.3 INSTANCE Procedure 105-5
105.3.4 INTERVAL Procedure 105-6
105.3.5 NEXT_DATE Procedure 105-6
105.3.6 REMOVE Procedure 105-7
105.3.7 RUN Procedure 105-7
105.3.8 SUBMIT Procedure 105-8
105.3.9 USER_EXPORT Procedures 105-10

105.3.10 WHAT Procedure 105-10

106 DBMS_JSON_DUALITY

106.1 DBMS_JSON_DUALITY Overview 106-1
106.2 DBMS_JSON_DUALITY Security 106-2
106.3 Summary of DBMS_JSON_Duality Subprograms 106-2
106.3.1 INFER_SCHEMA Function 106-3

114.8.39 MOVE_TO_DBFS_LINK Procedures 114-56
114.8.40 OPEN Procedures 114-57
114.8.41 READ Procedures 114-58
114.8.42 SET_DBFS_LINK Procedures 114-60
114.8.43 SETCONTENTTYPE Procedure 114-61
114.8.44 SETOPTIONS Procedures 114-62
114.8.45 SUBSTR Functions 114-63
114.8.46 TRIM Procedures 114-65
114.8.47 WRITE Procedures 114-66
114.8.48 WRITEAPPEND Procedures 114-68

115 DBMS_LOCK

115.1 DBMS_LOCK Overview 115-1
115.2 DBMS_LOCK Security Model 115-1
115.3 DBMS_LOCK Constants 115-2
115.4 DBMS_LOCK. Rules and Limits 115-2
115.5 DBMS_LOCK Operational Notes 115-3
115.6 Summary of DBMS_LOCK Subprograms 115-3
115.6.1 ALLOCATE_UNIQUE Procedure 115-3
115.6.2 ALLOCATE_UNIQUE_AUTONOMOUS Procedure 115-5
115.6.3 CONVERT Function 115-6

115.6.4 RELEASE Function 115-7
115.6.5 REQUEST Function 115-8

116 DBMS_LOGMNR

116.1 DBMS_LOGMNR Overview 116-1
116.2 DBMS_LOGMNR Security Model 116-2
116.3 DBMS_LOGMNR Constants 116-2
116.4 DBMS_LOGMNR Views 116-4
116.5 DBMS_LOGMNR Operational Notes 116-4
116.6 Summary of DBMS_LOGMNR Subprograms 116-4
116.6.1 ADD_LOGFILE Procedure 116-5
116.6.2 COLUMN_PRESENT Function 116-7
116.6.3 END_LOGMNR Procedure 116-8
116.6.4 MINE_VALUE Function 116-9
116.6.5 REMOVE_LOGFILE Procedure 116-10
116.6.6 START_LOGMNR Procedure 116-11

117 DBMS_LOGSTDBY

117.1 DBMS_LOGSTDBY Overview 117-1
117.2 DBMS_LOGSTDBY Security Model 117-1
117.3 DBMS_LOGSTDBY Constants 117-2
117.4 Summary of DBMS_LOGSTDBY Subprograms 117-2
117.4.1 APPLY_SET Procedure 117-4
117.4.2 APPLY_UNSET Procedure 117-7
117.4.3 BUILD Procedure 117-7
117.4.4 INSTANTIATE_TABLE Procedure 117-8
117.4.5 IS_APPLY_SERVER Function 117-10
117.4.6 MAP_PRIMARY_SCN Function 117-10
117.4.7 PREPARE_FOR_NEW_PRIMARY Procedure 117-11
117.4.8 PURGE_SESSION Procedure 117-12
117.4.9 REBUILD Procedure 117-13
117.4.10 SET_TABLESPACE Procedure 117-13
117.4.11 SKIP Procedure 117-14
117.4.12 SKIP_ERROR Procedure 117-23
117.4.13 SKIP_TRANSACTION Procedure 117-26
117.4.14 UNSKIP Procedure 117-28
117.4.15 UNSKIP_ERROR Procedure 117-29
117.4.16 UNSKIP_TRANSACTION Procedure 117-30

118 DBMS_LOGMNR_D

118.1 DBMS_LOGMNR_D Overview 118-1
118.2 DBMS_LOGMNR_D Security Model 118-2
118.3 Summary of DBMS_LOGMNR_D Subprograms 118-2
118.3.1 BUILD Procedure 118-2
118.3.2 SET_TABLESPACE Procedure 118-5

119 DBMS_LOGSTDBY_CONTEXT

119.1 DBMS_LOGSTDBY_CONTEXT Overview 119-1
119.2 DBMS_LOGSTDBY_CONTEXT Security Model 119-2
119.3 Summary of DBMS_LOGSTDBY_CONTEXT Subprograms 119-2
119.3.1 CLEAR_ALL_CONTEXT Procedure 119-3
119.3.2 CLEAR_CONTEXT Procedure 119-3
119.3.3 GET_CONTEXT Procedure 119-3
119.3.4 SET_CONTEXT Procedure 119-4

120 DBMS_MEMOPTIMIZE

120.1 DBMS_MEMOPTIMIZE Overview 120-1
120.2 Summary of DBMS_MEMOPTIMIZE Subprograms 120-1
120.2.1 DROP_OBJECT Procedure 120-2
120.2.2 GET_APPLY_HWM_SEQID Function 120-3
120.2.3 GET_WRITE_HWM_SEQID Function 120-3
120.2.4 POPULATE Procedure 120-3
120.2.5 WRITE_END Procedure 120-4

121 DBMS_MEMOPTIMIZE_ADMIN

121.1 DBMS_MEMOPTIMIZE_ADMIN Overview 121-1
121.2 Summary of DBMS_MEMOPTIMIZE_ADMIN Subprograms 121-1
121.2.1 WRITES_FLUSH Procedure 121-2

122 DBMS_METADATA

122.1 DBMS_METADATA Overview 122-1
122.2 DBMS_METADATA Security Model 122-2
122.3 Rules and Limits 122-3
122.4 DBMS_METADATA Data Structures - Object and Table Types 122-3
122.5 DBMS_METADATA Subprogram Groupings 122-4
122.5.1 DBMS_METADATA Subprograms for Retrieving Multiple Objects From the Database 122-4

122.5.2 DBMS_METADATA Subprograms for Submitting XML to the Database 122-5
122.6 Summary of All DBMS_METADATA Subprograms 122-5
122.6.1 ADD_TRANSFORM Function 122-6
122.6.2 CLOSE Procedure 122-10
122.6.3 CONVERT Functions and Procedures 122-10
122.6.4 FETCH_xxx Functions and Procedures 122-12
122.6.5 GET_xxx Functions 122-15
122.6.6 GET_QUERY Function 122-19
122.6.7 OPEN Function 122-20
122.6.8 OPENW Function 122-27
122.6.9 PUT Function 122-28
122.6.10 SET_COUNT Procedure 122-29
122.6.11 SET_FILTER Procedure 122-30
122.6.12 SET_PARSE_ITEM Procedure 122-41
122.6.13 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures 122-44

123 DBMS_METADATA_DIFF

123.1 DBMS_METADATA_DIFF Overview 123-1
123.2 DBMS_METADATA_DIFF Security Model 123-1
123.3 DBMS_METADATA_DIFF — Browsing APIs for Fetching and Comparing Objects 123-2
123.4 Summary of DBMS_METADATA_DIFF Subprograms 123-3
123.4.1 OPENC Function 123-4
123.4.2 ADD_DOCUMENT Procedure 123-4
123.4.3 FETCH_CLOB Functions and Procedures 123-5
123.4.4 CLOSE Procedure 123-6

124 DBMS_MGD_ID_UTL

124.1 DBMS_MGD_ID_UTL Security Model 124-1
124.2 DBMS_MGD_ID_UTL Constants 124-2
124.3 DBMS_MGD_ID_UTL Exceptions 124-2
124.4 Summary of DBMS_MGD_ID_UTL Subprograms 124-3
124.4.1 ADD_SCHEME Procedure 124-4
124.4.2 CREATE_CATEGORY Function 124-7
124.4.3 EPC_TO_ORACLE_SCHEME Function 124-8
124.4.4 GET_CATEGORY_ID Function 124-11
124.4.5 GET_COMPONENTS Function 124-12
124.4.6 GET_ENCODINGS Function 124-13
124.4.7 GET_JAVA_LOGGING_LEVEL Function 124-13
124.4.8 GET_PLSQL_LOGGING_LEVEL Function 124-14
124.4.9 GET_SCHEME_NAMES Function 124-15

124.4.10 GET_TDT_XML Function 124-15
124.4.11 GET_VALIDATOR Function 124-17
124.4.12 REFRESH_CATEGORY Function 124-20
124.4.13 REMOVE_CATEGORY Procedure 124-21
124.4.14 REMOVE_PROXY Procedure 124-22
124.4.15 REMOVE_SCHEME Procedure 124-22
124.4.16 SET_JAVA_LOGGING_LEVEL Procedure 124-23
124.4.17 SET_PLSQL_LOGGING_LEVEL Procedure 124-23
124.4.18 SET_PROXY Procedure 124-24
124.4.19 VALIDATE_SCHEME Function 124-25

125 DBMS_MGWADM

125.1 DBMS_MGWADM Security Model 125-1
125.2 DBMS_MGWADM Deprecated Subprograms 125-1
125.3 DBMS_MGWADM Constants 125-2
125.4 DBMS_MGWADM Data Structures 125-5
125.4.1 DBMS_MGWADM SYS.MGW_MQSERIES_PROPERTIES Object Type 125-5
125.4.2 DBMS_MGWADM SYS.MGW_PROPERTIES Object Type 125-7
125.4.3 DBMS_MGWADM SYS.MGW_PROPERTY Object Type 125-8
125.4.4 SYS.MGW_TIBRV_PROPERTIES Object Type 125-9
125.5 Summary of DBMS_MGWADM Subprograms 125-10
125.5.1 ADD_SUBSCRIBER Procedure 125-12
125.5.2 ALTER_AGENT Procedures 125-15
125.5.3 ALTER_JOB Procedure 125-16
125.5.4 ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous 125-18
125.5.5 ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ 125-19
125.5.6 ALTER_PROPAGATION_SCHEDULE Procedure 125-20
125.5.7 ALTER_SUBSCRIBER Procedure 125-21
125.5.8 CLEANUP_GATEWAY Procedures 125-23
125.5.9 CREATE_AGENT Procedure 125-25
125.5.10 CREATE_JOB Procedure 125-27
125.5.11 CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous 125-30
125.5.12 CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ 125-31
125.5.13 DB_CONNECT_INFO Procedure 125-32
125.5.14 DISABLE_JOB Procedure 125-32
125.5.15 DISABLE_PROPAGATION_SCHEDULE Procedure 125-33
125.5.16 ENABLE_JOB Procedure 125-33
125.5.17 ENABLE_PROPAGATION_SCHEDULE Procedure 125-34
125.5.18 REGISTER_FOREIGN_QUEUE Procedure 125-34
125.5.19 REMOVE_AGENT Procedure 125-35
125.5.20 REMOVE_JOB Procedure 125-36

125.5.21 REMOVE_MSGSYSTEM_LINK Procedure 125-36
125.5.22 REMOVE_OPTION Procedure 125-37
125.5.23 REMOVE_SUBSCRIBER Procedure 125-38
125.5.24 RESET_JOB Procedure 125-39
125.5.25 RESET_SUBSCRIBER Procedure 125-40
125.5.26 SCHEDULE_PROPAGATION Procedure 125-40
125.5.27 SET_LOG_LEVEL Procedures 125-42
125.5.28 SET_OPTION Procedure 125-42
125.5.29 SHUTDOWN Procedures 125-44
125.5.30 STARTUP Procedures 125-44
125.5.31 UNREGISTER_FOREIGN_QUEUE Procedure 125-45
125.5.32 UNSCHEDULE_PROPAGATION Procedure 125-46

126 DBMS_MGWMSG

126.1 DBMS_MGWMSG Security Model 126-1
126.2 DBMS_MGWMSG Constants 126-1
126.3 DBMS_MGWMSG Types 126-3
126.3.1 DBMS_MGWMSG SYS.MGW_NAME_VALUE_T Type 126-3
126.3.2 DBMS_MGWMSG SYS.MGW_NAME_TYPE_ARRAY_T Type 126-6
126.3.3 DBMS_MGWMSG SYS.MGW_TEXT_VALUE_T Type 126-6
126.3.4 DBMS_MGWMSG SYS.MGW_RAW_VALUE_T Type 126-6
126.3.5 DBMS_MGWMSG SYS.MGW_BASIC_MSG_T Type 126-7
126.3.6 DBMS_MGWMSG SYS.MGW_NUMBER_ARRAY_T Type 126-8
126.3.7 DBMS_MGWMSG SYS.MGW_TIBRV_FIELD_T Type 126-8
126.3.8 DBMS_MGWMSG SYS.MGW_TIBRV_MSG_T Type 126-9
126.4 Summary of DBMS_MGWMSG Subprograms 126-17
126.4.1 LCR_TO_XML Function 126-18
126.4.2 NVARRAY_ADD Procedure 126-19
126.4.3 NVARRAY_FIND_NAME Function 126-19
126.4.4 NVARRAY_FIND_NAME_TYPE Function 126-20
126.4.5 NVARRAY_GET Function 126-21
126.4.6 NVARRAY_GET_BOOLEAN Function 126-21
126.4.7 NVARRAY_GET_BYTE Function 126-22
126.4.8 NVARRAY_GET_DATE Function 126-22
126.4.9 NVARRAY_GET_DOUBLE Function 126-23
126.4.10 NVARRAY_GET_FLOAT Function 126-23
126.4.11 NVARRAY_GET_INTEGER Function 126-24
126.4.12 NVARRAY_GET_LONG Function 126-24
126.4.13 NVARRAY_GET_RAW Function 126-25
126.4.14 NVARRAY_GET_SHORT Function 126-25
126.4.15 NVARRAY_GET_TEXT Function 126-26

126.4.16 XML_TO_LCR Function 126-27

127 DBMS_MLE

127.1 DBMS_MLE Overview 127-1
127.2 DBMS_MLE Security Model 127-2
127.3 Summary of DBMS_MLE Subprograms 127-2
127.3.1 CREATE_CONTEXT Function 127-3
127.3.2 DISABLE_CTX_STDERR Procedure 127-4
127.3.3 DISABLE_CTX_STDOUT Procedure 127-5
127.3.4 DISABLE_DEBUGGING Procedure 127-5
127.3.5 DISABLE_ICS_STDERR Procedure 127-6
127.3.6 DISABLE_ICS_STDOUT Procedure 127-6
127.3.7 DISABLE_STDERR Procedure 127-7
127.3.8 DISABLE_STDOUT Procedure 127-7
127.3.9 DROP_CONTEXT Procedure 127-8
127.3.10 ENABLE_DEBUGGING Procedure 127-9
127.3.11 EVAL Procedure 127-9
127.3.12 EXPORT_TO_MLE Procedure 127-11
127.3.13 GET_AVAILABLE_LANGUAGES Function 127-13
127.3.14 GET_CTX_ERROR_STACK Function 127-13
127.3.15 GET_ERROR_STACK Function 127-14
127.3.16 IMPORT_FROM_MLE Procedure 127-14
127.3.17 PARSE_DEBUG_OUTPUT Function 127-16
127.3.18 SET_CTX_STDERR Procedure 127-17
127.3.19 SET_CTX_STDERR_TO_DBMS_OUTPUT Procedure 127-18
127.3.20 SET_CTX_STDOUT Procedure 127-18
127.3.21 SET_CTX_STDOUT_TO_DBMS_OUTPUT Procedure 127-19
127.3.22 SET_ICS_STDERR Procedure 127-19
127.3.23 SET_ICS_STDERR_TO_DBMS_OUTPUT Procedure 127-20
127.3.24 SET_ICS_STDOUT Procedure 127-21
127.3.25 SET_ICS_STDOUT_TO_DBMS_OUTPUT Procedure 127-21
127.3.26 SET_STDERR Procedure 127-22
127.3.27 SET_STDERR_TO_DBMS_OUTPUT Procedure 127-23
127.3.28 SET_STDOUT Procedure 127-23
127.3.29 SET_STDOUT_TO_DBMS_OUTPUT Procedure 127-24

128 DBMS_MONITOR

128.1 Summary of DBMS_MONITOR Subprograms 128-1
128.1.1 CLIENT_ID_STAT_DISABLE Procedure 128-2
128.1.2 CLIENT_ID_STAT_ENABLE Procedure 128-2

128.1.3 CLIENT_ID_TRACE_DISABLE Procedure 128-3
128.1.4 CLIENT_ID_TRACE_ENABLE Procedure 128-3
128.1.5 DATABASE_TRACE_DISABLE Procedure 128-4
128.1.6 DATABASE_TRACE_ENABLE Procedure 128-4
128.1.7 SERV_MOD_ACT_STAT_DISABLE Procedure 128-5
128.1.8 SERV_MOD_ACT_STAT_ENABLE Procedure 128-5
128.1.9 SERV_MOD_ACT_TRACE_DISABLE Procedure 128-7
128.1.10 SERV_MOD_ACT_TRACE_ENABLE Procedure 128-8
128.1.11 SESSION_TRACE_DISABLE Procedure 128-9
128.1.12 SESSION_TRACE_ENABLE Procedure 128-10

129 DBMS_MVIEW

129.1 DBMS_MVIEW Operational Notes 129-1
129.2 DBMS_MVIEW Security Model 129-1
129.3 DBMS_MVIEW Rules and Limits 129-1
129.4 Summary of DBMS_MVIEW Subprograms 129-2
129.4.1 BEGIN_TABLE_REORGANIZATION Procedure 129-2
129.4.2 END_TABLE_REORGANIZATION Procedure 129-3
129.4.3 ESTIMATE_MVIEW_SIZE Procedure 129-3
129.4.4 EXPLAIN_MVIEW Procedure 129-4
129.4.5 EXPLAIN_REWRITE Procedure 129-5
129.4.6 I_AM_A_REFRESH Function 129-6
129.4.7 PMARKER Function 129-6
129.4.8 PURGE_DIRECT_LOAD_LOG Procedure 129-7
129.4.9 PURGE_LOG Procedure 129-7
129.4.10 PURGE_MVIEW_FROM_LOG Procedure 129-8
129.4.11 REFRESH Procedures 129-9
129.4.12 REFRESH_ALL_MVIEWS Procedure 129-11
129.4.13 REFRESH_DEPENDENT Procedures 129-13
129.4.14 REGISTER_MVIEW Procedure 129-15
129.4.15 UNREGISTER_MVIEW Procedure 129-16

130 DBMS_MVIEW_STATS

130.1 DBMS_MVIEW_STATS Overview 130-1
130.2 DBMS_MVIEW_STATS Security Model 130-1
130.3 Summary of DBMS_MVIEW_STATS Subprograms 130-1
130.3.1 PURGE_REFRESH_STATS Procedure 130-2
130.3.2 SET_MVREF_STATS_PARAMS Procedure 130-3
130.3.3 SET_SYSTEM_DEFAULT Procedure 130-4

131 DBMS_NETWORK_ACL_ADMIN

131.1 DBMS_NETWORK_ACL_ADMIN Overview 131-1
131.2 DBMS_NETWORK_ACL_ADMIN Deprecated Subprograms 131-1
131.3 DBMS_NETWORK_ACL_ADMIN Security Model 131-2
131.4 DBMS_NETWORK_ACL_ADMIN Constants 131-2
131.5 DBMS_NETWORK_ACL_ADMIN Exceptions 131-2
131.6 DBMS_NETWORK_ACL_ADMIN Examples 131-3
131.7 Summary of DBMS_NETWORK_ACL_ADMIN Subprograms 131-4
131.7.1 ADD_PRIVILEGE Procedure 131-6
131.7.2 APPEND_HOST_ACE Procedure 131-7
131.7.3 APPEND_HOST_ACL Procedure 131-8
131.7.4 APPEND_WALLET_ACE Procedure 131-9
131.7.5 APPEND_WALLET_ACL Procedure 131-10
131.7.6 ASSIGN_ACL Procedure 131-10
131.7.7 ASSIGN_WALLET_ACL Procedure 131-12
131.7.8 CHECK_PRIVILEGE Function 131-13
131.7.9 CHECK_PRIVILEGE_ACLID Function 131-14
131.7.10 CREATE_ACL Procedure 131-15
131.7.11 DELETE_PRIVILEGE Procedure 131-16
131.7.12 DROP_ACL Procedure 131-17
131.7.13 REMOVE_HOST_ACE Procedure 131-17
131.7.14 REMOVE_WALLET_ACE Procedure 131-18
131.7.15 SET_HOST_ACL Procedure 131-18
131.7.16 SET_WALLET_ACL Procedure 131-19
131.7.17 UNASSIGN_ACL Procedure 131-20
131.7.18 UNASSIGN_WALLET_ACL Procedure 131-21

132 DBMS_NETWORK_ACL_UTILITY

132.1 DBMS_NETWORK_ACL_UTILITY Security Model 132-1
132.2 DBMS_NETWORK_ACL_UTILITY Examples 132-1
132.3 Summary of DBMS_NETWORK_ACL_UTILITY Subprograms 132-2
132.3.1 CONTAINS_HOST Function 132-3
132.3.2 DOMAIN_LEVEL Function 132-4
132.3.3 DOMAINS Function 132-5
132.3.4 EQUALS_HOST Function 132-5

133 DBMS_ODCI

133.1 Summary of DBMS_ODCI Subprograms 133-1

133.1.1 ESTIMATE_CPU_UNITS Function 133-1

134 DBMS_OPTIM_BUNDLE

134.1 DBMS_OPTIM_BUNDLE Security Model 134-1
134.2 Summary of DBMS_OPTIM_BUNDLE Subprograms 134-1
134.2.1 ENABLE_OPTIM_FIXES Procedure 134-1
134.2.2 GETBUGSFORBUNDLE Procedure 134-3
134.2.3 LISTBUNDLESWITHFCFIXES Procedure 134-3
134.2.4 SET_FIX_CONTROLS Procedure 134-4

135 DBMS_OUTLN

135.1 DBMS_OUTLN Overview 135-1
135.2 DBMS_OUTLN Security Model 135-2
135.3 Summary of DBMS_OUTLN Subprograms 135-2
135.3.1 CLEAR_USED Procedure 135-2
135.3.2 CREATE_OUTLINE Procedure 135-3
135.3.3 DROP_BY_CAT Procedure 135-3
135.3.4 DROP_UNUSED Procedure 135-4
135.3.5 EXACT_TEXT_SIGNATURES Procedure 135-4
135.3.6 UPDATE_BY_CAT Procedure 135-4
135.3.7 UPDATE_SIGNATURES Procedure 135-4

136 DBMS_OUTPUT

136.1 DBMS_OUTPUT Overview 136-1
136.2 DBMS_OUTPUT Security Model 136-1
136.3 DBMS_OUTPUT Operational Notes 136-1
136.4 DBMS_OUTPUT Exceptions 136-2
136.5 DBMS_OUTPUT Rules and Limits 136-2
136.6 DBMS_OUTPUT Examples 136-2
136.7 DBMS_OUTPUT Data Structures 136-5
136.7.1 CHARARR Table Type 136-5
136.7.2 DBMS_OUTPUT DBMSOUTPUT_LINESARRAY Object Type 136-5
136.8 Summary of DBMS_OUTPUT Subprograms 136-6
136.8.1 DISABLE Procedure 136-6
136.8.2 ENABLE Procedure 136-6
136.8.3 GET_LINE Procedure 136-7
136.8.4 GET_LINES Procedure 136-8
136.8.5 NEW_LINE Procedure 136-8
136.8.6 PUT Procedure 136-9

136.8.7 PUT_LINE Procedure 136-10

137 DBMS_PARALLEL_EXECUTE

137.1 DBMS_PARALLEL_EXECUTE Overview 137-1
137.2 DBMS_PARALLEL_EXECUTE Security Model 137-1
137.3 DBMS_PARALLEL_EXECUTE Constants 137-2
137.4 DBMS_PARALLEL_EXECUTE Views 137-3
137.5 DBMS_PARALLEL_EXECUTE Exceptions 137-3
137.6 DBMS_PARALLEL_EXECUTE Examples 137-3
137.7 Summary of DBMS_PARALLEL_EXECUTE Subprograms 137-6
137.7.1 ADM_DROP_CHUNKS Procedure 137-7
137.7.2 ADM_DROP_TASK Procedure 137-7
137.7.3 ADM_TASK_STATUS Function 137-8
137.7.4 ADM_STOP_TASK Procedure 137-8
137.7.5 CREATE_TASK Procedure 137-8
137.7.6 CREATE_CHUNKS_BY_NUMBER_COL Procedure 137-9
137.7.7 CREATE_CHUNKS_BY_ROWID Procedure 137-9
137.7.8 CREATE_CHUNKS_BY_SQL Procedure 137-10
137.7.9 DROP_TASK Procedure 137-11
137.7.10 DROP_CHUNKS Procedure 137-11
137.7.11 GENERATE_TASK_NAME Function 137-11
137.7.12 GET_NUMBER_COL_CHUNK Procedure 137-12
137.7.13 GET_ROWID_CHUNK Procedure 137-12
137.7.14 PURGE_PROCESSED_CHUNKS Procedure 137-13
137.7.15 RESUME_TASK Procedures 137-14
137.7.16 RUN_TASK Procedure 137-16
137.7.17 SET_CHUNK_STATUS Procedure 137-17
137.7.18 STOP_TASK Procedure 137-18
137.7.19 TASK_STATUS Procedure 137-18

138 DBMS_PART

138.1 DBMS_PART Security Model 138-1
138.2 DBMS_PART Operational Notes 138-1
138.3 Summary of DBMS_PART Subprograms 138-1
138.3.1 CLEANUP_GIDX Procedure 138-2
138.3.2 CLEANUP_GIDX_JOB Procedure 138-2
138.3.3 CLEANUP_ONLINE_OP Procedure 138-3

139 DBMS_PCLXUTIL

139.1 DBMS_PCLXUTIL Overview 139-1
139.2 DBMS_PCLXUTIL Security Model 139-2
139.3 DBMS_PCLXUTIL Operational Notes 139-2
139.4 DBMS_PCLXUTIL Rules and Limits 139-2
139.5 Summary of DBMS_PCLXUTIL Subprograms 139-3
139.5.1 BUILD_PART_INDEX Procedure 139-3

140 DBMS_PDB

140.1 DBMS_PDB Overview 140-1
140.2 DBMS_PDB Security Model 140-2
140.3 Summary of DBMS_PDB Subprograms 140-2
140.3.1 CHECK_PLUG_COMPATIBILITY Function 140-3
140.3.2 DESCRIBE Procedure 140-4
140.3.3 EXPORTRMANBACKUP Procedure 140-4
140.3.4 RECOVER Procedure 140-5
140.3.5 REMOVE_LINK Procedure 140-6
140.3.6 SET_DATA_LINKED Procedure 140-6
140.3.7 SET_EXT_DATA_LINKED Procedure 140-7
140.3.8 SET_METADATA_LINKED Procedure 140-8
140.3.9 SET_PROFILE_EXPLICIT Procedure 140-9
140.3.10 SET_ROLE_EXPLICIT Procedure 140-9
140.3.11 SET_USER_EXPLICIT Procedure 140-10

141 DBMS_PDB_ALTER_SHARING

141.1 DBMS_PDB_ALTER_SHARING Overview 141-1
141.2 DBMS_PDB_ALTER_SHARING Security Model 141-2
141.3 Summary of DBMS_PDB_ALTER_SHARING Subprograms 141-2
141.3.1 REMOVE_LINK Procedure 141-3
141.3.2 SET_DATA_LINKED Procedure 141-3
141.3.3 SET_EXT_DATA_LINKED Procedure 141-4
141.3.4 SET_METADATA_LINKED Procedure 141-5
141.3.5 SET_PROFILE_EXPLICIT Procedure 141-6
141.3.6 SET_ROLE_EXPLICIT Procedure 141-6
141.3.7 SET_USER_EXPLICIT Procedure 141-7

142 DBMS_PERF

142.1 DBMS_PERF Overview 142-1
142.2 DBMS_PERF Security Model 142-1

142.3 Summary of DBMS_PERF Subprograms 142-1
142.3.1 REPORT_PERFHUB Function 142-2
142.3.2 REPORT_SESSION Function 142-3
142.3.3 REPORT_SQL Function 142-5

143 DBMS_PIPE

143.1 DBMS_PIPE Overview 143-1
143.2 DBMS_PIPE Security Model 143-2
143.3 DBMS_PIPE Constants 143-2
143.4 DBMS_PIPE Operational Notes 143-2
143.5 DBMS_PIPE Exceptions 143-5
143.6 DBMS_PIPE Examples 143-5
143.7 Summary of DBMS_PIPE Subprograms 143-14
143.7.1 CREATE_PIPE Function 143-15
143.7.2 GET_CREDENTIAL_NAME Function 143-17
143.7.3 GET_LOCATION_URI Function 143-17
143.7.4 NEXT_ITEM_TYPE Function 143-17
143.7.5 PACK_MESSAGE Procedures 143-18
143.7.6 PURGE Procedure 143-19
143.7.7 RECEIVE_MESSAGE Function 143-20
143.7.8 RESET_BUFFER Procedure 143-24
143.7.9 REMOVE_PIPE Function 143-24
143.7.10 SEND_MESSAGE Function 143-25
143.7.11 SET_CREDENTIAL_NAME Procedure 143-28
143.7.12 SET_LOCATION_URI Procedure 143-28
143.7.13 UNIQUE_SESSION_NAME Function 143-29
143.7.14 UNPACK_MESSAGE Procedures 143-29

144 DBMS_PLSQL_CODE_COVERAGE

144.1 DBMS_PLSQL_CODE_COVERAGE Overview 144-1
144.2 DBMS_PLSQL_CODE_COVERAGE Security Model 144-1
144.3 DBMS_PLSQL_CODE_COVERAGE Constants 144-2
144.4 DBMS_PLSQL_CODE_COVERAGE Data Structures 144-2
144.4.1 MAP_REC Record Type 144-2
144.4.2 T_MAP_REC Table Type 144-3
144.5 Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms 144-3
144.5.1 CREATE_COVERAGE_TABLES Procedure 144-3
144.5.2 GET_BLOCK_MAP Function 144-4
144.5.3 START_COVERAGE Function 144-4

144.5.4 STOP_COVERAGE Procedure 144-5

145 DBMS_PREDICTIVE_ANALYTICS

145.1 DBMS_PREDICTIVE_ANALYTICS Overview 145-1
145.2 DBMS_PREDICTIVE_ANALYTICS Security Model 145-1
145.3 Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms 145-2
145.3.1 EXPLAIN Procedure 145-2
145.3.2 PREDICT Procedure 145-4
145.3.3 PROFILE Procedure 145-6

146 DBMS_PREPROCESSOR

146.1 DBMS_PREPROCESSOR Overview 146-1
146.2 DBMS_PREPROCESSOR Operating Notes 146-1
146.3 DBMS_PREPROCESSOR Data Structures 146-2
146.3.1 DBMS_PREPROCESSOR SOURCE_LINES_T Table Type 146-2
146.4 Summary of DBMS_PREPROCESSOR Subprograms 146-2
146.4.1 GET_POST_PROCESSED_SOURCE Functions 146-3
146.4.2 PRINT_POST_PROCESSED_SOURCE Procedures 146-4

147 DBMS_PRIVILEGE_CAPTURE

147.1 DBMS_PRIVILEGE_CAPTURE Overview 147-1
147.2 DBMS_PRIVILEGE_CAPTURE Security Model 147-1
147.3 DBMS_PRIVILEGE_CAPTURE Constants 147-1
147.4 DBMS_PRIVILEGE_CAPTURE Examples 147-2
147.5 Summary of DBMS_PRIVILEGE_CAPTURE Subprograms 147-3
147.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure 147-3
147.5.2 CREATE_CAPTURE Procedure 147-3
147.5.3 DELETE_RUN Procedure 147-5
147.5.4 DISABLE_CAPTURE Procedure 147-5
147.5.5 DROP_CAPTURE Procedure 147-6
147.5.6 ENABLE_CAPTURE Procedure 147-6
147.5.7 GENERATE_RESULT Procedure 147-7

148 DBMS_PROCESS

148.1 DBMS_PROCESS Overview 148-1
148.2 DBMS_PROCESS Security Model 148-1
148.3 Summary of DBMS_PROCESS Subprograms 148-2
148.3.1 CONFIGURE_POOL Procedure 148-2

148.3.2 START_POOL Procedure 148-3
148.3.3 STOP_POOL Procedure 148-4

149 DBMS_PROFILER

149.1 DBMS_PROFILER Overview 149-1
149.2 DBMS_PROFILER Security Model 149-3
149.3 DBMS_PROFILER Operational Notes 149-3
149.4 DBMS_PROFILER Exceptions 149-5
149.5 Summary of DBMS_PROFILER Subprograms 149-6
149.5.1 FLUSH_DATA Function and Procedure 149-6
149.5.2 GET_VERSION Procedure 149-6
149.5.3 INTERNAL_VERSION_CHECK Function 149-7
149.5.4 PAUSE_PROFILER Function and Procedure 149-7
149.5.5 RESUME_PROFILER Function and Procedure 149-7
149.5.6 START_PROFILER Functions and Procedures 149-7
149.5.7 STOP_PROFILER Function and Procedure 149-8

150 DBMS_PROPAGATION_ADM

150.1 DBMS_PROPAGATION_ADM Overview 150-1
150.2 DBMS_PROPAGATION_ADM Security Model 150-1
150.3 Summary of DBMS_PROPAGATION_ADM Subprograms 150-1
150.3.1 ALTER_PROPAGATION Procedure 150-2
150.3.2 CREATE_PROPAGATION Procedure 150-3
150.3.3 DROP_PROPAGATION Procedure 150-6
150.3.4 START_PROPAGATION Procedure 150-7
150.3.5 STOP_PROPAGATION Procedure 150-7

151 DBMS_QOPATCH

151.1 DBMS_QOPATCH Overview 151-1
151.2 DBMS_QOPATCH Security Model 151-1
151.3 DBMS_QOPATCH Operational Notes 151-1
151.4 DBMS_QOPATCH Exceptions 151-1
151.5 Summary of DBMS_QOPATCH Subprograms 151-2
151.5.1 CHECK_PATCH_INSTALLED Function 151-3
151.5.2 GET_OPATCH_BUGS Function 151-3
151.5.3 GET_OPATCH_COUNT Function 151-4
151.5.4 GET_OPATCH_DATA Function 151-4
151.5.5 GET_OPATCH_FILES Function 151-4
151.5.6 GET_OPATCH_INSTALL_INFO Function 151-5

151.5.7 GET_OPATCH_LIST Function 151-5
151.5.8 GET_OPATCH_LSINVENTORY 151-5
151.5.9 GET_OPATCH_OLAYS Function 151-5
151.5.10 GET_OPATCH_PREQS Function 151-6
151.5.11 GET_OPATCH_XSLT 151-6
151.5.12 GET_PATCH_DETAILS Function 151-6
151.5.13 GET_SQLPATCH_STATUS Procedure 151-7
151.5.14 IS_PATCH_INSTALLED Function 151-7
151.5.15 OPATCH_COMPARE_CURRENT Function 151-7
151.5.16 OPATCH_COMPARE_NODES Function 151-8
151.5.17 SET_CURRENT_OPINST Procedure 151-8

152 DBMS_RANDOM

152.1 DBMS_RANDOM Deprecated Subprograms 152-1
152.2 DBMS_RANDOM Security Model 152-1
152.3 DBMS_RANDOM Operational Notes 152-1
152.4 Summary of DBMS_RANDOM Subprograms 152-2
152.4.1 INITIALIZE Procedure 152-2
152.4.2 NORMAL Function 152-3
152.4.3 RANDOM Function 152-3
152.4.4 SEED Procedures 152-4
152.4.5 STRING Function 152-4
152.4.6 TERMINATE Procedure 152-5
152.4.7 VALUE Functions 152-5

153 DBMS_REDACT

153.1 DBMS_REDACT Overview 153-1
153.2 DBMS_REDACT Security Model 153-1
153.3 DBMS_REDACT Constants 153-2
153.4 DBMS_REDACT Operating Procedures 153-2
153.5 Summary of DBMS_REDACT Subprograms 153-7
153.5.1 ADD_POLICY Procedure 153-7
153.5.2 ALTER_POLICY Procedure 153-13
153.5.3 APPLY_POLICY_EXPR_TO_COL Procedure 153-20
153.5.4 CREATE_POLICY_EXPRESSION Procedure 153-21
153.5.5 DISABLE_POLICY Procedure 153-22
153.5.6 DROP_POLICY Procedure 153-23
153.5.7 DROP_POLICY_EXPRESSION Procedure 153-23
153.5.8 ENABLE_POLICY Procedure 153-24
153.5.9 UPDATE_FULL_REDACTION_VALUES Procedure 153-25

153.5.10 UPDATE_POLICY_EXPRESSION Procedure 153-26

154 DBMS_REDEFINITION

154.1 DBMS_REDEFINITION Overview 154-1
154.2 DBMS_REDEFINITION Security Model 154-1
154.3 DBMS_REDEFINITION Constants 154-1
154.4 DBMS_REDEFINITION Operational Notes 154-2
154.5 DBMS_REDEFINITION Rules and Limits 154-3
154.6 DBMS_REDEFINITION Examples 154-3
154.7 Summary of DBMS_REDEFINITION Subprograms 154-4
154.7.1 ABORT_REDEF_TABLE Procedure 154-5
154.7.2 ABORT_ROLLBACK Procedure 154-5
154.7.3 ABORT_UPDATE Procedure 154-6
154.7.4 CAN_REDEF_TABLE Procedure 154-7
154.7.5 COPY_TABLE_DEPENDENTS Procedure 154-7
154.7.6 EXECUTE_UPDATE Procedure 154-9
154.7.7 FINISH_REDEF_TABLE Procedure 154-9
154.7.8 REDEF_TABLE Procedure 154-10
154.7.9 REGISTER_DEPENDENT_OBJECT Procedure 154-12
154.7.10 ROLLBACK Procedure 154-13
154.7.11 SET_PARAM Procedure 154-13
154.7.12 START_REDEF_TABLE Procedure 154-14
154.7.13 SYNC_INTERIM_TABLE Procedure 154-16
154.7.14 UNREGISTER_DEPENDENT_OBJECT Procedure 154-16

155 DBMS_REFRESH

155.1 DBMS_REFRESH Overview 155-1
155.2 DBMS_REFRESH Security Model 155-1
155.3 Summary of DBMS_REFRESH Subprograms 155-1
155.3.1 ADD Procedure 155-2
155.3.2 CHANGE Procedure 155-2
155.3.3 DESTROY Procedure 155-4
155.3.4 MAKE Procedure 155-4
155.3.5 REFRESH Procedure 155-6
155.3.6 SUBTRACT Procedure 155-7

156 DBMS_REPAIR

156.1 DBMS_REPAIR Overview 156-1
156.2 DBMS_REPAIR Security Model 156-1

156.3 DBMS_REPAIR Constants 156-1
156.4 DBMS_REPAIR Operating Notes 156-2
156.5 DBMS_REPAIR Exceptions 156-3
156.6 DBMS_REPAIR Examples 156-4
156.7 Summary of DBMS_REPAIR Subprograms 156-4
156.7.1 ADMIN_TABLES Procedure 156-4
156.7.2 CHECK_OBJECT Procedure 156-5
156.7.3 DUMP_ORPHAN_KEYS Procedure 156-6
156.7.4 FIX_CORRUPT_BLOCKS Procedure 156-7
156.7.5 ONLINE_INDEX_CLEAN Function 156-8
156.7.6 REBUILD_FREELISTS Procedure 156-9
156.7.7 SEGMENT_FIX_STATUS Procedure 156-9
156.7.8 SKIP_CORRUPT_BLOCKS Procedure 156-10

157 DBMS_RESCONFIG

157.1 DBMS_RESCONFIG Overview 157-1
157.2 Summary of DBMS_RESCONFIG Subprograms 157-1
157.2.1 ADDREPOSITORYRESCONFIG Procedure 157-2
157.2.2 ADDRESCONFIG Procedure 157-3
157.2.3 APPENDRESCONFIG Procedure 157-3
157.2.4 DELETEREPOSITORYRESCONFIG Procedure 157-4
157.2.5 DELETERESCONFIG Procedures 157-5
157.2.6 GETLISTENERS Function 157-5

192.7.131 UNLOCK_TABLE_STATS Procedure 192-251
192.7.132 UPGRADE_STAT_TABLE Procedure 192-252

193 DBMS_STORAGE_MAP

193.1 DBMS_STORAGE_MAP Overview 193-1
193.2 DBMS_STORAGE_MAP Operational Notes 193-2
193.3 Summary of DBMS_STORAGE_MAP Subprograms 193-2
193.3.1 DROP_ALL Function 193-2
193.3.2 DROP_ELEMENT Function 193-3
193.3.3 DROP_FILE Function 193-3
193.3.4 LOCK_MAP Procedure 193-4
193.3.5 MAP_ALL Function 193-4
193.3.6 MAP_ELEMENT Function 193-4
193.3.7 MAP_FILE Function 193-5
193.3.8 MAP_OBJECT Function 193-6
193.3.9 RESTORE Function 193-6
193.3.10 SAVE Function 193-7
193.3.11 UNLOCK_MAP Procedure 193-7

194 DBMS_SYNC_REFRESH

194.1 DBMS_SYNC_REFRESH Overview 194-1
194.2 DBMS_SYNC_REFRESH Security Model 194-1
194.3 Summary of DBMS_SYNC_REFRESH Subprograms 194-2
194.3.1 ABORT_REFRESH Procedure 194-2
194.3.2 ALTER_REFRESH_STATS_RETENTION Procedure 194-3
194.3.3 CAN_SYNCREF_TABLE Procedure 194-4
194.3.4 EXECUTE_REFRESH Procedure 194-5
194.3.5 GET_ALL_GROUP_IDS Function 194-6
194.3.6 GET_GROUP_ID Function 194-6
194.3.7 GET_GROUP_ID_LIST Function 194-7
194.3.8 PREPARE_REFRESH Procedure 194-7
194.3.9 PREPARE_STAGING_LOG Procedure 194-8

194.3.10 PURGE_REFRESH_STATS Procedure 194-10
194.3.11 REGISTER_MVIEWS 194-10
194.3.12 REGISTER_PARTITION_OPERATION Procedure 194-11
194.3.13 UNREGISTER_MVIEWS 194-12
194.3.14 UNREGISTER_PARTITION_OPERATION Procedure 194-12

195 DBMS_TABLE_DATA

195.1 DBMS_TABLE_DATA Overview 195-1
195.2 DBMS_TABLE_DATA Security Model 195-1
195.3 Summary of DBMS_TABLE_DATA Subprograms 195-2
195.3.1 GET_BYTES_FOR_COLUMN Procedure 195-2
195.3.2 GET_BYTES_FOR_COLUMNS Procedure 195-3
195.3.3 GET_BYTES_FOR_ROW Procedure 195-3

196 DBMS_TDB

196.1 DBMS_TDB Overview 196-1
196.2 DBMS_TDB Security Model 196-2
196.3 DBMS_TDB Constants 196-2
196.4 DBMS_TDB Views 196-2
196.5 DBMS_TDB Operational Notes 196-2
196.6 Summary of DBMS_TDB Subprograms 196-2
196.6.1 CHECK_DB Function 196-3
196.6.2 CHECK_EXTERNAL Function 196-4

197 DBMS_TF

197.1 DBMS_TF Overview 197-1
197.2 DBMS_TF Security Model 197-1
197.3 DBMS_TF Constants 197-2
197.4 DBMS_TF Operational Notes 197-2
197.4.1 PTF Client Interface 197-3
197.4.1.1 DESCRIBE Only Polymorphic Table Function 197-5
197.4.2 PTF Server Side Interface 197-5
197.4.3 Read Columns 197-6
197.4.4 Pass-Through Columns 197-6
197.4.5 State Management 197-7
197.4.5.1 CSTORE Compilation State Management 197-7
197.4.5.2 XSTORE Execution State Management 197-9
197.4.6 Method Name Overrides 197-9
197.4.7 Using the COLUMNS Pseudo-Operator 197-11

197.4.8 Query Transformations 197-11
197.4.9 Parallel Execution 197-12
197.5 DBMS_TF Execution Flow 197-12
197.6 DBMS_TF Restrictions 197-14
197.7 DBMS_TF Examples 197-15
197.7.1 Echo Polymorphic Table Function Example 197-16
197.8 DBMS_TF Data Structures 197-19
197.8.1 Supported Types Collections 197-20
197.8.2 COLUMN_DATA_T Record Type 197-21
197.8.3 COLUMN_METADATA_T Record Type 197-22
197.8.4 COLUMN_T Record Type 197-23
197.8.5 DESCRIBE_T Record Type 197-23
197.8.6 ENV_T Record Type 197-23
197.8.7 PARALLEL_ENV_T Record Type 197-24
197.8.8 TABLE_T Record Type 197-25
197.8.9 COLUMNS_NEW_T Table Type 197-25
197.8.10 COLUMNS_T Table Type 197-25
197.8.11 COLUMNS_WITH_TYPE_T Table Type 197-25
197.8.12 TABLE_COLUMNS_T Table Type 197-26
197.8.13 ROW_SET_T Table Type 197-26
197.8.14 XID_T Subtype 197-26
197.9 Summary of DBMS_TF Subprograms 197-26
197.9.1 COLUMN_TYPE_NAME Function 197-27
197.9.2 COL_TO_CHAR Function 197-28
197.9.3 CSTORE_EXISTS Function 197-29
197.9.4 CSTORE_GET Procedure 197-29
197.9.5 GET_COL Procedure 197-30
197.9.6 GET_ENV Function 197-32
197.9.7 GET_ROW_SET Procedure 197-32
197.9.7.1 Stack Polymorphic Table Function Example 197-33
197.9.8 GET_XID Function 197-36
197.9.9 PUT_COL Procedure 197-36
197.9.9.1 Rand_col Polymorphic Table Function Example 197-37
197.9.10 PUT_ROW_SET Procedure 197-40
197.9.10.1 Split Polymorphic Table Function Example 197-40
197.9.11 ROW_REPLICATION Procedure 197-43
197.9.12 ROW_TO_CHAR Function 197-45
197.9.13 SUPPORTED_TYPE Function 197-46
197.9.14 TRACE Procedure 197-46
197.9.15 XSTORE_CLEAR Procedure 197-47
197.9.16 XSTORE_EXISTS Function 197-48
197.9.17 XSTORE_GET Procedure 197-48

197.9.17.1 Row_num Polymorphic Table Function Example 197-49
197.9.18 XSTORE_REMOVE Procedure 197-51
197.9.19 XSTORE_SET Procedure 197-52

198 DBMS_TNS

198.1 DBMS_TNS Overview 198-1
198.2 DBMS_TNS Security Model 198-1
198.3 Summary of DBMS_TNS Subprograms 198-1
198.3.1 RESOLVE_TNSNAME Function 198-2

199 DBMS_TRACE

199.1 DBMS_TRACE Overview 199-1
199.2 DBMS_TRACE Security Model 199-1
199.3 DBMS_TRACE Constants 199-1
199.4 DBMS_TRACE Restrictions 199-2
199.5 DBMS_TRACE Operational Notes 199-3
199.6 Summary of DBMS_TRACE Subprograms 199-5
199.6.1 CLEAR_PLSQL_TRACE Procedure 199-5
199.6.2 GET_PLSQL_TRACE_LEVEL Function 199-6
199.6.3 PLSQL_TRACE_VERSION Procedure 199-6
199.6.4 SET_PLSQL_TRACE Procedure 199-6

200 DBMS_TRANSACTION

200.1 DBMS_TRANSACTION Security Model 200-1
200.2 Summary of DBMS_TRANSACTION Subprograms 200-1
200.2.1 ADVISE_COMMIT Procedure 200-2
200.2.2 ADVISE_NOTHING Procedure 200-3
200.2.3 ADVISE_ROLLBACK Procedure 200-3
200.2.4 COMMIT Procedure 200-3
200.2.5 COMMIT_COMMENT Procedure 200-3
200.2.6 COMMIT_FORCE Procedure 200-3
200.2.7 GET_TRANSACTION_ID Function 200-4
200.2.8 GET_TRANSACTION_TIMEOUT Function 200-4
200.2.9 GET_TRANSACTION_TYPE Function 200-4
200.2.10 LOCAL_TRANSACTION_ID Function 200-5
200.2.11 PURGE_LOST_DB_ENTRY Procedure 200-5
200.2.12 PURGE_MIXED Procedure 200-7
200.2.13 READ_ONLY Procedure 200-7
200.2.14 READ_WRITE Procedure 200-8

200.2.15 ROLLBACK Procedure 200-8
200.2.16 ROLLBACK_FORCE Procedure 200-8
200.2.17 ROLLBACK_SAVEPOINT Procedure 200-8
200.2.18 SAVEPOINT Procedure 200-9
200.2.19 START_TRANSACTION Function 200-9
200.2.20 STEP_ID Function 200-10
200.2.21 SUSPEND_TRANSACTION Procedure 200-10
200.2.22 USE_ROLLBACK_SEGMENT Procedure 200-11

201 DBMS_TRANSFORM

201.1 Summary of DBMS_TRANSFORM Subprograms 201-1
201.1.1 CREATE_TRANSFORMATION Procedure 201-1
201.1.2 DROP_TRANSFORMATION Procedure 201-2
201.1.3 MODIFY_TRANSFORMATION Procedure 201-3

202 DBMS_TSDP_MANAGE

202.1 DBMS_TSDP_MANAGE Overview 202-1
202.2 DBMS_TSDP_MANAGE Security Model 202-1
202.3 Summary of DBMS_TSDP_MANAGE Subprograms 202-2
202.3.1 ADD_SENSITIVE_COLUMN Procedure 202-2
202.3.2 ALTER_SENSITIVE_COLUMN Procedure 202-3
202.3.3 ADD_SENSITIVE_TYPE Procedure 202-4
202.3.4 DROP_SENSITIVE_COLUMN Procedure 202-4
202.3.5 DROP_SENSITIVE_TYPE Procedure 202-5
202.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure 202-5
202.3.7 IMPORT_DISCOVERY_RESULT Procedure 202-6
202.3.8 IMPORT_SENSITIVE_TYPES Procedure 202-6
202.3.9 REMOVE_DISCOVERY_RESULT Procedure 202-7

203 DBMS_TSDP_PROTECT

203.1 DBMS_TSDP_PROTECT Overview 203-1
203.2 DBMS_TSDP_PROTECT Security Model 203-1
203.3 DBMS_TSDP_PROTECT Constants 203-2
203.4 DBMS_TSDP_PROTECT Data Structures 203-2
203.4.1 FEATURE_OPTIONS Table Type 203-2
203.4.2 POLICY_CONDITIONS Table Type 203-2
203.5 Summary of DBMS_TSDP_PROTECT Subprograms 203-2
203.5.1 ADD_POLICY Procedure 203-3
203.5.2 ALTER_POLICY Procedure 203-4

203.5.3 ASSOCIATE_POLICY Procedure 203-5
203.5.4 DISABLE_PROTECTION_COLUMN Procedure 203-6
203.5.5 DISABLE_PROTECTION_SOURCE Procedure 203-7
203.5.6 DISABLE_PROTECTION_TYPE Procedure 203-7
203.5.7 DROP_POLICY Procedure 203-7
203.5.8 ENABLE_PROTECTION_COLUMN Procedure 203-9
203.5.9 ENABLE_PROTECTION_SOURCE Procedure 203-9
203.5.10 ENABLE_PROTECTION_TYPE Procedure 203-10

204 DBMS_TTS

204.1 DBMS_TTS Security Model 204-1
204.2 DBMS_TTS Exceptions 204-1
204.3 DBMS_TTS Operational Notes 204-1
204.4 Summary of DBMS_TTS Subprograms 204-2
204.4.1 DOWNGRADE Procedure 204-2
204.4.2 TRANSPORT_SET_CHECK Procedure 204-2

205 DBMS_TYPES

205.1 DBMS_TYPES Constants 205-1
205.2 DBMS_TYPES Exceptions 205-2

206 DBMS_UMF

206.1 Summary of DBMS_UMF Subprograms 206-1
206.1.1 CONFIGURE_NODE Procedure 206-2
206.1.2 CREATE_LINK Procedure 206-2
206.1.3 CREATE_TOPOLOGY Procedure 206-3
206.1.4 DROP_LINK Procedure 206-3
206.1.5 DROP_TOPOLOGY Procedure 206-4
206.1.6 ENABLE_SERVICE Procedure 206-4
206.1.7 GET_NODE_ID_LOCAL Function 206-5
206.1.8 GET_NODE_NAME_LOCAL Function 206-6
206.1.9 GET_TARGET_ID Function 206-6
206.1.10 GET_TOPOLOGY_NAME_LOCAL Function 206-6
206.1.11 QUERY_LINK_INFO Procedure 206-7
206.1.12 QUERY_NODE_INFO Procedures 206-7
206.1.13 REGISTER_NODE Function and Procedure 206-8
206.1.14 SWITCH_DESTINATION Procedure 206-9
206.1.15 UNCONFIGURE_NODE Procedure 206-10

206.1.16 UNREGISTER_NODE Procedure 206-10

207 DBMS_UNDO_ADV

207.1 Summary of DBMS_UNDO_ADV Subprograms 207-1
207.1.1 BEST_POSSIBLE_RETENTION Function 207-2
207.1.2 RBU_MIGRATION Function 207-3
207.1.3 LONGEST_QUERY Function 207-3
207.1.4 REQUIRED_RETENTION Function 207-4
207.1.5 REQUIRED_UNDO_SIZE Function 207-5
207.1.6 UNDO_ADVISOR Function 207-6
207.1.7 UNDO_AUTOTUNE Function 207-7
207.1.8 UNDO_HEALTH Function 207-7
207.1.9 UNDO_INFO Function 207-9

208 DBMS_USER_CERTS

208.1 DBMS_USER_CERTS Overview 208-1
208.2 DBMS_USER_CERTS Security Model 208-1
208.3 Summary of DBMS_USER_CERTS Subprograms 208-2
208.3.1 ADD_CERTIFICATE Procedure 208-2
208.3.2 ADD_COPY Procedure 208-2
208.3.3 DROP_CERTIFICATE Procedure 208-3

209 DBMS_USERDIAG

209.1 DBMS_USERDIAG Overview 209-1
209.2 Summary of DBMS_USERDIAG Subprograms 209-1
209.2.1 CHECK_SQL_TRACE_EVENT Procedure 209-2
209.2.2 ENABLE_SQL_TRACE_EVENT Procedure 209-2
209.2.3 GET_CALL_ERROR_MSG Function 209-3
209.2.4 GET_CALL_STATUS Function 209-3
209.2.5 SET_EXCEPTION_MODE Procedure 209-4
209.2.6 SET_TRACEFILE_IDENTIFIER Procedure 209-4
209.2.7 TRACE Procedure 209-4

210 DBMS_UTILITY

210.1 DBMS_UTILITY Deprecated Subprograms 210-1
210.2 DBMS_UTILITY Security Model 210-1
210.3 DBMS_UTILITY Constants 210-2
210.4 DBMS_UTILITY Exceptions 210-2

212.1.7 DROP_PREFERENCE 212-17
212.1.8 DROP_VOCABULARY 212-18
212.1.9 RERANK 212-18

212.1.10 UTL_TO_CHUNKS 212-22
212.1.11 UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS 212-28
212.1.12 UTL_TO_GENERATE_TEXT 212-35
212.1.13 UTL_TO_TEXT 212-43
212.1.14 UTL_TO_SUMMARY 212-44
212.2 Supported Languages and Data File Locations 212-51

213 DBMS_WARNING

213.1 DBMS_WARNING Security Model 213-1
213.2 Summary of DBMS_WARNING Subprograms 213-1
213.2.1 ADD_WARNING_SETTING_CAT Procedure 213-2
213.2.2 ADD_WARNING_SETTING_NUM Procedure 213-2
213.2.3 GET_CATEGORY Function 213-3
213.2.4 GET_WARNING_SETTING_CAT Function 213-4
213.2.5 GET_WARNING_SETTING_NUM Function 213-4
213.2.6 GET_WARNING_SETTING_STRING Function 213-4
213.2.7 SET_WARNING_SETTING_STRING Procedure 213-5

214 DBMS_WM

215 DBMS_WORKLOAD_CAPTURE

215.1 DBMS_WORKLOAD_CAPTURE Overview 215-1
215.2 DBMS_WORKLOAD_CAPTURE Security Model 215-1
215.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms 215-2
215.3.1 ADD_FILTER Procedures 215-2
215.3.2 DECRYPT_CAPTURE Procedure 215-4
215.3.3 DELETE_CAPTURE_INFO Procedure 215-5
215.3.4 DELETE_FILTER Procedure 215-5
215.3.5 ENCRYPT_CAPTURE Procedure 215-6
215.3.6 EXPORT_AWR Procedure 215-6
215.3.7 FINISH_CAPTURE Procedure 215-7
215.3.8 GET_CAPTURE_INFO Function 215-8
215.3.9 IMPORT_AWR Function 215-8
215.3.10 REPORT Function 215-9
215.3.11 START_CAPTURE Procedure 215-10

216 DBMS_WORKLOAD_REPLAY

216.1 DBMS_WORKLOAD_REPLAY Overview 216-1
216.2 DBMS_WORKLOAD_REPLAY Security Model 216-1
216.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms 216-2
216.3.1 ADD_CAPTURE Function 216-4
216.3.2 ADD_FILTER Procedure 216-5
216.3.3 ADD_SCHEDULE_ORDERING Function 216-5
216.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure 216-6
216.3.5 BEGIN_REPLAY_SCHEDULE Procedure 216-7
216.3.6 CALIBRATE Function 216-7
216.3.7 CANCEL_REPLAY Procedure 216-8
216.3.8 COMPARE_PERIOD_REPORT Procedure 216-9
216.3.9 COMPARE_SQLSET_REPORT Function 216-9
216.3.10 CREATE_FILTER_SET Procedure 216-10
216.3.11 DELETE_FILTER Procedure 216-11
216.3.12 DELETE_REPLAY_INFO Procedure 216-11
216.3.13 END_REPLAY_SCHEDULE Procedure 216-12
216.3.14 EXPORT_AWR Procedure 216-12
216.3.15 GENERATE_CAPTURE_SUBSET Procedure 216-12
216.3.16 GET_DIVERGING_STATEMENT Function 216-13
216.3.17 GET_REPLAY_DIRECTORY Function 216-14
216.3.18 GET_REPLAY_INFO Function 216-14
216.3.19 GET_REPLAY_TIMEOUT Procedure 216-15
216.3.20 IMPORT_AWR Function 216-15
216.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure 216-16
216.3.22 INITIALIZE_REPLAY Procedure 216-17
216.3.23 IS_REPLAY_PAUSED Function 216-19
216.3.24 LOAD_LONG_SQLTEXT Procedure 216-19
216.3.25 PAUSE_REPLAY Procedure 216-19
216.3.26 POPULATE_DIVERGENCE Procedure 216-20
216.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure 216-20
216.3.28 PREPARE_REPLAY Procedure 216-22
216.3.29 PROCESS_CAPTURE Procedure 216-26
216.3.30 REMAP_CONNECTION Procedure 216-27
216.3.31 REMOVE_CAPTURE Procedure 216-28
216.3.32 REMOVE_SCHEDULE_ORDERING Procedure 216-29
216.3.33 REPORT Function 216-29
216.3.34 RESUME_REPLAY Procedure 216-30
216.3.35 REUSE_REPLAY_FILTER_SET Procedure 216-30
216.3.36 SET_ADVANCED_PARAMETER Procedure 216-31
216.3.37 SET_REPLAY_DIRECTORY Procedure 216-32

216.3.38 SET_REPLAY_TIMEOUT Procedure 216-32
216.3.39 SET_SQL_MAPPING Procedure 216-33
216.3.40 SET_USER_MAPPING Procedure 216-34
216.3.41 START_CONSOLIDATED_REPLAY Procedure 216-34
216.3.42 START_REPLAY Procedure 216-35
216.3.43 USE_FILTER_SET Procedure 216-35

217 DBMS_WORKLOAD_REPOSITORY

217.1 DBMS_WORKLOAD_REPOSITORY Examples 217-1
217.2 DBMS_WORKLOAD_REPOSITORY Data Structures 217-1
217.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type 217-2
217.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type 217-2
217.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type 217-3
217.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms 217-3
217.3.1 ADD_COLORED_SQL Procedure 217-5
217.3.2 ASH_GLOBAL_REPORT_HTML Function 217-5
217.3.3 ASH_GLOBAL_REPORT_TEXT Function 217-7
217.3.4 ASH_REPORT_ANALYTICS Function 217-9
217.3.5 ASH_REPORT_HTML Function 217-10
217.3.6 ASH_REPORT_TEXT Function 217-12
217.3.7 AWR_DIFF_REPORT_HTML Function 217-15
217.3.8 AWR_DIFF_REPORT_TEXT Function 217-15
217.3.9 AWR_EXP Procedure 217-16
217.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions 217-17
217.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions 217-18
217.3.12 AWR_GLOBAL_REPORT_HTML Functions 217-19
217.3.13 AWR_GLOBAL_REPORT_TEXT Functions 217-20
217.3.14 AWR_IMP Procedure 217-21
217.3.15 AWR_REPORT_HTML Function 217-21
217.3.16 AWR_REPORT_TEXT Function 217-22
217.3.17 AWR_SET_REPORT_THRESHOLDS Procedure 217-23
217.3.18 AWR_SQL_REPORT_HTML Function 217-24
217.3.19 AWR_SQL_REPORT_TEXT Function 217-25
217.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure 217-26
217.3.21 CREATE_BASELINE Functions and Procedures 217-26
217.3.22 CREATE_BASELINE_TEMPLATE Procedures 217-28
217.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure 217-29
217.3.24 CREATE_SNAPSHOT Function and Procedure 217-30
217.3.25 DROP_BASELINE Procedure 217-31

217.3.26 DROP_BASELINE_TEMPLATE Procedure 217-32
217.3.27 DROP_SNAPSHOT_RANGE Procedure 217-32
217.3.28 LOCAL_AWR_DBID Function 217-33
217.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure 217-33
217.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures 217-34
217.3.31 PURGE_SQL_DETAILS Procedure 217-35
217.3.32 REGISTER_REMOTE_DATABASE Procedures 217-36
217.3.33 REMOVE_COLORED_SQL Procedure 217-36
217.3.34 RENAME_BASELINE Procedure 217-37
217.3.35 SELECT_BASELINE_DETAILS Function 217-37
217.3.36 SELECT_BASELINE_METRIC Function 217-38
217.3.37 UNREGISTER_REMOTE_DATABASE Procedures 217-38
217.3.38 UPDATE_DATAFILE_INFO Procedure 217-39
217.3.39 UPDATE_OBJECT_INFO Procedure 217-39

218 DBMS_XDB

218.1 DBMS_XDB Overview 218-1
218.2 DBMS_XDB Security Model 218-2

Index

Preface

This Preface contains these topics:

- Audience
- Related Documents
- Conventions

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customer access to and use of Oracle support services will be pursuant to the terms and conditions specified in their Oracle order for the applicable services.

Related Documents

For more information, see the following documents:

- *Oracle Database Development Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

`http://shop.oracle.com/`

To download free release notes, installation documentation, technical briefs, or other collateral, please visit the Oracle Technology Network (OTN).

`http://docs.oracle.com/`

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an **index-organized table**.
Italics	Italic typeface indicates book titles or emphasis.	*Oracle Database Concepts* Ensure that the recovery catalog and target database do *not* reside on the same disk.
`UPPERCASE monospace (fixed-width) font`	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a `NUMBER` column. You can back up the database by using the `BACKUP` command. Query the `TABLE_NAME` column in the `USER_TABLES` data dictionary view. Use the `DBMS_STATS.GENERATE_STATS` procedure.
`lowercase monospace (fixed-width) font`	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. *Note:* Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter `sqlplus` to start SQL*Plus. The password is specified in the `orapwd` file. Back up the datafiles and control files in the `/disk1/oracle/dbs` directory. The `department_id`, `department_name`, and `location_id` columns are in the `hr.departments` table. Set the `QUERY_REWRITE_ENABLED` initialization parameter to `true`. The `JRepUtil` class implements these methods.
`lowercase italic monospace (fixed-width) font`	Lowercase italic monospace font represents placeholders or variables.	You can specify the *`parallel_clause`*. Run *`old_release`*`.SQL` where *`old_release`* refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
`[ ]`	Anything enclosed in brackets is optional.	`DECIMAL (digits [ , precision ])`
`{ }`	Braces are used for grouping items.	`{ENABLE | DISABLE}`
`|`	A vertical bar represents a choice of two options.	`{ENABLE | DISABLE}` `[COMPRESS | NOCOMPRESS]`
`...`	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	`CREATE TABLE ... AS subquery;` `SELECT col1, col2, ... , coln FROM employees;`
Other symbols	You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (|), and ellipsis points (...) exactly as shown.	`acctbal NUMBER(11,2);` `acct CONSTANT NUMBER(4) := 3;`
Italics	Italicized text indicates placeholders or variables for which you must supply particular values.	`enter password` `DB_NAME = database_name`

`UPPERCASE`	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	`SELECT last_name, employee_id FROM employees;`
		`SELECT * FROM USER_TABLES;`
		`DROP TABLE hr.employees;`

`lowercase`	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.
	Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
		`SELECT last_name, employee_id FROM employees;`
		`sqlplus user_id/password`
		`CREATE USER mjones IDENTIFIED BY ty3MU9;`

Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

This preface contains:

- Changes in this Release

Changes in this Release

Review changes in this release of *Oracle Database PL/SQL Packages and Types Reference*.

- New Features
- Deprecated Features
- Desupported Features

New Features

This section lists the major new features in Oracle Database release 23ai *PL/SQL Packages and Types Reference*.

The following features are new in this release:

- DBMS_AUTOIM provides functions to manage the execution of the Automatic In-Memory feature.
- DBMS_SPM supports the SQL plan management feature by providing an interface for the DBA or other users to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.
- DBMS_INMEMORY_ADVISE enables you to determine if a workload can benefit from Oracle's Database In-Memory feature.
- The `DBMS_VECTOR` package is a lightweight package that simplifies common operations with Oracle AI Vector Search, such as chunking and embedding data, generating text for prompts and images, or managing vector indexes.

  DBMS_VECTOR
- The `DBMS_VECTOR_CHAIN` package enables advanced operations with Oracle AI Vector Search, such as chunking and embedding data, generating text for prompts and images along with text processing and end-to-end similarity search.

  DBMS_VECTOR_CHAIN
- The `DBMS_HYBRID_VECTOR` package enables you to search by both vectors and keywords against hybrid vector indexes.

  DBMS_HYBRID_VECTOR
- `DBMS_DICTIONARY_CHECK` is a read-only and lightweight PL/SQL package procedure that helps you identify database dictionary inconsistencies.

DBMS_DICTIONARY_CHECK

- The `UTL_HTTP` package supports digest SHA-256.

  UTL_HTTP

- The `UTL_I18N` package supports three new procedures that detect the most likely Oracle character sets and Oracle languages for a given data sample: `DETECT_CHARSET`, `DETECT_LANGUAGE`, and `DETECT_LANGUAGE_CHARSET`.

  UTL_I18N

- The `DBMS_SAGA_ADM` package provides a collection of saga administration functions and procedures to define and manage saga participants, coordinators, and brokers.

  DBMS_SAGA_ADM

- The `DBMS_SAGA` package provides a collection of saga functions and procedures to initiate and finalize sagas.

  DBMS_SAGA

- The DBMS_FLASHBACK_ARCHIVE package includes the GET_CURRENT_LIFESPAN_DIGEST Function that generates the current lifespan digest for the specified row in a user table, and the VERIFY_BLOCKCHAIN_LIFESPAN Procedure that verifies the contents of the current lifespans, historical lifespans, or all lifespans of the user table rows that are protected using blockchain Flashback Archive.
- The DBMS_KAFKA package provides a PL/SQL interface for enabling Oracle SQL access to topics in Kafka clusters.
- The `DBMS_SEARCH` package enables you to create, maintain, and query ubiquitous search indexes.

  DBMS_SEARCH

- The `DBMS_SQL_FIREWALL` package enables users to administer SQL Firewall.

  DBMS_SQL_FIREWALL

- The `DBMS_CRYPTO` package has the following new features.

  DBMS_CRYPTO

  - New APIs for elliptic-curve Diffie–Hellman (ECDH) operations
    - `ECDH_GENKEYPAIR`: This function generates an EC public/private key pair
    - `ECDHDERIVE_SHAREDSECRET`: This function derives shared secret using private key of local application and public key from the remote application.
  - New `PKENCRYPT`/`PKDECRYPT` algorithm: `PKENCRYPT_RSA_PKCS1_OAEP_SHA2`
  - New chain modes `GCM CCM`
  - New `DBMS_CRYPTO` block cipher suites `AES_CCM_NONE` and `AES_GCM_NONE`
  - New signature and verification algorithms:
    - `SIGN_SHA224_ECDSA`
    - `SIGN_SHA256_ECDSA`
    - `SIGN_SHA384_ECDSA`
    - `SIGN_SHA512_ECDSA`
    - `SIGN_ECDSA`

- The DBMS_SCHEDULER package has a new DUMP_IN_MEMORY_TRACE procedure that dumps the scheduler in-memory trace buffer of the specified process state object address into the current trace file of the requester process.

  DBMS_SCHEDULER

- The DBMS_SQL and DBMS_TF packages are updated to support the ISO SQL standard-compliant BOOLEAN data type.

  DBMS_SQL

  DBMS_TF

- The DBMS_COMPRESSION package is updated to support the Advanced Low Index Compression for IOTs.

  DBMS_COMPRESSION

- The DBMS_SHARDING_DIRECTORY package is added to support the Oracle Globally Distributed Database directory-based data distribution method.

  DBMS_SHARDING_DIRECTORY

- The DBMS_AUTO_CLUSTERING package is added to support the automatic clustering and zone mapping.

  DBMS_AUTO_CLUSTERING

- The DBMS_AUTO_INDEX package has a new parameter AUTO_INDEX_INCLUDE_DML_COST for the DBMS_AUTO_INDEX.CONFIGURE procedure.

  DBMS_AUTO_INDEX

- The DBMS_BLOCKCHAIN_TABLE package has enhancements related to Blockchain Table User Chains, Blockchain Table Delegate Signer, and Blockchain Table Countersignature.

  DBMS_BLOCKCHAIN_TABLE

- The DBMS_DATA_MINING package is enhanced to support the following settings:

  – IMPORT_ONNX_MODEL procedure. To learn more, see IMPORT_ONNX_MODEL Procedure.

  Generalized Linear Model setting:

  – GLMS_LINK_FUNCTION. See DBMS_DATA_MINING — Algorithm Settings: Generalized Linear Model.

  XGBoost settings:

  – xgboost_interaction_constraints
  – xgboost_decrease_constraints
  – xgboost_increase_constraints
  – objective: survival:aft
  – xgboost_aft_loss_distribution
  – xgboost_aft_loss_distribution_scale
  – xgboost_aft_right_bound_column_name
    See DBMS_DATA_MINING — Algorithm Settings: XGBoost.

  Explicit Semantic Analysis settings:

  – ESAS_EMBEDDINGS

  - `ESAS_EMBEDDING_SIZE`
    See DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis.

  Expectation Maximization setting:

  - `EMCS_OUTLIER_RATE`
    See DBMS_DATA_MINING — Algorithm Settings: Expectation Maximization.

  Exponential Smoothing settings:

  - `EXSM_SERIES_LIST`
  - `EXSM_INITVL_OPTIMIZE`
    See DBMS_DATA_MINING — Algorithm Settings: Exponential Smoothing.

  k-Means setting:

  - `KMNS_WINSORIZE`
    See DBMS_DATA_MINING — Algorithm Settings: *k*-Means.

  Global settings:

  - `ODMS_BOXCOX`
  - `ODMS_EXPLOSION_MIN_SUPP`
    See DBMS_DATA_MINING — Global Settings.

- The `DBMS_USERDIAG` package is a new package that allows you to perform a limited set of diagnosis operations on the PDB, such as establish trace operations. Most of the regular diagnostic mechanisms available in a CDB have been restricted out of security concerns.

  See DBMS_USERDIAG.

- The `DBMS_PIPE` package has been enhanced to support singleton pipes as well as persistent messaging using Cloud Object stores.

  DBMS_PIPE

- The `DBMS_MLE` package is updated to support the use of JavaScript modules.

  DBMS_MLE

- The `DBMS_AQMIGTOOL` package simplifies migration from Oracle Database Advanced Queuing (AQ) to Transactional Event Queue (TxEventQ) with orchestration automation, source and target compatibility diagnostics and remediation, and a unified user experience.

  DBMS_AQMIGTOOL

- The `DBMS_XMLSCHEMA_UTIL` package provides an interface for XML schema validation.

  DBMS_XMLSCHEMA_UTIL

- The `DBMS_SPACE` package provides an interface for analyzing and shrinking a bigfile tablespace.

  DBMS_SPACE

- DBMS_CACHEUTIL has new `TRUE_CACHE_KEEP` and `TRUE_CACHE_UNKEEP` procedures to manage assignments to the `KEEP` buffer pool for Oracle True Cache.

- The following new procedures are introduced in the `DBMS_APP_CONT` package to enhance the Application Continuity functionality:

  - `APPLY_REPLAY_RULE`
  - `GET_REPLAY_RULES`
  - `RESET_REPLAY_RULES`

- The following new procedures are introduced in the `DBMS_APP_CONT_ADMIN` package to enhance the Application Continuity protection check:
  - `ENABLE_AC`
  - `ENABLE_TAC`
  - `ACCHK_SET_FILTER`
  - `ACCHK_SHOW_FILTERS`
  - `ACCHK_CLEAR_FILTER`
  - `DISABLE_FAILOVER`
  - `ENABLE_RESET_STATE`
  - `MODIFY_SERVICE`
  - `SET_DRAINING`
  - `SET_LOAD_BALANCING`

Deprecated Features

Review this list of deprecated features in Oracle Database release 23ai *Oracle Database PL/SQL Packages and Types Reference*.

Oracle recommends that you do not use deprecated features or values in new applications. Support for deprecated features is for backward compatibility only. For more information about deprecated features, see *Oracle Database Upgrade Guide*.

Deprecation of the mkstore wallet management command line tool

The `mkstore` wallet management command line tool is deprecated with Oracle Database 23ai, and can be removed in a future release.
To manage wallets, Oracle recommends that you use the `orapki` command line tool.

Deprecation of DBMS_RESULT_CACHE Function Names

Oracle is changing the names of several DBMS_RESULT_CACHE function names in Oracle Database 23ai.
The following functions and procedures are deprecated:

- `BLACK_LIST` function. Use `BLOCK_LIST` function.
- BLACK_LIST_ADD procedure. Use BLOCK_LIST_ADD procedure.
- BLACK_LIST_CLEAR procedure. Use BLOCK_LIST_CLEAR procedure
- BLACK_LIST_REMOVE procedure. Use BLOCK_LIST_REMOVE procedure
- OBJECT_BLACK_LIST function. Use OBJECT_BLOCK_LIST function
- OBJECT_BLACK_LIST_ADD procedure. Use OBJECT_BLOCK_LIST_ADD procedure.
- OBJECT_BLACK_LIST_CLEAR procedure. Use OBJECT BLOCK LIST_CLEAR procedure.
- OBJECT_BLACK_LIST_REMOVE procedure. Use OBJECT_BLOCK_LIST_REMOVE procedure.

Deprecation of DBMS_XMLSTORE

The PL/SQL package `DBMS_XMLSTORE` is deprecated in Oracle Database 23ai.

DBMS_XMLSTORE is a non-standard Oracle-proprietary package that enables you to store and manipulate XML data in Oracle Database. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use regular SQL DML and with standard XQuery and SQL/XML to store and manage XML data. Using standard functionality provides future-proof way to store and manipulate XML data.

Deprecation of DBMS_XMLGEN PL/SQL Package

The PL/SQL package DBMS_XMLGEN is deprecated in Oracle Database 23ai.
DBMS_XMLGEN is a non-standard Oracle-proprietary package that is provided to generate and convert XML documents from SQL queries or with PL/SQL. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use SQL/XML operators to generate XML from relational columns instead. Using ANSI SQL/XML operators for any generation and modification of XML documents provides a standardized and future-proof way to work with XML documents.

Deprecation of XML DB Repository

The Oracle XML DB Repository is deprecated with Oracle Database 23ai.
Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

Deprecation of DBMS_HANG_MANAGER Package

The DBMS_HANG_MANAGER package is deprecated in Oracle Database 23ai. Use DBMS_BLOCKER_RESOLVER instead.
The DBMS_HANG_MANAGER package provides a method of changing some configuration parameters and constraints to address session issues. This package is being replaced with DBMS_BLOCKER_RESOLVER. DBMS_HANG_MANAGER can be removed in a future release.

Deprecation of Traditional Auditing Packages and Functions

Traditional auditing packages and functions are deprecated in Oracle Database 23ai.

With the desupport of traditional auditing, the PL/SQL packages and functions associated with traditional auditing are deprecated, This deprecation includes the packages and functions INIT_CLEANUP, DEINIT_CLEANUP, and IS_CLEANUP_INITIALIZED. While these packages or functions continue to operate in Oracle Database 23ai, you can neither add to or modify traditional auditing configurations.

Deprecation of Oracle OLAP

Analytic workspaces, the OLAP DML programming language, financial reporting, and the OLAP Java API continue to be deprecated in Oracle Database 23ai.

Be aware that OLAP will not be supported beyond the term of the current release (Oracle Database 23ai) premier support. Oracle strongly recommends that you do not start new projects using OLAP and begin migrating applications using OLAP to alternatives now. If your application requires an in-database dimensional model, then consider using Oracle Analytic Views. Analytic views provide a dimensional semantic model, calculations, and query semantics using data in Oracle Database. When used with columnar tables, analytic views provide query performance similar to the OLAP Option. If your application requires support for advanced dimensional analytics, what-if analysis, or forecasting, then consider Oracle Essbase. Oracle Essbase is a multidimensional database management system with support for complex dimensional business analytics.

Related Topics

- Oracle Database Changes Desupports and Deprecations in *Oracle Database Upgrade Guide*

Desupported Features

This section lists the desupported features in Oracle Database Release 23ai *Oracle Database PL/SQL Packages and Types Reference*.

For more information about desupported features in this release, see *Oracle Database Upgrade Guide*

The following features are desupported in this release:

Desupport of Oracle Enterprise Manager Database Express

Oracle Enterprise Manager Database Express (EM Express) is desupported in Oracle Database Release 23ai.
EM Express is a web-based database management tool that is built inside Oracle Database. It supports key performance management and basic database administration functions. EM Express was deprecated in Oracle Database 21c. Many of EM Express's capabilities are now available in Oracle Cloud Infrastructure (OCI) Database Management service, Oracle Enterprise Manager Cloud Control, or Oracle SQL Developer.

Desupport of Service Attribute Value SESSION_STATE_CONSISTENCY = STATIC Parameter

The service attribute values `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = STATIC` are no longer a supported service attribute combination.
In previous releases, you could use the service parameter `SESSION_STATE_CONSISTENCY` to manage session state automatically using Application Continuity by setting `SESSION_STATE_CONSISTENCY` to `DYNAMIC` or `STATIC`. However, starting with Oracle Database 23ai, you can no longer use the `STATIC` option. Instead, use one of the following failover options:

- `FAILOVER_TYPE = AUTO` with `SESSION_STATE_CONSISTENCY = AUTO`
- `FAILOVER_TYPE = TRANSACTION` with `SESSION_STATE_CONSISTENCY = DYNAMIC`

These configurations enforce session state tracking in Oracle Database, ensuring that session state is preserved at session migration and session failover.

Desupport of Oracle Wallet Manager (OWM)

Starting with Oracle Database 23ai, the Oracle Wallet Manager (OWM) is desupported. Oracle recommends using the `orapki` command line tool to replace OWM.

Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
     WHERE Owner IN (
       'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
       'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
       'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
       'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
       'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
       'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
     AND Object_Type IN ('PACKAGE', 'TYPE')
     ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages and Types

> **See Also:**
>
> *Oracle Database Development Guide* for information on how to create your own packages

1.1 Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

1.1.1 Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
[BEGIN
   -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

1.1.2 Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

1.1.3 Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

> **Note:**
>
> It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

> **See Also:**
>
> – *Oracle Database PL/SQL Language Reference*
> – *Oracle Database Development Guide* for more information on creating new packages
> – *Oracle Database Concepts*
>
> for more information on storing and executing packages

1.1.3.1 Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

1.1.3.1.1 Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER;
   PROCEDURE fire_emp (emp_id NUMBER);
   PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
       new_empno    NUMBER(10);

   BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
         hiredate, sal, comm, deptno);
      RETURN (new_empno);
   END hire_emp;

   PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
   BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
         Number: ' || TO_CHAR(emp_id));
   END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
   BEGIN

   -- If employee exists, then update salary with increase.

      UPDATE emp
         SET sal = sal + sal_incr
         WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
         raise_application_error(-20011, 'Invalid Employee
            Number: ' || TO_CHAR(emp_id));
      END IF;
   END sal_raise;
END employee_management;
```

> **Note:**
>
> If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:
>
> ```
> SQL> CREATE SEQUENCE emp_sequence
>    > START WITH 8000 INCREMENT BY 10;
> ```

1.1.4 Referencing Package Contents

When you want to reference the types, items, and subprograms declared in a package specification, use the dot notation.

For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

1.2 Summary of Oracle Supplied PL/SQL Packages and Types

PL/SQL packages are supplied with the Oracle server that extend database functionality and provide PL/SQL access to SQL features.

These packages, listed in the following table, run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

> **Note:**
>
> - The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
> - Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1-1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
`APEX_APPLICATION` through `APEX_ZIP`	For a complete description of all the packages that ship with Oracle Application Express, see *Oracle Application Express API Reference*
`CTX_ADM`	Lets you administer servers and the data dictionary
`CTX_ANL`	The `CTX_ANL` package is used with `AUTO_LEXER` and provides procedures for adding and dropping a custom dictionary from the lexer.
`CTX_CLS`	Lets you generate `CTXRULE` rules for a set of documents
`CTX_DDL`	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
`CTX_DOC`	Lets you request document services
`CTX_ENTITY`	The `CTX_ENTITY` package enables you to search for terms that are unknown to you without specifying a particular search text.
`CTX_OUTPUT`	Lets you manage the index log
`CTX_QUERY`	Lets you generate query feedback, count hits, and create stored query expressions
`CTX_REPORT`	Lets you create various index reports

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADDM	Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements
DBMS_AUTOIM	Provides functions to manage the execution of the AIM feature
DBMS_ALERT	Provides support for the asynchronous notification of database events
DBMS_APP_CONT	The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.
DBMS_APP_CONT_ADMIN	This package provides a collection dba level admin operations in relation to Application Continuity
DBMS_APP_CONT_REPORT	This procedure generates a report of ACCHK trace collected while ACCHK_SET(TRUE)
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_AQMIGTOOL	The DBMS_AQMIGTOOL package provides procedures for migrating AQ queues toTransactional Event Queues (TxEventQ)
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUDIT_UTIL	The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.
DBMS_AUDIT_MGMT	The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail.

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_AUTO_REPORT	The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.
DBMS_AUTO_SQLTUNE	The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task
DBMS_AUTO_INDEX	The DBMS_AUTO_INDEX package provides the interface for managing auto indexes in an Oracle database
DBMS_AUTO_MV	The DBMS_AUTO_MV contains subprograms for configuring automatic materialized views.
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AUTO_ZONEMAP	The DBMS_AUTO_ZONEMAP package provides autonomous maintenance and creation of zonemap
DBMS_AVTUNE	The DBMS_AVTUNE package analyzes query access levels and aggregation workloads for each auto-cache enabled analytic view (AV) and creates or drops AV auto-caches to improve the overall performance of the SQL queries on that AV.
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_BLOCKCHAIN_TABLE	A blockchain table is an append-only table designed for centralized blockchain applications.
DBMS_BLOCKER_RESOLVER	The DBMS_BLOCKER_RESOLVER package provides a method of changing some Blocker Resolver configuration parameters.
DBMS_CACHEUTIL	Provides an interface to control object-level cache fusion locking policies in an Oracle Real Application Clusters (Oracle RAC) environment and to manage assignments to the KEEP buffer pool for Oracle True Cache.
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Replication
DBMS_CLOUD	The DBMS_CLOUD package provides comprehensive support for working with data in ObjectStorage
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_COMPRESSION	Provides an interface to facilitate choosing the correct compression level for an application
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CREDENTIAL	The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite
DBMS_CUBE_LOG	DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DB_VERSION	The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.
DBMS_DBCOMP	The DBMS_DBCOMP package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases.
DBMS_DBFS_CONTENT	Provides an interface comprising a file system-like abstraction backed by one or more Store Providers
DBMS_DBFS_CONTENT_SPI	Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers
DBMS_DBFS_HS	Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables
DBMS_DBFS_SFS	Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEBUG_JDWP	The DBMS_DEBUG_JDWP provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).
DBMS_DEBUG_JDWP_CUSTOM	The DBMS_DEBUG_JDWP_CUSTOM package is a PL/SQL package that provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DICTIONARY_CHECK	Enables you to identify Oracle Database dictionary inconsistencies.
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_DNFS	The DBMS_DNFS package provides an interface to assists in creating a database using files in the backup set.
DBMS_DST	The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.
DBMS_EDITIONS_UTILITIES	The DBMS_EDITIONS_UTILITIES package provides helper functions for edition related operations.
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_FGA	Provides fine-grained security functions
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FLASHBACK_ARCHIVE	Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively
DBMS_FLASHBACK_ARCHIVE_MIGRATE	Enables you to export and import the Flashback Archive base tables along with their history to another database using the Transportable Tablespaces
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_FS	The DBMS_FS package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.
DBMS_GOLDENGATE_ADM	The DBMS_GOLDENGATE_ADM package provides subprograms to configure and manage Oracle GoldenGate conflict detection and resolution
DBMS_GOLDENGATE_AUTH	The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_HADOOP	The DBMS_HADOOP package provides a PL/SQL procedure called CREATE_EXTDDL_FOR_HIVE(), that creates an Oracle external table for a given hive table.
DBMS_HEAT_MAP	The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace.
DBMS_HIERARCHY	Contains functions and procedures for validating the data in tables used by analytic views and hierarchies and for creating a log table.
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_HYBRID_VECTOR	Contains a SEARCH API that lets you to perform hybrid searches by both vectors and keywords against hybrid vector indexes.
DBMS_ILM	The DBMS_ILM package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.
DBMS_ILM_ADMIN	The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution.
DBMS_IMMUTABLE_TABLE	The DBMS_IMMUTABLE_TABLE package allows you to delete the expired rows in an immutable table and add interval partitioning
DBMS_INMEMORY	The DBMS_INMEMORY package provides an interface for In-Memory Column Store (IM column store) functionality.
DBMS_INMEMORY_ADMIN	The DBMS_INMEMORY_ADMIN package provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JAVASCRIPT	The DBMS_JAVASCRIPT package provides a PL/SQL procedure for running DBMS-residingJavaScript code from the location identified by its argument
DBMS_JOB	Schedules and manages jobs in the job queue (Deprecated)
DBMS_JSON_DUALITY	The DBMS_JSON_DUALITY package provides PL/SQL interface for accessing JSON relational duality functionality
DBMS_JSON	Provides an interface for data-guide operations
DBMS_KAFKA	The DBMS_KAFKA package provides a PL/SQL interface for enabling Oracle SQL access to topics in Kafka clusters

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_KAFKA_ADM	The DBMS_KAFKA_ADM package provides a PL/SQL interface to create cluster definitions, which you can then use to grant access to Kafka cluster data for applications
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only)
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_LOGSTDBY_CONTEXT	You can use the procedures provided in the DBMS_LOGSTDBY_CONTEXT package to set and retrieve various parameters associated with LSBY_APPLY_CONTEXT.
DBMS_MEMOPTIMIZE	The DBMS_MEMOPTIMIZE package provides the interface for managing the Memoptimized Rowstore data buffered in the large pool and the memoptimize pool
DBMS_MEMOPTIMIZE_ADMIN	The DBMS_MEMOPTIMIZE_ADMIN package provides the interface for flushing the Memoptimized Rowstore data buffered in the large pool to disk
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary
DBMS_METADATA_DIFF	Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MLE	The DBMS_MLE package allows users to execute JavaScript code inside the Oracle Database and exchange data seamlessly between PL/SQL and JavaScript.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_MVIEW_STATS	The DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_ACL_UTILITY	The DBMS_NETWORK_ACL_UTILITY package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OPTIM_BUNDLE	This package is used to manage the installed but disabled module bug fixes that cause an execution plan change.
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PARALLEL_EXECUTE	Enables the user to incrementally update table data in parallel
DBMS_PART	The DBMS_PART package provides an interface for maintenance and management operations on partitioned objects.
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes
DBMS_PDB	The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface specify which database objects are application common objects.
DBMS_PDB_ALTER_SHARING	In an application container with a pre-installed application, the DBMS_PDB_ALTER_SHARING package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.
DBMS_PERF	The DBMS_PERF package provides and interface to generate active reports for monitoring database performance.
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PLSQL_CODE_COVERAGE	The DBMS_PLSQL_CODE_COVERAGE package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_PRIVILEGE_CAPTURE	The DBMS_PRIVILEGE_CAPTURE package provides an interface to database privilege analysis.
DBMS_PROCESS	The DBMS_PROCESS package provides an interface to manage the prespawned servers.
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_QOPATCH	The DBMS_QOPATCH package provides an interface to view the installed database patches.
DBMS_RANDOM	Provides a built-in random number generator
DBMS_REDACT	The DBMS_REDACT package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by lowprivileged users or an application.
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLS	Provides row level security administrative interface
DBMS_ROLLING	The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion.
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents
DBMS_RULE	Describes the subprograms that enable the evaluation of a rule set for a specified event
DBMS_RULE_ADM	Provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts
DBMS_SAGA_ADM	The DBMS_SAGA_ADM package provides a collection of saga administration functions and procedures to define and manage saga participants, coordinators, and brokers.

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SAGA	The DBMS_SAGA package provides a collection of saga functions and procedures to initiate and finalize sagas.
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SEARCH	Enables the indexing of multiple schema objects in a single index
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SFW_ACL_ADMIN	The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SHARDED_DIRECTORY	Provides procedures to manage an Oracle Globally Distributed Database (sharded database) created with directory-based data distribution.
DBMS_SODA	Implements Simple Oracle Document Access (SODA) which allows you to use the Oracle Database as a NoSQL document store.
DBMS_SPACE	Provides segment space information not available through standard SQL
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPD	The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database
DBMS_SQL_FIREWALL	Lets you monitor users and prevent them from performing SQL injection attacks
DBMS_SQL_MONITOR	The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring.
DBMS_SQL_TRANSLATOR	The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLPA	Provides an interface to implement the SQL Performance Analyzer
DBMS_SQLQ	The DBMS_SQLQ package provides the interface for configuring quarantine thresholds for execution plans of SQL statements
DBMS_SQLSET	The DBMS_SQLSET package provides an interface to manage SQL tuning sets

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_SYNC_REFRESH	The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.
DBMS_TABLE_DATA	The DBMS_TABLE_DATA package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table.
DBMS_TDB	Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TF	The DBMS_TF package contains utilities for POLYMORPHIC TABLE functions (PTFs) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment..
DBMS_TNS	The DBMS_TNS package provides the RESOLVE_TNSNAME function to resolve a TNS name and return the corresponding Oracle Net8 connection string.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TSDP_MANAGE	The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database.
DBMS_TSDP_PROTECT	The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. The DBMS_TSDP_PROTECT package is available with the Enterprise Edition only.
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types
DBMS_UMF	The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.
DBMS_USER_CERTS	The DBMS_USER_CERTS package allows you add and delete certificates.
DBMS_UTILITY	Provides various utility routines.

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_VECTOR	Simplifies common operations with Oracle AI Vector Search, such as chunking and embedding data, generating text for prompts and images, or managing vector indexes.
DBMS_VECTOR_CHAIN	Enables advanced operations with Oracle AI Vector Search, such as chunking and embedding data, generating text for prompts and images along with text processing and end-to-end similarity search.
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings.
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement XMLIndex administration operation
DBMS_XDB_CONFIG	The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.
DBMS_XDB_CONSTANTS	The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants.
DBMS_XDB_REPOS	The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asychronous indexing and apply node referencing
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSCHEMA_ANNOTATE	The DBMS_XMLSCHEMA_ANNOTATE package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_XMLSCHEMA_UTIL	The DBMS_XMLSCHEMA_UTIL package provides an interface for XML schema validation
DBMS_XMLSTORAGE_MANAGE	The DBMS_XMLSTORAGE_MANAGE package provides an interface to manage and modify XML storage after schema registration has been completed
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command
DBMS_XSTREAM_ADM	The DBMS_XSTREAM_ADM package provides interfaces for streaming database changes between an Oracle database and other systems
DBMS_XSTREAM_AUTH	The DBMS_XSTREAM_AUTH package provides subprograms for granting privileges to and revoking privileges from XStream administrators
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_AGGR	The SDO_GEOR_AGGR package provides an interface to the SDO_GEOR_AGGR package for performing aggregate operations on GeoRaster objects
SDO_GEOR_RA	The SDO_GEOR_RA package provides an interface to the SDO_GEOR_RA package for performing raster algebra and analytic operations related to GeoRaster
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_NFE	The SDO_NFE package contains functions and procedures for performing network feature editing
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_OLS	The SEM_OLS package provides an interface to the SEM_OLS package for providing triple-level security to RDF data, using Oracle Label Security (OLS)
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
SEM_RDFCTX	Contains subprograms for managing extractor policies and semantic indexes created for documents
SEM_RDFSA	Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)
UTL_CALL_STACK	The UTL_CALL_STACK package provides an interface to provide information about currently executing subprograms
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing
UTL_IDENT	Specifies which database or client PL/SQL is running
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_MATCH	The UTL_MATCH package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_RECOMP	Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels

Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_RPADV	Provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Database Advanced Queuing Types	Describes the types used in Advanced Queuing
DBFS Content Interface Types	Describes public types defined to support the DBMS_DBFS_CONTENT interface.
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database.
MG_ID Package Types	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
POLYMORPHIC TABLE FUNCTION (PTF) Package Types	Describes types defined in the DBMS_TF package to support PTF
RULES TYPEs	Describes the types used with rules, rule sets, and evaluation contexts
SODA Types	Describes the SODA Types.
UTL Streams Types	Describes abstract streams types used with Oracle XML functionality
XMLType	Describes the types and functions used for native XML support in the server

2

Oracle Application Express Packages APEX_APPLICATION Through APEX_ZIP

The Oracle Application Express supplies PL/SQL packages for application developers who are building database-centric web applications using Oracle Application Express.

For a complete description of all the packages that ship with Oracle Application Express, see the *Oracle Application Express API Reference*.

3
CTX_ADM

The `CTX_ADM` package lets you administer the Oracle Text data dictionary.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the Oracle Text Reference.

4
CTX_ANL

The `CTX_ANL` package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.

A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

For a complete description of this package within the context of Oracle Text, see `CTX_ANL` in the Oracle Text Reference.

4.1 GET_COMPRESSION_RATIO Procedure

Use this procedure to estimate the storage space that you can save by enabling the compression feature for an existing SecureFile LOB. It analyzes the compression ratio of a table or an index and gives information about compressibility of the object. You can provide various parameters to selectively analyze different compression types.

In Oracle Database 23ai, this procedure has been enhanced to estimate the compression ratio faster for LOBs while using less space. Now you can also estimate the compression ratio for BasicFile LOBs. This helps you decide upfront whether you want to compress BasicFile LOBs, before migrating BasicFile LOBs to SecureFile LOBs. You can also estimate the compression ratio at the LOB byte level and the time taken, in hours, to compress the LOB data in the table.

The compression ratio is estimated for the number of rows in the LOB column that you specify. For example, let's consider that the compression ratio is 2.33. It indicates that after you enable the compression feature, you can save around half of the space for the sampled rows in the LOB column.

Disclaimer: The compression ratio is an approximate value, which is calculated based on the sampled rows in the LOB column. The actual space that you save when you enable compression for the complete table may be different.

Syntax

The syntax to get the compression ratio differs for objects, LOBs, IOTs, and indexes on a table.

- Syntax to get the compression ratio for an object (table or index, default is table).

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   ownname               IN     VARCHAR2,
   objname               IN     VARCHAR2,
   subobjname            IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   row_cmp               OUT    PLS_INTEGER,
   row_uncmp             OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   block_compr_ratio     OUT    PLS_INTEGER,
   byte_comp_ratio       OUT    NUMBER,
```

```
   subset_numrows        IN     NUMBER  DEFAULT COMP_RATIO_MINROWS,
   objtype               IN     PLS_INTEGER DEFAULT OBJTYPE_TABLE);
```

- Syntax to get compression ratio for BasicFile and SecureFile LOBs:

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   tabowner              IN     VARCHAR2,
   tabname               IN     VARCHAR2,
   lobname               IN     VARCHAR2,
   partname              IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   lobcnt                OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   byte_comp_ratio       OUT    NUMBER,
   total_time            OUT    NUMBER
   subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_LOB_MAXROWS);
```

- Syntax to get the compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
  scratchtbsname        IN     VARCHAR2,
  ownname               IN     VARCHAR2,
  tabname               IN     VARCHAR2,
  comptype              IN     NUMBER,
  index_cr              OUT    DBMS_COMPRESSION.COMPRECLIST,
  comptype_str          OUT    VARCHAR2,
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```

- Syntax to get the compression ratio for IOTs.

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
     scratchtbsname       IN     VARCHAR2,
     ownname              IN     VARCHAR2,
     objname              IN     VARCHAR2,
     subobjname           IN     VARCHAR2,
     comptype             IN     NUMBER,
     iotcomp_cr           OUT    DBMS_COMPRESSION.COMPRECLIST,
     comptype_str         OUT    VARCHAR2,
     subset_numrows       IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```

Parameters

Table 4-1 GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
`scratchtbsname`	Temporary scratch tablespace that can be used for analysis
`ownname` / `tabowner`	Schema of the table to analyze
`tabname`	Name of the table to analyze
`objname`	Name of the object
`subobjname`	Name of the partition or sub-partition of the object

Table 4-1 (Cont.) GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
comptype	Compression types for which analysis should be performed When the object is an index, only the following compression types are valid: COMP_INDEX_ADVANCED_HIGH (value 1024) and COMP_INDEX_ADVANCED_LOW (value 2048). **Note:** The following compression types cannot be specified in this parameter for any type of object: COMP_BLOCK (value 64) and COMP_BASIC (value 4096).
blkcnt_cmp	Number of blocks used by compressed sample of the table
blkcnt_uncmp	Number of blocks used by uncompressed sample of the table
row_cmp	Number of rows in a block in compressed sample of the table
row_uncmp	Number of rows in a block in uncompressed sample of the table
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp. It provides the ratio of **blocks** occupied by the uncompressed data to the blocks occupied by the compressed data.
comptype_str	String describing the compression type
subset_numrows	Number of rows sampled to estimate compression ratio.
objtype	Type of the object, either OBJTYPE_TABLE or OBJTYPE_INDEX
lobname	Name of the LOB column
partname	In case of partitioned tables, the related partition name
lobcnt	Number of lobs actually sampled to estimate compression ratio
byte_comp_ratio	Provides the ratio of bytes of uncompressed data to the bytes of compressed data for LOBs.
index_cr	List of indexes and their estimated compression ratios
iotcomp_cr	Compression ratio for the IOT The first object contains the compression ratio for the whole IOT. The second object contains the compression ratio only for the top index section of the IOT (excludes the overflow segment).
total_time	Provides an estimate of the time taken, in hours, to compress the LOB data in the table.

Example: Estimate the compression ratio for inline and out-of-line LOBs

The following example shows how to estimate the compression ratio for LOBs.

```
SET SERVEROUTPUT ON
DECLARE
    bcmp                    INTEGER;
    buncmp                  INTEGER;
    lobcmp                  INTEGER;
    cr                      NUMBER;
    byte_cr                 NUMBER;
    cstr                    VARCHAR2(2000);
    total_time              NUMBER;
    l_segment_name          VARCHAR2(30);
    l_segment_size_blocks   NUMBER;
    l_segment_size_bytes    NUMBER;
    l_used_blocks           NUMBER;
```

```
    l_used_bytes            NUMBER;
    l_expired_blocks        NUMBER;
    l_expired_bytes         NUMBER;
    l_unexpired_blocks      NUMBER;
    l_unexpired_bytes       NUMBER;
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
     scratchtbsname        => 'LOBTBSP',
     tabowner              => 'CMPADV',
     tabname               => p_tablename,
     lobname               => 'C',
     partname              => NULL,
     comptype              => 256,
     blkcnt_cmp            => bcmp,
     blkcnt_uncmp          => buncmp,
     lobcnt                => lobcmp,
     cmp_ratio             => cr,
     comptype_str          => cstr,
     subset_numrows        => 1000,
     byte_comp_ratio       => byte_cr,
     total_time            => total_time
);
DBMS_OUTPUT.put_line('Estimated ratio of blocks used by the uncompressed data
to the compressed data :  ' || cr);
DBMS_OUTPUT.put_line('Estimated ratio of bytes used by the uncompressed data
to the compressed data  :  ' || byte_cr);
END;
/
```

To understand the output of this procedure, let's consider `tab_inline`, an inline table, and `tab_outofline`, an out-of-line table as shown in the following example.

```
CREATE TABLE tab_inline
(
    a NUMBER,
    c CLOB
)
LOB(c) STORE AS SECUREFILE  (ENABLE STORAGE IN ROW CACHE LOGGING);

CREATE TABLE tab_outofline
(
    a NUMBER,
    c CLOB
)
LOB(c) STORE AS SECUREFILE  (DISABLE STORAGE IN ROW CACHE LOGGING);
```

Data is stored in different ways in `tab_inline` and `tab_outofline`. In the `tab_inline` table, if the LOB is less than 4K, then data is stored in the table segment; otherwise, it is stored in the LOB segment. For the `tab_outofline` table, data of all sizes is stored in the LOB segment.

Let's consider that you have inserted 1000 LOBs of 3K each in both the tables, and then calculate the compression ratios. You can use the `dbms_space.space_usage` procedure to calculate the space used by the data that is stored in the LOB segments.

Sample output of compression ratio for inline LOBs.

```
Estimated block compression ratio : 1
Estimated byte compression ratio           : 57.6
Space used(in bytes)                       : 0
space used(in blocks)                      : 0
```

Sample output of compression ratio for out-of-line LOBs.

```
Estimated block compression ratio : 1
Estimated byte compression ratio           : 56.1
Space used(in bytes)                       : 8 MB
space used(in blocks)                      : 1000
```

In this example, even though the estimated byte and block compression ratios are almost the same for inline and out-of-line LOBs, the space that is used is different. In the case of `tab_inline`, LOB segment is not used so the space used is 0. In both cases, the data is approximately 3KB, which is small. Therefore, the data before and after compression uses the same number of blocks (that is 1 block), so the block compression ratio is 1. However, the byte level compression ratio, `byte_comp_ratio`, which compares the actual number of bytes used by the LOBs before and after compression is 57.6 or 56.1.

Example: Estimate the compression ratio for indexes on a table with low compression type

The following example shows how to estimate the compression ratio for advanced index compression (low):

```
SET SERVEROUTPUT ON
DECLARE
  l_blkcnt_cmp       PLS_INTEGER;
  l_blkcnt_uncmp   PLS_INTEGER
  l_row_cmp       PLS_INTEGER;
  l_row_uncmp       PLS_INTEGER;
  l_cmp_ratio       NUMBER;
  l_comptype_str   VARCHAR2(32767);
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname =>       'USERS' ,
    ownname       =>       'TEST' ,
    objname       =>       'SALES_IDX' ,
    subobjname     =>        NULL ,
    comptype       =>        DBMS_COMPRESSION.COMP_INDEX_ADVANCED_LOW,
    blkcnt_cmp     =>        l_blkcnt_cmp,
    blkcnt_uncmp   =>        l_blkcnt_uncmp,
    row_cmp       =>        l_row_cmp,
    row_uncmp      =>        l_row_uncmp,
    cmp_ratio      =>        l_cmp_ratio,
    comptype_str   =>        l_comptype_str,
    subset_numrows =>        DBMS_COMPRESSION.comp_ratio_minrows,
    objtype       =>        DBMS_COMPRESSION.objtype_index
   );
DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
object   :  ' || l_blkcnt_cmp);
DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
```

```
the object :  ' || l_blkcnt_uncmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in compressed sample of the
object    :  ' || l_row_cmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in uncompressed sample of
the object :  ' || l_row_uncmp);
DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of
Sample                          :  ' || l_cmp_ratio);
DBMS_OUTPUT.put_line( 'Compression Type                              :  ' ||
l_comptype_str);
END;
/
```

Output of compression advisor estimate for advanced index compression (Low):

```
Number of blocks used by the compressed sample of the object     : 243
Number of blocks used by the uncompressed sample of the object   : 539
Number of rows in a block in compressed sample of the object     : 499
Number of rows in a block in uncompressed sample of the object   : 145
Estimated Compression Ratio of Sample                 : 2.2
Compression Type                         : “Compress Advanced Low”
```

Example: Estimate the compression ratio for LOBs with medium compression type

The following example shows how to estimate the compression ratio for advanced LOB compression (medium):

```
SET SERVEROUTPUT ON
DECLARE
  l_blkcnt_cmp     PLS_INTEGER;
  l_blkcnt_uncmp   PLS_INTEGER;
  l_row_cmp       PLS_INTEGER;
  l_lobcnt       PLS_INTEGER;
  l_cmp_ratio      NUMBER;
  l_comptype_str   VARCHAR2(32767);
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname => 'USERS' ,
    tabowner       => 'TEST' ,
    tabname       => 'PARTS' ,
    lobname       =>  'PART_DESCRIPTION' ,
    partname       =>  NULL ,
    comptype       =>  DBMS_COMPRESSION.COMP_LOB_MEDIUM,
    blkcnt_cmp     => l_blkcnt_cmp,
    blkcnt_uncmp   => l_blkcnt_uncmp,
    row_cmp       => l_row_cmp,
    lobcnt       => l_lobcnt,
    cmp_ratio      => l_cmp_ratio,
    comptype_str   => l_comptype_str,
    subset_numrows => DBMS_COMPRESSION.comp_ratio_lob_maxrows
   );
DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
object    :  ' || l_blkcnt_cmp);
DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the object  :  ' || l_blkcnt_uncmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in compressed sample of the
object    :  ' || l_row_cmp);
DBMS_OUTPUT.put_line( 'Number of LOBS actually
```

```
sampled                        :  ' || 1_lobcnt);
DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of
Sample                              :  ' || 1_cmp_ratio);
DBMS_OUTPUT.put_line( 'Compression
Type                                                :  ' || 1_comptype_str);
END;
/
```

Output of compression advisor estimate for advanced LOB compression (Medium):

```
Number of blocks used by the compressed sample of the object   : 199
Number of blocks used by the uncompressed sample of the object     : 389
Number of rows in a block in compressed sample of the object       : 293
Number of LOBS actually sampled                              : 55
Estimated Compression Ratio of Sample                        : 1.9
Compression Type                                        : “Compress Medium”
```

Example: Estimate the compression ratio for IoTs

The following example shows how to estimate the compression ratio for IOTs:

```
SET SERVEROUTPUT ON
DECLARE
  bcmp       INTEGER;
  buncmp     INTEGER;
  rowcmp     INTEGER;
  rowuncmp   INTEGER;
  cr         NUMBER;
  cstr       VARCHAR2(2000);
  iotcomp_cr DBMS_COMPRESSION.COMPRECLIST;
 BEGIN
    DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname        => 'USERS',
    ownname               => 'TEST',
    objname               => 'SALES',
    subobjname            =>  NULL,
    comptype              =>  DBMS_COMPRESSION.COMP_INDEX_ADVANCED_LOW,
    iotcomp_cr            =>  iotcomp_cr,
    comptype_str          =>  cstr,
    subset_numrows        =>  DBMS_COMPRESSION.COMP_RATIO_ALLROWS
    );
 --information about the index and the overflow segment
 DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
IOT table                                     : ' || iotcomp_cr(1).blkcnt_cmp);
 DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the IOT table                                   : ' ||
iotcomp_cr(1).blkcnt_uncmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the compressed
sample of the IOT table                         : ' || iotcomp_cr(1).row_cmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the uncompressed
sample of the IOT table                      : ' || iotcomp_cr(1).row_uncmp);
 DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of the
sample                                                          : ' ||
iotcomp_cr(1).cmp_ratio);
 --information about the index segment
 DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
index segment of the IOT table               : ' || iotcomp_cr(2).blkcnt_cmp);
```

```
 DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the index segment of the IOT table             : ' ||
iotcomp_cr(2).blkcnt_uncmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the compressed
sample of the index segment of the IOT table   : ' || iotcomp_cr(2).row_cmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the uncompressed
sample of the index segment of the IOT table : ' || iotcomp_cr(2).row_uncmp);
 DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of the
sample                                                          : ' ||
iotcomp_cr(2).cmp_ratio);
 END;
 /
```

Output of the compression ratio for IOTs:

```
Number of blocks used by the compressed sample of the IOT
table                                    : 5027
Number of blocks used by the uncompressed sample of the IOT
table                                  : 7950
Average number of rows in a block in the compressed sample of the IOT
table                         : 199
Average number of rows in a block in the uncompressed sample of the IOT
table                       : 126
Estimated Compression Ratio of the
sample                                                        : 1.58
Number of blocks used by the compressed sample of the index segment of the IOT
table               : 3238
Number of blocks used by the uncompressed sample of the index segment of the IOT
table             : 6161
Average number of rows in a block in the compressed sample of the index segment of the
IOT table   : 309
Average number of rows in a block in the uncompressed sample of the index segment of the
IOT table : 162
Estimated Compression Ratio of the
sample                                                        : 1.9
```

Usage Notes

- The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.
- From 23ai onwards, this feature has been enhanced to estimate the compression ratio faster for LOBs while using less space. To get a more accurate result, run the following command to switch to the old method. The older method to calculate the compression ratio takes more time to return the results and uses more space.

  ```
  alter session set "_kdlf_new_compression_adv"= FALSE;
  ```

- To understand the impact of compression, use the value of the byte compression ratio for inline LOBs and for out-of-line LOBs, use the value of the block compression ratio and space used.
- You can get more benefits when you compress large volume of data as compared to small volumes of data. If you want to compress small volumes of data, look at the byte ratio instead of the block ratio to understand the impact of compression.

5
CTX_DDL

The `CTX_DDL` package lets you create and manage the preferences, section groups, and stoplists required for Text indexes.

Note that you must install this package in order to use it.

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the Oracle Text Reference.

6
CTX_CLS

The `CTX_CLS` package enables generation of CTXRULE rules for a set of documents.

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the Oracle Text Reference.

7
CTX_DOC

The `CTX_DOC` package lets you request document services.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the Oracle Text Reference.

8
CTX_ENTITY

The `CTX_ENTITY` package enables you to search for terms that are unknown to you without specifying a particular search text.

It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

For the complete description of this package within the context of Oracle Text, see `CTX_ENTITY` in the *Oracle Text Reference.*

9
CTX_OUTPUT

This Oracle Text package lets you manage the index log.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the Oracle Text Reference.

10
CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_QUERY` in the Oracle Text Reference.

11
CTX_REPORT

This Oracle Text package lets you create various index reports.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the Oracle Text Reference.

12
CTX_THES

This Oracle Text package lets you to manage and browse thesauri.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the Oracle Text Reference.

13
CTX_ULEXER

This Oracle Text package is for use with the user-lexer.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the Oracle Text Reference.

14
DBMS_ACTIVITY

`DBMS_ACTIVITY` contains functions and procedures allowing authorized users to control the activity information captured by OATS.

This package is owned by `SYS`, so `EXECUTE` package privilege is required of the non-`SYS` users. Users with DBA role are granted the `EXECUTE` privilege on this package.

This chapter contains the following topics:

- Using DBMS_ACTIVITY
- Summary of DBMS_ACTIVITY Subprograms

14.1 Using DBMS_ACTIVITY

Object Activity Tracking System (OATS) is a generic RDBMS based tracking service that provides information about various types of activities associated with different database objects. An activity represents a user or system-initiated action such as scanning or loading a table. Most of the activities are tracked in the form of frequencies (i.e. counts over fixed time intervals) such as the number of scans of a table in 15 minutes.

The database objects whose activities are tracked include tables and materialized views. Different types of activities include row insert, delete and update, table scan, load and truncate, partition maintenance operations (create, drop, move, split, merge, and exchange), materialized view rewrite and refresh.

Another important class of activities is related to the usage or non-usage of auxiliary structures such as MVs, indexes and zone maps.

Depending on the type of activity the tracking technique can be precise, approximate, or probabilistic. Most of the activities are tracked approximately mostly for efficiency reasons.

Depending on the type of activity and its usage by different clients a certain tracking technique would be more suitable than others. For example, counters are useful for tracking the index and materialized view usage. Counters are maintained for fixed time intervals in order to capture the object usage pattern over time. The same technique can be used to track the update activity of table columns by maintaining update counters for each. Setting bits in a bitvector is another form of tracking technique which is suitable for registering the occurrence of a certain activity within a time interval without saying how many times that activity occurred.

Precise Tracking: an activity is accounted for with 100% accuracy. Some form of atomic update or some latching is required to get precise tracking in a multi-processor environment. OATS generally avoidS precise tracking, unless a client needs that kind of precision.

Approximate Tracking: an activity is accounted for in almost all cases but with rare exceptions. An example of approximate tracking is the dirty update of activity counters. Dirty updating is very efficient because no locking or latching is performed and atomic operations are not used when counters are changed. However, dirty updating can result in lost updates leading to under counting. If lost updates are rare then dirty updating is a very efficient technique for approximate tracking.

Probabilistic Tracking: an activity is sampled with a certain probability, and it is accounted for when it becomes part of the sample. Probabilistic tracking produces activity data that is less accurate but it prevents frequent tracking actions.

Occurrence Tracking: records certain activity as having occurred within a time interval. Specifically, occurrence tracking provides information that says that certain object activity occurred at least once in a given time interval without saying how many times it occurred. The use of bitvector is a popular technique for occurrence tracking. Depending on how the bits are set in a bitvector the occurrence tracking can be either precise (no collisions) or approximate (possible collisions).

Counter Effects of Transactions and Rollback: Except for the precise tracking counters, none of the other types of counters is transactional or affected by rollback. This means that if a transaction fails, the approximate counters may still record any actions from that transaction. And when the database is rolled back to a save point, the approximate counters are not set back to their previous state.

14.2 Summary of DBMS_ACTIVITY Subprograms

`DBMS_ACTIVITY` uses the `CONFIGURE`, `CREATE_SNAPSHOP`, and `DELETE_SNAPSHOTS` procedures.

Table 14-1 DBMS_ACTIVITY Package Subprograms

Subprogram	Description
CONFIGURE Procedure	Allows an authorized user to set configuration parameters for OATS in parameter/value format.
CREATE_SNAPSHOT Procedure	Allows an authorized user to manually create an activity snapshot on local instance or on all database instances by flushing the activity information maintained in memory to disk
DELETE_SNAPSHOT Procedure	Allows an authorized user to manually delete all older snapshots based on an input snapshot id called `BEFORE_SNAP_ID`.
DELETE_SNAPSHOTS	Allows an authorized user to manually delete all older snapshots based on an input timestamp value called `BEFORE_TIME`.

14.2.1 CONFIGURE Procedure

This procedure allows an authorized user to set configuration parameters for OATS in parameter/value format.

This function can be called numerous times, each time setting a different configuration parameter, or same parameter but with different value. The parameter setting applies to the indicated database or the local database.

Syntax

```
DBMS_ACTIVITY.CONFIGURE (
   PARAMETER_NAME       IN VARCHAR2
   PARAMETER_VALUE      IN NUMBER,
   CON_DBNAME           IN VARCHAR2 := NULL
);
```

Parameters

Table 14-2 CONFIGURE Procedure Parameters

Parameter	Description
PARAMETER_NAME	Name of the configuration parameter to set. Parameters available: • ACTIVITY_INTERVAL_MINUTES: The interval in minutes for maintaining activity information before it is flushed and reset. The default is 15. Other values: 30, 60, 120, 180, 240, 360, 480, 720, 1440 • ACTIVITY_RETENTION_DAYS: the number of days to maintain the activity information before it is purged. The default is 400. From 8 to 2000. • ACTIVITY_SPACE_PERCENT: soft limit in percent of the SYSAUX space for storing the activity information. The default is 5. From 1 to 25.
PARAMETER_VALUE	Value of the configuration parameter to use.
CON_DBNAME	Name of a container in the consolidated database (CDB). It is either root or a pluggable database. When omitted, the default is the local database.

> **Note:**
>
> The current CDB or PDB name is the only non-null value supported.

Usage Notes

The user must be SYS, or must have the DBA role, or granted the EXECUTE package privilege.

14.2.2 CREATE_SNAPSHOT Procedure

This procedure allows an authorized user to manually create an activity snapshot on local instance or on all database instances by flushing the activity information maintained in memory to disk.

Syntax

```
DBMS_ACTIVITY.CREATE_SNAPSHOT(
   ALL_INSTANCES       IN BOOLEAN := TRUE,
   CON_DBNAME          IN VARCHAR2 := NULL
);
```

Parameters

Table 14-3 CREATE_SNAPSHOT Procedure Parameters

Parameter	Description
ALL_INSTANCES	Specify FALSE if activity snapshot should be created only for the local instance. The default is to create snapshot on all database instances.

Table 14-3 (Cont.) CREATE_SNAPSHOT Procedure Parameters

Parameter	Description
CON_DBNAME	Name of a container in the consolidated database (CDB). It is either root or a pluggable database. When omitted, the default is the local database.

> **Note:**
>
> The current CDB or PDB name is the only non-null value supported.

Usage Notes

The SNAP_ID of snapshot created.

The user must be SYS, or must have the DBA role, or granted the EXECUTE package privilege.

14.2.3 DELETE_SNAPSHOT Procedure

This procedure allows an authorized user to manually delete all older snapshots based on an input snapshot id called BEFORE_SNAP_ID.

Syntax

```
DBMS_ACTIVITY.DELETE_SNAPSHOT (
   BEFORE_SNAP_ID      IN NUMBER,
   CON_DBNAME          IN VARCHAR2 := NULL
);
```

Parameters

Table 14-4 DELETE_SNAPSHOT Procedure Parameters

Parameter	Description
BEFORE_SNAP_ID	All snapshots with SNAP_ID value less than this argument value is removed from the disk storage (SYSAUX).
CON_DBNAME	Name of a container in the consolidated database (CDB). It is either root or a pluggable database. When omitted, the default is the local database.

> **Note:**
>
> The current CDB or PDB name is the only non-null value supported.

Usage Notes

Returns TRUE if one or more snapshots were deleted; FALSE otherwise.

The user must be SYS, or must have the DBA role, or granted the EXECUTE package privilege.

14.2.4 DELETE_SNAPSHOT Procedure

This procedure allows an authorized user to manually delete all older snapshots based on an input timestamp value called BEFORE_TIME.

Syntax

```
DBMS_ACTIVITY.DELETE_SNAPSHOT (
   BEFORE_TIME          IN TIMESTAMP,
   CON_DBNAME           IN VARCHAR2 := NULL
);
```

Parameters

Table 14-5 DELETE_SNAPSHOT Procedure Parameters

Parameter	Description
BEFORE_TIME	All snapshots associated with a time less than this argument value are removed from the disk storage (SYSAUX).
CON_DBNAME	Name of a container in the consolidated database (CDB). It is either root or a pluggable database. When omitted, the default is the local database.

> **Note:**
>
> The current CDB or PDB name is the only non-null value supported.

Usage Notes

Returns TRUE if one or more snapshots were deleted; FALSE otherwise.

The user must be SYS, or must have the DBA role, or granted the EXECUTE package privilege.

15
DBMS_ADDM

The `DBMS_ADDM` package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_ADDM Subprograms

> **See Also:**
>
> - *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
> - *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

15.1 DBMS_ADDM Security Model

The `DBMS_ADDM` package runs with the caller's permission, not the definer's, and then applies the security constraints required by the `DBMS_ADVISOR` package.

> **See Also:**
>
> The DBMS_ADVISOR package for more information about "Security Model".

15.2 Summary of DBMS_ADDM Subprograms

The table in this topic lists and describes the DBMS_ADDM subprograms.

Table 15-1 DBMS_ADDM Package Subprograms

Subprogram	Description
ANALYZE_DB Procedure	Creates an ADDM task for analyzing in database analysis mode and executes it
ANALYZE_INST Procedure	Creates an ADDM task for analyzing in instance analysis mode and executes it.
ANALYZE_PARTIAL Procedure	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
COMPARE_CAPTURE_REPLAY_REPORT Function	Produces a Compare Period ADDM report comparing the performance of a capture to a replay
COMPARE_DATABASES Function	Produces a Compare Period ADDM report for a database-wide performance comparison
COMPARE_INSTANCES Function	Produces a Compare Period ADDM report for an instance-level performance comparison
COMPARE_REPLAY_REPLAY_REPORT Function	Produces a Compare Period ADDM report comparing the performance of a replay to another replay
DELETE Procedure	Deletes an already created ADDM task (of any kind)
DELETE_FINDING_DIRECTIVE Procedure	Deletes a finding directive
DELETE_PARAMETER_DIRECTIVE Procedure	Deletes a parameter directive
DELETE_SEGMENT_DIRECTIVE Procedure	Deletes a segment directive
DELETE_SQL_DIRECTIVE Procedure	Deletes a SQL directive
FAILED_AUTO_TASKS_REPORT Function	Creates a plain text, user-readable report for the failed tasks registered in the `DBA_ADDM_PENDING_AUTOTASKS` views.
GET_ASH_QUERY Function	Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding
GET_REPORT Function	Retrieves the default text report of an executed ADDM task
INSERT_FINDING_DIRECTIVE Procedure	Creates a directive to limit reporting of a specific finding type.
INSERT_PARAMETER_DIRECTIVE Procedure	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
INSERT_SEGMENT_DIRECTIVE Procedure	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
INSERT_SQL_DIRECTIVE Procedure	Creates a directive to limit reporting of actions on specific SQL
REAL_TIME_ADDM_REPORT Function	Produces a real-time report of ADDM activity
REEXECUTE_FAILED_AUTO_TASKS Procedure	Re-executes the tasks registered in the `DBA_ADDM_PENDING_AUTOTASKS` views.

15.2.1 ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (
   task_name                 IN OUT VARCHAR2,
   begin_snapshot            IN     NUMBER,
   end_snapshot              IN     NUMBER,
   read_only_type_override   IN     VARCHAR2,
   db_id                     IN     NUMBER := NULL);
```

Parameters

Table 15-2 ANALYZE_DB Procedure Parameters

Parameter	Description
task_name	Name of the task to be created.
begin_snapshot	Number of the snapshot that starts the analysis period.
end_snapshot	Number of the snapshot that ends the analysis period.
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
db_id	Database ID for the database you to analyze. By default, this is the database currently connected.

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

15.2.2 ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_INST (
   task_name                 IN OUT VARCHAR2,
   begin_snapshot            IN     NUMBER,
   end_snapshot              IN     NUMBER,
   cdb_type_override         IN     VARCHAR2,
   read_only_type_override   IN     VARCHAR2,
   instance_number           IN     NUMBER := NULL,
   db_id                     IN     NUMBER := NULL);
```

Parameters

Table 15-3 ANALYZE_INST Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a `CLOB`, formatted to fit line size of 80.

15.2.3 ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
   task_name                 IN OUT VARCHAR2,
   instance_numbers          IN     VARCHAR2,
   begin_snapshot            IN     NUMBER,
   end_snapshot              IN     NUMBER,
   cdb_type_override         IN     VARCHAR2,
   read_only_type_override   IN     VARCHAR2,
   db_id                     IN     NUMBER := NULL);
```

Parameters

Table 15-4 ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
`task_name`	Name of the task to be created
`instance_numbers`	Comma separated list of instance numbers to analyze
`begin_snapshot`	Number of the snapshot that starts the analysis period
`end_snapshot`	Number of the snapshot that ends the analysis period

Table 15-4 (Cont.) ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

15.2.4 COMPARE_CAPTURE_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
   replay_id                 IN NUMBER,
   cdb_type_override         IN VARCHAR2,
   read_only_type_override   IN VARCHAR2,
   report_type               IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 15-5 COMPARE_CAPTURE_REPLAY_REPORT Function Parameters

Parameter	Description
`replay_id`	Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.
`cdb_type_override`	Overrides the type of `CDB` that `ADDM` determines for doing analysis. The possible values are: • `AUTONOMOUS OLTP`—autonomous OLTP inside a PDB • `AUTONOMOUS DATA WAREHOUSE`—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows `ADDM` to decide the type of `CDB` to override based on the data
`read_only_type_override`	Overrides the type of `CDB` `ADDM` determines for analysis. The possible values are: • `READ-WRITE`—a regular database or the primary database in a data guard configuration • `READ-ONLY`—a database open in read-only mode, such as an active data guard standby • `AUTO`—allows `ADDM` to decide the type of `CDB` to override based on the data
`report_type`	`HTML` (the default) for an HTML active report, `'XML'` for an XML report

Return Values

A `CLOB` containing a compare period ADDM report

15.2.5 COMPARE_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_DATABASES (
   base_dbid             IN NUMBER := NULL,
   base_begin_snap_id    IN NUMBER,
   base_end_snap_id      IN NUMBER,
   comp_dbid             IN NUMBER := NULL,
   comp_begin_snap_id    IN NUMBER,
   comp_end_snap_id      IN NUMBER,
   cdb_type_override          IN     VARCHAR2,
   read_only_type_override    IN     VARCHAR2,
   report_type           IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 15-6 COMPARE_DATABASES Function Parameters

Parameter	Description
base_dbid	Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.
base_begin_snap_ids	Begin AWR snapshot ID of the base period.
base_end_snap_id	End AWR snapshot ID of the base period.
comp_dbid	Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.
comp_begin_snap_id	Begin AWR snapshot ID of the comparison period
comp_end_snap_id	End AWR snapshot ID of the comparison period
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data

Table 15-6 (Cont.) COMPARE_DATABASES Function Parameters

Parameter	Description
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
report_type	'HTML' (the default) for an HTML active report, 'XML' for an XML report

Return Values

A CLOB containing a compare period ADDM report

15.2.6 COMPARE_INSTANCES Function

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_INSTANCES (
   base_dbid                 IN NUMBER := NULL,
   base_instance_id          IN NUMBER,
   base_begin_snap_id        IN NUMBER,
   base_end_snap_id          IN NUMBER,
   comp_dbid                 IN NUMBER := NULL,
   comp_instance_id          IN NUMBER,
   comp_begin_snap_id        IN NUMBER,
   comp_end_snap_id          IN NUMBER,
   cdb_type_override         IN VARCHAR2,
   read_only_type_override   IN VARCHAR2,
   report_type               IN VARCHAR2 := 'HTML')
  RETURN CLOB;
```

Parameters

Table 15-7 COMPARE_INSTANCES Function Parameters

Parameter	Description
base_dbid	Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.
base_instance_id	Instance number of the database instance to include from the base period
base_begin_snap_id	Begin AWR snapshot ID of the base period.

Table 15-7 (Cont.) COMPARE_INSTANCES Function Parameters

Parameter	Description
base_end_snap_id	End AWR snapshot ID of the base period.
comp_dbid	Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.
comp_instance_id	Instance number of the database instance to include from the comparison period
comp_begin_snap_id	Begin AWR snapshot ID of the comparison period
comp_end_snap_id	End AWR snapshot ID of the comparison period
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
report_type	'HTML' (the default) for an HTML active report, 'XML' for an XML report

Return Values

A CLOB containing a compare period ADDM report

15.2.7 COMPARE_REPLAY_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
   replay_id1                IN     NUMBER,
   replay_id2                IN     NUMBER,
```

```
  cdb_type_override          IN     VARCHAR2,
  read_only_type_override    IN     VARCHAR2,
  report_type                IN     VARCHAR2 := 'HTML')
 RETURN CLOB;
```

Parameters

Table 15-8 COMPARE_REPLAY_REPLAY_REPORT Function Parameters

Parameter	Description
replay_id1	Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.
replay_id2	Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression.
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data
report_type	'HTML' (the default) for an HTML active report, 'XML' for an XML report

Return Values

A CLOB containing a compare period ADDM report

15.2.8 DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (
   task_name           IN VARCHAR2);
```

Parameters

Table 15-9 DELETE Procedure Parameters

Parameter	Description
task_name	Name of the task to be deleted

Examples

```
BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

15.2.9 DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15-10 DELETE_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

15.2.10 DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15-11 DELETE_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

Examples

```
BEGIN
   DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

15.2.11 DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15-12 DELETE_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

15.2.12 DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15-13 DELETE_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

15.2.13 FAILED_AUTO_TASKS_REPORT Function

This function creates a plain text, user-readable report for the failed tasks registered in the `DBA_ADDM_PENDING_AUTOTASKS` views.

Syntax

```
DBMS_ADDM.FAILED_AUTO_TASKS_REPORT(
   instance_number     IN   NUMBER :=NULL,
   begin_snapshot      IN   NUMBER :=NULL,
   end_snapshot        IN   NUMBER :=NULL,
   dbid                IN   NUMBER :=NULL)
```

Parameters

Table 15-14 FAILED_AUTO_TASKS_REPORT Function Parameters

Parameter	Description
`instance_number`	Instance number for the tasks to be reported.
`begin_snapshot`	Earliest begin snapshot ID for the tasks to be reported.
`end_snapshot`	Latest end snapshot ID for the tasks to be reported.
`dbid`	Database ID for the tasks to be reported.

15.2.14 GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding.

For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

Syntax

```
DBMS_ADDM.GET_ASH_QUERY (
   task_name           IN   VARCHAR2,
   finding_id          IN   NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 15-15 GET_ASH_QUERY Function Parameters

Parameter	Description
`task_name`	Name of the task
`finding`	ID of the finding within the task

Return Values

A `VARCHAR` containing an ASH query identifying the rows in ASH with impact for the finding

15.2.15 GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (
   task_name           IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 15-16 GET_REPORT Function Parameters

Parameter	Description
task_name	Name of the task

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

15.2.16 INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   finding_name          IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_perc_impact       IN NUMBER := 0);
```

Parameters

Table 15-17 INSERT_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
finding_name	Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.
min_active_sessions	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.

Table 15-17 (Cont.) INSERT_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
min_perc_impact	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
   NULL,
   'Undersized SGA directive',
   'Undersized SGA',
   2,
   10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

15.2.17 INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   parameter_name        IN VARCHAR2);
```

Parameters

Table 15-18 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
parameter_name	Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT does not show these actions.

```
var tname varchar2(60);
BEGIN
  DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
   NULL,
   'my Parameter directive',
   'sga_target');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

15.2.18 INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   owner_name            IN VARCHAR2,
   object_name           IN VARCHAR2 := NULL,
   sub_object_name       IN VARCHAR2 := NULL);

DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   object_number         IN NUMBER);
```

Parameters

Table 15-19 INSERT_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
owner_name	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
object_name	Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.

Table 15-19 (Cont.) INSERT_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
sub_object_name	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
object_number	Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

15.2.19 INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   sql_id                IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_response_time     IN NUMBER := 0);
```

Parameters

Table 15-20 INSERT_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
sql_id	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.

Table 15-20 (Cont.) INSERT_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
min_active_sessions	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
min_response_time	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

15.2.20 REAL_TIME_ADDM_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over GV$ is possible.

Syntax

```
DBMS_ADDM.REAL_TIME_ADDM_REPORT (
   cdb_type_override         IN     VARCHAR2,
   read_only_type_override   IN     VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 15-21 REAL_TIME_ADDM_REPORT Function Parameters

Parameter	Description
cdb_type_override	Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: • AUTONOMOUS OLTP—autonomous OLTP inside a PDB • AUTONOMOUS DATA WAREHOUSE—autonomous data warehouse (ADWH) inside a PDB • PDB —a regular PDB • CDB ROOT —the root of a CDB • NON-CDB —a system that is not CDB or PDB • AUTO —allows ADDM to decide the type of CDB to override based on the data
read_only_type_override	Overrides the type of CDB ADDM determines for analysis. The possible values are: • READ-WRITE—a regular database or the primary database in a data guard configuration • READ-ONLY—a database open in read-only mode, such as an active data guard standby • AUTO—allows ADDM to decide the type of CDB to override based on the data

Return Values

CLOB containing a real-time ADDM report

15.2.21 REEXECUTE_FAILED_AUTO_TASKS Procedure

This procedure re-executes the tasks registered in the DBA_ADDM_PENDING_AUTOTASKS views.

This API can be called from both the CDB and PDB level. The user specifies the range for the snapshots or a time interval. The duration of the re-execution is time constrained by a user-specified parameter or a default value. Once a task has executed successfully, its corresponding row is removed from the DBA_ADDM_PENDING_AUTOTASKS view.

Syntax

```
DBMS_ADDM.REXECUCUTE_FAILED_AUTO_TASKS(
   instance_number      IN   NUMBER :=NULL,
   begin_snapshot       IN   NUMBER :=NULL,
   end_snapshot         IN   NUMBER :=NULL,
   dbid                 IN   NUMBER :=NULL,
   time_budget_in_sec   IN   NUMBER :=NULL,
   max_attempts         IN   NUMBER :=NULL);
```

Parameters

Table 15-22 REEXECUTE_FAILED_AUTO_TASKS Function Parameters

Parameter	Description
instance_number	Instance number for the tasks to be re executed.
begin_snapshot	Earliest begin snapshot ID for the tasks to be re executed.
end_snapshot	Latest end snapshot ID for the tasks to be re executed.
dbid	Database ID for the tasks to be re executed.
time_budget_in_sec	Forced time out to run the procedure after exiting.
max_attempts	Maximum number of attempts to re execute a task.

16
DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

> **See Also:**
>
> *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- DBMS_ADVANCED_REWRITE Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms

16.1 DBMS_ADVANCED_REWRITE Security Model

Default privileges are not granted to anyone for access to DBMS_ADVANCED_REWRITE Security Model procedures. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

16.2 Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists the DBMS_ADVANCED_REWRITE subprograms and briefly describes them.

Table 16-1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure	Changes the mode of the rewrite equivalence declaration to the mode you specify

Table 16-1 (Cont.) DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures	Creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure	Validates the specified rewrite equivalence declaration using the same validation method as described with the `validate` parameter

16.2.1 ALTER_REWRITE_EQUIVALENCE Procedure

This table list the all the package subprograms in alphabetical order.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
   name            VARCHAR2,
   rewrite_mode    VARCHAR2);
```

Parameters

Table 16-2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to alter. The name can be of the form `owner.name`, where `owner` complies with the rules for a schema name, and `name` compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.

Table 16-2 (Cont.) ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
rewrite_mode	The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

16.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the DBMS_ADVISOR.TUNE_MVIEW procedure.

It is required to enable query rewrite and fast refresh when DBMS_ADVISOR.TUNE_MVIEW decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the BUILD_SAFE_REWRITE_EQUIVALENCE procedure. You should use either the DBMS_ADVISOR.TUNE_MVIEW or the DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE procedure as appropriate.

16.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance.

The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          VARCHAR2,
   destination_stmt     VARCHAR2,
   validate             BOOLEAN    := TRUE,
```

```
   rewrite_mode         VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          CLOB,
   destination_stmt     CLOB,
   validate             BOOLEAN    := TRUE,
   rewrite_mode         VARCHAR2   := 'TEXT_MATCH');
```

Parameters

Table 16-3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration. The name can be of the form `owner.name`, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate `CREATE MATERIALIZED VIEW` privileges to alter an equivalence declaration.
`source_stmt`	A sub-`SELECT` expression in either `VARCHAR2` or `CLOB` format. This is the query statement that is the target of optimization.
`destination_stmt`	A sub-`SELECT` expression in either `VARCHAR2` or `CLOB` format.
`validate`	A Boolean indicating whether to validate that the specified `source_stmt` is functionally equivalent to the specified `destination_stmt`. If `validate` is specified as `TRUE`, `DECLARE_REWRITE_EQUIVALENCE` evaluates the two sub-`SELECT`s and compares their results. If the results are not the same, `DECLARE_REWRITE_EQUIVALENCE` does not create the rewrite equivalence and returns an error condition. If `FALSE`, `DECLARE_REWRITE_EQUIVALENCE` does not validate the equivalence.
`rewrite_mode`	The following modes are supported, in increasing order of power: • `disabled`: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. • `text_match`: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. • `general`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified `destination_query`. • `recursive`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified `destination_query` for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

Exceptions

Table 16-4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

16.2.4 DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 16-5 DROP_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

16.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration.

It uses the same validation method as described with the `VALIDATE` parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure".

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 16-6 VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the `source_stmt` and `destination_stmt` of the specified equivalence declaration.

17
DBMS_ADVISOR

`DBMS_ADVISOR` is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than `DBMS_ADVISOR`. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (`DBMS_ADDM`)
- SQL Performance Analyzer (`DBMS_SQLPA`)
- SQL Repair Advisor (`DBMS_SQLDIAG`)
- SQL Tuning Advisor (`DBMS_SQLTUNE`)
- Compression Advisor (`DBMS_COMPRESSION.GET_COMPRESSION_RATIO`)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for `DBMS_ADVISOR`. Undo Advisor and Compression Advisor do not support `DBMS_ADVISOR` subprograms.

This chapter contains the following topics:

- DBMS_ADVISOR Deprecated Subprograms
- DBMS_ADVISOR Security Model
- Summary of DBMS_ADVISOR Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide* to learn about Segment Advisor
> - *Oracle Database Get Started with Performance Tuning* to learn how to use SQL Access Advisor in Enterprise Manager
> - *Oracle Database SQL Tuning Guide* to learn more about SQL Access Advisor

17.1 DBMS_ADVISOR Deprecated Subprograms

The section lists programs that are deprecated with Oracle Database 11*g*.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedure
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedure
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure

17.2 DBMS_ADVISOR Security Model

The `ADVISOR` privilege is required to use the DBMS_ADVISOR package.

17.3 Summary of DBMS_ADVISOR Subprograms

This topic lists and describes the subprograms in the DBMS_ADVISOR package.

In the following table, the `Used in` column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

Table 17-1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure	Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)	SQL Access Advisor
ADD_SQLWKLD_STATEMENT Procedure	Adds a single statement to a workload	SQL Access Advisor
ADD_STS_REF Procedure	Establishes a link between the current SQL Access Advisor task and a SQL tuning set	SQL Access Advisor
CANCEL_TASK Procedure	Cancels a currently executing task operation	Segment Advisor, SQL Access Advisor
COPY_SQLWKLD_TO_STS Procedure	Copies the contents of a SQL workload object to a SQL tuning set	SQL Access Advisor
CREATE_FILE Procedure	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	SQL Access Advisor

Table 17-1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
CREATE_OBJECT Procedure	Creates a new task object	Segment Advisor
CREATE_SQLWKLD Procedure	Creates a new workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
CREATE_TASK Procedures	Creates a new Advisor task in the repository	Segment Advisor, SQL Access Advisor
DELETE_SQLWKLD Procedure	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_SQLWKLD_REF Procedure	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_SQLWKLD_STATEMENT Procedure	Deletes one or more statements from a workload (Caution: Deprecated Subprogram)	SQL Access Advisor
DELETE_STS_REF Procedure	Removes a link between the current SQL Access Advisor task and a SQL tuning set object	SQL Access Advisor
DELETE_TASK Procedure	Deletes the specified task from the repository	SQL Access Advisor
EXECUTE_TASK Procedure	Executes the specified task	Segment Advisor, SQL Access Advisor
GET_REC_ATTRIBUTES Procedure	Retrieves specific recommendation attributes from a task	SQL Access Advisor
GET_TASK_REPORT Function	Creates and returns a report for the specified task	
GET_TASK_SCRIPT Function	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	SQL Access Advisor
IMPLEMENT_TASK Procedure	Implements the recommendations for a task	SQL Access Advisor
IMPORT_SQLWKLD_SCHEMA Procedure	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_SQLCACHE Procedure	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_STS Procedure	Imports data from a SQL tuning set into a SQL workload data object (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_SUMADV Procedure	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
IMPORT_SQLWKLD_USER Procedure	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor
INTERRUPT_TASK Procedure	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	Segment Advisor, SQL Access Advisor

Table 17-1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
MARK_RECOMMENDATION Procedure	Sets the `annotation_status` for a particular recommendation	Segment Advisor, SQL Access Advisor
QUICK_TUNE Procedure	Performs an analysis on a single SQL statement	SQL Access Advisor
RESET_SQLWKLD Procedure	Resets a workload to its initial starting point (Caution: Deprecated Subprogram)	SQL Access Advisor
RESET_TASK Procedure	Resets a task to its initial state	Segment Advisor, SQL Access Advisor
SET_DEFAULT_SQLWKLD_PARAMETER Procedure	Imports data into a workload from schema evidence	SQL Access Advisor
SET_DEFAULT_TASK_PARAMETER Procedure	Modifies a default task parameter	Segment Advisor, SQL Access Advisor
SET_SQLWKLD_PARAMETER Procedure	Sets the value of a workload parameter	SQL Access Advisor
SET_TASK_PARAMETER Procedure	Sets the specified task parameter value	Segment Advisor, SQL Access Advisor
TUNE_MVIEW Procedure	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor
UPDATE_OBJECT Procedure	Updates a task object	Segment Advisor
UPDATE_REC_ATTRIBUTES Procedure	Updates an existing recommendation for the specified task	SQL Access Advisor
UPDATE_SQLWKLD_ATTRIBUTES Procedure	Updates a workload object	SQL Access Advisor
UPDATE_SQLWKLD_STATEMENT Procedure	Updates one or more SQL statements in a workload	SQL Access Advisor
UPDATE_TASK_ATTRIBUTES Procedure	Updates a task's attributes	Segment Advisor, SQL Access Advisor

17.3.1 ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use `ADD_STS_REF` instead of `ADD_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17-2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access Advisor task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure `DELETE_REFERENCE`.
`is_sts`	Indicates the type of workload source. Possible values are: • 0 - SQL workload object • 1 - SQL tuning set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
```

```
END;
/
```

17.3.2 ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
   workload_name          IN VARCHAR2,
   module                 IN VARCHAR2,
   action                 IN VARCHAR2,
   cpu_time               IN NUMBER := 0,
   elapsed_time           IN NUMBER := 0,
   disk_reads             IN NUMBER := 0,
   buffer_gets            IN NUMBER := 0,
   rows_processed         IN NUMBER := 0,
   optimizer_cost         IN NUMBER := 0,
   executions             IN NUMBER := 1,
   priority               IN NUMBER := 2,
   last_execution_date    IN DATE := 'SYSDATE',
   stat_period            IN NUMBER := 0,
   username               IN VARCHAR2,
   sql_text               IN CLOB);
```

Parameters

Table 17-3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The cost value calculated by the optimizer.
executions	The total execution count of the SQL statement. This value should be greater than zero.

Table 17-3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the database uses the current date and time.
stat_period	Time interval in seconds from which statement statistics were calculated.
username	The database user that executed the SQL statement. Because a user name is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott or Scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

You cannot modify or delete a workload when it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. The database only uses the disk_reads, buffer_gets, and optimizer_cost parameters to sort workload data when actual analysis occurs. Therefore, actual values are only necessary when the order_list task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys:

- cpu_time
- elapsed_time
- buffer_gets
- optimizer_cost
- disk_reads
- executions
- priority

The optimizer_cost key, which is a typical setting of priority, indicates that SQL Access Advisor sorts the workload data by priority and optimizer_cost, and processes the highest cost statements first. Any statements that you add to the workload must include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, then choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT
AVG(amount_sold) FROM sh.sales');
END;
/
```

17.3.3 ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set.

The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use `ADD_STS_REF` for any STS-based advisor runs. The older method of using `ADD_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `ADD_STS_REF` function accepts a SQL tuning set owner name, whereas `ADD_SQLWKLD_REF` does not.

Syntax

```
DBMS_ADVISOR.ADD_STS_REF(
  task_name       IN VARCHAR2 NOT NULL,
  sts_owner       IN VARCHAR2,
  workload_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17-4 ADD_STS_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access Advisor task name that uniquely identifies an existing task.
`sts_owner`	The owner of the SQL tuning set. The value of this parameter may be `NULL`, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.

Table 17-4 (Cont.) ADD_STS_REF Procedure Parameters

Parameter	Description
workload_name	The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```

17.3.4 CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate.

This call performs a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
   task_name      IN  VARCHAR2);
```

Parameters

Table 17-5 CANCEL_TASK Procedure Parameter

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command restores the task to its condition prior to the start of the canceled operation. Therefore, a canceled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
```

```
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

17.3.5 COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (
   workload_name          IN VARCHAR2,
   sts_name               IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW');
```

Parameters

Table 17-6 COPY_SQLWKLD_TO_STS Procedure Parameter

Parameter	Description
workload_name	The SQL Workload object name to copy.
sts_name	The SQL tuning set name into which the SQL Workload object will be copied.
import_mode	Specifies the handling of the target SQL tuning set. Possible values are: • APPEND Causes SQL Workload data to be appended to the target SQL tuning set. • NEW Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported. • REPLACE Causes any existing data in the target SQL tuning set to be purged prior to the workload copy. In all cases, if the specified SQL tuning set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

```
BEGIN
   DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

17.3.6 CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL `CLOB` variable, which is used for creating scripts and reports.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
   buffer       IN  CLOB,
   location     IN  VARCHAR2,
   filename     IN  VARCHAR2);
```

Parameters

Table 17-7 CREATE_FILE Procedure Parameters

Parameter	Description
`buffer`	A `CLOB` buffer containing report or script information.
`location`	The name of the directory that will contain the output file. You must use the alias as defined by the `CREATE DIRECTORY` statement. The Advisor translates the alias into the actual directory location.
`filename`	The name of the output file. The file name can only contain the name and an optional file type of the form `filename.filetype`.

Usage Notes

You must embed all formatting within the `CLOB`.

The database restricts file access within stored procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
  v_task_id NUMBER;
  v_task_name VARCHAR2(30);
  v_workload_name VARCHAR2(30);
BEGIN
  v_task_name := 'My Task';
  v_workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(
      advisor_name => DBMS_ADVISOR.SQLACCESS_ADVISOR
  ,   task_id      => v_task_id
  ,   task_name    => v_task_name );
  DBMS_ADVISOR.CREATE_SQLWKLD(
      workload_name => v_workload_name
  ,   description   => 'My Workload' );
```

```
  DBMS_ADVISOR.ADD_SQLWKLD_REF(
      task_name     => v_task_name
  ,   workload_name => v_workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(
      workload_name       => v_workload_name
  ,   module              => 'MONTHLY'
  ,   action              => 'ROLLUP'
  ,   cpu_time            => 100
  ,   elapsed_time        => 400
  ,   disk_reads          => 5041
  ,   buffer_gets         => 103
  ,   rows_processed      => 640445
  ,   optimizer_cost      => 680000
  ,   executions          => 2
  ,   priority            => 1
  ,   last_execution_date => SYSDATE
  ,   stat_period         => 1
  ,   username            => 'SH'
  ,   sql_text            => 'SELECT AVG(amount_sold) FROM sh.sales' );
  DBMS_ADVISOR.EXECUTE_TASK(v_task_name);
  DBMS_ADVISOR.CREATE_FILE(
      buffer   => DBMS_ADVISOR.GET_TASK_SCRIPT(v_task_name)
  ,   location => 'MY_DIR'
  ,   filename => 'script.sql' );
END;
/
```

17.3.7 CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   attr5             IN VARCHAR2 :=  NULL,
   object_id         OUT NUMBER,
   attr6             IN VARCHAR2 :=  NULL,
   attr7             IN VARCHAR2 :=  NULL,
   attr8             IN VARCHAR2 :=  NULL,
   attr9             IN VARCHAR2 :=  NULL,
   attr10            IN VARCHAR2 :=  NULL);
```

Parameters

Table 17-8 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.
attr6	Advisor-specific data.
attr7	Advisor-specific data.
attr8	Advisor-specific data.
attr9	Advisor-specific data.
attr10	Advisor-specific data.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or `LOB` column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL, 'SELECT * FROM
```

```
TEST_TAB',NULL,obj_id,NULL,NULL,NULL,NULL,NULL);
END;
/
```

17.3.8 CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user.

A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
   workload_name            IN OUT VARCHAR2,
   description              IN VARCHAR2 := NULL,
   template                 IN VARCHAR2 := NULL,
   is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

Table 17-9 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
`workload_name`	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
`description`	Specifies an optional workload description. Descriptions can be up to 256 characters.
`template`	An optional SQL Workload name of an existing workload data object or data object template.
`is_template`	An optional value that enables you to set the newly created workload as a template. Valid values are `TRUE` and `FALSE`.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the `ADD_SQLWKLD_REF` procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

17.3.9 CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_name             IN VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   parent_task_name      IN VARCHAR2,
   rec_id                IN NUMBER,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2,
   template              IN VARCHAR2);
```

Parameters

Table 17-10 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.

Table 17-10 (Cont.) CREATE_TASK Procedure Parameters

Parameter	Description
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier DBMS_ADVISOR.SQLACCESS_ADVISOR as the advisor_name.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- DBMS_ADVISOR.SQLACCESS_OLTP

  Parameters are preset to favor an OLTP application environment.

- DBMS_ADVISOR.SQLACCESS_WAREHOUSE

  Parameters are preset to favor a data warehouse application environment.

- DBMS_ADVISOR.SQLACCESS_GENERAL

  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
```

```
END;
/
```

17.3.10 DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
   workload_name         IN VARCHAR2);
```

Parameters

Table 17-11 DELETE_SQLWKLD Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload. The wildcard `%` is supported as a `WORKLOAD_NAME`. The rules of use are identical to the `LIKE` operator. For example, to delete all tasks for the current user, use the wildcard `%` as the `WORKLOAD_NAME`. If a wildcard is provided, the `DELETE_SQLWKLD` operation will not delete any workloads marked as `READ_ONLY` or `TEMPLATE`.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

17.3.11 DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17-12 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be unlinked. The wildcard `%` is supported as a `workload_name`. The rules of use are identical to the `LIKE` operator. For example, to remove all links to workload objects, use the wildcard `%` as the `workload_name`.
`is_sts`	Indicates the type of workload source. Possible values are: • 0 - SQL workload object • 1 - SQL tuning set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

17.3.12 DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

> **Note:**
>
> This procedure has been deprecated.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   search               IN VARCHAR2,
   deleted              OUT NUMBER);
```

Parameters

Table 17-13 DELETE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
```

```
                                        FROM sh.sales');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

17.3.13 DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set.

Use `DELETE_STS_REF` for any STS-based advisor runs. The older method of using `DELETE_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `DELETE_STS_REF` function accepts an STS owner name, whereas `DELETE_SQLWKLD_REF` does not.

Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
  task_name      IN VARCHAR2 NOT NULL,
  sts_owner      IN VARCHAR2,
  workload_name  IN VARCHAR2 NOT NULL);
```

Parameters

Table 17-14 DELETE_STS_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access Advisor task name that uniquely identifies an existing task.
`sts_owner`	The owner of the SQL tuning set. The value of this parameter may be `NULL`, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.
`workload_name`	The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. The wildcard `%` is supported as a workload name. The rules of use are identical to the SQL `LIKE` operator. For example, to remove all links to SQL tuning set objects, use the wildcard `%` as the `STS_NAME`.

Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
```

17.3.14 DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17-15 DELETE_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

17.3.15 EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
   task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
```

```
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2             := NULL,
   execution_name    IN VARCHAR2             := NULL,
   execution_params  IN dbms_advisor.argList := NULL,
   execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;
```

Parameters

Table 17-16 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values: • EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. • TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework. • ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: `DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'hr')`
execution_desc	A 256-length string describing the execution.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
```

```
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

17.3.16 GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
   workload_name         IN VARCHAR2,
   rec_id                IN NUMBER,
   action_id             IN NUMBER,
   attribute_name        IN VARCHAR2,
   value                 OUT VARCHAR2,
   owner_name            IN VARCHAR2 := NULL);
```

Parameters

Table 17-17 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
```

```
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

17.3.17 GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
   task_name      IN VARCHAR2,
   type           IN VARCHAR2 := 'TEXT',
   level          IN VARCHAR2 := 'TYPICAL',
   section        IN VARCHAR2 := 'ALL',
   owner_name     IN VARCHAR2 := NULL,
   execution_name IN VARCHAR2 := NULL,
   object_id      IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17-18 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the buffer receiving the script.

17.3.18 GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to a file.

The output script contains all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
   task_name          IN VARCHAR2
   type               IN VARCHAR2 := 'IMPLEMENTATION',
   rec_id             IN NUMBER   := NULL,
   act_id             IN NUMBER   := NULL,
   owner_name         IN VARCHAR2 := NULL,
   execution_name     IN VARCHAR2 := NULL,
   object_id          IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17-19 GET_TASK_SCRIPT Function Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.
`type`	Specifies the type of script to generate. The possible values are `IMPLEMENTATION` and `UNDO`.
`rec_id`	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value `DBMS_ADVISOR.ADVISOR_ALL` indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
`act_id`	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value `DBMS_ADVISOR.ADVISOR_ALL` indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
`owner_name`	An optional task owner name.
`execution_name`	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
`object_id`	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the script as a `CLOB` buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

17.3.19 IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified Advisor task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 17-20 IMPLEMENT_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional Boolean to exit on the first error.

17.3.20 IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17-21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: • APPEND Indicates that the collected workload will be added to any existing workload in the task. • NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. • REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number or rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

17.3.21 IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17-22 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.

Table 17-22 (Cont.) IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
import_mode	Specifies the action to be taken when storing the workload. Possible values are: • APPEND Indicates that the collected workload will be added to any existing workload in the task. • NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. • REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

17.3.22 IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name          IN VARCHAR2,
   sts_name               IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name          IN VARCHAR2,
   sts_owner              IN VARCHAR2,
   sts_name               IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17-23 IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload.
`sts_owner`	The optional owner of the SQL tuning set.
`sts_name`	The name of an existing SQL tuning set workload from which the data will be imported. If the `sts_owner` value is not provided, the owner will default to the current user.
`import_mode`	Specifies the action to be taken when storing the workload. Possible values are: • `APPEND` Indicates that the collected workload will be added to any existing workload in the task. • `NEW` Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. • `REPLACE` Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is `NEW`.

Table 17-23 (Cont.) IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
     saved, failed);
END;
/
```

17.3.23 IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload.

This procedure is intended to assist Oracle9*i* Database Summary Advisor users in the migration to SQL Access Advisor.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   sumadv_id              IN NUMBER,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17-24 IMPORT_SQLWKLD_SUMADV Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: • APPEND Indicates that the collected workload will be added to any existing workload in the task. • NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. • REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
```

```
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

17.3.24 IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   owner_name             IN VARCHAR2,
   table_name             IN VARCHAR2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17-25 IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload.
`import_mode`	Specifies the action to be taken when storing the workload. Possible values are: • `APPEND` Indicates that the collected workload will be added to any existing workload in the task. • `NEW` Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. • `REPLACE` Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is `NEW`.
`owner_name`	Specifies the owner name of the table or view from which workload data will be collected.

Table 17-25 (Cont.) IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
table_name	Specifies the name of the table or view from which workload data will be collected.
saved_rows	Returns the number of rows actually saved in the workload object.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

17.3.25 INTERRUPT_TASK Procedure

This procedure stops a currently executing task.

The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17-26 INTERRUPT_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

17.3.26 MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
   task_name          IN VARCHAR2
   id                 IN NUMBER,
   action             IN VARCHAR2);
```

Parameters

Table 17-27 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.

Table 17-27 (Cont.) MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
action	The recommendation action setting. The possible actions are: • ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. • IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. • REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

17.3.27 QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
   advisor_name           IN VARCHAR2,
   task_name              IN VARCHAR2,
   attr1                  IN CLOB,
   attr2                  IN VARCHAR2 := NULL,
   attr3                  IN NUMBER := NULL,
   template               IN VARCHAR2 := NULL,
   implement              IN BOOLEAN := FALSE,
   description            IN VARCHAR2 := NULL);
```

Parameters

Table 17-28 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
template	Name of an existing task or template from which the initial settings need to be copied.
implement	Flag specifying whether to implement the task.
description	Description of the task.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                  'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

17.3.28 RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point.

Resetting the workload has the effect of removing all journal and log messages, and recalculating necessary volatility and usage statistics.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 17-29 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

`RESET_SQLWKLD` should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

17.3.29 RESET_TASK Procedure

This procedure re-initializes the metadata for the specified task. The task status will be set to `INITIAL`.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17-30 RESET_TASK Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

17.3.30 SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17-31 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

17.3.31 SET_DEFAULT_TASK_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a task or a template.

A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name         IN VARCHAR2
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name         IN VARCHAR2
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17-32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
   'VALID_TABLE_LIST', 'SH.%');
END;
/
```

17.3.32 SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17-33 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,
'VALID_TABLE_LIST','SH.%');
END;
/
```

17.3.33 SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 17-34 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See RESET_TASK Procedure to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 17-35 lists SQL Access Advisor task parameters.

Table 17-35 SQL Access Advisor Task Parameters

Parameter	Description
ANALYSIS_SCOPE	A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are: • ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION. • EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone. • INDEX Allows the SQL Access Advisor to recommend index structure changes. • MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes. • PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options. • TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning. Using the new keywords, the following combinations are valid: • INDEX • MVIEW • INDEX, PARTITION • INDEX, MVIEW, PARTITION • INDEX, TABLE, PARTITION • MVIEW, PARTITION • MIVEW, TABLE, PARTITION • INDEX, MVIEW, TABLE, PARTITION • TABLE, PARTITION • EVALUATION The default value is INDEX. The data type is STRINGLIST.
CREATION_COST	When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored. The data type is STRING.
DAYS_TO_EXPIRE	Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The data type is NUMBER. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are: • an integer in the range of 0 to 2147483647 • ADVISOR_UNLIMITED • ADVISOR_UNUSED The default value is 30.
DEF_EM_TEMPLATE	Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values. The default value is SQLACCESS_EMTASK. The data type is STRING.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DEF_INDEX_OWNER	Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are: • Existing schema name. Quoted identifiers are supported. • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRING.
DEF_INDEX_TABLESPACE	Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: • Existing tablespace name. Quoted identifiers are supported. • ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. The default value is ADVISOR_UNUSED. The data type is STRING.
DEF_MVIEW_OWNER	Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are: • Existing schema name. Quoted identifiers are supported. • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRING.
DEF_MVIEW_TABLESPACE	Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are • Existing tablespace name. Quoted identifiers are supported. • ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The data type is STRING.
DEF_MVLOG_TABLSPACE	Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: • Existing tablespace name. Quoted identifiers are supported. • ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The data type is STRING.
DEF_PARTITION_TABLESPACE	Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: • Existing tablespace name. Quoted identifiers are supported. • ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. The default value is ADVISOR_UNUSED. The data type is STRING.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DML_VOLATILITY	When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The data type is STRING. See the related parameter refresh_mode.
END_TIME	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: • DD is the numeric date • MM is the numeric month • YYYY is the numeric year • HH is the hour in 24 hour format • MI is the minute • SS is the second The data type is STRING.
EVALUATION_ONLY	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are: • FALSE • TRUE The default value is FALSE. The data type is STRING.
EXECUTION_TYPE	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are: • FULL => FULL • INDEX_ONLY => INDEX • MVIEW_ONLY => MVIEW • MVIEW_LOG_ONLY => MVIEW_LOG_ONLY The type of recommendations that is desired. Possible values: • FULL All supported recommendation types will be considered. • INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. • MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. • MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. The default value is FULL. The data type is STRINGLIST.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
IMPLEMENT_EXIT_ON_ERROR	When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are: • TRUE • FALSE The default value is TRUE. The data type is STRING.
INDEX_NAME_TEMPLATE	Specifies the method by which new index names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ID* in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are: • Any literal value up to 22 characters. • TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. • TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. • SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is *table*_IDX$$_*task_idsequence*. The data type is STRING.
INVALID_ACTION_LIST	Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: • single action • comma-delimited action list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
INVALID_MODULE_LIST	Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are: • single application • comma-delimited module list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
INVALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are: • single string • comma-delimited string list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
INVALID_USERNAME_LIST	Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are: • single user name • comma-delimited user name list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
JOURNALING	Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal. Possible values are: • UNUSED: no journal messages • FATAL: explanation of fatal conditions • ERROR: explanation of errors • WARNING: explanation of warnings • INFORMATION: information message • INFORMATION2: common information • INFORMATION3: common information • INFORMATION4: common information • INFORMATION5: common information • INFORMATION6: common information Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least. The default value is INFORMATION. The data type is NUMBER.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
LIMITED_PARTITION_SCHEMES	User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are: • An integer in the range of 1 to 10 • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is NUMBER.
MAX_NUMBER_PARTITIONS	Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are: • An integer in the range of 1 to 4294967295 • ADVISOR_UNLIMITED • ADVISOR_UNUSED The default value is ADVISOR_UNLIMITED. The data type is NUMBER.
MODE	Specifies the mode by which Access Advisor will operate during an analysis. Valid values are: • LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. • COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. The default value is COMPREHENSIVE. The data type is STRING.
MVIEW_NAME_TEMPLATE	Specifies the method by which new materialized view names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ID* in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: • Any literal value up to 22 characters. • *TASK_ID* Causes the current task identifier number to be inserted in hexadecimal form. • *SEQ* Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is: MV$$_*task_idsequence*. The data type is STRING.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
ORDER_LIST	This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys. Possible values are: • BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. • CPU_TIME Sets the order using the SQL statement's CPU time value. • DISK_READS Sets the order using the SQL statement's disk-read count value. • ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. • EXECUTIONS Sets the order using the SQL statement's execution frequency value. • OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. • I/O Sets the order using the SQL statement's I/O count value. • PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST.
PARTITION_NAME_TEMPLATE	Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: • Any literal value up to 22 characters. • *table* - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit. • *task_id* - Causes the current task identifier number to be inserted in hexadecimal form. • *sequence* - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is PTN$$_*table_task_idsequence*. The data type is STRING.
PARTITIONING_GOAL	Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The data type is STRING.
PARTITIONING_TYPES	Specifies the type of partitioning used. Possible values are RANGE and HASH. The data type is STRING.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
RANKING_MEASURE	Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are: • BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. • CPU_TIME Sets the order using the SQL statement's CPU time value. • DISK_READS Sets the order using the SQL statement's disk-read count value. • ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. • EXECUTIONS Sets the order using the SQL statement's elapsed time value. • OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. • PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST.
RECOMMEND_MV_EXACT_TEXT_MATCH	When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are: • TRUE • FALSE The default value is TRUE. The data type is STRING.
RECOMMENDED_TABLESPACES	Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are: • TRUE • FALSE (the default) The data type is STRING.
REFRESH_MODE	Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are: • ON_DEMAND • ON_COMMIT The default value is ON_DEMAND. The data type is STRING.
REPORT_DATE_FORMAT	This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The data type is STRING.
SHOW_RETAINS	Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are: • TRUE • FALSE The default value is TRUE. The data type is STRING.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
SQL_LIMIT	Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table hr.employees are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: • An integer in the range of 1 to 2147483647 • ADVISOR_UNLIMITED • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is NUMBER.
START_TIME	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: • DD is the numeric date • MM is the numeric month • YYYY is the numeric year • HH is the hour in 24 hour format • MI is the minute • SS is the second The data type is STRING.
STORAGE_CHANGE	Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values: • Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED. The data type is NUMBER.
TIME_LIMIT	Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values: • An integer in the range of 1 to 10,000 • ADVISOR_UNLIMITED The default value is 720 (12 hours). The data type is NUMBER. Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_ACTION_LIST	Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: • single action • comma-delimited action list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
VALID_MODULE_LIST	Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: • single application • comma-delimited module list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
VALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: • single string • comma-delimited string list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_TABLE_LIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: • schema.table • schema • schema.% (equivalent to schema) • comma-delimited action list • ADVISOR_UNUSED The possible values are: • single table reference • comma-delimited reference list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is TABLELIST.
VALID_USERNAME_LIST	Contains a fully qualified list of user names that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's user name does not match a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are: • single user name • comma-delimited user name list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.
WORKLOAD_SCOPE	Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables. The data type is STRING.

Segment Advisor Parameters

Table 17-36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 17-36 Segment Advisor Task Parameters

Parameter	Description
MODE	The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are: • LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository • COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics
TIME_LIST	The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.
RECOMMEND_ALL	Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

   DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
   DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
      'SH.%,SCOTT.EMP');
END;
/
```

Undo Advisor Task Parameters

Table 17-37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 17-37 Undo Advisor Task Parameters

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.

Table 17-37 (Cont.) Undo Advisor Task Parameters

Parameter	Description
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

Examples

```
DECLARE
   tname  VARCHAR2(30);
   oid    NUMBER;
   BEGIN
     DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor
Task');
     DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null',
oid);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'INSTANCE', 1);
     DBMS_ADVISOR.EXECUTE_TASK(tname);
   END;
/
```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 17-38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure.

Table 17-38 ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```
DECLARE
   tid     NUMBER;
   tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
   DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
   DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package and *Oracle Database SQL Tuning Guide* for more information.

17.3.34 TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into multiple views and to restate the materialized view to be optimized for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
   task_name         IN OUT VARCHAR2,
   mv_create_stmt    IN     [CLOB | VARCHAR2]);
```

Parameters

Table 17-39 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for querying the results in a catalog view. If not specified, the database generates a task name, and then returns.
mv_create_stmt	The original materialized view creation statement.

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one for the implementation, and the other for undoing the implementation. The output is accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to print the TUNE_MVIEW results into a script file for later execution.

Table 17-40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The name of the materialized view owner.
TASK_NAME	The name of the task. This name serves as a key to access the set of recommendations.
SCRIPT_TYPE	Recommendation ID that indicates whether the row is for the IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: • CREATE MATERIALIZED VIEW LOG • ALTER MATERIALIZED VIEW LOG FORCE • [CREATE | DROP] MATERIALIZED VIEW

Examples

The following example shows how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
DECLARE
  v_tname VARCHAR2(30);
BEGIN
  v_tname := 'mview_task';
  DBMS_ADVISOR.TUNE_MVIEW(
      task_name      => v_tname
  ,   mv_create_stmt =>
       'CREATE MATERIALIZED VIEW omv REFRESH WITH ROWID AS SELECT * FROM
orders');
END;
```

You can view the results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example (sample output included):

```
SET LINESIZE 120
COL TASK_NAME FORMAT a20
COL STATEMENT FORMAT a40

SELECT *
FROM   USER_TUNE_MVIEW
WHERE  TASK_NAME='mview_task'
AND    SCRIPT_TYPE='IMPLEMENTATION';

TASK_NAME             ACTION_ID SCRIPT_TYPE    STATEMENT
-------------------- ---------- --------------
```

```
----------------------------------------
mview_task                     1 IMPLEMENTATION CREATE MATERIALIZED VIEW LOG
ON "OE"."OR
                                                DERS" WITH ROWID

mview_task                     2 IMPLEMENTATION ALTER MATERIALIZED VIEW LOG
FORCE ON "OE
                                                "."ORDERS" ADD ROWID

mview_task                     3 IMPLEMENTATION CREATE MATERIALIZED VIEW
OE.OMV REFRESH
                                                FAST WITH ROWID DISABLE QUERY
REWRITE
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS_DIR AS  '/tmp';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS_DIR TO PUBLIC;
BEGIN
  DBMS_ADVISOR.CREATE_FILE(
      buffer     => DBMS_ADVISOR.GET_TASK_SCRIPT( task_name => 'mview_task')
  ,   location   => 'TUNE_RESULTS_DIR'
  ,   filename   => 'mview_create.sql' );
END;
```

The preceding statement will save the results in `/tmp/mview_create.sql`.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide*for more information about using the `TUNE_MVIEW` procedure

17.3.35 UPDATE_OBJECT Procedure

This procedure updates an existing task object.

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
   task_name       IN VARCHAR2
   object_id       IN NUMBER,
   attr1           IN VARCHAR2 := NULL,
   attr2           IN VARCHAR2 := NULL,
   attr3           IN VARCHAR2 := NULL,
   attr4           IN CLOB := NULL,
   attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 17-41 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

> **See Also:**
>
> *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor

17.3.36 UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
   task_name            IN VARCHAR2
   rec_id               IN NUMBER,
   action_id            IN NUMBER,
   attribute_name       IN VARCHAR2,
   value                IN VARCHAR2);
```

Parameters

Table 17-42 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.
`rec_id`	The Advisor-generated identifier number that is assigned to the recommendation.
`action_id`	The Advisor-generated action identifier that is assigned to the particular command.
`attribute_name`	Name of the attribute to be changed. The valid values are: • `owner` The new owner of the object. • `name` The new name of the object. • `tablespace` The new tablespace for the object.
`value`	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
```

```
task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';

  DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

17.3.37 UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
   workload_name        IN VARCHAR2,
   new_name             IN VARCHAR2 := NULL,
   description          IN VARCHAR2 := NULL,
   read_only            IN VARCHAR2 := NULL,
   is_template          IN VARCHAR2 := NULL,
   how_created          IN VARCHAR2 := NULL);
```

Parameters

Table 17-43 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.

Table 17-43 (Cont.) UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

17.3.38 UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

> **Note:**
>
> This procedure is deprecated starting in Oracle Database 11*g*.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   sql_id            IN NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   search            IN VARCHAR2,
   updated           OUT NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);
```

Parameters

Table 17-44 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a user name is an Oracle identifier, the username value must be entered exactly like it is stored in the database. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. The database does not recognize the user scott as a match for SCOTT.
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
```

```
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

17.3.39 UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
   task_name          IN VARCHAR2
   new_name           IN VARCHAR2 := NULL,
   description        IN VARCHAR2 := NULL,
   read_only          IN VARCHAR2 := NULL,
   is_template        IN VARCHAR2 := NULL,
   how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 17-45 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
```

```
task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```

18
DBMS_AUTOIM

This API provides functions to manage the execution of the AIM feature.

18.1 Using DBMS_AUTOIM

Automatic In-Memory Management (AIM) is an In-Memory column store feature that optimizes the column store through actions such evicting cold data, populating frequently accessed data, and compressing cold columns.

The DBMS_AUTOIM package provides APIs to manage the execution of the AIM feature. These are procedures to get and set AIM parameters as well as a reporting function.

18.2 Summary of DBMS_AUTOIM Subprograms

The table in this topic lists and describes the DBMS_AUTOIM subprograms.

Table 18-1 DBMS_AUTOIM Subprograms

Subprogram	Description
SET_PARAMETER	Sets the value of one of the available parameters: `AUTO_IM_PERF_TASK`, `INTERVAL`, or `AIM_STATWINDOW_DAYS`.
ACTIVITY_REPORT	Reports AIM task activity within the specified time interval for the given feature or for all features.

18.2.1 SET_PARAMETER Procedure

Use this DBMS_AUTOIM procedure to set configuration parameter values for AIM features.

Syntax

```
DBMS_AUTOIM.SET_PARAMETER( parameter_name IN VARCHAR2, parameter_value IN
VARCHAR2 );
```

Parameters

The parameters for DBMS_AUTOIM.SET_PARAMETER are as follows.

Table 18-2 SET_PARAMETER Procedure Parameters

Parameter	Description
`aim_task`	Turns the automatic IM automatic performance feature creation task on or off. Values: `enable`, `disable`.

Table 18-2 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
interval	Controls the statistics time window used by AIM to compute decisions. Value: Any positive integer representing the time window in seconds. The default is 900 seconds.

18.2.2 ACTIVITY_REPORT Function

Use this function to generate a report on the automatic creation of IM performance features. These features include Autonomous Join Groups, Autonomous Bloom Filter Optimization, Autonomous Optimized Arithmetic, and Autonomous Vector Optimization.

Syntax

```
DBMS_AUTOIM.ACTIVITY_REPORT( feature_id IN NUMBER, start_time IN TIMESTAMP,
end_time IN TIMESTAMP, type IN VARCHAR2, level IN VARCHAR2 )
```

Table 18-3 ACTIVITY_REPORT Function Parameters

Parameter	Type	Description
feature_id	integer	A NULL feature_id generates report on all AIM features. The default is NULL. You can get the feature_id for each feature from the view V$AIM_FEATURES .
start_time	timestamp	Start of the time window in which AIM activities are considered for the report. A NULL start_time returns the report for last execution. Default is NULL.
end_time	timestamp	End of time window in which AIM activities are considered for the report. A NULL end_time returns the report for last execution. Default is NULL.
type	varchar2	Type of the report. Possible values are: 'TEXT', 'HTML', 'XML'. Default is 'TEXT'.
level	varchar2	Level of verbosity. Possible values are 'BASIC' and 'DETAILED'. Default is 'BASIC'.

Example 18-1 ACTIVY_REPORT function

Create an AIM activity report for the previous day in TEXT format. The return type is CLOB.

```
declare
   report clob := null;
   begin
       report := DBMS_AUTOIM.activity_report();
   end;
```

> **Note:**
>
> See the view V$AIM_FEATURES to obtain the `feature_id` for each feature.

19
DBMS_ALERT

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples
- Summary of DBMS_ALERT Subprograms

19.1 DBMS_ALERT Overview

This scenario describes a possible use of the DBMS_ALERT package.

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (WAITONE) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (SIGNAL) whenever the trigger is fired.

19.2 DBMS_ALERT Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package.

19.3 DBMS_ALERT Constants

The DBMS_ALERT package uses the constants listed and described in tis topic.

Table 19-1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

19.4 DBMS_ALERT Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

19.5 DBMS_ALERT Exceptions

`DBMS_ALERT` raises the application error -20000 on error conditions.

Table 19-2 shows the messages and the procedures that can raise them.

19.6 DBMS_ALERT Operational Notes

This topic lists notes related to general and specific applications. Also, a list of DBMS_ALERT error messages is provided.

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

> **See Also:**
>
> DBMS_PIPE

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to five seconds and can be set by the `SET_DEFAULTS` procedure.

- `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 19-2 DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10001 lock request error, status: N	SIGNAL
ORU-10015 error: N waiting for pipe status	WAITANY
ORU-10016 error: N sending on pipe 'X'	SIGNAL
ORU-10017 error: N receiving on pipe 'X'	SIGNAL
ORU-10019 error: N on lock request	WAIT
ORU-10020 error: N on lock request	WAITANY
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

19.7 DBMS_ALERT Examples

In this example, suppose that you want to graph average salaries by department, for all employees. Your application needs to know whenever `EMP` is changed.

Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
    <<readagain>>:
   /* ... read the emp table and graph it */
      DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
      if status = 0 then goto <<readagain>>; else
      /* ... error condition */
```

The `EMP` table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
      DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
   END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

19.8 Summary of DBMS_ALERT Subprograms

This table lists the `DBMS_ALERT` subprograms and briefly describes them.

Table 19-3 DBMS_ALERT Package Subprograms

Subprogram	Description
REGISTER Procedure	Receives messages from an alert
REMOVE Procedure	Disables notification from an alert
REMOVEALL Procedure	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure	Sets the polling interval
SIGNAL Procedure	Signals an alert (send message to registered sessions)
WAITANY Procedure	Waits `timeout` seconds to receive alert message from an alert registered for session
WAITONE Procedure	Waits `timeout` seconds to receive message from named alert

19.8.1 REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
   name      IN  VARCHAR2,
   cleanup   IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 19-4 REGISTER Procedure Parameters

Parameter	Description
`name`	Name of the alert in which this session is interested
`cleanup`	Specifies whether to perform cleanup of any extant orphaned pipes used by the `DBMS_ALERT` package. This cleanup is only performed on the first call to `REGISTER` for each package instantiation. The default for the parameter is `TRUE`.

> **WARNING:**
>
> Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling `REMOVE`.

19.8.2 REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
   name  IN  VARCHAR2);
```

Parameters

Table 19-5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

19.8.3 REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated unusually can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

19.8.4 SET_DEFAULTS Procedure

In case a polling loop is required, use the `SET_DEFAULTS` procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (
   sensitivity  IN  NUMBER);
```

Parameters

Table 19-6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

19.8.5 SIGNAL Procedure

This procedure signals an alert. The effect of the SIGNAL call only occurs when the transaction in which it is made commits. If the transaction rolls back, SIGNAL has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
   name     IN  VARCHAR2,
   message  IN  VARCHAR2);
```

Parameters

Table 19-7 SIGNAL Procedure Parameters

Parameter	Description
name	Name of the alert to signal.
message	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

19.8.6 WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
   name      OUT  VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 19-8 WAITANY Procedure Parameters

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

```
-20000, ORU-10024: there are no alerts registered.
```

19.8.7 WAITONE Procedure

This procedure waits for a specific alert to occur.

An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
   name      IN   VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 19-9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.

Table 19-9 (Cont.) WAITONE Procedure Parameters

Parameter	Description
`message`	Returns the message associated with the alert. This is the message provided by the `SIGNAL` call. If multiple signals on this alert occurred before `WAITONE`, the message corresponds to the most recent `SIGNAL` call. Messages from prior `SIGNAL` calls are discarded.
`status`	Values returned: 0 - alert occurred 1 - timeout occurred
`timeout`	Maximum time to wait for an alert. If the named alert does not occurs before `timeout` seconds, this returns a status of 1.

20
DBMS_APP_CONT

The `DBMS_APP_CONT` package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

> **See Also:**
>
> *Oracle Database Development Guide* for explanations of application continuity and Transaction Guard, and the relationship between these two features:
>
> - "Using Transaction Guard"

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_APP_CONT Subprograms

20.1 DBMS_APP_CONT Overview

The DBMS_APP_CONT package can be used to solve this example issue.

Problem Description

One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

GET_LTXID_OUTCOME

The purpose of the GET_LTXID_OUTCOME Procedure is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.

> **See Also:**
>
> *Oracle Database Concepts* for explanation of Logical Transaction ID

20.2 DBMS_APP_CONT Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT` package.

To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user ;
```

20.3 Summary of DBMS_APP_CONT Subprograms

The `DBMS_APP_CONT` package contains the `GET_LTXID_OUTCOME` Procedure.

Table 20-1 DBMS_APP_CONT Package Subprograms

Subprogram	Description
ADD_SQL_CONNECTION_TEST Procedure	This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added.
APPLY_REPLAY_RULE Procedure	This procedure activates a new replay rule that is inherited by any sub-routine unless it is overwritten by a new rule applied to that sub-routine.
DELETE_SQL_CONNECTION_TEST Procedure	This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.
DISABLE_CONNECTION_TEST Procedure	This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.
ENABLE_CONNECTION_TEST Procedure	This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.
GET_LTXID_OUTCOME Procedure	Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.
GET_REPLAY_RULES Function	This function returns a list of the replay rules. From the results, you can test if any rule target is replayable with bit and function.
RESET_REPLAY_RULES Procedure	This procedure resets all existing replay rules. When you call this procedure, it clears all locally defined rules in the specified scope and restores them to the original state when they were inherited from their parent scope, or the service if parent scope is not specified.

20.3.1 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
   connection_test          IN VARCHAR2
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 20-2 ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier.

Usage Notes

The ADD_SQL_CONNECTION_TEST Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view DBA_CONNECTION_TESTS.

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

20.3.2 APPLY_REPLAY_RULE Procedure

This procedure activates a new replay rule that is inherited by any sub-routine unless it is overwritten by a new rule applied to that sub-routine.

A replay rule activated in a PL/SQL block loses its effect when reset_replay_rules is called or the block returns.

> **Note:**
>
> Calling this procedure in a sub-block of a procedure, function, or anonymous block applies the rule to its parent scope. When the sub-block returns, the rule will not lose its effect. Thus, you are not recommended to call this procedure in a sub-block.

Syntax

```
DBMS_APP_CONT.APPLY_REPLAY_RULE (
 replayable IN  BOOLEAN,
 targets    IN  BINARY_INTEGER,
 scope      IN  BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT);
```

Parameters

Table 20-3 *APPLY_REPLAY_RULE Procedure Parameters*

Parameter	Description
replayable	TRUE or FALSE, depending on weather the rule is replayable or not.

Table 20-3 (Cont.) *APPLY_REPLAY_RULE Procedure Parameters*

Parameter	Description
targets	Target effects on which this rule is applied. If multiple effects are desired, pass them as bit or as individual effects, such as: dbms_app_cont.side_effects + dbms_app_cont.autonomous_transactions
scope	Scope of the rule, either dbms_app_cont.scope_current (default) or dbms_app_cont.scope_parent.

20.3.3 DELETE_SQL_CONNECTION_TEST Procedure

This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_SESSION.DELETE_SQL_CONNECTION_TEST (
   connection_test          IN VARCHAR2
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 20-4 DELETE_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier. If the optional SERVICE_NAME qualifier is provided, only the test for that service name is deleted.

Usage Notes

If you are not certain if a test should be deleted, you can disable the test using DISABLE_CONNECTION_TEST Procedure. Only custom SQL tests can be deleted. Predefined tests cannot be deleted. Check for latest updates on service qualifier availability.

This procedure is owned by SYS at CDB$ROOT or PDB level, or SYS for when not multitenant.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

20.3.4 DISABLE_CONNECTION_TEST Procedure

This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_SESSION.DISABLE_CONNECTION_TEST (
   connection_test_type     IN VARCHAR2,
   connection_test          IN VARCHAR2,
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 20-5 DISABLE_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST_TYPE	The permitted values are: • DBMS_SESSION.SQL_TEST • DBMS_SESSION.PING_TEST • DBMS_SESSION.ENDREQUEST_TEST
CONNECTION_TEST	The SQL text used to test and drain connections. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. A disable at service name level takes precedence over an enable at PDB level. That is the PDB can be enabled, and the service disabled.

Usage Notes

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

20.3.5 ENABLE_CONNECTION_TEST Procedure

This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_SESSION.ENABLE_CONNECTION_TEST (
   connection_test_type     IN VARCHAR2,
   connection_test          IN VARCHAR2,
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 20-6 ENABLE_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST_TYPE	The connection type used when managing connection tests for draining before planned maintenance. See ADD, DELETE, ENABLE, DISABLE procedures for connection tests. The permitted values are: • DBMS_SESSION.SQL_TEST • DBMS_SESSION.PING_TEST • DBMS_SESSION.ENDREQUEST_TEST

Table 20-6 (Cont.) ENABLE_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections at the RDBMS before planned maintenance starts. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled.

Usage Notes

- This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level
- ENABLE_CONNECTION_TEST enables a connection test for draining sessions during planned maintenance. The enable operation applies to all RAC instances where the PDB is open. It persists across database restarts.
- This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

20.3.6 GET_LTXID_OUTCOME Procedure

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

Syntax

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (
 client_ltxid          IN    RAW,
 committed             OUT   BOOLEAN,
 user_call_completed   OUT   BOOLEAN)
```

Parameters

Table 20-7 *GET_LTXID_OUTCOME Procedure Parameters*

Parameter	Description
client_ltxid	Client-side logical transaction ID. Obtain the LTXID from the previous failed session using the client driver provided APIs - getLTXID for JDBC, and LogicalTransactionId for ODP.net., and OCI_ATTR_GET with LTXID for OCI.
committed	Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.

Table 20-7 (Cont.) *GET_LTXID_OUTCOME Procedure Parameters*

Parameter	Description
user_call_completed	Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter.

Exceptions

Table 20-8 GET_LTXID_OUTCOME Procedure Exceptions

Exception	Description
ORA-14950 - SERVER_AHEAD	The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage.
ORA-14951 - CLIENT_AHEAD	The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.
ORA-14906 - SAME_SESSION	Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.
ORA-14909 - COMMIT_BLOCKED	Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.
ORA-14952 - ERROR	The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.

20.3.7 GET_REPLAY_RULES Function

This function returns a list of the replay rules. From the results, you can test if any rule target is replayable with bit and function.

Syntax

```
DBMS_APP_CONT.GET_REPLAY_RULES (
 replayable BOOLEAN,
 scope      IN  BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT)
 RETURN     BINARY_INTEGER;
```

Parameters

Table 20-9 *GET_REPLAY_RULES Procedure Parameters*

Parameter	Description
`replayable`	`TRUE` or `FALSE`, depending on weather the rule is replayable or not.
`scope`	Scope of the rules, either `dbms_app_cont.scope_current` (default) or `dbms_app_cont.scope_parent`.

20.3.8 RESET_REPLAY_RULES Procedure

This procedure resets all existing replay rules. When you call this procedure, it clears all locally defined rules in the specified scope and restores them to the original state when they were inherited from their parent scope, or the service if parent scope is not specified.

Syntax

```
DBMS_APP_CONT.RESET_REPLAY_RULES (
 targets  IN  BINARY_INTEGER DEFAULT NULL,
 scope    IN  BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT);
```

Parameters

Table 20-10 *RESET_REPLAY_RULES Procedure Parameters*

Parameter	Description
`targets`	Target effects on which you want to reset the rules.
`scope`	Scope of the rule, either `dbms_app_cont.scope_current` (default) or `dbms_app_cont.scope_parent`.

21
DBMS_APP_CONT_ADMIN

This package provides a collection dba level admin operations in relation to Application Continuity.

This chapter contains the following topics:

- DBMS_APP_CONT_ADMIN Security Model
- Summary of DBMS_APP_CONT_ADMIN Subprograms

21.1 DBMS_APP_CONT_ADMIN Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT_ADMIN` package.

21.2 Summary of DBMS_APP_CONT_ADMIN Subprograms

This topic lists the `DBMS_APP_CONT_ADMIN` subprograms in alphabetical order and briefly describes them.

Table 21-1 DBMS_APP_CONT_ADMIN Package Subprograms

Subprogram	Description
ACCHK_CLEAR_FILTER Procedure	This procedure clears an ACCHK filter by providing a filter type and filter name.
ACCHK_SET Procedure	This procedure enables or disables data collection for acchk protection for your application when using Application Continuity or Transparent Application Continuity. The `DISABLE_TIME` parameter is used to extend the runtime. Default is `5` minutes.
ACCHK_SET_FILTER Procedure	This procedure sets ACCHK filtering options for `acchk` protection analysis by service name, module name, program name, and machine name.
ACCHK_SHOW_FILTERS Procedure	This procedure uses a cursor to show ACCHK filters ordered by service, program, module, and machine name.
ADD_SQL_CONNECTION_TEST Procedure	This procedure adds a new connection test that is used during draining sessions before planned maintenance begins.
DELETE_SQL_CONNECTION_TEST Procedure	This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.
DISABLE_CONNECTION_TEST Procedure	This procedure disables usage of a connection test during draining of sessions.
DISABLE_FAILOVER Procedure	This procedure disables failover on a given service.
ENABLE_AC Procedure	This procedure enables Application Continuity (AC) on a given service.
ENABLE_CONNECTION_TEST Procedure	This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

Table 21-1 (Cont.) DBMS_APP_CONT_ADMIN Package Subprograms

Subprogram	Description
ENABLE_RESET_STATE Procedure	This procedure enables clearing the session state usage between requests, so that each new request starts clean (usage web and stateless applications).
ENABLE_TAC Procedure	This procedure enables Transparent Application Continuity (TAC) on a given service.
MODIFY_SERVICE Procedure	This procedure modifies a database service using the given parameters.
SET_DRAINING Procedure	This procedure configures draining options for your service, such as timeout value and stop option.
SET_LOAD_BALANCING Procedure	This procedure configures load balancing options for your service.

21.2.1 ACCHK_CLEAR_FILTER Procedure

This procedure clears an ACCHK filter by providing a filter type, filter name, or all the filters.

- You should call `ACCHK_CLEAR_FILTER` before `ACCHK_SET`, which loads the filters.
- `ACCHK_CLEAR_FILTER` is set at the PDB level.

Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_CLEAR_FILTER (
   filter_type IN NUMBER   DEFAULT NULL,
   filter_name IN VARCHAR2 DEFAULT NULL,
   purge_all   IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 21-2 ACCHK_CLEAR_FILTER Procedure Parameters

Parameter	Description
`filter_type`	Type of the filter, which can be one of the constants `SERVICE_FILTER`, `PROGRAM_FILTER`, `MODULE_FILTER`, or `MACHINE_FILTER` from the `DBMS_APP_CONT_ADMIN` package.
`filter_name`	Name of the filter that you want to delete when `purge_all` is FALSE.
`purge_all`	This parameter is used to delete all the filters. • `TRUE`- enables deletion of all the filters. • `FALSE`- disables deletion of all the filters. When this parameter is set to `FALSE`, then only the specified filter is deleted.

Error Messages

Table 21-3 ACCHK_CLEAR_FILTER Procedure Error Messages

Error Code	Description
ORA-20000	Provided filter name exceeds maximum number of characters.
ORA-20000	Invalid filter type value.
ORA-20000	Filter name is not specified.

Examples

The following examples illustrate how to clear an ACCHK service filter:

```
SQL> execute
dbms_app_cont_admin.acchk_clear_filter(DBMS_APP_CONT_ADMIN.SERVICE_FILTER,
'ORACLE.Service1');
```

21.2.2 ACCHK_SET Procedure

This procedure enables or disables data collection for `acchk` protection reports for your application when using Application Continuity or Transparent Application Continuity. The `DISABLE_TIME` parameter is used to extend the runtime. Default value is `10` minutes.

Enabling or disabling data collection applies to the level connected, that is, a CDB or a PDB.

- `acchk` is enabled/disabled at your CDB if connected to the container.
- `acchk` is enabled/disabled at your PDB only when connected to the PDB.

Data collection applies to new sessions only.

Once enabled, data is collected for the workload run under this service. You can then view this data in the `ACCHK_REPORT`s and can also be mined in the `ACCHK` views.

Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_SET (
   enabled                 IN BOOLEAN,
   disable_time_in_seconds  DEFAULT 600);
```

Parameters

Table 21-4 ACCHK_SET Procedure Parameters

Parameter	Description
enabled	This parameter is used to enable or disable data collection at a CDB or PDB level. • `TRUE`-enables data collection at this level. • `FALSE`-explicitly disables data collection.

Table 21-4 (Cont.) ACCHK_SET Procedure Parameters

Parameter	Description
disable_time_in_seconds	Optional parameter used to disable ACCHK tracing automatically in a given number of seconds. The maximum value that you can specify is 3600 seconds. The default value is 600 seconds.

Usage Notes

- This procedure is owned by SYS at CDB$ROOT or PDB level, or by SYS when not multitenant
- The acchk activation is enabled across all instances of RAC supporting that service.
- Enabling is persistent to allow for failover and restart tests, that is, implementation uses ALTER SESSION SET EVENTS ….. SCOPE=BOTH. The enable is per database. For Data Guard, enable and disable must be at each database.

Examples

Application Continuity Protection Check is not enabled by default. Follow this procedure to enable or disable ACCHK and generate reports to check protection level for the applications.

1. Grant read access to the users, who will run the Application Continuity Protection Check report and views, using the ACCHK_READ role:

   ```
   GRANT ACCHK_READ TO USER;
   ```

2. Enable Application Continuity tracing for your applications using the dbms_app_cont_admin.acchk_set(true) procedure:

   ```
   SQL> execute dbms_app_cont_admin.acchk_set(true);
   ```

   By default, ACCHK is disabled automatically after 600 seconds. You can specify a lower number to reduce the auto disable time. For example, to disable ACCHK after 300 seconds:

   ```
   SQL> dbms_app_cont_admin.acchk_set(true,300);
   ```

   The dbms_app_cont_admin.acchk_set(true) procedure enables Application Continuity tracing at the database level to which you are connected. If you are connected at the CDB level, then tracing is enabled for the CDB, and if you are connected at the PDB level, then tracing is enabled for the PDB.

   > **Note:**
   >
   > Set the COMPATIBLE parameter to 12.2.0 or greater.

3. To disable Application Continuity tracing for new sessions in your applications:

   ```
   SQL> execute dbms_app_cont_admin.acchk_set(false);
   ```

> **Note:**
>
> The tracing will not be disabled for the current sessions until the sessions are terminated.

21.2.3 ACCHK_SET_FILTER Procedure

This procedure sets ACCHK filtering options for `acchk` protection analysis by service name, module name, program name, and machine name.

Filter options are cumulative by multiple calls of this procedure.

- You should call `ACCHK_SET_FILTER` before `ACCHK_SET`, which loads the filters.
- `ACCHK_SET_FILTER` is set at the PDB level.

Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_SET_FILTER (
   filter_type IN NUMBER,
   filter_name IN VARCHAR2);
```

Parameters

Table 21-5 ACCHK_SET_FILTER Procedure Parameters

Parameter	Description
`filter_type`	Type of the filter, which can be one of the constants`SERVICE_FILTER`, `PROGRAM_FILTER`, `MODULE_FILTER`, or `MACHINE_FILTER` from the `DBMS_APP_CONT_ADMIN` package.
`filter_name`	Name of the filter, which must match a service name, program name, module name, or machine name.

Error Messages

Table 21-6 ACCHK_SET_FILTER Procedure Error Messages

Error Code	Description
`ORA-20000`	Provided filter name exceeds maximum number of characters.
`ORA-20000`	Service `service_name` does not exist.
`ORA-20000`	Invalid filter type value.
`ORA-20000`	Filter name is not specified.
`ORA-20000`	The limit has been reached, only 1024 filters are allowed.
`ORA-20000`	Filter name already exists.

Examples

The following examples illustrate how to set filters for ACCHK constants:

- To set a service filter:

```
SQL> execute
dbms_app_cont_admin.acchk_set_filter(DBMS_APP_CONT_ADMIN.SERVICE_FILTER,
'ORACLE.Service1');
```

- To set a program filter:

```
SQL> execute
dbms_app_cont_admin.acchk_set_filter(DBMS_APP_CONT_ADMIN.PROGRAM_FILTER,
'Oracle.Program');
```

- To set a module filter:

```
SQL> execute
dbms_app_cont_admin.acchk_set_filter(DBMS_APP_CONT_ADMIN.MODULE_FILTER,
'Oracle.Module');
```

21.2.4 ACCHK_SHOW_FILTERS Procedure

This procedure uses a cursor to show ACCHK filters ordered by service, program, module, and machine name.

Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_SHOW_FILTERS;
```

Examples

The following examples illustrate how to show ACCHK filters:

```
SQL> execute dbms_app_cont_admin.acchk_show_filters;
ResultSet TYPE  FILTER_NAME  SERVICE          PROGRAM            MODULE
#1                           oracle.service1  oracle.program     oracle.module
```

21.2.5 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_APP_CONT_ADMIN.ADD_SQL_CONNECTION_TEST (
   connection_test          IN VARCHAR2
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 21-7 ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.

Table 21-7 (Cont.) ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier.

Usage Notes

The ADD_SQL_CONNECTION_TEST Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view DBA_CONNECTION_TESTS.

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

21.2.6 DELETE_SQL_CONNECTION_TEST Procedure

This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_APP_CONT_ADMIN.DELETE_SQL_CONNECTION_TEST (
   connection_test          IN VARCHAR2
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 21-8 DELETE_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier. If the optional SERVICE_NAME qualifier is provided, only the test for that service name is deleted.

Usage Notes

If you are not certain if a test should be deleted, you can disable the test using DISABLE_CONNECTION_TEST Procedure. Only custom SQL tests can be deleted. Predefined tests cannot be deleted. Check for latest updates on service qualifier availability.

This procedure is owned by SYS at CDB$ROOT or PDB level, or SYS for when not multitenant.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

21.2.7 DISABLE_CONNECTION_TEST Procedure

This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_APP_CONT_ADMIN.DISABLE_CONNECTION_TEST (
   connection_test_type     IN VARCHAR2,
   connection_test          IN VARCHAR2,
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 21-9 DISABLE_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST_TYPE	The permitted values are: • DBMS_APP_CONT_ADMIN.SQL_TEST • DBMS_APP_CONT_ADMIN.PING_TEST • DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST
CONNECTION_TEST	The SQL text used to test and drain connections. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. A disable at service name level takes precedence over an enable at PDB level. That is the PDB can be enabled, and the service disabled.

Usage Notes

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

21.2.8 DISABLE_FAILOVER Procedure

This procedure disables failover on a given service.

Syntax

```
DBMS_APP_CONT_ADMIN.DISABLE_FAILOVER (
    service_name IN VARCHAR2);
```

Parameters

Table 21-10 DISABLE_FAILOVER Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, then failover is disabled only for that service name.

Usage Notes

- You must have the PDBADMIN user permissions to use this procedure.
- Use the full service name on which you want to disable the failover.

Examples

The following example illustrates how to disable failover for a service:

```
SQL> execute dbms_app_cont_admin.disable_failover('TPURGENT');
```

21.2.9 ENABLE_AC Procedure

This procedure enables Application Continuity (AC) on a given service.

Syntax

```
DBMS_APP_CONT_ADMIN.ENABLE_AC (
   service_name              IN VARCHAR2,
   failover_restore          IN VARCHAR2       DEFAULT 'LEVEL1'
   replay_initiation_timeout IN BINARY_INTEGER DEFAULT 300);
```

Parameters

Table 21-11 ENABLE_AC Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, AC is enabled only for the specified service. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled.
FAILOVER_RESTORE	Failover restore. Possible values are NONE or LEVEL1.
REPLAY_INITIATION_TIMEOUT	Replay timeout that specifies how many seconds after a request is submitted to allow that request to replay.

Usage Notes

- You must have the PDBADMIN user permissions to use this procedure.
- Use the full service name on which you want to enable AC.

Examples

The following example illustrates how to enable Application Continuity for your service:

```
SQL> execute dbms_app_cont_admin.enable_ac('TPURGENT', 'LEVEL1', 600);
```

21.2.10 ENABLE_CONNECTION_TEST Procedure

This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```
DBMS_APP_CONT_ADMIN.ENABLE_CONNECTION_TEST (
   connection_test_type     IN VARCHAR2,
   connection_test          IN VARCHAR2,
   service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 21-12 ENABLE_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST_TYPE	The connection type used when managing connection tests for draining before planned maintenance. See ADD, DELETE, ENABLE, DISABLE procedures for connection tests. The permitted values are: • DBMS_APP_CONT_ADMIN.SQL_TEST • DBMS_APP_CONT_ADMIN.PING_TEST • DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST • DBMS_APP_CONT_ADMIN.BEGINREQUEST_TEST
CONNECTION_TEST	The SQL text used to test and drain connections at the RDBMS before planned maintenance starts. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled.

Usage Notes

- This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level
- ENABLE_CONNECTION_TEST enables a connection test for draining sessions during planned maintenance. The enable operation applies to all RAC instances where the PDB is open. It persists across database restarts.

- This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

21.2.11 ENABLE_RESET_STATE Procedure

This procedure enables clearing the session state usage between requests, so that each new request starts clean (usage web and stateless applications).

Syntax

```
DBMS_APP_CONT_ADMIN.ENABLE_RESET_STATE (
   service_name IN VARCHAR2,
   level        IN VARCHAR2 DEFAULT AUTO);
```

Parameters

Table 21-13 ENABLE_RESET_STATE Procedure Parameters

Parameter	Description
`SERVICE_NAME`	Optional service name qualifier. If the optional service name qualifier is provided, `RESET_STATE` is enabled only for the specified service.
`LEVEL`	Level of the Oracle Database reset session state configuration. Available options are `LEVEL1`, `LEVEL2`, or `AUTO`.

Usage Notes

- You must have the `PDBADMIN` user permissions to use this procedure.
- Use the full service name for which you want to clear the session state.

Examples

The following example illustrates how to enable reset state for your service:

```
SQL> execute dbms_app_cont_admin.enable_reset_state('TPURGENT', 'AUTO');
```

21.2.12 ENABLE_TAC Procedure

This procedure enables Transparent Application Continuity (TAC) on a given service.

Syntax

```
DBMS_APP_CONT_ADMIN.ENABLE_TAC (
   service_name              IN VARCHAR2,
   failover_restore          IN VARCHAR2       DEFAULT 'AUTO'
   replay_initiation_timeout IN BINARY_INTEGER DEFAULT 300
   session_state_consistency IN VARCHAR2       DEFAULT 'AUTO');
```

Parameters

Table 21-14 ENABLE_TAC Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, TAC is enabled only for the specified service. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled.
FAILOVER_RESTORE	Failover restore. Possible values are AUTO or LEVEL1.
REPLAY_INITIATION_TIMEOUT	Replay timeout that specifies how many seconds after a request is submitted to allow that request to replay.
SESSION_STATE_CONSISTENCY	Session State Consistency. Possible values are AUTO or HYBRID.

Exceptions

- When FAILOVER_RESTORE is set to NULL or FAILOVER_RESTORE is not set to AUTO or LEVEL1: ORA-20000 - Invalid failover_restore parameter.
- When SESSION_STATE_CONSISTENCY is set to NULL or SESSION_STATE_CONSISTENCY is not set as AUTO: ORA-20000 - Invalid session_state_consistency parameter.

Usage Notes

- You must have the PDBADMIN user permissions to use this procedure.
- Use the full service name on which you want to enable TAC.

Examples

The following example illustrates how to enable Transparent Application Continuity for your service:

```
SQL> execute dbms_app_cont_admin.enable_tac('TPURGENT', 'AUTO', 600, 'AUTO');
```

21.2.13 MODIFY_SERVICE Procedure

This procedure modifies a database service using the given parameters.

Syntax

```
DBMS_APP_CONT_ADMIN.MODIFY_SERVICE(
   service_name   IN VARCHAR2,
   service_params IN svc_parameter_array);
```

Parameters

Table 21-15 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary
parameter_array	Associative array with name/value pairs of the service attributes. Supported names: • aq_ha_notifications • auto_connection_rebalance • clb_goal • commit_fast_path • commit_outcome • drain_timeout • edition • failover_delay • failover_method • failover_restore • failover_retries • failover_type • goal • replay_initiation_timeout • reset_state • retention_timeout • session_state_consistency • sql_translation_profile • stop_option • template_timeout • true_cache_service
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12*c*, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
auto_connection_rebalance	Automatically balances the workload management.
clb_goal	Connection Load Balancing goal, either LONG or SHORT.
commit_fast_path	Enable or disable Oracle Database transaction guard.
commit_outcome	Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable.Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note: • Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set. • commit_outcome has no effect on active Data Guard and read-only databases. • commit_outcome is allowed only on user-defined database services

Table 21-15 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
drain_timeout	When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, to stop and relocate drains for this time by default.
edition	If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_restore	For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state. For AC OCI, use NONE for applications that are not STATIC.
failover_retries	Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
failover_type	Failover TYPE for the service for Application Continuity and TAF.
goal	Workload management goal directive for the service. Valid values: • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
replay_initiation_timeout	For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.

Table 21-15 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
reset_state	Use to clean session state automatically by Oracle Database between requests.
retention_timeout	Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
session_state_consistency	Describes how nontransactional is changed during a request. This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.
sql_translation_profile	Name of SQL translation profile.
stop_option	Stop options for the service.
template_timeout	Template timeout time in seconds.
true_cache_service	Name of the True Cache service being registered with the primary service.

Examples

```
DECLARE
params dbms_app_cont_admin.svc_parameter_array;
BEGIN
   params('FAILOVER_TYPE')             :='TRANSACTION';
   params('FAILOVER_RESTORE')          :='LEVEL2';
   params('RESET_STATE')               :='NONE';
   params('SESSION_STATE_CONSISTENCY') :='DYNAMIC';
   DBMS_APP_CONT_ADMIN.MODIFY_SERVICE('ernie.example.com', params);
END;
```

21.2.14 SET_DRAINING Procedure

This procedure configures draining options for your service, such as timeout value and stop option.

Syntax

```
DBMS_APP_CONT_ADMIN.SET_DRAINING (
   service_name  IN VARCHAR2,
   drain_timeout IN BINARY_INTEGER DEFAULT 300
   stop_option   IN VARCHAR2       DEFAULT 'NONE');
```

Parameters

Table 21-16 SET_DRAINING Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, draining is set only for that service.
DRAIN_TIMEOUT	Specify the time, in seconds, allowed for resource draining to be completed. Accepted values are an empty string (""), 0, or any positive integer.
STOP_OPTION	Specify the method of stopping the service. Available options are NONE, IMMEDIATE, or TRANSACTIONAL.

Examples

The following example illustrates how to set draining options for your service:

```
SQL> execute dbms_app_cont_admin.set_draining('TPURGENT', 300, 'IMMEDIATE');
```

21.2.15 SET_LOAD_BALANCING Procedure

This procedure configures load balancing options for your service.

Syntax

```
DBMS_APP_CONT_ADMIN.SET_LOAD_BALANCING (
   service_name IN VARCHAR2,
   goal         IN VARCHAR2);
```

Parameters

Table 21-17 SET_LOAD_BALANCING Procedure Parameters

Parameter	Description
SERVICE_NAME	Optional service name qualifier. If the optional service name qualifier is provided, load balancing is set only for the specified service.
GOAL	Load balancing goal. Possible values are: • CLBGOAL- Connection Load Balancing Goal. • RLBGOAL- Runtime Load Balancing Goal.

Examples

The following example illustrates how to set load balancing goal for your service:

```
SQL> execute dbms_app_cont_admin.set_load_balancing('TPURGENT', 'CLBGOAL');
```

22
DBMS_APP_CONT_REPORT

This procedure generates a report of ACCHK trace collected while `ACCHK_SET(TRUE)`.

This chapter contains the following topics:

- DBMS_APP_CONT_REPORT Security Model
- Summary of DBMS_APP_CONT_REPORT Subprograms

22.1 DBMS_APP_CONT_REPORT Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT_REPORT` package.

22.2 Summary of DBMS_APP_CONT_REPORT Subprograms

This topic lists the `DBMS_APP_CONT_REPORT` subprograms in alphabetical order and briefly describes them.

Table 22-1 *DBMS_APP_CONT_REPORT Package Subprograms*

Subprogram	Description
ACCHK_REPORT Procedure	This procedure provides a report of your run. The data is derived from the `acchk` views.

22.2.1 ACCHK_REPORT Procedure

This procedure generates a report of your run. The data is derived from the `acchk` views.

Syntax

```
DBMS_APP_CONT_REPORT.ACCHK_REPORT (
   level        IN NUMBER    DEFAULT SUMMARY,
   service_name IN VARCHAR2  DEFAULT NULL,
   start_time   IN DATE      DEFAULT NULL,
   duration     IN NUMBER    DEFAULT NULL,
   source       IN NUMBER    DEFAULT FROM_TABLES);
```

Parameters

Table 22-2 ACCHK_REPORT Procedure Parameters

Parameter	Description
`level`	These are constants. • `SUMMARY`-summary report only (default) • `WARNING`-summary and warnings • `FULL`-summary and all workload capture, including where there are no warnings

Table 22-2 (Cont.) ACCHK_REPORT Procedure Parameters

Parameter	Description
service_name	The service name qualifier (Optional). The value NULL applies to all service_names.
start_time	Optional parameter for the start time to filter events and statistics. By default, starts at first available row in tables/trace with ACCHK.
duration	Optional parameter for the amount of time in seconds to filter events and statistics. By default, uses available rows in tables/traces starting from the start_time value. **Note:** If both start_time and duration are not specified, then all available rows in tables/traces are used for reporting.
source	Optional parameter for obtaining the statistics and events from trace files when capture was in read-only mode by providing the constant value DBMS_APP_CONT_REPORT.FROM_TRACES. DBMS_APP_CONT_REPORT.FROM_TABLES is the default value and uses the views CDB_ACCHK_STATISTICS and CDB_ACCHK_EVENTS for the report. There are two constants from DBMS_APP_CONT_REPORT: • FROM_TABLES- The procedure uses CDB_ACCHK_STATISTICS and CDB_ACCHK_EVENTS to show the report. • FROM_TRACES- The procedure uses traces to show the report.

Procedure Exceptions

The exceptions of DBMS_APP_CONT_REPORT.ACCHK_REPORT procedure are as follows:

- 20000- Invalid report level, use DBMS_APP_CONT_REPORT with SUMMARY or WARNING or FULL.
- 20000- Invalid duration, set a valid value.
- 20000- Invalid source, use DBMS_APP_CONT_REPORT with either FROM_TABLES or FROM_TRACES.

Example

To get the recorded statistics and events starting from 10 minutes ago:

```
execute dbms_app_cont_report.acchk_report(dbms_app_cont_report.FULL,
start_time => current_date -INTERVAL '10' MINUTE);
```

To get the recorded statistics and events starting from 10 minutes ago up to 420 seconds (7 minutes):

```
execute dbms_app_cont_report.acchk_report(dbms_app_cont_report.FULL,
start_time  => current_date -INTERVAL '10' MINUTE, duration => 420);
```

To get the recorded statistics and events of the first 60 seconds starting from the first recorded statistic or event:

```
execute dbms_app_cont_report.acchk_report(dbms_app_cont_report.FULL, duration
=> 60);
```

To get the report by using tables:

```
execute dbms_app_cont_report.acchk_report(source =>
dbms_app_cont_report.FROM_TABLES);
```

To get the report by using traces. Use this option when in read-only mode:

```
execute dbms_app_cont_report.acchk_report(source =>
dbms_app_cont_report.FROM_TRACES);
```

To get only the summary report:

```
execute dbms_app_cont_report.acchk_report(dbms_app_cont_report.SUMMARY);
```

23
DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_APPLICATION_INFO Subprograms

23.1 DBMS_APPLICATION_INFO Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

23.2 DBMS_APPLICATION_INFO Security Model

No further privileges are required. The `DBMSAPIN.SQL` script is already run as a part of standard database creation.

> **Note:**
>
> The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

23.3 DBMS_APPLICATION_INFO Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

23.4 Summary of DBMS_APPLICATION_INFO Subprograms

This table lists and describes the DBMS_APPLICATION_INFO package subprograms.

Table 23-1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
READ_CLIENT_INFO Procedure	Reads the value of the client_info field of the current session
READ_MODULE Procedure	Reads the values of the module and action fields of the current session
SET_ACTION Procedure	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure	Sets the client_info field of the session
SET_MODULE Procedure	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure	Sets a row in the V$SESSION_LONGOPS table

23.4.1 READ_CLIENT_INFO Procedure

This procedure reads the value of the client_info field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
   client_info OUT VARCHAR2);
```

Parameters

Table 23-2 *READ_CLIENT_INFO Procedure Parameters*

Parameter	Description
client_info	Last client information value supplied to the SET_CLIENT_INFO procedure.

23.4.2 READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
   module_name OUT VARCHAR2,
   action_name OUT VARCHAR2);
```

Parameters

Table 23-3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.

Table 23-3 (Cont.) READ_MODULE Procedure Parameters

Parameter	Description
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

23.4.3 SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
   action_name IN VARCHAR2);
```

Parameters

Table 23-4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

   DBMS_APPLICATION_INFO.SET_ACTION(
      action_name => 'transfer from chk to sav');
   UPDATE chk SET bal = bal + :amt
      WHERE acct# = :acct;
   UPDATE sav SET bal = bal - :amt
      WHERE acct# = :acct;
   COMMIT;
   DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

23.4.4 SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
   client_info IN VARCHAR2);
```

Parameters

Table 23-5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.

> **Note:**
>
> CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

23.4.5 SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
   module_name IN VARCHAR2,
   action_name IN VARCHAR2);
```

Parameters

Table 23-6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

23.4.6 SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET_SESSION_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V$SESSION_LONGOPS view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
   rindex      IN OUT BINARY_INTEGER,
   slno        IN OUT BINARY_INTEGER,
   op_name     IN     VARCHAR2       DEFAULT NULL,
   target      IN     BINARY_INTEGER DEFAULT 0,
   context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
   totalwork   IN     NUMBER         DEFAULT 0,
   target_desc IN     VARCHAR2       DEFAULT 'unknown target',
   units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 23-7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
rindex	A token which represents the v$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.
slno	Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.
op_name	Specifies the name of the long running task. It appears as the OPNAME column of v$session_longops. The maximum length is 64 bytes.
target	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.
context	Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.
sofar	Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.
totalwork	Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.
units	Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```
DECLARE
        rindex    BINARY_INTEGER;
        slno      BINARY_INTEGER;
```

```
  totalwork number;
  sofar     number;
  obj       BINARY_INTEGER;

BEGIN
  rindex := dbms_application_info.set_session_longops_nohint;
  sofar := 0;
  totalwork := 10;

  WHILE sofar < 10 LOOP
    -- update obj based on sofar
    -- perform task on object target

    sofar := sofar + 1;
    dbms_application_info.set_session_longops(rindex, slno,
      "Operation X", obj, 0, sofar, totalwork, "table", "tables");
  END LOOP;
END;
```

24
DBMS_APPLY_ADM

The `DBMS_APPLY_ADM` package provides subprograms to configure and manage Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_APPLY_ADM Subprograms

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about XStream outbound servers and inbound servers

24.1 DBMS_APPLY_ADM Overview

The `DBMS_APPLY_ADM` package provides interfaces to start, stop, and configure Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

Note:

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.

See Also:

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

24.2 DBMS_APPLY_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles..

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

Note:

The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

Oracle Database XStream Guide for information about configuring an XStream administrator

24.3 DBMS_APPLY_ADM Deprecated Subprograms

The `NONE` value for the `commit_serialization` apply component parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

> **Note:**
>
> Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

> **See Also:**

> SET_PARAMETER Procedure

24.4 Summary of DBMS_APPLY_ADM Subprograms

This table topic lists and describes the `DBMS_APPLY_ADM` subprograms.

Table 24-1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ALTER_APPLY Procedure	Alters an apply component
CLEAR_KEY_COLUMNS Procedure	Removes the key columns that were used as the substitute primary key by the `SET_KEY_COLUMNS` procedure
COMPARE_OLD_VALUES Procedure	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure	Creates an apply component
CREATE_OBJECT_DEPENDENCY Procedure	Creates an object dependency
DELETE_ALL_ERRORS Procedure	Deletes all the error transactions for the specified apply component
DELETE_ERROR Procedure	Deletes the specified error transaction
DROP_APPLY Procedure	Drops an apply component
DROP_OBJECT_DEPENDENCY Procedure	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure	Reexecutes the error transactions for the specified apply component
EXECUTE_ERROR Procedure	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function	Returns the message payload from the error queue for the specified message number and transaction identifier
HANDLE_COLLISIONS	Enables or disables basic conflict resolution for an apply process and a table

Table 24-1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_DML_CONFLICT_HANDLER Procedure	Adds, modifies, or removes a prebuilt DML conflict handler for `INSERT`, `UPDATE`, or `DELETE` conflicts on the specified object
SET_DML_HANDLER Procedure	Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database
SET_ENQUEUE_DESTINATION Procedure	Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure	Specifies whether a message that satisfies the specified rule is executed by an apply component
SET_GLOBAL_INSTANTIATION_SCN Procedure	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure	Sets an apply parameter to the specified value
SET_REPERROR_HANDLER Procedure	Specifies how a particular error is handled based on its error number
SET_SCHEMA_INSTANTIATION_SCN Procedure	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database
SET_TABLE_INSTANTIATION_SCN Procedure	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure	Sets or removes a value dependency
START_APPLY Procedure	Directs the apply component to start applying messages
STOP_APPLY Procedure	Stops the apply component from applying any messages and rolls back any unfinished transactions being applied

Note:

All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

24.4.1 ALTER_APPLY Procedure

This procedure alters an apply component.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
   apply_name                IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   message_handler           IN  VARCHAR2  DEFAULT NULL
   remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
   ddl_handler               IN  VARCHAR2  DEFAULT NULL,
   remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
   apply_user                IN  VARCHAR2  DEFAULT NULL,
   apply_tag                 IN  RAW       DEFAULT NULL,
   remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler         IN  VARCHAR2  DEFAULT NULL,
   remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 24-2 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.
rule_set_name	The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.

Table 24-2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue. If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply component. See "Usage Notes" in the CREATE_APPLY Procedure for more information about a message handler procedure.
remove_message_handler	If TRUE, then the procedure removes the message handler for the specified apply component. If FALSE, then the procedure retains any message handler for the specified apply component. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.
ddl_handler	A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" in the CREATE_APPLY Procedure for more information about a DDL handler procedure.
remove_ddl_handler	If TRUE, then the procedure removes the DDL handler for the specified apply component. If FALSE, then the procedure retains any DDL handler for the specified apply component. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 24-2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the apply component • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package. **Note:** If the apply user for an apply component is dropped using DROP USER. . . CASCADE, then the apply component is also dropped automatically.
apply_tag	A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply component is not changed. The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17')

Table 24-2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply component. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways: • When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. • When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component. The precommit handler procedure must conform to the following restrictions: • Any work that commits must be an autonomous transaction. • Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" in the CREATE_APPLY Procedure for more information about a precommit handler procedure.
remove_precommit_handler	If TRUE, then the procedure removes the precommit handler for the specified apply component. If FALSE, then the procedure retains any precommit handler for the specified apply component. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 24-2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue. If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply component. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

The following usage notes apply to this procedure:

- Automatic Restart of Apply Components
- The ALTER_APPLY Procedure and XStream Outbound Servers
- The ALTER_APPLY Procedure and XStream Inbound Servers

Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler

The ALTER_APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The `apply_user` parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: `message_handler`, `ddl_handler`, and `precommit_handler`.

  The client application can perform custom processing of the LCRs instead if necessary.
- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the `apply_tag` parameter.

The ALTER_APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

24.4.2 CLEAR_KEY_COLUMNS Procedure

This procedure removes the key columns that were used as the substitute primary key by the `SET_KEY_COLUMNS` procedure.

Syntax

```
DBMS_APPLY_ADM.CLEAR_KEY_COLUMNS(
   apply_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameter

Table 24-3 CLEAR_KEY_COLUMNS Procedure Parameter

Parameter	Description
`apply_name`	The apply component name.

Usage Notes

The following usage notes apply to this procedure:

The CLEAR_KEY_COLUMNS Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The CLEAR_KEY_COLUMNS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The CLEAR_KEY_COLUMNS Procedure and CDBs

This procedure removes the columns that are used as a substitute primary key. You must perform the `CLEAR_KEY_COLUMNS` procedure in the appropriate PDB.

24.4.3 COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply.

This procedure is relevant only for `UPDATE` and `DELETE` operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_list         IN VARCHAR2,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_table        IN DBMS_UTILITY.LNAME_ARRAY,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 24-4 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`object_name`	The name of the source table specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`column_list`	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify `*` to include all nonkey columns.
`column_table`	A PL/SQL associative array of type `DBMS_UTILITY.LNAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.
`operation`	The name of the operation, which can be specified as: • `UPDATE` for `UPDATE` operations • `DELETE` for `DELETE` operations • `*` for both `UPDATE` and `DELETE` operations
`compare`	If `compare` is `TRUE`, the old values of the specified columns are compared during apply. If `compare` is `FALSE`, the old values of the specified columns are not compared during apply.

Table 24-4 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

The following usage notes apply to this procedure:

- Conflict Detection
- The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers
- The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

Conflict Detection

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the `COMPARE_OLD_VALUES` procedure, specify the set of columns in the `column_list` or `column_table` parameter, and set the `compare` parameter to `FALSE`.

In addition, when the `compare_key_only` apply component parameter is set to `Y`, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the `compare_key_only` apply component parameter is set to `N`, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

Note:

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
- This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

See Also:

SET_PARAMETER Procedure for more information about the `compare_key_only` apply component parameter

The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.4 CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
   queue_name              IN  VARCHAR2,
   apply_name              IN  VARCHAR2,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   message_handler         IN  VARCHAR2  DEFAULT NULL,
   ddl_handler             IN  VARCHAR2  DEFAULT NULL,
   apply_user              IN  VARCHAR2  DEFAULT NULL,
   apply_database_link     IN  VARCHAR2  DEFAULT NULL,
   apply_tag               IN  RAW       DEFAULT '00',
   apply_captured          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler       IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-5 CREATE_APPLY Procedure Parameters

Parameter	Description
queue_name	The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the apply component is created.
apply_name	The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. **Note:** The apply_name setting cannot be altered after the apply component is created.
rule_set_name	The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist.

Table 24-5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply component. See "Usage Notes" for more information about a message handler procedure.
ddl_handler	A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" for more information about a DDL handler procedure.
apply_user	The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used. The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the apply component • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles. You can use the DBMS_XSTREAM_AUTH package to grant and revoke administrative privileges in XStream configuration. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects. **Note:** If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically. See "Usage Notes" for more information about this parameter.

Table 24-5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_database_link	The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database. **Note:** The apply_database_link setting cannot be altered after the apply component is created.
apply_tag	A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter. By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply component generates redo entries with NULL tags.
apply_captured	Either TRUE or FALSE. If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Replication capture process. If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Replication capture process, such as persistent LCRs or user messages. To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components. **Note:** The apply_captured setting cannot be altered after the apply component is created.

Table 24-5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
`precommit_handler`	A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways: • When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. • When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction. • When a user or application enqueues messages and then issues a `COMMIT` statement, the commit directive is enqueued automatically. For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component. The precommit handler procedure must conform to the following restrictions: • Any work that commits must be an autonomous transaction. • Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" for more information about a precommit handler procedure.
`negative_rule_set_name`	The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a negative rule set in the `hr` schema named `neg_apply_rules`, enter `hr.neg_apply_rules`. If the schema is not specified, then the current user is the default. If you specify `NULL`, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the `apply_captured` parameter. An error is returned if the specified rule set does not exist. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.

Table 24-5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply component is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically. The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the DBA_APPLY_PROGRESS data dictionary view.

Usage Notes

The following sections describe usage notes for this procedure:

- DBA Role Requirement
- Handler Procedure Names
- Message Handler and DDL Handler Procedure
- Precommit Handler Procedure
- The CREATE_APPLY Procedure and XStream Outbound Servers
- The CREATE_APPLY Procedure and XStream Inbound Servers

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the apply_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the apply_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the apply_user to SYS.

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- *[schema_name.]procedure_name*
- *[schema_name.]package_name.procedure_name*

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the *schema_name* is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

> **See Also:**
>
> Logical Change Record TYPEs for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the precommit_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name   IN  NUMBER);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

The CREATE_APPLY Procedure and XStream Outbound Servers

This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the DBMS_XSTREAM_ADM package.

The CREATE_APPLY Procedure and XStream Inbound Servers

The following usage notes apply to this procedure and XStream inbound servers:

- The CREATE_APPLY procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.
- When creating an inbound server using the CREATE_APPLY procedure, set the apply_captured parameter to TRUE. Inbound servers only process LCRs captured by a capture process.
- Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.

24.4.5 CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

> **Note:**
>
> An error is raised if `NULL` is specified for either of the procedure parameters.

> **See Also:**
>
> DROP_OBJECT_DEPENDENCY Procedure

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 24-6 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[schema_name.]object_name`. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

Usage Notes

The following usage notes apply to this procedure:

- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers
- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.6 DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
   apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

Table 24-7 DELETE_ALL_ERRORS Procedure Parameter

Parameter	Description
`apply_name`	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If `NULL`, then all error transactions for all apply components are deleted.

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.7 DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
   local_transaction_id  IN  VARCHAR2);
```

Parameter

Table 24-8 DELETE_ERROR Procedure Parameter

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

Usage Notes

The following usage notes apply to this procedure:

The DELETE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.8 DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
   apply_name             IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 24-9 DROP_APPLY Procedure Parameters

Parameter	Description
`apply_name`	The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.
`drop_unused_rule_sets`	If `TRUE`, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Replication or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If `FALSE`, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.

Usage Notes

The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- `ALL_STREAMS_GLOBAL_RULES`

- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

The DROP_APPLY Procedure and XStream Outbound Servers

When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers

When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

24.4.9 DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

> **Note:**
>
> - An error is raised if an object dependency does not exist for the specified database objects.
> - An error is raised if NULL is specified for either of the procedure parameters.

> **See Also:**
>
> CREATE_OBJECT_DEPENDENCY Procedure

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 24-10 DROP_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
object_name	The name of the child database object, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

Table 24-10 (Cont.) DROP_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
parent_object_name	The name of the parent database object, specified as [*schema_name.*]*object_name*. For example, hr.departments. If the schema is not specified, then the current user is the default.

Usage Notes

The following usage notes apply to this procedure:

The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.10 EXECUTE_ALL_ERRORS Procedure

This procedure re-executes the error transactions in the error queue for the specified apply component.

The transactions are re-executed in commit SCN order. Error re-execution stops if an error is raised.

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
   apply_name       IN  VARCHAR2  DEFAULT NULL,
   execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 24-11 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are re-executed.
execute_as_user	If TRUE, then the procedure re-executes the transactions in the security context of the current user. If FALSE, then the procedure re-executes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.

Usage Notes

The following usage notes apply to this procedure:

- The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
- The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.11 EXECUTE_ERROR Procedure

This procedure re-executes the specified error transaction in the error queue.

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-12 EXECUTE_ERROR Procedure Parameters

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
`execute_as_user`	If `TRUE`, then the procedure re-executes the transaction in the security context of the current user. If `FALSE`, then the procedure re-executes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.
`user_procedure`	A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify `NULL` to execute the error transaction without running a user procedure. **See Also:** "Usage Notes" for more information about the user procedure

Usage Notes

The following usage notes apply to this procedure:

- The User Procedure
- The EXECUTE_ERROR Procedure and XStream Outbound Servers
- The EXECUTE_ERROR Procedure and XStream Inbound Servers

The User Procedure

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[`*`schema_name`*`.]`*`package_name`*`.`*`procedure_name`*
- `[`*`schema_name`*`.]`*`procedure_name`*

If the procedure is in a package, then the *`package_name`* must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the *`schema_name`* is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the *`schema_name`*.
- `fix_errors` is the *`package_name`*.
- `fix_hr_errors` is the *`procedure_name`*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     in_anydata                    IN      ANYDATA,
     error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
     error_message_number          IN      NUMBER,
     messaging_default_processing  IN OUT  BOOLEAN,
     out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- `in_anydata`: The `ANYDATA` encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- `error_record`: The row in the `DBA_APPLY_ERROR` data dictionary view that identifies the transaction
- `error_message_number`: The message number of the `ANYDATA` object in the `in_anydata` parameter, starting at 1
- `messaging_default_processing`: If `TRUE`, then the apply component continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers.

  If `FALSE`, then the apply component skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.
- `out_anydata`: The `ANYDATA` object processed by the user procedure and used by the apply component if `messaging_default_processing` is `TRUE`.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.
- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have the SELECT or READ privilege on the DBA_APPLY_ERROR data dictionary view.

> **Note:**
>
> LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.12 GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

> **See Also:**
>
> - SET_ENQUEUE_DESTINATION Procedure
> - SET_EXECUTE Procedure

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2,
   destination_queue_name  OUT  VARCHAR2,
   execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 24-13 GET_ERROR_MESSAGE Function Parameters

Parameter	Description
message_number	The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.
local_transaction_id	Identifier of the error transaction for which to return a message
destination_queue_name	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.
execute	Contains TRUE if the message should be executed Contains FALSE if the message should not be executed

Usage Notes

The following usage notes apply to this procedure:

- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.13 HANDLE_COLLISIONS

This procedure enables or disables basic conflict resolution for an apply process and a table.

Syntax

```
DBMS_APPLY_ADM.HANDLE_COLLISIONS(
   apply_name    IN  VARCHAR2,
   enable        IN  BOOLEAN,
   object        IN  VARCHAR2,
   source_object IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 24-14 HANDLE_COLLISIONS Procedure Parameters

Parameter	Description
apply_name	The name of the apply process.
enable	If TRUE, then the following conflict resolution methods are used: • When a conflict is detected for a row that exists in the table, the data in the row LCR overwrites the data in the table. • When a conflict is detected for a row that does not exist in the table, the data in the row LCR is ignored. If FALSE then it disables conflict resolution set by this procedure for the specified apply process and object. If NULL, then removes any explicit table-level setting for collision handling for the specified apply process and object.
object	The schema and name of the target table, specified as [*schema_name.*]*table_name* for the change of the setting. For example, if you are changing the setting for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
source_object	The schema and object name of the source table, specified as [*schema_name.*]*table_name* for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.

24.4.14 SET_DML_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt DML conflict handler for INSERT, UPDATE, or DELETE conflicts on the specified object.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
  apply_name             IN  VARCHAR2,
  conflict_handler_name  IN  VARCHAR2,
  object                 IN  VARCHAR2  DEFAULT NULL,
  operation_name         IN  VARCHAR2  DEFAULT NULL,
```

```
  conflict_type          IN  VARCHAR2  DEFAULT NULL,
  method_name            IN  VARCHAR2  DEFAULT NULL,
  column_list            IN  VARCHAR2  DEFAULT NULL,
  resolution_column      IN  VARCHAR2  DEFAULT NULL,
  source_object          IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
  apply_name             IN  VARCHAR2,
  conflict_handler_name  IN  VARCHAR2,
  object                 IN  VARCHAR2  DEFAULT NULL,
  operation_name         IN  VARCHAR2  DEFAULT NULL,
  conflict_type          IN  VARCHAR2  DEFAULT NULL,
  method_name            IN  VARCHAR2  DEFAULT NULL,
  column_table           IN  DBMS_UTILITY.LNAME_ARRAY,
  resolution_column      IN  VARCHAR2  DEFAULT NULL,
  source_object          IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-15 SET_DML_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
apply_name	The name of the apply process.
conflict_handler_name	The name of the conflict handler.
object	The schema and name of the target table, specified as [*schema name.*]*table name* for which a conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
operation_name	The name of the operation, which can be specified as: • INSERT • UPDATE • DELETE In order to set up conflict handlers for different operations on the same table, you must make one call per operation.
conflict_type	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: • ROW_EXISTS: A row with the same primary key already exists in the database for an insert or update. • ROW_MISSING:A row with the same primary key cannot be found for an update or delete.

Table 24-15 (Cont.) SET_DML_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
method_name	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: • DELTA: If the conflict type is ROW_EXISTS and the LCR is an update, then take the difference between the old and new values of the column in the LCR and add it to the current value of the column in the target database. The columns in the column group must be of type NUMBER. • IGNORE: Silently ignores the LCR and can be used for all conflict types. • MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for ROW_EXISTS and only applies to inserts and updates. • MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for ROW_EXISTS and only applies to inserts and updates. • OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. An INSERT with ROW_EXISTS is converted to an UPDATE. An UPDATE with ROW_MISSING is converted to an INSERT. A DELETE with ROW_MISSING is ignored. • RECORD: Enqueue the LCR into the error queue. Can be used for all conflict types and can only be specified for a column group that contains all the columns in the table. • MAX_AND_EQUALS: Applies the column list from the source database if the value of resolution column is greater than or equal to the value of the column in the database. • MIN_AND_EQUALS: Applies the column list from the source database if the value of resolution column is less than or equal to the value of the column in the database. If NULL, then the procedure removes any existing conflict handler with the same object_name, resolution_group, and conflict_type. If a conflict handler already exists with the same object_name and resolution_column and conflict_type, then the existing handler is replaced.

Table 24-15 (Cont.) SET_DML_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
column_list	A comma-separated list of the column names for which the conflict handler is called. The same column cannot be in more than one column list (for a given apply_name, object_name, operation_name and conflict_type). Specify * for the default column group, which includes all the columns in the table that are not already specified in another column list (for a given apply_name, object_name, operation_name and conflict_type). If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. You cannot use a column_list if you use a * in the object_name. The only time you can use multiple column groups is when you are specifying a conflict handler for insert or update for ROW_EXISTS. **Note:** Prebuilt conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-suppled type columns. Therefore, you should not include these types of columns in the column_list parameter. This parameter must be set to '*' in the following cases: • The operation_name is DELETE. • The method_name is RECORD. • The operation_name is UPDATE and the conflict_type is ROW_MISSING.
column_table	An array of column names for which the conflict handler is called. This parameter is the same as the column_list parameter, but it uses an array instead of a list for the column names. **Note:** The column_list and column_table parameters are mutually exclusive.
resolution_column	For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is the one tested to determine whether the current row or the LCR has the smaller value. The resolution column must be one of the columns listed in the column_list or column_table parameter. You can specify NULL for other resolution methods.
source_object	The schema and object name of the source table, specified as [*schema_name.*]*table_name* for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.

Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Conflict Handler
- Removing an Existing Conflict Handler
- Series of Actions for Conflicts

- Procedure DML Handlers for Conflicts
- A Column Can Be in Only One Column List
- The SET_DML_CONFLICT_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_CONFLICT_HANDLER Procedure and XStream Inbound Servers
- Table 24-16
- Example

Modifying an Existing Conflict Handler

If you want to modify an existing conflict handler, then you specify the `object`, `conflict_type`, and `resolution_column` of an the existing conflict handler. You can modify the `method_name` or the `column_list`.

Removing an Existing Conflict Handler

If you want to remove an existing conflict handler, then specify `NULL` for the `method_name` and specify the `object`, `conflict_type`, and `resolution_column` of the existing conflict handler.

Series of Actions for Conflicts

If an conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate conflict handler to resolve the conflict
2. If no conflict handler is specified or if the conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, object name, and operation name to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

> **See Also:**
>
> "Signature of a DML Handler Procedure or Error Handler Procedure" for information about setting an error handler

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

> **See Also:**
>
> SET_DML_HANDLER Procedure

A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

The SET_DML_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_DML_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Table 24-16 Valid Combinations of Parameters

Operation	Conflict Type	Method
INSERT	ROW_EXISTS	OVERWRITE
		RECORD
		IGNORE
		MAXIMUM
		MINIMUM
UPDATE	ROW_EXISTS	OVERWRITE
		RECORD
		IGNORE
		MAXIMUM
		MINIMUM
		DELTA
UPDATE	ROW_MISSING	OVERWRITE
		RECORD
		IGNORE
DELETE	ROW_EXISTS	OVERWRITE
		RECORD
		IGNORE
DELETE	ROW_MISSING	RECORD
		IGNORE

Example

The following is an example for setting a conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name            =>  'appl1',
    conflict_handler_name =>  'emp_handler_update',
    object                =>  'hr.employees',
    operation_name        =>  'UPDATE',
    conflict_type         =>  'ROW_EXISTS',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_table          =>  cols);
```

```
END;
/
```

This example sets a conflict handler named `emp_handler_update` that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

24.4.15 SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
   object_name          IN  VARCHAR2,
   object_type          IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   error_handler        IN  BOOLEAN   DEFAULT FALSE,
   user_procedure       IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL,
   assemble_lobs        IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 24-17 SET_DML_HANDLER Procedure Parameters

Parameter	Description
`object_name`	The name of the source object specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
`object_type`	The type of the source object. Currently, `TABLE` is the only possible source object type.
`operation_name`	The name of the operation, which can be specified as: • `INSERT` • `UPDATE` • `DELETE` • `LOB_UPDATE` • `DEFAULT` The procedure must be run for each operation individually. Specify `DEFAULT` to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any `INSERT`, `UPDATE`, `DELETE`, and `LOB_WRITE` on the database object, if another procedure DML handler is not specifically set for the operation on the database object.

Table 24-17 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
error_handler	If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.
user_procedure	A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered. Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	The name of the apply component that uses the procedure DML handler or error handler. If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply component, then use the apply_name parameter to specify the apply component to unset the handler.
assemble_lobs	If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.

Usage Notes

The following usage notes apply to this procedure:

- Run the SET_DML_HANDLER Procedure at the Destination Database
- Procedure DML Handlers and Error Handlers
- The apply_name Parameter
- Signature of a DML Handler Procedure or Error Handler Procedure
- LOB Assembly
- The SET_DML_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_HANDLER Procedure and XStream Inbound Servers

Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

> **Note:**
>
> Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply component uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Signature of a DML Handler Procedure or Error Handler Procedure

You can use the SET_DML_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [*schema_name.*]*package_name.procedure_name*
- [*schema_name.*]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- hr is the *schema_name*.
- apply_pkg is the *package_name*.
- employees_default is the *procedure_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

> **See Also:**
>
> Logical Change Record TYPEs for more information about LCRs

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     message            IN  ANYDATA,
     error_stack_depth  IN  NUMBER,
     error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
     error_messages     IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the `EXECUTE` member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

> **Note:**
>
> - Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
> - The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

LOB Assembly

Do not modify `LONG`, `LONG RAW`, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

The SET_DML_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_DML_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.16 SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is an `ANYDATA` instance containing the queue name specified as a `VARCHAR2`.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

Table 24-18 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. For example, to specify a rule named `hr5` in the `hr` schema, enter `hr.hr5` for this parameter. If the schema is not specified, then the current user is the default.
`destination_queue_name`	The name of the queue into which the apply component enqueues the message. Specify the queue in the form `[`*`schema_name`*`.]`*`queue_name`*. Only local queues can be specified. For example, to specify a queue in the `hr` schema named `streams_queue`, enter `hr.streams_queue`. If the schema is not specified, then the current user is the default. If `NULL`, then an existing name-value pair with the name `APPLY$_ENQUEUE` is removed. If no name-value pair exists with the name `APPLY$_ENQUEUE` for the rule, then no action is taken. If non-`NULL` and a name-value pair exists for the rule with the name `APPLY$_ENQUEUE`, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

The following usage notes apply to this procedure:

- The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
- Considerations for the SET_ENQUEUE_DESTINATION Procedure
- The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
- The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.

- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.17 SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is an `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, an apply component does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name  IN  VARCHAR2,
  execute    IN  BOOLEAN);
```

Parameters

Table 24-19 SET_EXECUTE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. For example, to specify a rule named `hr5` in the `hr` schema, enter `hr.hr5` for this parameter. If the schema is not specified, then the current user is the default.

Table 24-19 (Cont.) SET_EXECUTE Procedure Parameters

Parameter	Description
execute	If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_EXECUTE Procedure
- The SET_EXECUTE Procedure and XStream Outbound Servers
- The SET_EXECUTE Procedure and XStream Inbound Servers

Considerations for the SET_EXECUTE Procedure

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

The SET_EXECUTE Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.18 SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the

instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-20 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
`source_database_name`	The global name of the source database. For example, `DBS1.NET`. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `NET`, then the procedure specifies `DBS1.NET` automatically.
`instantiation_scn`	The instantiation SCN. Specify `NULL` to remove the instantiation SCN metadata for the source database from the data dictionary.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.

Table 24-20 (Cont.) SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, if you want to do the instantiation for a specific container than you must specify both source_database and source_root_name. If you want to do the instantiation for all the containers in the CDB, specify the source_root_name for the database and leave the source_database name as NULL.

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_SCHEMA_INSTANTIATION_SCN Procedure
- SET_TABLE_INSTANTIATION_SCN Procedure
- LCR$_DDL_RECORD Type for more information about DDL LCRs

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, `and base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

24.4.19 SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-21 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
`object_name`	The name of the table specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
`column_list`	A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names. If the `column_list` parameter is empty or `NULL`, then the current set of key columns is removed.
`column_table`	A PL/SQL associative array of type `DBMS_UTILITY.NAME_ARRAY` of the columns in the table to use as the substitute primary key. The index for `column_table` must be 1-based, increasing, dense, and terminated by a `NULL`. If the `column_table` parameter is empty or `NULL`, then the current set of key columns is removed.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
`apply_name`	The name of the apply component.

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_KEY_COLUMNS Procedure
- Duplicate Rows and Substitute Primary Key Columns

- The SET_KEY_COLUMNS Procedure and XStream Outbound Servers
- The SET_KEY_COLUMNS Procedure and XStream Inbound Servers
- The SET_KEY_COLUMNS Procedure and CDBs

Considerations for the SET_KEY_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain `NULL`s. However, Oracle recommends that each column you specify as a substitute key column be a `NOT NULL` column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one `NOT NULL` column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, `LONG`, `LONG RAW`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including `Any` types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, `LONG`, and `LONG RAW` columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the `allow_duplicate_rows` apply component parameter is set to `Y`, a single row LCR with an `UPDATE` or `DELETE` command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate

at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, `LONG`, and `LONG RAW` columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

> **See Also:**
>
> SET_PARAMETER Procedure for more information about the `allow_duplicate_rows` apply component parameter

The SET_KEY_COLUMNS Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_KEY_COLUMNS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The SET_KEY_COLUMNS Procedure and CDBs

This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.

24.4.20 SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
   apply_name  IN  VARCHAR2,
   parameter   IN  VARCHAR2,
   value       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-22 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply component name. Do not specify an owner.
parameter	The name of the parameter you are setting.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Apply Component Parameters

The following table lists the parameters for an apply component.

> **Note:**
>
> Starting from Oracle Database 21c release, OPTIMIZE_PROGRESS_TABLE is desupported.

Table 24-23 Apply Component Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows. If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Usage Notes" and "Duplicate Rows and Substitute Primary Key Columns"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
apply_sequence_nextval	Y or N	N for apply processes Y for XStream outbound servers and XStream inbound servers	Controls whether the apply component checks and adjusts sequence values. If Y, then the apply component checks and adjusts sequence values. For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values. For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values. If N, then the apply component does not check or adjust sequence values. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** SET_PARAMETER Procedure for information about the capture_sequence_nextval capture process parameter

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
batchsql_mode	DEPENDENT, DEPENDENT_EAGER, or SEQUENTIAL	DEPENDENT	Determines the batching method used to generate batch transactions for reordering. This parameter can be set to one of the following: • DEPENDENT - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. An executing batch has no unresolved dependencies. • DEPENDENT_EAGER - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. A batch can be executed when there are unresolved dependencies. The apply server waits for dependencies to be resolved before executing an LCR. • SEQUENTIAL - Batch transactions in a sequential manner. COMMIT_SERIALIZATION = FULL runs in this mode regardless of the Oracle GoldenGate BATCHSQL mode. **Note:** This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.
cdgranularity	ROW or COLGROUP	COLGROUP for XStream In ROW for Oracle GoldenGate	Specifies the conflict detection granularity. This parameter can be set to one of the following: • ROW - Conflict resolution is applied for all column groups if there is a conflict for any column group. • COLGROUP - Conflict resolution is applied for column groups that have a conflict. Conflict resolution is not applied for column groups that do not have a conflict. **Note:** This parameter is intended for XStream and Oracle GoldenGate. Do not set this parameter for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
commit_serialization	DEPENDENT_TRANSACTIONS or FULL	DEPENDENT_TRANSACTIONS	The order in which applied transactions are committed. Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database. You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings: • DEPENDENT_TRANSACTIONS - The apply component can commit nondependent transactions in any order. Performance is best if you specify DEPENDENT_TRANSACTIONS. • FULL - The apply component commits applied transactions in the order in which they were committed at the source database. Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. If you specify DEPENDENT_TRANSACTIONS, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order: 1. Transaction A 2. Transaction B At the destination database, these transactions might be committed in the opposite order: 1. Transaction B 2. Transaction A If you specify DEPENDENT_TRANSACTIONS and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add RELY constraints to account for the application constraints. See *Oracle Database Data Warehousing Guide* for information about RELY constraints. **Note:** The NONE value is deprecated for this parameter. It is replaced by the DEPENDENT_TRANSACTIONS value.

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
			See Also: "Usage Notes"
compare_key_only	Y or N	N for apply processes Y for XStream inbound servers	If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR. If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR. **Note:** The COMPARE_OLD_VALUES procedure in this package can disable comparison of old values for specified columns during apply. See COMPARE_OLD_VALUES Procedure. **See Also:** "Usage Notes"
compute_lcr_dep_on_arrival	Y or N	N	If Y, the dependencies are computed as the LCRs for the transaction are received. If N, the dependencies are computed only after all the LCRs for a transaction are received. If the target table has all of the same constraints as the source table, you can improve the performance by setting this parameter to Y. If the number of LCRs in transaction exceeds the value of the number of the eager_size parameter, then the dependencies for that transaction are calculated on arrival regardless of the setting of compute_lcr_dep_on_arrival. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.
disable_on_error	Y or N	Y	If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable. If N, then the apply component continues regardless of unresolved errors.

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply component is restarted immediately after stopping because it reached a limit. When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APnn) remains the same.
eager_size	A positive integer	9500	The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than eager_size LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than eager_size LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes. Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter max_parallelism limits the maximum number of apply servers that can be used for an apply process. This apply parameter is relevant only if its value is less than the value of the txn_lcr_spill_threshold apply parameter. When the value of txn_lcr_spill_threshold is lower than the value of eager_size, transactions spill to disk before eager apply begins. **Note:** This parameter is intended for XStream. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
enable_xstream_table_stats	Y or N	Y	When this parameter is set to Y, statistics about the operations of applied transactions are collected and made available in the V$XSTREAM_TABLE_STATS view. When this parameter is set to N, no statistics are collected. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment.
excludetag	Comma-delimited list of Oracle Replication tags	NULL	Controls whether the capture process for an outbound server captures DML changes that are tagged with one of the specified Oracle Replication tags. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
excludetrans	Comma-delimited list of transaction names	NULL	Controls whether the capture process for an outbound server captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
excludeuser	Comma-delimited list of user names	NULL	Controls whether the capture process for an outbound server captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
excludeuserid	Comma-delimited list of user ID values	NULL	Controls whether the capture process for an outbound server captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
getapplops	Y or N	Y	If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. When N is set for both getapplops and getreplicates, no data is captured. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter
getreplicates	Y or N	N	If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. When N is set for both getapplops and getreplicates, no data is captured. **Note:** This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes" for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
grouptransops	A positive integer from 1 to 10000	250 for apply processes and XStream inbound servers 10000 for XStream outbound servers	The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction. This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. **Note:** This parameter is intended for XStream outbound servers and inbound servers. An Oracle Apply process ignores this parameter unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
handlecollisions	Y or N	N	This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading. This parameter should be set to N for normal replication activity. It should be set to Y only when data is being loaded (instantiated) and replication is enabled. If Y, then does the equivalent of OVERWRITE for INSERT, UPDATE and DELETE operations that get ROW_EXISTS errors, and ignores UPDATE and DELETE operations that get ROW_MISSING errors. Specifically, the apply component performs the following actions when this parameter is set to Y: • If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update. • If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and the a row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values. • If the operation is a delete and the row does not exist, then the change is ignored. If N then it disables the above settings. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Replication environment.

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid source transaction ID or NULL	NULL	Instructs the apply component to ignore the specified transaction from the source database, effective immediately. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter. If NULL, then the apply component ignores this parameter. **Note:** An apply component ignores this parameter for transactions that were not captured by a capture process. **See Also:** "Usage Notes"
maximum_scn	A valid SCN or INFINITE	INFINITE	The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply component runs regardless of the SCN value. **Note:** An apply component ignores this parameter for transactions that were not captured by a capture process. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
max_parallelism	A positive integer	50	Limits the maximum number of apply servers that can be used for an apply component. When the apply parallelism parameter is set greater than one, the apply component adds apply servers when necessary to process transactions until it reaches the limit set by this parameter (max_parallelism). Transactions include both unassigned (eager) and assigned transactions. Apply servers that idle for more than 5 minutes are shut down until the configured parallelism is attained. Runtime statistics for servers that have been shut down are aggregated into apply server 0 so that accurate apply statistics for the entire apply process can be maintained. **Note:** This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.
max_sga_size	A positive integer	INFINITE	Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes. The memory is allocated for the duration of the apply component's session and is released when the apply component becomes disabled. **Note:** The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
message_tracking_frequency	0 or a positive integer	2000000	The frequency at which messages applied by the inbound server are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is *inbound_server_name*:AUTOTRACK, where *inbound_server_name* is the name of the inbound server. Only the first 20 bytes of the inbound server name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically.
optimize_self_updates	Y or N	Y	This parameter affects conflict resolution when an update in the source database sets a column to its existing value. When this parameter is set to Y, a conflict between the value in the LCR and the corresponding column in the target database is considered resolved. When this parameter is set to N, the conflict is processed.
parallelism	A positive integer	4	The number of apply servers that can concurrently apply transactions. The reader server and the apply server process names are AS*nn*, where *nn* can include letters and numbers. The total number of AS*nn* processes is the value of the parallelism parameter plus one. For example, if parallelism is set to 4, then an apply component uses a total of five AS*nn* processes. In this case, there is one reader server and four apply servers. Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the PROCESSES initialization parameter is set appropriately when you set the parallelism parameter. **Note:** When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
parallelism_interval	0 or a positive integer	0	The parallelism interval is the interval in seconds at which the current workload activity is computed. The apply component calculates the mean throughput every 5 X parallelism_interval seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers. The parallelism interval is used only if the parallelism parameter is set to a value greater than one and the max_parallelism parameter value is greater than the parallelism parameter value. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
preserve_encryption	Y or N	Y	Whether to preserve encryption for columns encrypted using Transparent Data Encryption. If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs. If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs. **Note:** When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. **See Also:** "Usage Notes"
rtrim_on_implicit_conversion	Y or N	Y	Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply. If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table. If N, then blank padding is preserved in the column. **See Also:** "Usage Notes"
startup_seconds	0, a positive integer, or INFINITE	0	The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start. If INFINITE, then an apply component does not start until another instantiation of the same apply component finishes. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
suppresstriggers	Y or N	Y	This parameter controls whether triggers fire when a change is made by the apply component. If Y, triggers do not fire for changes made by the apply component. If N, triggers fire for changes made by the apply component. If a trigger's firing property is set to always fire, then the trigger always fires for changes made by the apply component, regardless of the value of the suppresstriggers parameter. A trigger's firing property is set to always fire by running the DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY procedure with the fire_once parameter set to FALSE. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Replication environment. **See Also:** "Usage Notes"
time_limit	A positive integer or INFINITE	INFINITE	The apply component stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply component continues to run until it is stopped explicitly. **See Also:** "Usage Notes"
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services. **See Also:** "Usage Notes"
transaction_limit	A positive integer or INFINITE	INFINITE	The apply component stops after applying the specified number of transactions. If INFINITE, then the apply component continues to run regardless of the number of transactions applied. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
txn_age_spill_threshold	A positive integer or INFINITE	900	The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk. If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or INFINITE	10000	The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. **See Also:** "Usage Notes"

Table 24-23 (Cont.) Apply Component Parameters

Parameter Name	Possible Values	Default	Description
write_alert_log	Y or N	Y	If Y, then the apply component writes a message to the alert log on exit. If N, then the apply component does not write a message to the alert log on exit. The message specifies the reason why the apply component stopped.

Usage Notes

The following usage notes apply to this procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- The SET_PARAMETER Procedure and Replication
- The SET_PARAMETER Procedure and XStream Outbound Servers
- The SET_PARAMETER Procedure and XStream Inbound Servers

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and Replication

You can use the following parameters in Replication if you enable XStream performance optimizations for Oracle Replication using the procedure DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS:

- apply_sequence_nextval
- compute_lcr_dep_on_arrival
- eager_size
- grouptransops
- max_parallelism
- max_sga_size
- parallelism_interval

The SET_PARAMETER Procedure and XStream Outbound Servers

Outbound servers ignore the settings for the following apply parameters:

- allow_duplicate_rows
- commit_serialization
- compare_key_only
- compute_lcr_dep_on_arrival
- disable_on_error
- eager_size
- enable_xstream_table_stats
- grouptransops
- handlecollisions
- optimize_self_updates
- parallelism
- parallelism_interval
- preserve_encryption
- rtrim_on_implicit_conversion
- suppresstriggers

The commit_serialization parameter is always set to FULL for an outbound server, and the parallelism parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

The SET_PARAMETER Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- ignore_transaction
- maximum_scn

You can use all of the other apply component parameters with inbound servers.

The default setting for the compare_key_only parameter for an inbound server is Y.

The default setting for the `parallelism` parameter for an inbound server is `4`.

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

24.4.21 SET_REPERROR_HANDLER Procedure

This procedure specifies how a particular error is handled based on its error number.

You can choose between several predefined actions for a given error.

Syntax

```
DBMS_APPLY_ADM.SET_REPERROR_HANDLER(
  apply_name     IN  VARCHAR2,
  object         IN  VARCHAR2,
  error_number   IN  NUMBER,
  method         IN  VARCHAR2,
  source_object  IN  VARCHAR2  DEFAULT NULL,
  max_retries    IN  NUMBER    DEFAULT NULL,
  delay_csecs    IN  NUMBER    DEFAULT 6000);
```

Parameters

Table 24-24 SET_REPERROR_HANDLER Procedure Parameters

Parameter	Description
`apply_name`	The name of the apply process.
`object`	The schema and name of the target table, specified as `[`*`schema name`*`.]`*`table name`* for which an error handler is being added, modified, or removed. The table must exist. For example, if an update conflict handler is being added for table `employees` owned by user `hr`, then specify `hr.employees`. If the schema is not specified, then the current user is the default.
`error_number`	The error handling number. If `0`, then use the default for all error handling for `object`.
`method`	Specifies the action to take when the given `error_number` occurs. If `NULL`, remove the error handler for `error_number` The possible actions are: • `ABEND`: Stop the apply process when the error occurs. • `RECORD`: Move the LCR to the error queue when the error is encountered. • `IGNORE`: Silently ignore the error and do not apply the LCR. • `RETRY`: Retry the LCR `max_retries` times. • `RETRY_TRANSACTION`: Retry the transaction `max_retries` times. Wait `delay_csecs` centiseconds before each retry. `RECORD_TRANSACTION` : Move the entire transaction to the error queue if this error occurs.

Table 24-24 (Cont.) SET_REPERROR_HANDLER Procedure Parameters

Parameter	Description
source_object	The schema and object name of the source table, specified as [*schema_name*.]*table_name* for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
max_retires	Maximum number of times to retry for RETRY and RETRY_TRANSACTION actions in method. Must be specified with either the RETRY or RETRY_TRANSACTION
delay_csecs	The number of centiseconds between retries for RETRY and RETRY_TRANSACTION action in method.

Usage Notes

The following usage notes apply to this procedure:

- Priority of Error Handlers

Priority of Error Handlers

Any conflict handling specified by SET_UPDATE_CONFLICT_HANDLER or SET_DML_CONFLICT_HANDLER is tried before the actions specified by SET_REPERROR_HANDLER. The PL/SQL procedure specified by SET_DML_HANDLER is called to handle the error if none of the previously mentioned methods resolve it.

24.4.22 SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-25 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.

Usage Notes

The following usage notes apply to this procedure:

- The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs
- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure
- SET_TABLE_INSTANTIATION_SCN Procedure
- LCR$_DDL_RECORD Type for more information about DDL LCRs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-`NULL` `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

24.4.23 SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-26 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database. **Note:** This parameter must be NULL when the procedure is invoked from the root of a CDB.
source_root_name	The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and LCRs
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

> **Note:**
>
> The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

> **See Also:**
>
> - SET_GLOBAL_INSTANTIATION_SCN Procedure
> - SET_SCHEMA_INSTANTIATION_SCN Procedure
> - LCR$_ROW_RECORD Type for more information about row LCRs
> - LCR$_DDL_RECORD Type for more information about DDL LCRs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

24.4.24 SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
   object_name          IN  VARCHAR2,
```

```
  method_name          IN  VARCHAR2,
  resolution_column    IN  VARCHAR2,
  column_list          IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 24-27 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
`object_name`	The schema and name of the table, specified as `[schema_name.]object_name`, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table `employees` owned by user `hr`, then specify `hr.employees`. If the schema is not specified, then the current user is the default.
`method_name`	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: • `MAXIMUM`: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. • `MINIMUM`: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. • `OVERWRITE`: Applies the column list from the source database, overwriting the column values at the destination database. • `DISCARD`: Retains the column list from the destination database, discarding the column list from the source database. If `NULL`, then the procedure removes any existing update conflict handler with the same `object_name`, `resolution_column`, and `column_list`. If non-`NULL`, then the procedure replaces any existing update conflict handler with the same `object_name` and `resolution_column`.
`resolution_column`	Name of the column used to uniquely identify an update conflict handler. For the `MAXIMUM` and `MINIMUM` prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the `column_list` parameter. `NULL` is not allowed for this parameter. For the `OVERWRITE` and `DISCARD` prebuilt methods, you can specify any column in the column list.
`column_list`	List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. **Note:** Prebuilt update conflict handlers do not support LOB, `LONG`, `LONG RAW`, user-defined type, and Oracle-suppled type columns. Therefore, you should not include these types of columns in the `column_list` parameter.

Table 24-27 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. **Note:** Currently, conflict handlers are not supported when applying changes to a non-Oracle database.

Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Update Conflict Handler
- Removing an Existing Update Conflict Handler
- Series of Actions for Conflicts
- Procedure DML Handlers for Conflicts
- A Column Can Be in Only One Column List
- Update Conflict Handlers and Non-Oracle Databases
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

> **See Also:**
>
> "Signature of a DML Handler Procedure or Error Handler Procedure" for information about setting an error handler

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

> **See Also:**
>
> SET_DML_HANDLER Procedure

A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

Update Conflict Handlers and Non-Oracle Databases

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

24.4.25 SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 24-28 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
`dependency_name`	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If `NULL`, an error is raised.
`object_name`	The name of the table, specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If `NULL` and the specified dependency exists, then the dependency is removed. If `NULL` and the specified dependency does not exist, then an error is raised. If `NULL`, then `attribute_list` and `attribute_table` also must be `NULL`.
`attribute_list`	A comma-delimited list of column names in the table. There must be no spaces between entries.
`attribute_table`	A PL/SQL associative array of type `DBMS_UTILITY.NAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.

Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.26 START_APPLY Procedure

This procedure directs the apply component to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(
   apply_name  IN  VARCHAR2);
```

Parameter

Table 24-29 START_APPLY Procedure Parameter

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The following usage notes apply to this procedure:

- Apply Component Status
- The START_APPLY Procedure and XStream Outbound Servers
- The START_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is ENABLED, then the apply component is started upon database instance startup. An apply component (*annn*) is an Oracle background process. The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of an apply component.

The START_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

The START_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

24.4.27 STOP_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force       IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 24-30 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply component name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. See "Usage Notes" for more information.

Usage Notes

The following usage notes apply to this procedure:

- Apply Component Status
- Queue Subprograms Have No Effect on Apply Component Status
- The STOP_APPLY force Parameter and the commit_serialization Apply Parameter
- The STOP_APPLY Procedure and XStream Outbound Servers
- The STOP_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply component.

The STOP_APPLY force Parameter and the commit_serialization Apply Parameter

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Component Behavior
TRUE	FULL	The apply component stops immediately and does not apply any unfinished transactions.
TRUE	DEPENDENT_TRANSACTIONS	When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	FULL	The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	DEPENDENT_TRANSACTIONS	Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the `commit_serialization` apply component parameter is set to `DEPENDENT_TRANSACTIONS` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply component stops.

A different scenario would result if the `commit_serialization` apply component parameter is set to `FULL`. For example, assume that the `commit_serialization` apply component parameter is set to `FULL` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply component stops, and transaction C is rolled back.

See Also:

SET_PARAMETER Procedure for more information about the `commit_serialization` apply component parameter

The STOP_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

The STOP_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

25
DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Advanced Queuing (AQ).

This chapter contains the following topics:

- Security Model
- Constants
- Data Structures
- Operational Notes
- Summary of DBMS_AQ Subprograms

> **See Also:**
>
> - *Oracle Database Advanced Queuing User's Guide*
> - Oracle Database Advanced Queuing (AQ) Types for information about TYPEs to use with DBMS_AQ.

25.1 DBMS_AQ Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQ and DBMS_AQADM.

Queue Security

To enqueue or dequeue, users need EXECUTE rights on DBMS_AQ and either ENQUEUE or DEQUEUE privileges on target queues, or ENQUEUE_ANY/DEQUEUE_ANY system privileges. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the EXECUTE right on DBMS_AQ.

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

OCI Applications and Queue Access

For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the ENQUEUE ANY QUEUE

or DEQUEUE ANY QUEUE system privileges. The EXECUTE right of DBMS_AQ is not checked against the session user's rights.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also:

- DBMS_AQADM
- *Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation

25.2 DBMS_AQ Constants

This topic describes the constants used by DBMS_AQ.

The DBMS_AQ package uses the constants shown in the following table.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

Note:

The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

Table 25-1 Enumerated Constants

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE	-	-
-	ON_COMMIT	-	-
DEQUEUE_MODE	BROWSE	-	-
-	LOCKED	-	-
-	REMOVE	-	-

Table 25-1 (Cont.) Enumerated Constants

Parameter	Options	Type	Description
-	REMOVE_NODATA	-	-
NAVIGATION	FIRST_MESSAGE	-	-
-	NEXT_MESSAGE	-	-
STATE	WAITING	-	-
-	READY	-	-
-	PROCESSED	-	-
-	EXPIRED	-	-
SEQUENCE_DEVIATION	BEFORE	-	-
-	TOP	-	-
WAIT	FOREVER	BINARY_INTEGER	-
-	NO_WAIT	BINARY_INTEGER	-
DELAY	NO_DELAY	-	-
EXPIRATION	NEVER	-	-
NAMESPACE	NAMESPACE_AQ	-	-
-	NAMESPACE_ANONYMOUS	-	-
NTFN_GROUPING_CLASS	NFTN_GROUPING_CLASS_TIME	NUMBER	-
NTFN_GROUPING_TYPE	NTFN_GROUPING_TYPE_SUMMARY	NUMBER	-
-	NTFN_GROUPING_TYPE_LAST	NUMBER	-
NTFN_GROUPING_REPEAT_COUNT	NTFN_GROUPING_FOREVER	NUMBER	-

25.3 DBMS_AQ Data Types

This topic lists and describes DBMS_AQ data types.

Table 25-2 DBMS_AQ Data Structures

Data Structures	Description
OBJECT_NAME	Names database objects
TYPE_NAME	Defines queue types
JSON	Starting from Oracle Database Release 21c, AQ also supports JSON payload type. A dedicated JSON data type permits us to store the JSON data in a post-parse binary format which allows much faster access to nested JSON values.
Oracle Database Advanced Queuing PL/SQL Callback	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

OBJECT_NAME

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 128 bytes long. Queue names and queue table names can be up to 122 bytes long. Maximum length of agent names and subscriber names can be 128 characters with datablock size greater than 2k. For 2k datablock size, maximum length for subscriber is 128 bytes.

TYPE_NAME

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 25-3 Type Name Attributes

Attribute	Description
object_type	Maximum number of attributes in the object type is limited to 900.
"RAW"	To store payload of type `RAW`, Oracle Database Advanced Queuing creates a queue table with a `LOB` column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a `LOB` column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Database Advanced Queuing. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept `RAW` buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your `RAW` data will be limited to the maximum amount of contiguous memory (as an `OCIRaw` is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because `LOB` columns are used for storing `RAW` payload, the Oracle Database Advanced Queuing administrator can choose the `LOB` tablespace and configure the `LOB` storage by constructing a `LOB` storage string in the `storage_clause` parameter during queue table creation time.

Oracle Database Advanced Queuing PL/SQL Callback

The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a `RAW` payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

Attributes

Table 25-4 Oracle Database Advanced Queuing PL/SQL Callback Attributes

Attribute	Description
`context`	Specifies the context for the callback function that was passed by `dbms_aq.register`. See AQ$_REG_INFO Type.
`reginfo`	See AQ$_REG_INFO Type.
`descr`	See AQ$_DESCRIPTOR Type
`payload`	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
`payloadl`	Specifies the length of `payload`. If `payload` is null, `payload1` = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN RAW,
  reginfo  IN SYS.AQ$_REG_INFO,
  descr    IN SYS.AQ$_DESCRIPTOR,
  payload  IN VARCHAR2,
  payloadl IN NUMBER);
```

25.4 DBMS_AQ Operational Notes

This topic lists various DBMS_AQ operational notes.

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the `DBMS_AQIN` package to use these interfaces.

25.5 Summary of DBMS_AQ Subprograms

The `DBMS_AQ` package uses subprograms described in this table.

Table 25-5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure	Creates an entry for an Oracle Database Advanced Queuing agent in the LDAP directory
DEQUEUE Procedure	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function	Dequeues an array of messages from the specified queue
ENQUEUE Procedure	Adds a message to the specified queue
ENQUEUE_ARRAY Function	Adds an array of messages to the specified queue
LISTEN Procedures	Listen to one or more queues on behalf of a list of agents
POST Procedure	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure	Registers for message notifications
SEEK Procedure	Enables a subscriber to seek any particular message of choice
UNBIND_AGENT Procedure	Removes an entry for an Oracle Database Advanced Queuing agent from the LDAP directory
UNREGISTER Procedure	Unregisters a subscription which turns off notification

> **Note:**
>
> `DBMS_AQ` does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

25.5.1 BIND_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT(
   agent        IN SYS.AQ$_AGENT,
   certificate  IN VARCHAR2 default NULL);
```

Parameters

Table 25-6 BIND_AGENT Procedure Parameters

Parameter	Description
`agent`	Agent that is to be registered in LDAP server.
`certificate`	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute `usercertificate`) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

25.5.2 DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
   queue_name           IN      VARCHAR2,
   dequeue_options      IN      dequeue_options_t,
   message_properties   OUT     message_properties_t,
   payload              OUT     "<ADT_1>"
   msgid                OUT     RAW);
```

Parameters

Table 25-7 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue.
`dequeue_options`	See DEQUEUE_OPTIONS_T Type.
`message_properties`	See MESSAGE_PROPERTIES_T Type.
`payload`	Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of *`type_name`* refer to `TYPE_NAME` in DBMS_AQ Data Types.
`msgid`	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

  `Msgid` uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- `correlation`

  Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

- `deq_condition`

  Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and

PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

> **Note:**
>
> It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See DEQUEUE_OPTIONS_T Type for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure .
- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure.

25.5.3 DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   dequeue_options           IN   dequeue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  OUT  message_properties_array_t,
   payload_array             OUT  "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 25-8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
`queue_name`	The queue name from which messages are dequeued (same as single-row dequeue).
`dequeue_options`	The set of options which will be applied to all messages in the array (same as single-row dequeue).
`array_size`	The number of elements to dequeue. For buffered messages, `array_size` should be `1`.
`message_properties_array`	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type.
`payload_array`	An array of dequeued payload data. "`<COLLECTION_1>`" can be an associative array, varray or nested table in its PL/SQL representation. Users can dequeue `JSON`, `RAW` and `ADT` payloads.
`msgid_array`	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type.
`error_array`	Currently not implemented

Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeue by `message_id` is not supported. See DEQUEUE Procedure for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

> **See Also:**
>
> ENQUEUE_OPTIONS_T Type

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.

DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

25.5.4 ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
   queue_name          IN      VARCHAR2,
   enqueue_options     IN      enqueue_options_t,
   message_properties  IN      message_properties_t,
   payload             IN       "<ADT_1>",
   msgid               OUT     RAW);
```

Parameters

Table 25-9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type.
message_properties	See MESSAGE_PROPERTIES_T Type.
payload	Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of *type_name* refer to TYPE_NAME in DBMS_AQ Data Types.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

> **Note:**
>
> The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure .
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure.

25.5.5 ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   enqueue_options           IN   enqueue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  IN   message_properties_array_t,
   payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 25-10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type.
array_size	The number of elements to enqueue. For buffered messages, array_size should be 1.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation. Users can enqueue JSON, RAW, and ADT payloads.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

25.5.6 LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
   agent_list            IN    AQ$_AGENT_LIST_T,
   wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
   agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (
   agent_list             IN   AQ$_AGENT_LIST_T,
   wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
   listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
   agent                  OUT  SYS.AQ$_AGENT,
   message_delivery_mode  OUT  PLS_INTEGER);

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 25-11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

> **Note:**
>
> You cannot call LISTEN on nonpersistent queues.

25.5.7 POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list       IN  SYS.AQ$_POST_INFO_LIST,
  post_count      IN  NUMBER);
```

Parameters

Table 25-12 POST Procedure Parameters

Parameter	Description
post_list	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.
post_count	Specifies the number of entries in the post_list.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

25.5.8 REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   count        IN  NUMBER);
```

Parameters

Table 25-13 REGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
count	Specifies the number of entries in the reg_list.

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
  - Start time – when to start grouping (Default is current time)

- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

> **See Also:**
>
> DBMS_AQELM for more information on e-mail and HTTP notifications

25.5.9 SEEK Procedure

This procedure enables a subscriber to seek any particular message of choice. Once a seek operation is successful, the dequeues move from the new seek position onwards. A new call is added to facilitate the seek operation.

Syntax

```
DBMS_AQ.SEEK (
              queue_name         IN     VARCHAR2 not null,
              consumer_name      IN     VARCHAR2 default null,
              seek_input_array   IN     SEEK_INPUT_ARRAY_T,
              skip_option        IN     pls_integer DEFAULT DBMS_AQ.ERROR_IF_SKIPPED,
              seek_output_array OUT     SEEK_OUTPUT_ARRAY_T);
```

Parameters

Table 25-14 SEEK Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue.
`consumer_name`	Specifies the name of the subscriber performing seek. `consumer_name` can be `NULL` for single-consumer queues.
`seek_input_array`	Array of type `seek_input_t`, where individual element in the array has per shard seek input. See SEEK_INPUT_T Type.
`skip_option`	Specifies the skip options. The following are the possible values: • `DBMS_AQ.ERROR_IF_SKIPPED` (default): Raises an error if seek operation can result in skipping some undequeued messsages when a seek forward is performed. • `DBMS_AQ.NO_DISCARD_SKIPPED`: Does not discard any skipped messages. Allows the seek operation to go through irrespective of the direction of the seek. Such undequeued messages before seek point will be shown as `READY_SKIPPED` in `AQ$<QUEUE_TABLE_NAME>`. • `DBMS_AQ.DISCARD_SKIPPED`: Discards any skipped messages. As soon as all the messages in a subshard are either dequeued or discarded by all its subscribers, the subshard is "retained" which will be truncated after retention time is over. Before retention time is over, the subscribers who have discarded the messages can seek back and dequeue the discarded messages if they wish to do so. The discarded messages will be shown as `READY_DISCARDED` in `AQ$<QUEUE_TABLE_NAME>`.

Table 25-14 (Cont.) SEEK Procedure Parameters

Parameter	Description
seek_output_array	Array of type seek_output_t, where individual element in the array has seeked from and seeked to fields per shard-priority. See SEEK_OUTPUT_T Type.

25.5.10 UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
   agent     IN SYS.AQ$_AGENT);
```

Parameters

Table 25-15 BIND_AGENT Procedure Parameters

Parameter	Description
agent	Agent that is to be removed from the LDAP server

25.5.11 UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
   reg_list      IN  SYS.AQ$_REG_INFO_LIST,
   reg_count     IN  NUMBER);
```

Parameters

Table 25-16 UNREGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
reg_count	Specifies the number of entries in the reg_list.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

26
DBMS_AQADM

The DBMS_AQADM package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

> **See Also:**
>
> - *Oracle Database Advanced Queuing User's Guide*
> - Oracle Database Advanced Queuing (AQ) Types for information about the TYPEs to use with DBMS_AQADM

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_AQADM Subprograms

26.1 DBMS_AQADM Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQADM and DBMS_AQ. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas and can be granted and revoked through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE respectively. Starting from Oracle Database 12*c* Release 2, MANAGE_ANY privilege will not allow access to SYS owned queues by users other than SYS.

User Roles

The database administrator has the option of granting the system privileges ENQUEUE_ANY and DEQUEUE_ANY, exercising DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising DBMS_AQADM.GRANT_QUEUE_PRIVILEGE and DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE. Starting from Oracle Database 12*c* Release 2, ENQUEUE_ANY and DEQUEUE_ANY privileges will not allow access to SYS owned queues by users other than SYS.

> **See Also:**
>
> - DBMS_AQ.
> - *Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

Security Required for Propagation

Propagation jobs are owned by `SYS`, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted `EXECUTE` privileges on the `DBMS_AQADM` package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier `SYS.DBMS_AQADM` not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have `EXECUTE` access on the `DBMS_AQ` and `DBMS_AQADM` packages on the remote database.

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation.

Queue Table Migration

The `MIGRATE_QUEUE_TABLE` procedure requires that the `EXECUTE` privilege on `DBMS_AQADM` be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the `EXECUTE` privilege as soon as the migration is done.

> **See Also:**
>
> - "MIGRATE_QUEUE_TABLE Procedure."
> - *Oracle Database Advanced Queuing User's Guide* for more information on granting Oracle Database Advanced Queuing system privileges.

26.2 DBMS_AQADM Constants

When using enumerated constants, such as `INFINITE`, `TRANSACTIONAL`, or `NORMAL_QUEUE`, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with `DBMS_AQADM`. For example: `DBMS_AQADM.NORMAL_QUEUE`.

Table 26-1 Enumerated Types in the Administrative Interface

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

> **See Also:**
>
> For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

26.3 DBMS_AQADM Subprogram Groups

This section lists and describes the DBMS_AQADM subprogram groups.

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms
- Privilege Subprograms
- Queue Subprograms
- Subscriber Subprograms
- OKafka Subprograms
- Propagation Subprograms
- Miscellaneous Subprograms
- Oracle Database Advanced Queuing Agent Subprograms
- Alias Subprograms

26.3.1 DBMS_AQADM Queue Table Subprograms

This section lists and describes the DBMS_AQADM Queue Table subprograms.

Table 26-2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure	Drops an existing queue table
ENABLE_JMS_TYPES Procedure	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table

Table 26-2 (Cont.) Queue Table Subprograms

Subprograms	Description
PURGE_QUEUE_TABLE Procedure	Purges messages from queue tables

26.3.2 DBMS_AQADM Privilege Subprograms

This sections lists and describes the DBMS_AQADM Privilege subprograms.

Table 26-3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure	Grants Oracle Database Advanced Queuing system privileges to users and roles
REVOKE_QUEUE_PRIVILEGE Procedure	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure	Revokes Oracle Database Advanced Queuing system privileges from users and roles

26.3.3 DBMS_AQADM Queue Subprograms

This sections lists and describes the DBMS_AQADM Queue subprograms.

Table 26-4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure	Creates a queue in the specified queue table
CREATE_SHARDED_QUEUE Procedure	Creates a queue and its queue table for a sharded queue all together.
DROP_SHARDED_QUEUE Procedure	Drops an existing sharded queue from the database queuing system
ALTER_SHARDED_QUEUE Procedure	Alters an sharded queue in the database queuing system
CREATE_EXCEPTION_QUEUE Procedure	Creates an exception queue for a sharded queue
DROP_QUEUE Procedure	Drops an existing queue
QUEUE_SUBSCRIBERS Function	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
START_QUEUE Procedure	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure	Disables enqueuing or dequeuing on the specified queue

26.3.4 DBMS_AQADM Subscriber Subprograms

This sections lists and describes the DBMS_AQADM Subscriber subprograms.

Table 26-5 Subscriber Subprograms

Subprograms	Description
ADD_SUBSCRIBER Procedure	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure	Removes a default subscriber from a queue

26.3.5 DBMS_AQADM OKafka Subprograms

This section lists and describes the DBMS_AQADM OKafka subprograms.

Table 26-6 OKafka Subprograms

Subprograms	Description
CREATE_DATABASE_KAFKA_TOPIC Procedure	Creates an OKafka Topic. OKafka topic is a multi-consumer transactional event queue specifically design to be used with OKafka application.
DROP_DATABASE_KAFKA_TOPIC Procedure	Drops an existing OKafka topic. OKafka topic is a multi-consumer transactional event queue specifically design to be used with OKafka application.

26.3.6 DBMS_AQADM Propagation Subprograms

This section lists and describes the DBMS_AQADM propagation subprograms.

Table 26-7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure	Verifies that the source and destination queues have identical types

26.3.7 DBMS_AQADM Miscellaneous Subprograms

This section lists and describes the DBMS_AQADM miscellaneous subprograms.

Table 26-8 Miscellaneous Subprograms

Subprograms	Description
GET_QUEUE_PARAMETER Procedure	Used to get different parameters for sharded queues at queue or database level.
GET_MAX_STREAMS_POOL Procedure	Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit
GET_MIN_STREAMS_POOL Procedure	Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit
GET_WATERMARK Procedure	Retrieves the value of watermark set by the `SET_WATERMARK` Procedure
SET_QUEUE_PARAMETER Procedure	Used to set different parameters for sharded queues at queue or database level.
SET_MAX_STREAMS_POOL Procedure	Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use
SET_MIN_STREAMS_POOL Procedure	Used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use
SET_WATERMARK Procedure	Used for Oracle Database Advanced Queuing notification to specify and limit memory use
UNSET_QUEUE_PARAMETER Procedure	Used to unset different parameters for sharded queues at queue or database level.

26.3.8 DBMS_AQADM Agent Subprograms

This section lists and describes the DBMS_AQADM agent subprograms.

Table 26-9 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure	Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues
CREATE_AQ_AGENT Procedure	Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues
DISABLE_DB_ACCESS Procedure	Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent
DROP_AQ_AGENT Procedure	Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access
ENABLE_DB_ACCESS Procedure	Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user

26.3.9 DBMS_AQADM Alias Subprograms

This section lists and describes the DBMS_AQADM alias subprograms.

Table 26-10 Alias Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

26.4 Summary of DBMS_AQADM Subprograms

This section lists and describes the DBMS_AQADM package subprograms.

Table 26-11 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure	Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure	Alters the existing properties of a queue table
ALTER_SHARDED_QUEUE Procedure	Provides user the ability to alter the `cache_hint` and comment for the sharded queue *Starting with Oracle Database 20c, sharded queues are deprecated and will be desupported in a futur release. Use Transactional Event Queues(TEQ) instead.*
ALTER_SUBSCRIBER Procedure	Alters existing properties of a subscriber to a specified queue
ALTER_TRANSACTIONAL_EVENT_QUEUE Procedure	Provides user the ability to alter the `cache_hint` and comment for the TEQ queue
CREATE_AQ_AGENT Procedure	Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues
CREATE_NP_QUEUE Procedure	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure	Creates a queue in the specified queue table

Table 26-11 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
CREATE_SHARDED_QUEUE Procedure	Creates a queue and its queue table for a sharded queue all together. *Starting with Oracle Database 20c, sharded queues are deprecated and will be desupported in a futur release. Use Transactional Event Queues(TEQ) instead.*
CREATE_EXCEPTION_QUEUE Procedure	Creates an exception queue. *Starting with Oracle Database 20c, sharded queues are deprecated and will be desupported in a futur release. Use Transactional Event Queues(TEQ) instead.*
CREATE_EQ EXCEPTION_QUEUE Procedure	Creates an exception queue.
CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure	Creates a queue and its queue table for a Transactional Event Queue (TEQ).
CREATE_QUEUE_TABLE Procedure	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure	Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure	Disables a propagation schedule
DROP_AQ_AGENT Procedure	Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access
DROP_QUEUE Procedure	Drops an existing queue
DROP_SHARDED_QUEUE Procedure	Drops an existing sharded queue from the database queuing system *Starting with Oracle Database 20c, sharded queues are deprecated and will be desupported in a futur release. Use Transactional Event Queues(TEQ) instead.*
DROP_TRANSACTIONAL_EVENT_QUEUE Procedure	Drops an existing TEQ queue from the database queuing system
DROP_QUEUE_TABLE Procedure	Drops an existing queue table
ENABLE_DB_ACCESS Procedure	Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure	A precondition for the enqueue of JMS types and XML types
ENABLE_PROPAGATION_SCHEDULE Procedure	Enables a previously disabled propagation schedule
GET_MAX_STREAMS_POOL Procedure	Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit
GET_MIN_STREAMS_POOL Procedure	Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit

Table 26-11 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
GET_QUEUE_PARAMETER Procedure	Used to get different parameters for sharded queues at queue or database level.
GET_WATERMARK Procedure	Retrieves the value of watermark set by the `SET_WATERMARK` Procedure
GRANT_QUEUE_PRIVILEGE Procedure	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure	Grants Oracle Database Advanced Queuing system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
REMOVE_SUBSCRIBER Procedure	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure	Revokes Oracle Database Advanced Queuing system privileges from users and roles
SCHEDULE_PROPAGATION Procedure	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_QUEUE_PARAMETER Procedure	Used to set different parameters for sharded queues at queue or database level.
SET_MAX_STREAMS_POOL Procedure	Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use
SET_MIN_STREAMS_POOL Procedure	Used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use
SET_WATERMARK Procedure	Used for Oracle Database Advanced Queuing notification to specify and limit memory use
START_QUEUE Procedure	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure	Disables enqueuing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
UNSET_QUEUE_PARAMETER Procedure	Used to unset different parameters for sharded queues at queue or database level.
VERIFY_QUEUE_TYPES Procedure	Verifies that the source and destination queues have identical types

26.4.1 ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
   alias          IN VARCHAR2,
   obj_location   IN VARCHAR2);
```

Parameters

Table 26-12 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
`alias`	Name of the alias. Example: `west_shipping`.
`obj_location`	The distinguished name of the object (queue, agent or connection factory) to which `alias` refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.

26.4.2 ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
   queue_name      IN    VARCHAR2,
   subscriber      IN    sys.aq$_agent,
   rule            IN    VARCHAR2 DEFAULT NULL,
   transformation  IN    VARCHAR2 DEFAULT NULL
   queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
   delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 26-13 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
`queue_name`	Name of the queue.
`subscriber`	Agent on whose behalf the subscription is being defined.

Table 26-13 (Cont.) ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule   => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

26.4.3 ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 26-14 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.
enable_smtp	TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.
enable_anyp	TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).

26.4.4 ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
   queue_name           IN    VARCHAR2,
   destination          IN    VARCHAR2 DEFAULT NULL,
   duration             IN    NUMBER   DEFAULT NULL,
   next_time            IN    VARCHAR2 DEFAULT NULL,
   latency              IN    NUMBER   DEFAULT 60,
   destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-15 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.

Table 26-15 (Cont.) ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

26.4.5 ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max_retries, retention_time, and retry_delay are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
   queue_name         IN    VARCHAR2,
   max_retries        IN    NUMBER   DEFAULT NULL,
   retry_delay        IN    NUMBER   DEFAULT NULL,
   retention_time     IN    NUMBER   DEFAULT NULL,
   auto_commit        IN    BOOLEAN  DEFAULT TRUE,
   comment            IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-16 ALTER_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be altered
max_retries	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.

Table 26-16 (Cont.) ALTER_QUEUE Procedure Parameters

Parameter	Description
retry_delay	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
auto_commit	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
comment	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

26.4.6 ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
   queue_table          IN   VARCHAR2,
   comment              IN   VARCHAR2       DEFAULT NULL,
   primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
   secondary_instance   IN   BINARY_INTEGER DEFAULT NULL,
   replication_mode     IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 26-17 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

Table 26-17 (Cont.) ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
replication_mode	DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode. DBMS_AQADM.NONE if queue is being altered to not be replicated. The default value is NULL.

26.4.7 ALTER_SHARDED_QUEUE Procedure

This procedure provides user the ability to alter a sharded queue.

> **See Also:**
>
> *Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

Syntax

```
PROCEDURE ALTER_SHARDED_QUEUE(
    queue_name             IN VARCHAR2,
    max_retries            IN NUMBER         DEFAULT NULL,
    comment                IN VARCHAR2       DEFAULT NULL,
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,
    replication_mode       IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 26-18 ALTER_SHARDED_QUEUE Procedure Parameters

Parameter	Description
queue_name	This parameter specifies the name of the sharded queue. A maximum of 128 characters are allowed.
max_retries	The maximum number of retries allowed.
comment	The comment of the queue.
queue_properties	Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Typefor more information about queue_properties.
replication_mode	Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode or else DBMS_AQADM.NONE. Default is NULL.

26.4.8 ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
   queue_name     IN    VARCHAR2,
   subscriber     IN    sys.aq$_agent,
   rule           IN    VARCHAR2
   transformation IN    VARCHAR2);
```

Parameters

Table 26-19 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
`queue_name`	Name of the queue.
`subscriber`	Agent on whose behalf the subscription is being altered. See "AQ__AGENT Type".
`rule`	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to `NULL`.
`transformation`	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema*.AQ$*queue_table*_R and *schema*.AQ$*queue_table*_S views.

26.4.9 ALTER_TRANSACTIONAL_EVENT_QUEUE Procedure

This procedure provides user the ability to alter a TEQ queue.

> **See Also:**
>
> *Oracle® Database Advanced Queuing User's Guide* for information about TEQ queues

Syntax

```
PROCEDURE ALTER_TRANSACTIONAL_EVENT_QUEUE(
    queue_name              IN VARCHAR2,
    max_retries             IN NUMBER         DEFAULT NULL,
    comment                 IN VARCHAR2       DEFAULT NULL,
```

```
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,
    replication_mode       IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 26-20 ALTER_TRANSACTIONAL_EVENT_QUEUE Procedure Parameters

Parameter	Description
queue_name	This parameter specifies the name of the TEQ queue. A maximum of 128 characters are allowed.
max_retries	The maximum number of retries allowed.
comment	The comment of the queue.
queue_properties	Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Typefor more information about queue_properties.
replication_mode	Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode or else DBMS_AQADM.NONE. Default is NULL.

26.4.10 CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 26-21 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.
enable_smtp	TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.

Table 26-21 (Cont.) CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
enable_anyp	TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents.

26.4.11 CREATE_DATABASE_KAFKA_TOPIC Procedure

This procedure create an OKafka Topic. OKafka Topic is a multi-consumer transactional event queue specifically design to be used with OKafka application.

This procedure will create a transactional event queue underneath which should only be access by OKafka programming interfaces documented at Kafka APIs for Oracle Transactional Event Queues.

Syntax

```
PROCEDURE CREATE_DATABASE_KAFKA_TOPIC(
            topicname IN VARCHAR2,
            partition_num IN NUMBER  Default 1,
            retentiontime IN NUMBER Default 7*24*3600,
            partition_assignment_mode IN NUMBER DEFAULT 2,
            replication_mode IN BINARY_INTEGER DEFAULT SYS.DBMS_AQADM.NONE)
```

Parameters

Table 26-22 CREATE_DATABASE_KAFKA_TOPIC Procedure Parameters

Parameter	Description
topicname	Specifies the name of the topic that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle SQL Reserved Words and Keywords with regard to reserved characters.
partition_num	Specifies the number of maximum partitions this topic can have
retentiontime	Specifies the retention time for this topic in seconds
partition_assignment_mode	Partition assignment strategy for this topic. Value for this parameter should be 2.
replication_mode	DBMS_AQADM.REPLICATION_MODE if queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.

26.4.12 CREATE_NP_QUEUE Procedure

This procedure creates a nonpersistent `RAW` queue.

> **Note:**
>
> Nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
   queue_name              IN        VARCHAR2,
   multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
   comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-23 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
`queue_name`	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference.*
`multiple_consumers`	`FALSE` means queues created in the table can only have one consumer for each message. This is the default. `TRUE` means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
`comment`	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (`AQ$_MEM_SC` or `AQ$_MEM_MC`) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

26.4.13 CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
   queue_name          IN       VARCHAR2,
   queue_table         IN       VARCHAR2,
   queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
   max_retries         IN       NUMBER         DEFAULT NULL,
   retry_delay         IN       NUMBER         DEFAULT 0,
   retention_time      IN       NUMBER         DEFAULT 0,
   dependency_tracking IN       BOOLEAN        DEFAULT FALSE,
   comment             IN       VARCHAR2       DEFAULT NULL,
   auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 26-24 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 26-24 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

26.4.14 CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
   queue_table          IN      VARCHAR2,
   queue_payload_type   IN      VARCHAR2,
   storage_clause       IN      VARCHAR2        DEFAULT NULL,
   sort_list            IN      VARCHAR2        DEFAULT NULL,
   multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
   message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
   comment              IN      VARCHAR2        DEFAULT NULL,
   auto_commit          IN      BOOLEAN         DEFAULT TRUE,
   primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
   secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
   compatible           IN      VARCHAR2        DEFAULT NULL,
   secure               IN      BOOLEAN         DEFAULT FALSE
   replication_mode     IN      BINARY_INTEGER  DEFAULT NONE);
```

Parameters

Table 26-25 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name inDBMS_AQ Data Types for valid values for this parameter.

Table 26-25 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.
sort_list	The columns to be used as the sort key in ascending order. This parameter has the following format: '*sort_column_1*,*sort_column_2*' The allowed column names are priority, enq_time, and commit_time.If both columns are specified, then *sort_column_1* defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified. When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See also "Priority and Ordering of Messages" in *Oracle Database Advanced Queuing User's Guide* for information about message ordering in Oracle Database Advanced Queuing.
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
message_grouping	Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.
comment	User-specified description of the queue table. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.

Table 26-25 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
primary_instance	The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.
compatible	The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.
secure	This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.
replication_mode	DBMS_AQADM.REPLICATION_MODE if queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- aq$_*queue_table_name*_e, a default exception queue associated with the queue table
- aq$*queue_table_name*, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- aq$_*queue_table_name*_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- aq$_*queue_table_name*_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- aq$_*queue_table_name*_s, a table for storing information about the subscribers
- aq$_*queue_table_name*_r, a table for storing information about rules on subscriptions

aq$_*queue_table_name*_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only CLOB and BLOB can be propagated using Oracle Database Advanced Queuing propagation in Oracle8*i* release 8.1.5 or later. See the *Oracle Database Advanced Queuing User's Guide* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the

database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

26.4.15 CREATE_SHARDED_QUEUE Procedure

The `CREATE_SHARDED_QUEUE` API creates a queue and its queue table as appropriate for a sharded queue. This API cannot be used to create unsharded queues. Sharded queues must be created using this single integrated API that will automatically set AQ properties as needed

Starting with Oracle Database 20c, the `CREATE_SHARDED_QUEUE` procedure is deprecated and will be desupported in a future release. Use the CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure procedure instead.

Sharded queues may be either a single consumer or a multi-consumer queue.

Syntax

```
PROCEDURE CREATE_SHARDED_QUEUE (
    queue_name              IN VARCHAR2,
    storage_clause          IN VARCHAR2       DEFAULT NULL,
    multiple_consumers      IN BOOLEAN        DEFAULT FALSE,
    max_retries             IN NUMBER         DEFAULT NULL,
    comment                 IN VARCHAR2       DEFAULT NULL,
    queue_payload_type      IN VARCHAR2       DEFAULT JMS_TYPE,
    queue_properties        IN QUEUE_PROPS_T  DEFAULT NULL,
    replication_mode        IN BINARY_INTEGER DEFAULT NONE,
    queue_type         IN BINARY_INTEGER DEFAULT SHARDED_QUEUE,
    squeue_ver              IN BINARY_INTEGER DEFAULT SQ);
```

Parameters

Table 26-26 CREATE_SHARDED_QUEUE Procedure Parameters

Parameter	Description
`queue_name`	This required parameter specifies the name of the new queue. Maximum of 128 characters allowed.
`storage_clause`	The storage parameter is included in the `CREATE TABLE` statement when the queue table is created. The `storage_clause` argument can take any text that can be used in a standard `CREATE TABLE storage_clause` argument. The storage parameter can be made up of any combinations of the following parameters: `PCTFREE`, `PCTUSED`, `INITRANS`, `MAXTRANS`, `TABLESPACE`, `LOB`, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.
`multiple_consumers`	`FALSE` means queues can only have one consumer for each message. This is the default. `TRUE` means queues created in the table can have multiple consumers for each message.

Table 26-26 (Cont.) CREATE_SHARDED_QUEUE Procedure Parameters

Parameter	Description
max_retries	This optional parameter limits the number of times that a dequeue can reattempted on a message after a failure. The maximum value of max_retries is 2**31 -1. After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.
comment	This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.
queue_payload_type	Payload can be RAW, JSON, DBMS_AQADM.JMS_TYPE, or an object type. Default is DBMS_AQADM.JMS_TYPE. See DBMS_AQ Data Types.
queue_properties	Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.
replication_mode	Reserved for future use. DBMS_AQADM.REPLICATION_MODE if Queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.
queue_kind	This parameter specifies the queue type. The following types are: CLASSIC_QUEUE CONSTANT BINARY_INTEGER := 0; SHARDED_QUEUE CONSTANT BINARY_INTEGER := 1; TRANSACTIONAL_EVENT_QUEUE CONSTANT BINARY_INTEGER := 2; The default value is SHARDED_QUEUE.
squeue_ver	The sharded queue phase/version. SQ CONSTANT BINARY_INTEGER := 0; TEQ CONSTANT BINARY_INTEGER := 1;

26.4.16 CREATE_EXCEPTION_QUEUE Procedure

The CREATE_EXCEPTION_QUEUE API creates an exception queue for a sharded queue.

Syntax

```
PROCEDURE CREATE_EXCEPTION_QUEUE(
    sharded_queue_name      IN VARCHAR2,
    exception_queue_name    IN VARCHAR2 DEFAULT NULL
    );
```

Parameters

Table 26-27 CREATE_EXCEPTION_QUEUE Procedure Parameters

Parameter	Description
sharded_queue_name	The name of the sharded queue.

Table 26-27 (Cont.) CREATE_EXCEPTION_QUEUE Procedure Parameters

Parameter	Description
exception_queue_name	The name of the exception queue.

26.4.17 CREATE_EQ EXCEPTION_QUEUE Procedure

The CREATE_EQ_EXCEPTION_QUEUE API creates an exception queue for a TEQ queue.

Syntax

```
PROCEDURE CREATE_EQ_EXCEPTION_QUEUE(
    teq_queue_name     IN VARCHAR2,
    exception_queue_name   IN VARCHAR2 DEFAULT NULL
    );
```

Parameters

Table 26-28 CREATE_EQ_EXCEPTION_QUEUE Procedure Parameters

Parameter	Description
teq_queue_name	The name of the TEQ queue.
exception_queue_name	The name of the exception queue.

26.4.18 CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure

The CREATE_TRANSACTIONAL_EVENT_QUEUE API creates a queue and its queue table as appropriate for a Transactional Event Queue (TEQ). This API cannot be used to create AQ queues. TEQs must be created using this single integrated API that will automatically set AQ properties as needed.

TEQs may be either a single consumer or a multi-consumer queue.

Syntax

```
PROCEDURE CREATE_TRANSACTIONAL_EVENT_QUEUE (
    queue_name             IN VARCHAR2,
    storage_clause         IN VARCHAR2       DEFAULT NULL,
    multiple_consumers     IN BOOLEAN        DEFAULT FALSE,
    max_retries            IN NUMBER         DEFAULT NULL,
    comment                IN VARCHAR2       DEFAULT NULL,
    queue_payload_type     IN VARCHAR2       DEFAULT JMS_TYPE,
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,
    replication_mode       IN BINARY_INTEGER DEFAULT NONE);
```

Parameters

Table 26-29 CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure Parameters

Parameter	Description
queue_name	This required parameter specifies the name of the new queue. Maximum of 128 characters allowed.

Table 26-29 (Cont.) CREATE_TRANSACTIONAL_EVENT_QUEUE Procedure Parameters

Parameter	Description
storage_clause	The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.
multiple_consumers	FALSE means queues can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
max_retries	This optional parameter limits the number of times that a dequeue can reattempted on a message after a failure. The maximum value of max_retries is 2**31 -1. After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.
comment	This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.
queue_payload_type	Payload can be RAW, JSON, DBMS_AQADM.JMS_TYPE, or an object type. Default is DBMS_AQADM.JMS_TYPE. See DBMS_AQ Data Types.
queue_properties	Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.
replication_mode	Reserved for future use. DBMS_AQADM.REPLICATION_MODE if Queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.

26.4.19 DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQADM.DEL_ALIAS_FROM_LDAP(
   alias IN VARCHAR2);
```

Parameters

Table 26-30 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

26.4.20 DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 26-31 DISABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent.

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.

26.4.21 DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
   queue_name            IN   VARCHAR2,
   destination           IN   VARCHAR2 DEFAULT NULL,
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-32 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.

Table 26-32 (Cont.) DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

26.4.22 DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
  agent_name                IN VARCHAR2)
```

Parameters

Table 26-33 DROP_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent

26.4.23 DROP_DATABASE_KAFKA_TOPIC Procedure

This procedure drops an existing OKafka topic. OKafka Topic is a multi-consumer transactional event queue specifically design to be used with OKafka application.

Syntax

```
PROCEDURE DROP_DATABASE_KAFKA_TOPIC(
            topicname IN VARCHAR2)
```

Parameters

Table 26-34 DROP_DATABASE_KAFKA_TOPIC Procedure Parameters

Parameter	Description
topicname	Specifies the name of the topic that is to be dropped. The name must be unique within a schema and must follow object name guidelines in Oracle SQL Reserved Words and Keywords with regard to reserved characters.

26.4.24 DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
   queue_name         IN    VARCHAR2,
   auto_commit        IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 26-35 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

26.4.25 DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
   queue_table        IN    VARCHAR2,
   force              IN    BOOLEAN DEFAULT FALSE,
   auto_commit        IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 26-36 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.

Table 26-36 (Cont.) DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the force option is used, in which case this is done automatically.

26.4.26 DROP_SHARDED_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system.

You must stop the queue before calling DROP_SHARDED_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_SHARDED_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

Syntax

```
DBMS_AQADM.DROP_SHARDED_QUEUE(
       queue_name IN VARCHAR2,
       force      IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 26-37 DROP_SHARDED_QUEUE Procedure Parameters

Parameter	Description
queue_name	This required parameter specifies the name of the sharded queue.
force	The sharded queue is dropped even if the queue is not stopped.

26.4.27 DROP_TRANSACTIONAL_EVENT_QUEUE Procedure

This procedure drops an existing TEQ queue from the database queuing system.

You must stop the queue before calling DROP_TRANSACTIONAL_EVENT_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_TRANSACTIONAL_EVENT_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

Syntax

```
DBMS_AQADM.DROP_TRANSACTIONAL_EVENT_QUEUE(
       queue_name IN VARCHAR2,
       force      IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 26-38 DROP_TRANSACTIONAL_EVENT_QUEUE Procedure Parameters

Parameter	Description
queue_name	This required parameter specifies the name of the TEQ queue.
force	The TEQ queue is dropped even if the queue is not stopped.

26.4.28 ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 26-39 ENABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Database Advanced Queuing Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent.

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.

26.4.29 ENABLE_JMS_TYPES Procedure

Enqueue JMS types and XML types.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
   queue_table    IN    VARCHAR2);
```

Parameters

Table 26-40 ENABLE_JMS_TYPES Procedure Parameters

Parameter	Description
queue_table	Specifies name of the queue table to be enabled for JMS and XML types.

26.4.30 ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
   queue_name          IN   VARCHAR2,
   destination         IN   VARCHAR2 DEFAULT NULL,
   destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 26-41 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

26.4.31 GET_MAX_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MAX_STREAMS_POOL (
   value     OUT      NUMBER);
```

Parameters

Table 26-42 GET_MAX_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

26.4.32 GET_MIN_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MIN_STREAMS_POOL (
   value     OUT      NUMBER);
```

Parameters

Table 26-43 GET_MIN_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

26.4.33 GET_QUEUE_PARAMETER Procedure

This procedure allows user to get different parameters for sharded queues at queue or database level.

For database level the queue_name should be NULL. Note that queue overrides database level parameter values.

> **See Also:**
>
> *Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

Syntax

```
PROCEDURE  GET_QUEUE_PARAMETER(
    queue_name          IN VARCHAR2,
    param_name          IN VARCHAR2,
    param_value         OUT NUMBER);
```

Parameters

Table 26-44 GET_QUEUE_PARAMETER Procedure Parameters

Parameter	Description
queue_name	The name of the sharded queue.
param_name	The name of the parameter. Table 26-45 and Table 26-46 describe the valid parameter names.
param_value	The value of the parameter.

Table 26-45 Sharded queue parameters

Parameter Name	Scope	Allowed Values	Description
SHARD_NUM	Queue level	[1, UB4MAXVAL]	Number of shards created per instance for a queue, when KEY_BASED_ENQUEUE is not set. When KEY_BASED_ENQUEUE is set, the value is maximum number of shards created for the queue across all instances. The default value is 5.
KEY_BASED_ENQUEUE	Queue level	[0,1]	When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set. When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.
STICKY_DEQUEUE	Queue level	[0,1]	When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set. When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.

Table 26-46 Key-based Parameters

Parameter Name	Scope	Description
AQ$KEY_TO_SHARD_MAP	Queue level	Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped.
AQ$GET_KEY_SHARD_INST	Queue level	Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.

Example 26-1 Key to shard mapping

Users can explicitly map a new key to an existing shard or to a new shard.

To map a key value 'RED' to a shard with id 0 for queue named MY_SHQ1, submit the following:

```
execute
        dbms_aqadm.set_queue_paramter('MY_SHQ1',  'AQ$KEY_TO_SHARD_MAP=RED',
0);
```

If a key is being enqueued which has not been explicitly mapped to a shard, then one of the shards is chosen at random and mapped to that key permanently. Once a key is mapped to shard, the mapping cannot be changed.

To get the shard identifier for a key which is mapped already, submit the following:

```
declare
  pval number;
begin
  dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD=RED', pval);
  dbms_output.put_line('The key RED is mapped to shard id ' || pval);
END;
/
```

Example 26-2 Key to instance mapping

User sharding performs best when cross instance enqueues are not involved. To know the instance where a key can be enqueued without any cross instance enqueue, submit the following:

```
declare
  pval number;
begin
  dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD_INST=RED', pval);
  dbms_output.put_line('The key RED is owned by instance id ' || pval);
END;
/
```

26.4.34 GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by `SET_WATERMARK`.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 26-47 GET_WATERMARK Procedure Parameter

Parameter	Description
`wmvalue`	Watermark value in megabytes.

26.4.35 GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are `ENQUEUE` or `DEQUEUE`. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
   privilege        IN    VARCHAR2,
   queue_name       IN    VARCHAR2,
   grantee          IN    VARCHAR2,
   grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 26-48 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The Oracle Database Advanced Queuing queue privilege to grant. The options are `ENQUEUE`, `DEQUEUE`, and `ALL`. `ALL` means both `ENQUEUE` and `DEQUEUE`.
`queue_name`	Name of the queue.
`grantee`	Grantee(s). The grantee(s) can be a user, a role, or the `PUBLIC` role.
`grant_option`	Specifies if the access privilege is granted with the `GRANT` option or not. If the privilege is granted with the `GRANT` option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is `FALSE`.

26.4.36 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles.

The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. Initially, only `SYS` and `SYSTEM` can use this procedure successfully.

> **Note:**
>
> Starting from Oracle Database 12*c* Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
   privilege         IN    VARCHAR2,
   grantee           IN    VARCHAR2,
   admin_option      IN    BOOLEAN := FALSE);
```

Parameters

Table 26-49 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The Oracle Database Advanced Queuing system privilege to grant. The options are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. `ENQUEUE_ANY` means users granted this privilege are allowed to enqueue messages to any queues in the database. `DEQUEUE_ANY` means users granted this privilege are allowed to dequeue messages from any queues in the database. `MANAGE_ANY` means users granted this privilege are allowed to run `DBMS_AQADM` calls on any schemas in the database. **Note:** Starting from Oracle Database 12*c* Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.
`grantee`	Grantee(s). The grantee(s) can be a user, a role, or the `PUBLIC` role.
`admin_option`	Specifies if the system privilege is granted with the `ADMIN` option or not. If the privilege is granted with the `ADMIN` option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is `FALSE`.

26.4.37 MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
   queue_table    IN   VARCHAR2,
   compatible     IN   VARCHAR2);
```

Parameters

Table 26-50 MIGRATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies name of the queue table to be migrated.
compatible	Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.

26.4.38 PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
   queue_table        IN   VARCHAR2,
   purge_condition    IN   VARCHAR2,
   purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Oracle Database Advanced Queuing (AQ) Types.

Parameters

Table 26-51 PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies the name of the queue table to be purged.
purge_condition	Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).

Table 26-51 (Cont.) PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
purge_options	Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter. • If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. • delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You an purge selected messages from the queue table by specifying a purge_condition. Table 26-51 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.
- A trace file is generated in the udump destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one purge_queue_table call depending on the number of messages in the queue table.

26.4.39 QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$_subscriber_list_t.

Each element of the collection is of type sys.aq$_agent. This functionality is provided for 8.1-compatible queues by the AQ$*queue_table_name*_S view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
   queue_name          IN          VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 26-52 QUEUE_SUBSCRIBERS Function Parameters

Parameter	Description
queue_name	Specifies the queue whose subscribers are to be printed.

26.4.40 REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
   queue_name          IN         VARCHAR2,
   subscriber          IN         sys.aq$_agent);
```

Parameters

Table 26-53 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ$_AGENT Type.

26.4.41 REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
   privilege          IN      VARCHAR2,
   queue_name         IN      VARCHAR2,
   grantee            IN      VARCHAR2);
```

Parameters

Table 26-54 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Database Advanced Queuing queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

26.4.42 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY` and `MANAGE_ANY`. The `ADMIN` option for a system privilege cannot be selectively revoked. Starting from Oracle Database 12*c* Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
   privilege         IN   VARCHAR2,
   grantee           IN   VARCHAR2);
```

Parameters

Table 26-55 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The Oracle Database Advanced Queuing system privilege to revoke. The options are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. The `ADMIN` option for a system privilege cannot be selectively revoked. **Note:** Starting from Oracle Database 12*c* Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.
`grantee`	Grantee(s). The grantee(s) can be a user, a role, or the `PUBLIC` role.

26.4.43 SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
   queue_name          IN    VARCHAR2,
   destination         IN    VARCHAR2 DEFAULT NULL,
   start_time          IN    DATE     DEFAULT SYSDATE,
   duration            IN    NUMBER   DEFAULT NULL,
   next_time           IN    VARCHAR2 DEFAULT NULL,
   latency             IN    NUMBER   DEFAULT 60,
   destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-56 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 390 bytes, and if the name is not fully qualified, then the default domain name is used. The pattern *schema*.*queue*@dblink is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in either the same or different queues, the message is propagated to all of them at the same time.

Oracle extensions for JMS such as JMS propagation and remote subscribers are not currently supported for sharded queues. Propagation between sharded and non-sharded queues is not supported

26.4.44 SET_QUEUE_PARAMETER Procedure

This procedure allows user to set different parameters for sharded queues at queue or database level. For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

> **See Also:**
>
> *Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

Syntax

```
PROCEDURE  SET_QUEUE_PARAMETER(
  queue_name          IN VARCHAR2,
  param_name          IN VARCHAR2,
  param_value         IN NUMBER);
```

Parameters

Table 26-57 SET_QUEUE_PARAMETER Procedure Parameters

Parameter	Description
`queue_name`	The name of the sharded queue.
`param_name`	The name of the parameter. Table 26-58 and Table 26-59 describe the valid parameter names.
`param_value`	The value of the parameter.

Table 26-58 Sharded queue parameters

Parameter Name	Scope	Allowed Values	Description
`SHARD_NUM`	Queue level	`[1, UB4MAXVAL]`	Maximum number of shards allowed for the queue.

Table 26-58 (Cont.) Sharded queue parameters

Parameter Name	Scope	Allowed Values	Description
SUBSHARD_SIZE	Queue level	[1, UB2MAXVAL]	Default value is 20,000. This is the size of each partition for allocation of memory in a shard. Each shard consists of multiple subshards, which are allocated, used, and purged automatically based on message enqueue and dequeue rate for the shard.
KEY_BASED_ENQUEUE	Queue level	[0,1]	When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set. When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.
STICKY_DEQUEUE	Queue level	[0,1]	When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set. When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.

Table 26-59 Key-based Parameters

Parameter Name	Scope	Description
AQ$KEY_TO_SHARD_MAP	Queue level	Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped.
AQ$GET_KEY_SHARD_INST	Queue level	Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.

Example 26-3 Create a sharded queue with key based enqueues

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure DBMS_AQADM.SET_QUEUE_PARAMETER is called after CREATE_SHARDED_QUEUE.

```
execute
        sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');

execute
        dbms_aqadm.set_queue_parameter('MY_SHQ1', 'KEY_BASED_ENQUEUE', 1);
```

Example 26-4 Create a sharded queue with sticky dequeues

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure DBMS_AQADM.SET_QUEUE_PARAMETER is called after CREATE_SHARDED_QUEUE.

```
execute
        sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');

execute
        dbms_aqadm.set_queue_parameter('MY_SHQ1', 'STICKY_DEQUEUE', 1);
```

Example 26-5 Setting or changing the number of shards

Once a queue is created, it can have a maximum of 5 shards by default in non-Oracle RAC databases. In Oracle RAC databases, each queue can have a maximum of 5 shards per database instance by default.

```
execute
        dbms_aqadm.set_queue_parameter('MY_SHQ1', 'SHARD_NUM', 200);
```

> **Note:**
>
> Odd numbered shard identifiers are reserved for internal use. In the above example, the 200 shard identifiers used will be 0, 2, 4, …, 398.

26.4.45 SET_MAX_STREAMS_POOL Procedure

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

Syntax

```
DBMS_AQADM.SET_MAX_STREAMS_POOL (
   value      IN      NUMBER);
```

Parameters

Table 26-60 SET_MAX_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

26.4.46 SET_MIN_STREAMS_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

Syntax

```
DBMS_AQADM.SET_MIN_STREAMS_POOL (
   value      IN      NUMBER);
```

Parameters

Table 26-61 SET_MIN_STREAMS_POOL Procedure Parameter

Parameter	Description
value	Value in megabytes.

26.4.47 SET_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (
   wmvalue      IN      NUMBER);
```

Parameters

Table 26-62 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

26.4.48 START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
   queue_name      IN     VARCHAR2,
   enqueue         IN     BOOLEAN DEFAULT TRUE,
   dequeue         IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 26-63 START_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

26.4.49 STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
   queue_name      IN   VARCHAR2,
   enqueue         IN   BOOLEAN DEFAULT TRUE,
   dequeue         IN   BOOLEAN DEFAULT TRUE,
   wait            IN   BOOLEAN DEFAULT TRUE,
   free_memory     IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 26-64 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.
free_memory	Specifies whether the queue should be stopped.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

26.4.50 UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
   queue_name         IN  VARCHAR2,
   destination        IN  VARCHAR2 DEFAULT NULL
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-65 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

26.4.51 UNSET_QUEUE_PARAMETER Procedure

This procedure allows user to unset different parameters for sharded queues at queue or database level.

For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

> **See Also:**
>
> *Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

Syntax

```
PROCEDURE  UNSET_QUEUE_PARAMETER(
  queue_name          IN VARCHAR2,
  param_name          IN VARCHAR2);
```

Parameters

Table 26-66 UNSET_QUEUE_PARAMETER Procedure Parameters

Parameter	Description
`queue_name`	The name of the sharded queue.
`param_name`	The name of the parameter. Table 26-67 and Table 26-68 describe the valid parameter names.

Table 26-67 Sharded queue parameters

Parameter Name	Scope	Allowed Values	Description
`SHARD_NUM`	Queue level	`[1, UB4MAXVAL]`	Maximum number of shards allowed for the queue.
`SUBSHARD_SIZE`	Queue level	`[1, UB2MAXVAL]`	Default value is 20,000. This is the size of each partition for allocation of memory in a shard. Each shard consists of multiple subshards, which are allocated, used, and purged automatically based on message enqueue and dequeue rate for the shard.

Table 26-67 (Cont.) Sharded queue parameters

Parameter Name	Scope	Allowed Values	Description
KEY_BASED_ENQUEUE	Queue level	[0,1]	When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set. When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.
STICKY_DEQUEUE	Queue level	[0,1]	When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set. When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.

Table 26-68 Key-based Parameters

Parameter Name	Scope	Description
AQ$KEY_TO_SHARD_MAP	Queue level	Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped.

Table 26-68 (Cont.) Key-based Parameters

Parameter Name	Scope	Description
AQ$GET_KEY_SHARD_INST	Queue level	Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.

26.4.52 VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types.

The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
   src_queue_name    IN    VARCHAR2,
   dest_queue_name   IN    VARCHAR2,
   destination       IN    VARCHAR2 DEFAULT NULL,
   rc                OUT   BINARY_INTEGER);
```

Parameters

Table 26-69 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
src_queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
dest_queue_name	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
rc	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in `rc`.

Note:

- `SYS.AQ$_MESSAGE_TYPES` can have multiple entries for the same source queue, destination queue, and database link, but with different transformations.
- `VERIFY_QUEUE_TYPES` check happens once per AQ propagation schedule and not for every propagated message send.
- In case the payload of the queue is modified then the existing propagation schedule between source and destination queue needs to be dropped and recreated.

27
DBMS_AQELM

The package provides subprograms to manage the configuration of Oracle Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for detailed information about `DBMS_AQELM`

This chapter contains the following topics:`DBMS_AQELM`

- Security Model
- Summary of DBMS_AQELM Subprograms

27.1 DBMS_AQELM Security Model

You need the administrator role `AQ_ADMINISTRATOR_ROLE` to run all procedures in `DBMS_AQELM`.

27.2 Summary of DBMS_AQELM Subprograms

This section lists and briefly describes the DBMS_AQELM subprograms.

Table 27-1 DBMS_AQELM Package Subprograms

Subprogram	Description
SET_MAILHOST Procedure	Sets the host name for the SMTP server that the database will uses send out e-mail notifications
SET_MAILPORT Procedure	Sets the port number for the SMTP server
SET_SENDFROM Procedure	Sets the sent-from e-mail address

27.2.1 SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```

Parameters

Table 27-2 SET_MAILHOST Procedure Parameters

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

27.2.2 SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (
   mailport  IN NUMBER);
```

Parameters

Table 27-3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

27.2.3 SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
   sendfrom  IN  VARCHAR2);
```

Parameters

Table 27-4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package should set the sent-from address before registering for e-mail notifications

28
DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- Security Model

28.1 DBMS_AQIN Security Model

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces.

Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

You must have EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. You can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINSTRATOR_ROLE.

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide* for more information on accessing standard and Oracle JMS applications.

29
DBMS_AQMIGTOOL

The DBMS_AQMIGTOOL package simplifies migration from Oracle Database Advanced Queuing (AQ) to Transactional Event Queue (TxEventQ) with orchestration automation, source and target compatibility diagnostics and remediation, and a unified user experience. Migration scenarios can be short or long-lived and be performed with or without AQ downtime, eliminating operational disruption.

> **See Also:**
>
> Migrating from AQ to TxEventQ in *Oracle Database Advanced Queuing User's Guide* for detailed information about DBMS_AQMIGTOOL

This chapter contains the following topics:

- Security Model
- DBMS_AQMIGTOOL Constants
- Summary of DBMS_AQMIGTOOL Subprograms

29.1 DBMS_AQMIGTOOL Security Model

All DBMS_AQMIGTOOL subprograms require the user to have EXECUTE privilege over the DBMS_AQMIGTOOL package. If the invoker of the package is the owner of the queue, then only EXECUTE privilege on the DBMS_AQMIGTOOL package is sufficient, But if the invoker is non-owner, then it also needs to have MANAGE_ANY queue system privilege, which can be granted through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE.

29.2 DBMS_AQMIGTOOL Constants

The DBMS_AQMIGTOOL package defines several constants that can be used for specifying parameter values.

When using enumerated constants, such as AUTOMATIC, INTERACTIVE, or ENABLE_EVALUATION, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQMIGTOOL. For example, DBMS_AQMIGTOOL.AUTOMATIC.

Table 29-1 DBMS_AQMIGTOOL Constants

Paramater	Options	Value
mig_mode	AUTOMATIC	1
	INTERACTIVE	2
	OFFLINE	3
	ONLY_DEFINITION	4
ordering	GLOBAL	1
	SESSION	2
checkmode	CURRENT	1
	ENABLE_EVALUATION	2
cancelmode	RESTORE	1
	NORESTORE	2
	Q_EMPTY	3
purge_option	ONLY_CQ	1
	ONLY_TXEVENTQ	2
	BOTH_Q	3

29.3 Summary of DBMS_AQMIGTOOL Subprograms

This section lists and briefly describes the DBMS_AQMIGTOOL subprograms.

Table 29-2 DBMS_AQMIGTOOL Package Subprograms

Subprogram	Description
CANCEL_MIGRATION Procedure	Cancels an ongoing migration by dropping the interim TxEventQ
CHECK_MIGRATED_MESSAGES Procedure	Provides a count of messages in the READY state within the AQ and the interim TxEventQ
CHECK_MIGRATION_TO_TXEVENTQ Procedure	Analyzes the AQ's definition and data and report any features unsupported in TxEventQ
CHECK_STATUS Procedure	Returns the current status of the ongoing migration process
CLEAR_UNSUPPORTED_FEATURE_TABLE Procedure	Clears entries from the USER_TXEVENTQ_MIGRATION_STATUS view
COMMIT_MIGRATION Procedure	Completes the migration process by dropping AQ, renaming the interim TxEventQ to match AQ's name, and enabling TxEventQ for all operations
DISABLE_MIGRATION_CHECK Procedure	Disables the internal AQ monitoring for detecting unsupported features and stops event insertion in the USER_TXEVENTQ_MIGRATION_STATUS view
INIT_MIGRATION Procedure	Analyzes the AQ's definition and data for unsupported features and then starts the migration process by creating an interim TxEventQ copying the AQ's configuration
PURGE_QUEUE_MESSAGES Procedure	Purges messages from the queue

Table 29-2 (Cont.) DBMS_AQMIGTOOL Package Subprograms

Subprogram	Description
RECOVER_MIGRATION Procedure	Helps recovery from any failures during execution of migration procedures such as `DBMS_AQMIGTOOL.INIT_MIGRATION`, `DBMS_AQMIGTOOL.COMMIT_MIGRATION`, or `DBMS_AQMIGTOOL.CANCEL_MIGRATION`
RENAME_QUEUE Procedure	Renames the TxEventQ along with its default exception queue if present

29.3.1 CANCEL_MIGRATION Procedure

This procedure serves the purpose of canceling an ongoing migration. It involves dropping the interim TxEventQ, which was created during the execution of `DBMS_AQMIGTOOL.INIT_MIGRATION`.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.CANCEL_MIGRATION (
    cqschema     IN VARCHAR2,
    cqname       IN VARCHAR2,
    cancelmode   IN NUMBER DEFAULT DBMS_AQMIGTOOL.RESTORE );
```

Parameters

Table 29-3 CANCEL_MIGRATION Procedure Parameters

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the queue name for which the migration needs to be canceled
`cancelmode`	Specifies the mode in which the user wants to cancel the migration. The following are the possible values: `DBMS_AQMIGTOOL.RESTORE` (default): This option restores the messages from the interim TxEventQ into the AQ, including their message state. New MSGID will get populated for restored messages. **Note:** The priority behavior of restored messages may change as AQ and TxEventQ default values are different. `DBMS_AQMIGTOOL.NORESTORE`: Messages within interim TxEventQ will be discarded. `DBMS_AQMIGTOOL.EMPTY`: If the interim TxEventQ is not empty, selecting this option will trigger an exception, prompting the user to dequeue all messages from the interim TxEventQ. This mode is useful if the user wishes to prevent message migration while transitioning to the AQ.

Usage Notes

A prerequisite for this procedure is that the migration must already be started on the queue, that is, `DBMS_AQMIGTOOL.INIT_MIGRATION` should be invoked before executing this procedure. For `DBMS_AQMIGTOOL.RESTORE` mode, the TxEventQ's exception queue messages are not restored to AQ or its exception queue.

29.3.2 CHECK_MIGRATED_MESSAGES Procedure

This procedure calculates the count of messages in the `READY` state within both the AQ and the interim TxEventQ. This count provides valuable insight before using `DBMS_AQMIGTOOL.COMMIT_MIGRATION` or `DBMS_AQMIGTOOL.CANCEL_MIGRATION`. The calculated count is independent of the number of subscribers.

Syntax

```
PROCEDURE SYS.DBMS_AQMIGTOOL.CHECK_MIGRATED_MESSAGES (
    cqschema                          IN VARCHAR2,
    cqname                            IN VARCHAR2,
    txeventq_migrated_message         IN OUT NUMBER,
    cq_pending_messages               IN OUT NUMBER);
```

Parameters

Table 29-4 CHECK_MIGRATED_MESSAGES Procedure Parameters

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the name of the queue on which the migration process has started
`txeventq_migrated_message`	Represents the count of messages in the `READY` state within the interim TxEventQ. The count helps estimate the potential fallback time if the user opts to execute `DBMS_AQMIGTOOL.CANCEL_MIGRATION`.
`cq_pending_messages`	Represents the count of messages in the `READY` state within the AQ. The count helps determine the remaining number of `READY` state messages until the AQ is empty, which is a prerequisite for using the `DBMS_AQMIGTOOL.COMMIT_MIGRATION` procedure.

Usage Notes

A prerequisite for this procedure is that the migration must already be started on the queue, meaning `DBMS_AQMIGTOOL.INIT_MIGRATION` should be invoked before executing this procedure.

29.3.3 CHECK_MIGRATION_TO_TXEVENTQ Procedure

This procedure examines the AQ's definition and data and reports any features that are unsupported in TxEventQ. If no unsupported features are detected, then `migration_report` will be empty.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ (
    cqschema           IN VARCHAR2,
    cqname             IN VARCHAR2,
```

```
    migration_report    IN OUT TXEVENTQ_MIGREPORT_ARRAY,
    checkmode           IN NUMBER DEFAULT DBMS_AQMIGTOOL.ENABLE_EVALUATION);
```

Parameters

Table 29-5 CHECK_MIGRATION_TO_TXEVENTQ Procedure Parameters

Parameter	Description
cqschema	Specifies the schema name where the queue exists
cqname	Specifies the queue name for which unsupported features need to be checked
migration_report	A Varray containing details of unsupported events and their corresponding descriptions. It holds the most recent 20 unsupported features.
checkmode	Specifies the mode in which the user wants to check. The following are the possible values: DBMS_AQMIGTOOL.CURRENT: This mode generates a report using the current definition of the AQ and its data. DBMS_AQMIGTOOL.ENABLE_EVALUATION (Default): This mode, along with the CURRENT option report, will enable the monitoring of the AQ. It helps the capturing runtime-specific unsupported features. As more workload is applied to the AQ, the unsupported features, if found any, are recorded in an internal table accessible through the USER_TXEVENTQ_MIGRATION_STATUS view. Users can disable monitoring using DBMS_AQMIGTOOL.DISABLE_MIGRATION_CHECK.

Usage Notes

Several features like relative message identifier, sequence deviation, and transformation are not supported in TxEventQ. If the queue uses any of them, they will be recorded in the migration_report.

It is recommended to use the DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ procedure to detect unsupported features before beginning the migration process.

> **See Also:**
>
> Limitations and Workarounds in *Oracle Database Transactional Event Queues and Advanced Queuing User's Guide*

29.3.4 CHECK_STATUS Procedure

This procedure returns the status of the migration process. In case any unsupported features are detected, the procedure will return details about the most recent unsupported feature, including its description. On the other hand, if no unsupported features are detected, it will return a status of 'No Compatibility Error'.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.CHECK_STATUS (
    cqschema                    IN VARCHAR2,
    cqname                      IN VARCHAR2,
    status                      IN OUT VARCHAR2,
    migration_comment           IN OUT VARCHAR2);
```

Parameters

Table 29-6 CHECK_STATUS Procedure Parameters

Parameter	Description
cqschema	Specifies the schema name where the queue exists
cqname	Specifies the name of the queue for which the migration process status needs to be checked
status	Return the compatibility status. In case of incompatibility, that is, detection of unsupported features; the most recent unsupported event will be returned, and the status return format will be: "Compatibility Error: <feature_name> Unsupported Feature".
migration_comment	If the status is incompatible, the description of the unsupported event will be provided

Usage Notes

A prerequisite for this procedure is that the migration must already be started on the queue, meaning DBMS_AQMIGTOOL.INIT_MIGRATION should be invoked before executing this procedure.

The following table will store the information regarding events during pre-init or post-init migration. Users can access this information through security views: DBA_TXEVENTQ_MIGRATION_STATUS, USER_TXEVENTQ_MIGRATION_STATUS, and ALL_TXEVENTQ_MIGRATION_STATUS.

```
sys.aq$_migration_status(
        migration_id            RAW(16);
        source_schema           VARCHAR2(128) NOT NULL,
        source_queue            VARCHAR2(128) NOT NULL,
        source_queue_table      VARCHAR2(128),
        target_schema           VARCHAR2(128) NOT NULL,
        target_queue            VARCHAR2(128) NOT NULL,
        status                  NUMBER,
        event                   VARCHAR(128),
        event_timestamp         TIMESTAMP WITH TIME ZONE,
        event_id                NUMBER,
        event_error             VARCHAR2(1024),
        ordering                VARCHAR(30),
        suffix                  VARCHAR2(2),
        mig_mode                NUMBER,
        spare1                  NUMBER,
        spare2                  VARCHAR2(30),
        spare3                  TIMESTAMP WITH TIME ZONE
)
```

A unique migration_id will be assigned to each initiated migration.

> **See Also:**
>
> DBA_TXEVENTQ_MIGRATION_STATUS in Oracle Database Reference
>
> USER_TXEVENTQ_MIGRATION_STATUS in Oracle Database Reference
>
> ALL_TXEVENTQ_MIGRATION_STATUS in Oracle Database Reference

29.3.5 CLEAR_UNSUPPORTED_FEATURE_TABLE Procedure

This procedure removes entries from the underlying table of the `USER_TXEVENTQ_MIGRATION_STATUS` view. This view stores records related to unsupported features detected by the `DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ` procedure and details of other migration procedure calls (`INIT_MIGRATION`/`COMMIT_MIGRATION`/ `CANCEL_MIGRATION`) used for internal purposes.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.CLEAR_UNSUPPORTED_FEATURE_TABLE (
    cqschema             IN   VARCHAR2,
    cqname               IN   VARCHAR2 DEFAULT NULL,
    eraseall            IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 29-7 CLEAR_UNSUPPORTED_FEATURE_TABLE Procedure Parameters

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the name of the queue for which records need to be cleared
`eraseall`	`TRUE` erases all the records for the specified queue. **Note:** The `TRUE` value is intended solely for internal purposes and should not be used without consulting Oracle support. `FALSE` erases records related to unsupported features only.

Usage Notes

Users can use this procedure to erase the records generated by the `DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ` procedure. Dropping the queue or the user will also erase records for that queue. However, executing `DBMS_AQMIGTOOL.COMMIT_MIGRATION` or `DBMS_AQMIGTOOL.CANCEL_MIGRATION` will not clear the records for the queue. Therefore, this procedure offers the flexibility to erase records for a queue at any point.

29.3.6 COMMIT_MIGRATION Procedure

This procedure completes the migration process. It drops AQ and renames the interim TxEventQ to the AQ's name, and enables the TxEventQ for all operations. It is important to note that an empty AQ (that is, with no messages in the `READY` state) is required to execute the procedure successfully; otherwise, an exception will be raised.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.COMMIT_MIGRATION (
    cqschema         IN VARCHAR,
    cqname           IN VARCHAR,
    ignore_warning   IN BOOLEAN DEFAULT FALSE));
```

Parameters

Table 29-8 COMMIT_MIGRATION Procedure Parameters

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the queue name for which the migration needs to be completed
`ignore_warning`	After `DBMS_AQMIGTOOL.INIT_MIGRATION`, all unsupported events are recorded as warnings. `TRUE` means the procedure will ignore the warnings and complete the migration. `FALSE` means the procedure will throw an error if there are any warnings.

Usage Notes

A prerequisite for this procedure is that the migration must already be started on the queue. In other words, the `DBMS_AQMIGTOOL.INIT_MIGRATION` procedure should be invoked before executing this procedure. The messages from the AQ's exception queue will not be copied to the TxEventQ's exception queue.

29.3.7 DISABLE_MIGRATION_CHECK Procedure

This procedure disables the internal monitoring of the AQ aimed at detecting unsupported features. It also stops the recording of events for the `USER_TXEVENTQ_MIGRATION_STATUS` view.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.DISABLE_MIGRATION_CHECK (
    cqschema       IN VARCHAR2)
    cqname         IN VARCHAR2);
```

Parameters

Table 29-9 DISABLE_MIGRATION_CHECK Procedure Parameter

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the name of the queue on which migration monitoring needs to be disabled

Usage Notes

As a pre-migration step, the user can start recording unsupported features by invoking DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ with DBMS_AQMIGTOOL.ENABLE_EVALUATION option. This can be followed by running a comprehensive workload on the AQ to detect potential issues and then stop recording unsupported features by calling DBMS_AQMIGTOOL.DISABLE_MIGRATION_CHECK. The user can modify the workload if any migration issues are found before repeating the process. If no migration issues were found, migration of the AQ can be attempted.

29.3.8 INIT_MIGRATION Procedure

This procedure examines the definition and data of the AQ to detect any features that are not supported in TxEventQ. If any unsupported features are detected, an exception is raised. Otherwise, the procedure starts the migration process by creating an interim TxEventQ that copies the configuration of the AQ, which includes payload type, rules, subscribers, privileges, PL/SQL notifications, and more.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.INIT_MIGRATION (
    cqschema            IN VARCHAR2,
    cqname              IN VARCHAR2 DEFAULT NULL,
    txeventqschema      IN VARCHAR2 DEFAULT NULL,
    txeventqname        IN VARCHAR2 DEFAULT NULL,
    mig_mode            IN NUMBER DEFAULT DBMS_AQMIGTOOL.INTERACTIVE,
    ordering            IN NUMBER DEFAULT DBMS_AQMIGTOOL.GLOBAL,
    suffix              IN VARCHAR2 DEFAULT 'M');
```

Parameters

Table 29-10 INIT_MIGRATION Procedure Parameters

Parameter	Description
cqschema	Specifies the schema name where the queue (AQ) exists
cqname	Specifies the name of the queue (AQ) for which the migration process is to be started. If cqname is NULL, then migration initiates for all AQs in cqschema, ignoring queues with unsupported features. Execution displays the count of queues where DBMS_AQMIGTOOL.INIT_MIGRATION succeeded.
txeventqschema	Specifies the schema name where the target TxEventQ is intended to be created. Only provide this value for DBMS_AQMIGTOOL.ONLY_DEFINITION mode. If the invoker is on a different schema than txeventqschema, it needs MANAGE_ANY queue system privilege to execute this procedure successfully.
txeventqname	Specifies the name of the queue for the target TxEventQ to be created. Only provide this value for DBMS_AQMIGTOOL.ONLY_DEFINITION mode.

Table 29-10 (Cont.) INIT_MIGRATION Procedure Parameters

Parameter	Description
mig_mode	Specifies the migration mode. The following are the possible values: DBMS_AQMIGTOOL.AUTOMATIC: Enqueue and dequeue operations are allowed in this mode, but a background job will attempt to execute DBMS_AQMIGTOOL.COMMIT_MIGRATION once no messages are left in the READY state in AQ and no unsupported features are detected. DBMS_AQMIGTOOL.INTERACTIVE (Default): In this mode, both enqueue and dequeue operations are allowed. DBMS_AQMIGTOOL.OFFLINE: Only dequeue operations are allowed in this mode, which helps in reducing the workload by restricting the new enqueue operations. DBMS_AQMIGTOOL.ONLY_DEFINITION: This mode creates a separate TxEventQ with the same configuration as the AQ instead of an interim TxEventQ setup. This completes the migration process, with AQ and TxEventQ remaining in the system. The messages present in AQ will not be copied to the newly created TxEventQ. **Note:** For the DBMS_AQMIGTOOL.ONLY_DEFINITION mode, there is no need to call DBMS_AQMIGTOOL.COMMIT_MIGRATION or DBMS_AQMIGTOOL.CANCEL_MIGRATION to complete or cancel the migration; this DBMS_AQMIGTOOL.INIT_MIGRATION call is sufficient. However, for other modes, the user must explicitly call other procedures in the DBMS_AQMIGTOOL package to proceed further.
ordering	Specifies the message level ordering the user wants to follow. The following are the possible values: DBMS_AQMIGTOOL.GLOBAL (Default): This option implements global-level message ordering by setting the number of event streams in the TxEventQ to one. DBMS_AQMIGTOOL.SESSION: This option imposes a message order only for a session. The number of event streams in the TxEventQ will be set based on the initialization parameter _aq_init_shards. Oracle recommends using this option to achieve the full performance benefits of TxEventQ.
suffix	Specifies a single character suffix for naming the interim TxEventQ. The interim TxEventQ name will be in the format <cqname>_<suffix>. The default value for the suffix is M.

Usage Notes

- This procedure will also create the default exception queue on the TxEventQ, following the naming format AQ$_<TxEventQ_name>_E.
- The following points are not relevant for DBMS_AQMIGTOOL.ONLY_DEFINITION mode but apply to other modes:

  - It restricts AQ from administrative operations to maintain interim TxEventQ configuration integrity until the migration is completed or canceled.
  - The Enqueue - Dequeue operations are allowed on AQ:
    * Enqueue requests for new messages are directed to the interim TxEventQ.
    * Messages are first dequeued from AQ. If no messages are in the `READY` state, then messages are dequeued from the interim TxEventQ.
  - Users are restricted from performing all direct operations on the interim TxEventQ. Enqueue and dequeue operations on interim TxEventQ will always be performed through AQ.

- If the procedure triggers an exception due to the detection of unsupported features, it is recommended to use the `DBMS_AQMIGTOOL.CHECK_MIGRATION_TO_TXEVENTQ` procedure to obtain a detailed list of the detected unsupported features.
- If there is a name conflict, such as when a queue (AQ) being migrated shares the same name as the queue table in which it resides, then only the `DBMS_AQMIGTOOL.ONLY_DEFINITION` mode is supported. For any other modes, attempting to proceed will result in an exception being raised.

29.3.9 PURGE_QUEUE_MESSAGES Procedure

This procedure purges messages from the queue. It can perform message purging from the AQ, the interim TxEventQ, or both, depending on user input. Specifically, one of the prerequisites for executing `DBMS_AQMIGTOOL.COMMIT_MIGRATION` is to ensure an empty AQ, meaning no messages in the `READY` state. This procedure allows users to efficiently purge all messages from the AQ to fulfill this requirement.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.PURGE_QUEUE_MESSAGES (
    cqschema       IN VARCHAR2,
    cqname         IN VARCHAR2,
    purge_option   IN NUMBER DEFAULT DBMS_AQMIGTOOL.ONLY_CQ);
```

Parameters

Table 29-11 PURGE_QUEUE_MESSAGES Procedure Parameters

Parameter	Description
`cqschema`	Specifies the schema name where the queue exists
`cqname`	Specifies the name of the queue where the migration process started
`purge_option`	Specifies the option from which queue messages need to be purged. The following options are available: `DBMS_AQMIGTOOL.ONLY_CQ` (Default): Purge messages only from the AQ. `DBMS_AQMIGTOOL.ONLY_TXEVENTQ`: Purge messages only from the interim TxEventQ. `DBMS_AQMIGTOOL.BOTH`: Purge messages from both the AQ and the interim TxEventQ.

Usage Notes

Suppose the count of messages in the `READY` state within the AQ is obtained from the `DBMS_AQMIGTOOL.CHECK_MIGRATED_MESSAGE` procedure is large, and the user wishes to speed

up the DBMS_AQMIGTOOL.COMMIT_MIGRATION process without waiting for dequeues to consume the messages, the DBMS_AQMIGTOOL.PURGE_QUEUE_MESSAGES procedure can be used.

A prerequisite for this procedure is that the migration must already be started on the queue, meaning DBMS_AQMIGTOOL.INIT_MIGRATION should be invoked before executing this procedure.

29.3.10 RECOVER_MIGRATION Procedure

This procedure restores the migration state to the nearest feasible and consistent point, either before or after the execution of DBMS_AQMIGTOOL.CANCEL_MIGRATION, DBMS_AQMIGTOOL.COMMIT_MIGRATION, or DBMS_AQMIGTOOL.INIT_MIGRATION. The recovered state is then displayed to the user through the output parameter recovery_message, providing guidance for further action. If migration procedures experience unexpected failures, such as instance crashes, then this procedure can be used to recover the migration to the nearest consistent state like before INIT_MIGRATION, after INIT_MIGRATION, after COMMIT_MIRGATION, and after CANCEL_MIGRATION.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.RECOVER_MIGRATION (
    cqschema              IN VARCHAR2,
    cqname                IN VARCHAR2,
    recovery_message      OUT VARCHAR2);
```

Parameters

Table 29-12 RECOVER_MIGRATION Procedure Parameters

Parameter	Description
cqschema	Specifies the schema name where the queue exists
cqname	Specifies the name of the queue where the migration procedure was attempted
recovery_message	Returns a descriptive message indicating the restored migration state's nearest feasible and consistent point

Usage Notes

The following table shows all the possible recovery_message:

Table 29-13 Recommended action table according to recovery_message

Error while executing migration procedure:	recovery_message	Recommended Action
DBMS_AQMIGTOOL.INIT_MIGRATION	State is restored to before INIT_MIGRATION call execution.	To start the migration, the user must explicitly call DBMS_AQMIGTOOL.INIT_MIGRATION again.
DBMS_AQMIGTOOL.INIT_MIGRATION	State is restored to after INIT_MIGRATION call execution.	No further action is needed to start the migration, as this procedure has successfully started.

Table 29-13 (Cont.) Recommended action table according to recovery_message

Error while executing migration procedure:	recovery_message	Recommended Action
DBMS_AQMIGTOOL.COMMIT_MIGRATION	State is restored to after COMMIT_MIGRATION call execution.	No further action is needed to complete the migration, as this procedure has successfully completed it.
DBMS_AQMIGTOOL.CANCEL_MIGRATION	State is restored to before CANCEL_MIGRATION call execution.	To proceed with canceling the migration, the user must explicitly call DBMS_AQMIGTOOL.CANCEL_MIGRATION again.
DBMS_AQMIGTOOL.CANCEL_MIGRATION	State is restored to after CANCEL_MIGRATION call execution.	No further action is needed to cancel the migration, as this procedure has successfully cancelled it.
No migration procedure	No need for recovery call.	Since no migration procedure execution is detected, restoring it to the nearest feasible and consistent point is not required.

29.3.11 RENAME_QUEUE Procedure

This procedure renames the TxEventQ along with its default exception queue if present.

Syntax

```
PROCEDURE DBMS_AQMIGTOOL.RENAME_QUEUE (
    schema             IN VARCHAR2,
    qname              IN VARCHAR2,
    new_qname          IN VARCHAR2);
```

Parameters

Table 29-14 RENAME_QUEUE Procedure Parameters

Parameter	Description
schema	Specifies the schema name where the queue exists
qname	Specifies the current name of the queue to be renamed
new_qname	Specify the new name to be given to the existing queue. The new name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters.

Usage Notes

This procedure requires a prerequisite step: the user must perform DBMS_AQADM.STOP_QUEUE to ensure there are no concurrent enqueue and dequeue transactions.

If the default exception queue is present, it will be renamed from <schema>.AQ$_<qname>_E to <schema>.AQ$_<new_qname>_E.

30
DBMS_ASSERT

The DBMS_ASSERT package provides an interface to validate properties of the input value.

> **See Also:**
>
> *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Operational Notes
- Summary of DBMS_ASSERT Subprograms

30.1 DBMS_ASSERT Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

30.2 Summary of DBMS_ASSERT Subprograms

This section describes the subprograms of the DBMS_ASSERT package.

Table 30-1 DBMS_ASSERT Package Subprograms

Subprogram	Description
ENQUOTE_LITERAL Function	Enquotes a string literal
ENQUOTE_NAME Function	Ensures that a string is enclosed by quotation marks, then checks that the result is a valid SQL identifier.
NOOP Functions	Returns the value without any checking
QUALIFIED_SQL_NAME Function	Verifies that the input string is a qualified SQL name
SCHEMA_NAME Function	Verifies that the input string is an existing schema name
SIMPLE_SQL_NAME Function	Verifies that the input string is a simple SQL name
SQL_OBJECT_NAME Function	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

30.2.1 ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (
   str            VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 30-2 *ENQUOTE_LITERAL Function Parameters*

Parameter	Description
`str`	String to enquote

Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.

30.2.2 ENQUOTE_NAME Function

This function encloses the provided string in double quotes (quotation marks). No additional quotes are added if the string was already in quotes (quotation marks). The quoted string is then checked to see if it is a valid (quoted) simple SQL name.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference.

Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (
   str            VARCHAR2,
   capitalize     BOOLEAN DEFAULT TRUE)
RETURN VARCHAR2;
```

Parameters

Table 30-3 *ENQUOTE_NAME Function Parameters*

Parameter	Description
`str`	String to enquote
`capitalize`	If `TRUE` or defaulted, alphabetic characters of `str` which was not in quotes are translated to upper case

Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.

Examples

```
-- This procedure creates a single column table in the createOneColumnTable's schema.
create or replace procedure createOneColumnTable(proposedTableNamevarchar2) is
BEGIN
  IF
    (proposedTableName is NULL)
  THEN
    raise value_error;
  END IF;
  -- The use of ENQUOTE_NAME ensures that the table will be created in the
  -- definer's schema and not in some other schema even if the definer has
  -- privileges to create tables in other schemas.
  EXECUTE IMMEDIATE 'create table ' ||
  DBMS_ASSERT.ENQUOTE_NAME(proposedTableName) || ' (c1 number)';
  EXCEPTION
    WHEN
      others
    THEN
      dbms_output.put_line('Table creation failed due to: ' || SQLERRM);
END;
/

-- Examples of ENQUOTE_NAME showing input/output relationships
BEGIN
  -- 'eMp' becomes '"EMP"' since it is unquoted
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('eMp'));
END;
/

BEGIN
  -- For quoted strings, the case is preserved
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"EmP"'));
END;
/

-- Invalid identifier example
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('SCOTT."EMP"'));
END;
/

-- CHR(0) examples
-- The following examples illustrates that CHR(0), the NULL character, cannot appear
-- in the string; such a string poses a SQL injection risk.
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('BAD' || CHR(0) || 'IDENTIFIER'));
END;
/

BEGIN
   dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT' || CHR(0) || '.EMP"'));
END;
/

-- Oracle allows a period (.) to be a part of a quoted string
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT.EMP"'));
END;
/
```

```
-- The single quotation mark ('), as opposed to a double quotation mark, can appear in
the string
-- Note: In Oracle, a single quotation mark is specified in a literal using two single
-- quotes. The first quotation mark escapes the second quotation mark in the same way
that
-- backslash (\) in POSIX is an escape character.
BEGIN
   dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"O''LEARY"'));
END;
/
```

30.2.3 NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT.NOOP (
   str      CLOB CHARACTER SET ANY_CS)
 RETURN     CLOB CHARACTER SET str%CHARSET;
```

Parameters

Table 30-4 *NOOP Function Parameters*

Parameter	Description
str	Input value

30.2.4 QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 30-5 *QUALIFIED_SQL_NAME Function Parameters*

Parameter	Description
str	Input value

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> {'.' <simple name>}
<database link name> ::= <local qualified name> ['@' <connection string>]
<connection string> ::= <simple name>
<qualified name> ::= <local qualified name> ['@' <database link name>]
```

30.2.5 SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 30-6 *SCHEMA_NAME Function Parameters*

Parameter	Description
str	Input value

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

30.2.6 SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 30-7 *SIMPLE_SQL_NAME Function Parameters*

Parameter	Description
str	Input value

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must be meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

30.2.7 SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 30-8 *SQL_OBJECT_NAME Function Parameters*

Parameter	Description
`str`	Input value

Exceptions

`ORA44002`: Invalid object name

Usage Notes

The use of synonyms requires that the base object exists.

31
DBMS_AUDIT_MGMT

The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

This chapter contains the following topics:

- DBMS_AUDIT_MGMT Overview
- DBMS_AUDIT_MGMT Deprecated and Desupported Subprograms
- DBMS_AUDIT_MGMT Security Model
- DBMS_AUDIT_MGMT Constants
- DBMS_AUDIT_MGMT Views
- Subprogram Groups
- Summary of DBMS_AUDIT_MGMT Subprograms

> **See Also:**
>
> - *Oracle Database Security Guide* regarding verifying security access with auditing
> - *Oracle Database Upgrade Guide* regarding migrating to unified auditing

31.1 DBMS_AUDIT_MGMT Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

> **Note:**
>
> Traditional auditing is desupported in Oracle Database 23ai. Oracle recommends that you use unified auditing instead. Any current traditional audit settings that you have will still be honored, but you cannot create new traditional audit settings. You can delete existing traditional audit settings. See *Oracle Database Security Guide* for more information.

In a mixed mode environment, when AUDIT_TRAIL is set to DB, database records are written to the AUD$ table. In a unified auditing environment, audit records are written to a read-only table in the AUDSYS schema. The contents of this table are available from the UNIFIED_AUDIT_TRAIL data dictionary view.When AUDIT_TRAIL is set to OS, audit records are written to operating

system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the UNIFIED_AUDIT_TRAIL views.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

If you have not yet migrated to unified auditing, the DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

> **See Also:**
>
> *Oracle Database Security Guide* for a detailed description of unified auditing

31.2 DBMS_AUDIT_MGMT Deprecated and Desupported Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following have been deprecated from the DBMS_AUDIT_MGMT package starting in Oracle Database 12c release 12.2:

- DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL procedure (desupported starting in Oracle Database 23.4)
- AUDIT_TRAIL_WRITE mode of the AUDIT_TRAIL_PROPERTY parameter of the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY procedure

These are no longer necessary because audit records now bypass the common logging infrastructure queues and are directly written to a new internal relational table.

31.3 DBMS_AUDIT_MGMT Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA and AUDIT_ADMIN roles have EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the EXECUTE privilege on the DBMS_AUDIT_MGMT package and be granted the AUDIT_ADMIN role.

Executions of the DBMS_AUDIT_MGMT subprograms are always audited.

31.4 DBMS_AUDIT_MGMT Constants

The DBMS_AUDIT_MGMT package defines several constants that can be used for specifying parameter values.

These constants shown in the following tables:

- Table 31-1
- Table 31-2
- Table 31-3

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. The following table lists the audit trail type constants.

Table 31-1 DBMS_AUDIT_MGMT Constants - Audit Trail Types

Constant	Type	Description
AUDIT_TRAIL_ALL	PLS_INTEGER	All audit trail types. This includes the standard database audit trail (SYS.AUD$, SYS.FGA_LOG$ and unified audit trail tables), operating system (OS) audit trail, and XML audit trail.
AUDIT_TRAIL_AUD_STD	PLS_INTEGER	Standard database audit records in the SYS.AUD$ table
AUDIT_TRAIL_DB_STD	PLS_INTEGER	Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records
AUDIT_TRAIL_FGA_STD	PLS_INTEGER	Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table
AUDIT_TRAIL_FILES	PLS_INTEGER	Both operating system (OS) and XML audit trails
AUDIT_TRAIL_OS	PLS_INTEGER	Operating system audit trail. This refers to the audit records stored in operating system files.
AUDIT_TRAIL_UNIFIED	PLS_INTEGER	Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as UNIFIED_AUDIT_TRAIL.
AUDIT_TRAIL_UNIFIED_FILES	PLS_INTEGER	Operating system spillover files in each database (primary or standby); used in archive or purge operations
AUDIT_TRAIL_UNIFIED_TABLE	PLS_INTEGER	Records from the AUDSYS.AUD$UNIFIED table; used in archive or purge operations

Table 31-1 (Cont.) DBMS_AUDIT_MGMT Constants - Audit Trail Types

Constant	Type	Description
AUDIT_TRAIL_XML	PLS_INTEGER	XML audit trail. This refers to the audit records stored in XML files.

Audit trail properties determine the audit configuration settings. The following table lists the constants related to audit trail properties.

Table 31-2 DBMS_AUDIT_MGMT Constants - Audit Trail Properties

Constant	Type	Description
AUDIT_TRAIL_WRITE_MODE	PLS_INTEGER	**Note:** AUDIT_TRAIL_WRITE_MODE has been deprecated starting in Oracle Database 12*c* release 12.2. It is retained only for backwards compatibility, and has no effect on Oracle Database versions 12.2 and higher. A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUED_WRITE indicates that the audit record can be queued and persisting can be done according the database's flushing strategy. See Also *Oracle Database Security Guide*
CLEAN_UP_INTERVAL	PLS_INTEGER	Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail
DB_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.
FILE_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.
OS_FILE_MAX_AGE	PLS_INTEGER	Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created
OS_FILE_MAX_SIZE	PLS_INTEGER	Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened

The audit trail purge job cleans the audit trail. The following table lists the constants related to purge job status values.

Table 31-3 DBMS_AUDIT_MGMT Constants - Purge Job Status

Constant	Type	Description
PURGE_JOB_DISABLE	PLS_INTEGER	Disables a purge job
PURGE_JOB_ENABLE	PLS_INTEGER	Enables a purge job

31.5 DBMS_AUDIT_MGMT Views

DBMS_AUDIT_MGMT views are used to display `DBMS_AUDIT_MGMT` configuration and cleanup events.

These views listed in the following table.

Table 31-4 Views used by DBMS_AUDIT_MGMT

View	Description
`DBA_AUDIT_MGMT_CLEAN_EVENTS`	Displays the cleanup event history
`DBA_AUDIT_MGMT_CLEANUP_JOBS`	Displays the currently configured audit trail purge jobs
`DBA_AUDIT_MGMT_CONFIG_PARAMS`	Displays the currently configured audit trail properties
`DBA_AUDIT_MGMT_LAST_ARCH_TS`	Displays the last archive timestamps set for the audit trails

> **See Also:**
>
> *Oracle Database Reference* for more information on these views

31.6 DBMS_AUDIT_MGMT Subprogram Groups

The `DBMS_AUDIT_MGMT` package subprograms can be grouped into two categories: Audit Trail Management Subprograms and Audit Trail Cleanup Subprograms.

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms

31.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

Table 31-5 Audit Trail Management Subprograms

Subprogram	Description
ALTER_PARTITION_INTERVAL Procedure	Changes the unified audit internal relational table's partition interval
CLEAR_AUDIT_TRAIL_PROPERTY Procedure	Clears the value for the audit trail property that you specify
GET_ AUDIT_TRAIL_PROPERTY_VALUE Function	Returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure
GET_LAST_ARCHIVE_TIMESTAMP Function	Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance
LOAD_UNIFIED_AUDIT_FILES Procedure	Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace

Table 31-5 (Cont.) Audit Trail Management Subprograms

Subprogram	Description
SET_AUDIT_TRAIL_LOCATION Procedure	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure	Sets an audit trail property for the audit trail type that you specify
SET_LAST_ARCHIVE_TIMESTAMP Procedure	Sets a timestamp indicating when the audit records or files were last archived
TRANSFER_UNIFIED_AUDIT_RECORDS Procedure	Transfers audit records from the common logging infrastructure (CLI) swap table to the `AUDSYS.AUD$UNIFIED` relational table

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

31.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

Table 31-6 Audit Trail Cleanup Subprograms

Subprogram	Description
CLEAN_AUDIT_TRAIL Procedure	Deletes audit trail records or files that have been archived
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure	Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure	Creates a purge job for periodically deleting the audit trail records or files
DEINIT_CLEANUP Procedure	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_OLD_UNIFIED_AUDIT_TABLES Procedure	Drops old unified audit tables following the cloning of a pluggable database (PDB)
DROP_PURGE_JOB Procedure	Drops the purge job created using the CREATE_PURGE_JOB Procedure
INIT_CLEANUP Procedure	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records or files
IS_CLEANUP_INITIALIZED Function	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
SET_PURGE_JOB_INTERVAL Procedure	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure	Enables or disables the purge job that you specify

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

31.7 Summary of DBMS_AUDIT_MGMT Subprograms

This table lists and describes the subprograms of the `DBMS_AUDIT_MGMT` package

Table 31-7 DBMS_AUDIT_MGMT Package Subprograms

Subprogram	Description
ALTER_PARTITION_INTERVAL Procedure	Changes the unified audit internal relational table's partition interval
CLEAN_AUDIT_TRAIL Procedure	Deletes audit trail records that have been archived
CLEAR_AUDIT_TRAIL_PROPERTY Procedure	Clears the value for the audit trail property that you specify
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure	Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure	Creates a purge job for periodically deleting the audit trail records
DEINIT_CLEANUP Procedure	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_OLD_UNIFIED_AUDIT_TABLES Procedure	Drops old unified audit tables following the cloning of a pluggable database (PDB)
DROP_PURGE_JOB Procedure	Drops the purge job created using the CREATE_PURGE_JOB Procedure
GET_AUDIT_COMMIT_DELAY Function	Returns the audit commit delay time as the number of seconds. This is the maximum time that it takes to `COMMIT` an audit record to the database audit trail.
GET_ AUDIT_TRAIL_PROPERTY_VALUE Function	Returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure
GET_LAST_ARCHIVE_TIMESTAMP Function	Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance
INIT_CLEANUP Procedure	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records
IS_CLEANUP_INITIALIZED Function	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
LOAD_UNIFIED_AUDIT_FILES Procedure	Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace
SET_AUDIT_TRAIL_LOCATION Procedure	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure	Sets the audit trail properties for the audit trail type that you specify
SET_LAST_ARCHIVE_TIMESTAMP Procedure	Sets a timestamp indicating when the audit records were last archived
SET_PURGE_JOB_INTERVAL Procedure	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure	Enables or disables the purge job that you specify
TRANSFER_UNIFIED_AUDIT_RECORDS Procedure	Transfers audit records from the common logging infrastructure (CLI) swap table to the `AUDSYS.AUD$UNIFIED` relational table

31.7.1 ALTER_PARTITION_INTERVAL Procedure

This procedure changes the unified audit internal relational table's partition interval.

Syntax

```
DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
   interval_number          IN BINARY_INTEGER,
   interval_frequency       IN VARCHAR2);
```

Parameters

Table 31-8 ALTER_PARTITION_INTERVAL Procedure Parameters

Parameter	Description
`interval_number`	Sets how often the database creates partitions for the unified audit internal relational table. For example, to specify that the partition is created every two days, you must enter `2`.
`interval_frequency`	Sets the frequency for the value that was set in the `interval_number` setting. For example, for a partition to be created every two days, with `interval_number` set to `2`, you must set `interval_frequency` to `DAY`. Supported values are `YEAR`, `MONTH`, and `DAY`. The default is `DAY`.

Usage Notes

- The interval frequency that you choose depends on the rate of audit records that are generated in your database. The default setting is for one month. If you have a high audit record rate and are using the default, then too many audit records may be generated in the same partition. In this case, you should change the interval frequency to a more frequent interval, such as one month or one day. If the audit record rate generation is not so high, then you may want to keep it at the default of one month.

Example

The following example sets the partition interval to occur every two months.

```
BEGIN
 DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
   interval_number       => 2,
   interval_frequency    => 'MONTH');
 END;
```

31.7.2 CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records.

The `CLEAN_AUDIT_TRAIL` procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type         IN PLS_INTEGER,
   use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE,
```

```
container               IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
database_id             IN NUMBER DEFAULT NULL,
container_guid          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 31-9 CLEAN_AUDIT_TRAIL Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 31-1 .
use_last_arch_timestamp	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.
database_id	Database ID (DBID) of the audit records to cleanup
container_guid	Container GUID of the audit records to cleanup **Note:** This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the AUDIT_FILE_DEST parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS, it removes only the *.aud files under the directory specified by the AUDIT_FILE_DEST initialization parameter.

> **See Also:**
>
> "AUDIT_SYSLOG_LEVEL" in the *Oracle Database Reference*

- When the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML, this procedure only removes XML audit files (*.xml) from the current audit directory.

  Oracle database maintains a book-keeping file (adx_*$ORACLE_SID*.txt) for the XML audit files. This file is not removed by the cleanup procedure.

- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `TRUE`:
  - If you set the `database_id` value for the cleanup operation, then this value is used with the last archive timestamp while `CLEAN_AUDIT_TRAIL` runs. While cleaning up the unified audit records that are present in the database tables, if the `HIGH_VALUE` of an audit table partition is less than last archive timestamp, then those partitions will be dropped directly and for remaining audit table partitions, records will be deleted based on the `database_id` value along with last archive timestamp. However, for the unified audit records that are present during the cleanup of spillover operating system audit files, the `database_id` value is ignored. Cleanup for operating system audit files is based on the last archive timestamp only. If you want to have the `database_id` value used for the cleanup operation of unified audit trail records that are present in the spillover operating system audit files, then load the contents of these files into database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.
  - If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges unified audit records based on the last archive timestamp value irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside. During cleanup, last archive timestamp value of current database ID of the container will be used.
- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `FALSE`:
  - If you set the `database_id` value for the cleanup operation, then this value is used while `CLEAN_AUDIT_TRAIL` cleans up the unified audit trail records that are present in database tables. However, the `database_id` value is not used for the cleanup of unified audit trail records that are present in spillover operating system files. If want the `database_id` value to be used in the `CLEAN_AUDIT_TRAIL` operation of unified audit records that are present in spillover operating system audit files, then load the contents of these files to the database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.
  - If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges all unified audit records irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside.
- `CLEAN_AUDIT_TRAIL` procedure expects that the last archive timestamp set via SET_LAST_ARCHIVE_TIMESTAMP has been set usring SYS_EXTRACT_UTC if it want to refer to SYSTIMESTAMP. Reference to data in Unified Audit trail is done in UTC timeformat.
- If the PDB database is read only then clean up of that database audit record does not take place and returns without performing a clean up job on `AUDSYS.AUD$UNIFIED` table.
- If timestamp of database is ahead of current system timestamp then it will return an error.
- In a multitenant setup, if one of the PDB has timestamp ahead of the current system timestamp (in UTC format) then records for that PDB are not cleaned where as the other database do clean up their audit trail records leaving the last activity of "clean up" in the audit trail.

- The SET_LAST_ARCHIVE_TIMESTAMP procedure and CLEAN_AUDIT_TRAIL procedure should be not be executed in the same transaction block. Otherwise, the results are usually unpredictable.
- Make sure that the transaction for SET_LAST_ARCHIVE_TIMESTAMP is completed before you call the CLEAN_AUDIT_TRAIL procedure. To have predictable results in terms of cleaning records until the time provided in SET_LAST_ARCHIVE_TIMESTAMP(UTC format), make sure that SET_LAST_ARCHIVE_TIMESTAMP and CLEAN_AUDIT_TRAIL procedures are not called in the same transaction. It is recommended to commit before you call the CLEAN_AUDIT_TRAIL procedure.
- Run the CLEAN_AUDIT_TRAIL procedure when USE_LAST_ARCH_TIMESTAMP = TRUE uses the last archived timestamp that was set for the current DB_UNIQUE_NAME column value.

Examples

The following example calls the CLEAN_AUDIT_TRAIL procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type         =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   use_last_arch_timestamp  =>  TRUE);
END;
```

31.7.3 CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the specified audit trail property.

Audit trail properties are set using the SET_AUDIT_TRAIL_PROPERTY Procedure.

The CLEAR_AUDIT_TRAIL_PROPERTY procedure can optionally reset the property value to it's default value through the use_default_values parameter.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   audit_trail_type        IN PLS_INTEGER,
   audit_trail_property    IN PLS_INTEGER,
   use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

Table 31-10 CLEAR_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 31-1
audit_trail_property	The audit trail property whose value needs to be cleared. You cannot clear the value for the CLEANUP_INTERVAL property. Audit trail properties are listed in Table 31-2
use_default_values	Specifies whether the default value of the audit_trail_property should be used in place of the cleared value. A value of TRUE causes the default value of the parameter to be used. A value of FALSE causes the audit_trail_property to have no value. The default value for this parameter is FALSE.

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the `OS_FILE_MAX_SIZE` property.

  You can also use this procedure to reset an audit trail property to it's default value. You need to set `use_default_values` to `TRUE` when invoking the procedure.
- The `DB_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `DB_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `DB_DELETE_BATCH_SIZE` is still assumed. This is because audit records are always deleted in batches.
- The `FILE_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `FILE_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `FILE_DELETE_BATCH_SIZE` is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the `CLEANUP_INTERVAL` property.
- You cannot clear the value for the `AUDIT_TRAIL_WRITE_MODE` property.

Examples

The following example calls the `CLEAR_AUDIT_TRAIL_PROPERTY` procedure to clear the value for the audit trail property, `OS_FILE_MAX_SIZE`. The procedure uses a value of `FALSE` for the `USE_DEFAULT_VALUES` parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   AUDIT_TRAIL_TYPE        =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   AUDIT_TRAIL_PROPERTY    =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
   USE_DEFAULT_VALUES      =>  FALSE );
END;
```

31.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type         IN PLS_INTEGER,
   rac_instance_number      IN PLS_INTEGER DEFAULT NULL,
   container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
   database_id              IN NUMBER DEFAULT NULL,
   container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 31-11 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 31-1 .
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases. You can find the instance number by issuing the SHOW PARAMETER INSTANCE_NUMBER command in SQL*Plus.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB.
database_id	Database ID (DBID) of the audit records to cleanup
container_guid	Container GUID of the audit records to cleanup **Note:** This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   rac_instance_number  =>  1);
END;
```

Related Topics

- SET_LAST_ARCHIVE_TIMESTAMP Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

31.7.5 CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the `CREATE_PURGE_JOB` procedure.

Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_purge_interval  IN PLS_INTEGER,
   audit_trail_purge_name      IN VARCHAR2,
   use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE,
   container                   IN PLS_INTEGER DEFAULT CONTAINER_CURRENT) ;
```

Parameters

Table 31-12 CREATE_PURGE_JOB Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 31-1 .
`audit_trail_purge_interval`	The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.
`audit_trail_purge_name`	A name to identify the purge job.
`use_last_arch_timestamp`	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of `TRUE` indicates that only audit records created before the last archive timestamp should be deleted. A value of `FALSE` indicates that all audit records should be deleted. The default value is `TRUE`.
`container`	Values: `CONTAINER_CURRENT` for the connected pluggable database (PDB) or `CONTAINER_ALL` for all pluggable databases (PDBs). When `CONTAINER` is set to `CONTAINER_ALL`, it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.

Examples

The following example calls the `CREATE_PURGE_JOB` procedure to create a cleanup job called `CLEANUP`, for all audit trail types. It sets the `audit_trail_purge_interval` parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the `use_last_arch_timestamp` parameter value to `TRUE`. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
  audit_trail_type             =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
  audit_trail_purge_interval   =>  100 /* hours */,
  audit_trail_purge_name       =>  'CLEANUP',
  use_last_arch_timestamp      =>  TRUE);
END;
```

31.7.6 DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the `INIT_CLEANUP` procedure. This procedure is deprecated starting in Oracle Database 23ai.Traditional auditing packages and functions are deprecated in Oracle Database 23ai. The `DEINIT_CLEANUP` procedure clears the value of the `default_cleanup_interval` parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
   audit_trail_type  IN PLS_INTEGER,
   container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 31-13 DEINIT_CLEANUP Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 31-1
`container`	Values: `CONTAINER_CURRENT` for the connected pluggable database (PDB) or `CONTAINER_ALL` for all pluggable databases (PDBs). When `CONTAINER` is set to `CONTAINER_ALL`, this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only.

Usage Notes

With the desupport of traditional auditing, the PL/SQL packages and functions associated with traditional auditing are deprecated, This deprecation includes the packages and functions `INIT_CLEANUP`, `DEINIT_CLEANUP`, and `IS_CLEANUP_INITIALIZED`. While these packages or functions continue to operate in Oracle Database 23ai, you can neither add to or modify traditional auditing configurations.

You cannot run this procedure for `AUDIT_TRAIL_UNIFIED`. Doing so it will raise `ORA-46250 : Invalid value for argument 'AUDIT_TRAIL_TYPE'`

Examples

The following example clears the `default_cleanup_interval` parameter setting for the standard database audit trail:

```
BEGIN
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
  AUDIT_TRAIL_TYPE  => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;
```

Related Topics

- INIT_CLEANUP Procedure

31.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable database (PDB).

Syntax

```
DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES(
   container_guid    IN VARCHAR2) ;
```

Parameters

Table 31-14 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure Parameters

Parameter	Description
`container_guid`	Container GUID of the old unified audit tables

Usage Notes

When a pluggable database gets cloned, the unified audit tables get newly created in the new pluggable database. To drop the old unified audit tables, use the `DROP_OLD_UNIFIED_AUDIT_TABLES` by specifying the old `GUID` of the PDB from which the clone was created. You can query the historical `GUIDs` from the `DBA_PDB_HISTORY` view for the given PDB.

Only use the `DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES` procedure if the database was upgraded from Oracle Database release 12.1 or earlier. If the database was upgraded from a later release (including release 12.2), then an `ORA-55906: Secure file log [id: 0 name: ORA$AUDIT_NEXTGEN_LOG] does not exist` error will appear. This is because starting with release 12.2, the common logging infrastructure tables that this procedure searches are no longer being created. Instead, the `AUD$UNIFIED` relational table stores the unified audit records.

Examples

```
BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (
      container_guid => 'E4721865A9321CB5E043EFA9E80A2D77');
END;
```

31.7.8 DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB Procedure. The name of the purge job is passed as an argument.

Syntax

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
   audit_trail_purge_name     IN VARCHAR2) ;
```

Parameters

Table 31-15 DROP_PURGE_JOB Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

```
BEGIN
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
  AUDIT_TRAIL_PURGE_NAME  => 'CLEANUP');
END;
```

Related Topics

- CREATE_PURGE_JOB Procedure
  This procedure creates a purge job for periodically deleting the audit trail records.

31.7.9 GET_AUDIT_COMMIT_DELAY Function

This function returns the audit commit delay time as the number of seconds. audit commit delay time is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
  RETURN NUMBER;
```

31.7.10 GET_ AUDIT_TRAIL_PROPERTY_VALUE Function

This procedure returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
   audit_trail_type         IN PLS_INTEGER,
   audit_trail_property     IN PLS_INTEGER)
 RETURN NUMBER;
```

Parameters

Table 31-16 GET_ AUDIT_TRAIL_PROPERTY_VALUE Function Parameters

Parameter	Description
audit_trail_type	The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 31-1 .
audit_trail_property	The audit trail property that is being queried. Audit trail properties are listed in Table 31-2 .

Return Values

If the property value is cached in SGA memory, this function will return the value set by the SET_AUDIT_TRAIL_PROPERTY Procedure. Else it will return NULL.

The GET_AUDIT_TRAIL_PROPERTY_VALUE function may return an ORA-46250 error if the audit trail property value has been set to DBMS_AUDIT_MGMT.CLEAN_UP_INTERVAL. To find the cleanup interval of the purge job, query SYS.DAM_CLEANUP_JOBS$.

Examples

The following example prints the property value of OS_FILE_MAX_AGE set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

```
SET_AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
 OS_MAX_AGE_VAL NUMBER;
BEGIN
 OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
      audit_trail_property      => DBMS_AUDIT_MGMT. OS_FILE_MAX_AGE);
 IF OS_MAX_AGE_VAL is not NULL THEN
  DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
                       OS_MAX_AGE_VAL);
 END IF;
END;
```

Related Topics

- SET_AUDIT_TRAIL_PROPERTY Procedure
  This procedure sets an audit trail property for the audit trail type that is specified.

31.7.11 GET_LAST_ARCHIVE_TIMESTAMP Function

This procedure returns the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` procedure in that database instance.

Syntax

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     IN PLS_INTEGER)
 RETURN TIMESTAMP;
```

Parameters

Table 31-17 GET_LAST_ARCHIVE_TIMESTAMP Function Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for the timestamp to be retrieved. Supported Audit trail types for this procedure are `AUDIT_TRAIL_OS` , `AUDIT_TRAIL_XML` and `AUDIT_TRAIL_UNIFIED`. All Audit trail types are listed in Table 31-1 .

Return Values

The `GET_LAST_ARCHIVE_TIMESTAMP` function returns last archive timestamp.

Usage Notes

- Alternatively, you can query the `DBA_AUDIT_MGMT_LAST_ARCH_TS` data dictionary view to check the last archived timestamp for a database that is in read-write mode.
- The `DBA_AUDIT_MGMT_LAST_ARCH_TS` data dictionary view can contain multiple last archive timestamps with different `DB_UNIQUE_NAME` column values. `GET_LAST_ARCHIVE_TIMESTAMP` will return the last archive timestamp where the `DB_UNIQUE_NAME` column value is equal to the current `DB_UNIQUE_NAME` value.

Examples

The following example prints the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` procedure on a `READ ONLY` database.

```
SET SERVEROUTPUT ON
DECLARE
 LAT_TS TIMESTAMP;
BEGIN
 LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
 IF LAT_TS is not NULL THEN
  DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
 END IF;
END;
```

Related Topics

- SET_LAST_ARCHIVE_TIMESTAMP Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

31.7.12 INIT_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. This procedure is deprecated starting in Oracle Database 23ai. Traditional auditing packages and functions are deprecated in Oracle Database 23ai.
If the audit trail tables are in the `SYSTEM` tablespace, then the procedure moves them to the `SYSAUX` tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the `SYSAUX` tablespace by default. If you are not using unified auditing, refer to *Oracle Database Upgrade Guide* for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the `SYSTEM` tablespace enhances overall database performance. The `INIT_CLEANUP` procedure moves the audit trail tables to the `SYSAUX` tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The `INIT_CLEANUP` procedure is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:**
>
> Table 31-1 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

Syntax

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(
   audit_trail_type          IN PLS_INTEGER,
   default_cleanup_interval  IN PLS_INTEGER
   container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 31-18 INIT_CLEANUP Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the clean up operation needs to be initialized. Audit trail types are listed in Table 31-1 except `AUDIT_TRAIL_UNIFIED`
`default_cleanup_interval`	The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.

Table 31-18 (Cont.) INIT_CLEANUP Procedure Parameters

Parameter	Description
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all Open and Available pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this initializes the audit trails for clean up in all the Open and Available pluggable databases, otherwise this initializes the audit trail in the connected PDB only. When you add a new PDB you need to initialize the audit trails for clean up in the new PDB using the CONTAINER_CURRENT option.

Usage Notes

With the desupport of traditional auditing, the PL/SQL packages and functions associated with traditional auditing are deprecated, This deprecation includes the packages and functions INIT_CLEANUP, DEINIT_CLEANUP, and IS_CLEANUP_INITIALIZED. While these packages or functions continue to operate in Oracle Database 23ai, you can neither add to or modify traditional auditing configurations.

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.
- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.
- Invoking this procedure with AUDIT_TRAIL_UNIFIED results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

> **See Also:**
>
> "SET_AUDIT_TRAIL_LOCATION Procedure"

Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
               audit_trail_type   => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
      default_cleanup_interval    => 12 /* hours */);
END;
```

> **See Also:**
>
> Table 31-1 for a list of all audit trail types

31.7.13 IS_CLEANUP_INITIALIZED Function

This function checks to see if the `INIT_CLEANUP` procedure has been run for an audit trail type. This procedure is deprecated starting in Oracle Database 23ai. Traditional auditing packages and functions are deprecated in Oracle Database 23ai.
With the desupport of traditional auditing, the PL/SQL packages and functions associated with traditional auditing are deprecated, This deprecation includes the packages and functions `INIT_CLEANUP`, `DEINIT_CLEANUP`, and `IS_CLEANUP_INITIALIZED`. While these packages or functions continue to operate in Oracle Database 23ai, you can neither add to or modify traditional auditing configurations.

The `IS_CLEANUP_INITIALIZED` function returns `TRUE` if the procedure has already been run for the audit trail type. It returns `FALSE` if the procedure has not been run for the audit trail type.

This function is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:**
>
> Table 31-1 for a list of all audit trail types

Syntax

```
DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
   audit_trail_type  IN PLS_INTEGER
   container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
 RETURN BOOLEAN;
```

Parameters

Table 31-19 IS_CLEANUP_INITIALIZED Function Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the function needs to be called. Note that this does not apply to `AUDIT_TRAIL_UNIFIED`. Audit trail types are listed in Table 31-1
`container`	Values: `CONTAINER_CURRENT` for the connected pluggable database (PDB) or `CONTAINER_ALL` for all pluggable databases (PDBs). • When `CONTAINER` is set to `CONTAINER_ALL`, this function returns the initialization status of all the pluggable databases. The function returns `FALSE` even if one of the PDBs is not initialized. • When `CONTAINER` is set to `CONTAINER_CURRENT`, this returns the initialization status of the connected PDB.

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```
BEGIN
 IF
   NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD)
 THEN
   DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval  => 12 /* hours */);
 END IF;
END;
```

- INIT_CLEANUP Procedure

31.7.14 LOAD_UNIFIED_AUDIT_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

> **See Also:**
>
> *Oracle Database Security Guide* for information about moving the OS audit trail records into the unified audit trail

Syntax

```
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES (
   container       IN BINARY_INTEGER,
   load_batch_size IN PLS_INTEGER);
```

Parameters

Table 31-20 LOAD_UNIFIED_AUDIT_FILES Procedure Parameters

Parameter	Description
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). • CONTAINER_CURRENT - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in only current PDB • CONTAINER_ALL - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in the respective PDBs, but for all the active PDBs

Table 31-20 (Cont.) LOAD_UNIFIED_AUDIT_FILES Procedure Parameters

Parameter	Description
load_batch_size	Specifies the number of spillover OS audit files to be loaded into the designated unified audit trail tablespace. The load_batch_size parameter can have a minimum value of 1 and maximum value of 32767. The default value is equivalent to DEFAULT_FILE_LOAD_BATCH_SIZE.

Usage Notes

- Ensure that you set the audit data designated tablespace to be online before you run the LOAD_UNIFIED_AUDIT_FILES procedure.

31.7.15 SET_AUDIT_TRAIL_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET_AUDIT_TRAIL_LOCATION procedure is not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The AUDIT_FILE_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

> **See Also:**
>
> - Table 31-1 for a list of all audit trail types
> - AUDIT_FILE_DEST in the *Oracle Database Reference*

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_location_value  IN VARCHAR2) ;
```

Parameters

Table 31-21 SET_AUDIT_TRAIL_LOCATION Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the audit trail location needs to be set. Audit trail types are listed in Table 31-1
audit_trail_location_value	Target location or tablespace for the audit trail records

Usage Notes

The following usage notes apply:

- Before changing the audit trail location, check the block size of the new location that you plan to use. The block size must be the same size as that of the current audit trail location.

Otherwise, an `ORA-14520: Tablespace string block size [string] does not match existing object block size [string]` error appears. To check the block size of a tablespace, query the `USER_TABLESPACES` or `DBA_TABLESPACES` data dictionary view. See *Oracle Database VLDB and Partitioning Guide* for more information about partition restrictions for multiple block sizes.

- By default, audit trail records are written to the `SYSAUX` tablespace. You can change the tablespace location to a user tablespace using this procedure. However the designated tablespace must be an automatic storage space management (ASSM) tablespace.
- This procedure is valid for the following `audit_trail_type` values:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`
  - `AUDIT_TRAIL_UNIFIED`
- For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, you should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.
- This procedure involves data movement across tablespaces. For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, this can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You optionally can specify an encrypted tablespace for the audit trail location.
- When `AUDIT_TRAIL_TYPE` is `AUDIT_TRAIL_UNIFIED`, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource intensive for the unified audit trail.
- The `UNIFIED_AUDIT_TRAIL` data dictionary view is built on top of an internal relational table. This table is an interval partitioned table (irrespective of database editions) with a default interval of 1 day. This setting means that when you execute the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure, only newly created partitions of the internal table are created in the new tablespace that is set as part of this procedure. Existing partitions of this table remain in the earlier tablespace (`SYSAUX` is the default tablespace for this internal table). If you want to change this table's partition interval, then use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure.
- As a best practice to improve performance and the availability of audit records, enable the `AUTOEXTEND` option on the audit tablespace.
- If the tablespace that is specified for the `audit_trail_location_value` parameter has a block size that is different from the current tablespace, then this procedure for `AUDIT_TRAIL_UNIFIED` `audit_trail_type` fails with an `ORA-14520: Tablespace string block size [string] does not match existing object block size [string]` error. This is due to the restrictions of multiple block sizes for partition tables.

Examples

The following example moves the database audit trail tables, `AUD$` and `FGA_LOG$`, from the current tablespace to a user-created tablespace called `RECORDS`:

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
```

```
      audit_trail_location_value  =>  'RECORDS');
END;
```

31.7.16 SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets the properties `OS_FILE_MAX_SIZE`, `OS_FILE_MAX_AGE`, and `FILE_DELETE_BATCH_SIZE` for operating system (OS), XML, and unified audit trail types. The `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties determine the maximum size and age of an audit trail file before a new audit trail file is created. The `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The `FILE_DELETE_BATCH_SIZE` property specifies the number of audit trail files that are deleted in one batch.

The procedure sets the properties `DB_DELETE_BATCH_SIZE` and `CLEANUP_INTERVAL` for the database audit trail type. `DB_DELETE_BATCH_SIZE` specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The `CLEANUP_INTERVAL` specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_property        IN PLS_INTEGER,
   audit_trail_property_value  IN PLS_INTEGER) ;
```

Parameters

Table 31-22 SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the property needs to be set. Audit trail types are listed in Table 31-1
`audit_trail_property`	The audit trail property that is being set. Audit trail properties are listed in Table 31-2

Table 31-22 (Cont.) SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_property_value	The value of the property specified using audit_trail_property. The following are valid values for audit trail properties: • OS_FILE_MAX_SIZE can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. OS_FILE_MAX_SIZE is measured in kilobytes (KB). • OS_FILE_MAX_AGE can have a minimum value of 1 and a maximum value of 497. The default value is 5. OS_FILE_MAX_AGE is measured in days. • DB_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. DB_DELETE_BATCH_SIZE is measured as the number of audit records that are deleted in one batch. • FILE_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. FILE_DELETE_BATCH_SIZE is measured as the number of audit files that are deleted in one batch. • CLEANUP_INTERVAL can have a minimum value of 1 and a maximum value of 999. The default value is set using the INIT_CLEANUP Procedure. CLEANUP_INTERVAL is measured in hours.

Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.
- If you have set both the OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties for an operating system (OS), XML or unified audit trail type, then a new audit trail file is created depending on which of these two limits is reached first

  For example, let us take a scenario where OS_FILE_MAX_SIZE is 10000 and OS_FILE_MAX_AGE is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.
- You can set the OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties for the unified audit trail type by using AUDIT_TRAIL_UNIFIED or AUDIT_TRAIL_UNIFIED_FILES. Note that AUDIT_TRAIL_UNIFIED is deprecated
- The DB_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.
- The DB_DELETE_BATCH_SIZE property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
- The FILE_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.

- The FILE_DELETE_BATCH_SIZE property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.
- In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is SYSAUX. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

Examples

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_SIZE property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
       audit_trail_property_value  =>  102400 /* 100MB*/ );
END;
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_AGE property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property        =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
       audit_trail_property_value  =>  5 /* days */);
END;
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the DB_DELETE_BATCH_SIZE property for the AUDIT_TRAIL_AUD_STD audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the SYS.AUD$ table in batches of size 100000.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type              => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
       audit_trail_property          => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
       audit_trail_property_value    => 100000 /* delete batch size */);
END;
```

31.7.17 SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

The CLEAN_AUDIT_TRAIL Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type         IN PLS_INTEGER,
   last_archive_time        IN TIMESTAMP,
```

```
rac_instance_number      IN PLS_INTEGER DEFAULT NULL,
container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
database_id              IN NUMBER DEFAULT NULL,
container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 31-23 SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 31-1 .
last_archive_time	The TIMESTAMP value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived. **Note:** ORA-46250 error is thrown if any future date or TIMESTAMP value is given.
rac_instance_number	The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number parameter is not accepted when AUDIT_TRAIL_TYPE has values: • audit_trail_aud_std • audit_trail_db_std • audit_trail_fga_std • audit_trail_unified Set rac_instance_number to 1 for a single-instance database.
container	Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.
database_id	Database ID (DBID) of the audit records to cleanup
container_guid	Container GUID of the audit records to cleanup **Note:** This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- The last_archive_time must be specified in Coordinated Universal Time (UTC) when the audit trail types are AUDIT_TRAIL_AUD_STD, AUDIT_TRAIL_FGA_STD, or AUDIT_TRAIL_UNIFIED. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The last_archive_time must be specified as the local time zone time when the audit trail types are AUDIT_TRAIL_OS or AUDIT_TRAIL_XML. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating

system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- When you use an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.
- The `SET_LAST_ARCHIVE_TIMESTAMP` procedure and `CLEAN_AUDIT_TRAIL` procedure should be not be executed in the same transaction block. Otherwise, the results are usually unpredictable.
- If this timestamp set to a future date, an error is returned.
- Make sure that the transaction for `SET_LAST_ARCHIVE_TIMESTAMP` is completed before you call the `CLEAN_AUDIT_TRAIL` procedure. To have predictable results in terms of cleaning records until the time provided in `SET_LAST_ARCHIVE_TIMESTAMP`(UTC format), make sure that `SET_LAST_ARCHIVE_TIMESTAMP` and `CLEAN_AUDIT_TRAIL` procedures are not called in the same transaction. It is recommended to `commit` before you call the `CLEAN_AUDIT_TRAIL` procedure.
- When you invoke `SET_LAST_ARCHIVE_TIMESTAMP` using database links, be cognizant that there could be time difference between the source and the target databases.
- When you set the last archive timestamp on a read-write database, the `DB_UNIQUE_NAME` column of the `DBA_AUDIT_MGMT_LAST_ARCH_TS` data dictionary view is also populated. You cannot configure the `DB_UNIQUE_NAME` value, so you cannot set it by using the `SET_LAST_ARCHIVE_TIMESTAMP` procedure.
- For every configuration of the last archive timestamp, Oracle Database cleans entries from the `DBA_AUDIT_MGMT_LAST_ARCH_TS` data dictionary view where the `DB_UNIQUE_NAME` column value is not equal to the current `DB_UNIQUE_NAME` value. This avoids having to reuse the old last archive timestamp when multiple switch-over operations take place and keeps in check the growing rows of the `DBA_AUDIT_MGMT_LAST_ARCH_TS` view.

Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the CLEAN_AUDIT_TRAIL Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2012 14:10:10.0.

```
BEGIN
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   last_archive_time    => TO_TIMESTAMP('12-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
   rac_instance_number  => 1);
END;
```

31.7.18 SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job specified.

The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
   audit_trail_purge_name      IN VARCHAR2,
   audit_trail_interval_value  IN PLS_INTEGER) ;
```

Parameters

Table 31-24 SET_PURGE_JOB_INTERVAL Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the interval is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_interval_value	The interval, in hours, at which the clean up procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  AUDIT_TRAIL_PURGE_NAME       => 'CLEANUP',
  AUDIT_TRAIL_INTERVAL_VALUE   => 24 );
END;
```

Related Topics

- CLEAN_AUDIT_TRAIL Procedure
  This procedure deletes audit trail records.

31.7.19 SET_PURGE_JOB_STATUS Procedure

This procedure enables or disables the specified purge job.

The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
   audit_trail_purge_name     IN VARCHAR2,
   audit_trail_status_value   IN PLS_INTEGER) ;
```

Parameters

Table 31-25 SET_PURGE_JOB_STATUS Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the status is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_status_value	One of the values specified in Table 31-3. The value PURGE_JOB_ENABLE enables the specified purge job. The value PURGE_JOB_DISABLE disables the specified purge job.

Examples

The following example calls the SET_PURGE_JOB_STATUS procedure to enable the CLEANUP purge job.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
  audit_trail_purge_name      => 'CLEANUP',
  audit_trail_status_value    => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
```

31.7.20 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure

This procedure transfers unified audit records that were in a pre-upgraded Oracle database to an internal relational table that is designed to improve read performance.

In the pre-upgraded Oracle database, these records resided in the common logging infrastructure (CLI) SGA back-end tables.

Syntax

```
DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS (
   container_guid       IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 31-26 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure Parameters

Parameter	Description
container_guid	The GUID of the container of the associated CLI back-end table. This back-end table contains the audit records from the pre-upgraded Oracle database. If you omit this setting, then the GUID of the current container is used.

Usage Notes

- It is not mandatory to run DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS after an upgrade, but for better read performance of the unified audit trail, Oracle highly recommends that you run this procedure.
- The DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS is designed to be a one-time operation, to be performed after you upgrade from Oracle Database 12*c* release 12.1.

- There is one CLI back-end table per GUID of the container. You can find the GUIDs for containers by querying the `PDB_GUID` column of the `DBA_PDB_HISTORY` data dictionary view. Execute the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure by passing each of these GUIDs one by one to ensure that you move the unified audit records from these CLI back-end tables to the `AUDSYS.AUD$UNIFIED` table.
- In a multitenant environment, you must run the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure only in the container to which the transfer operation applies, whether it is the root or an individual PDB. You cannot run this procedure in the root, for example, to transfer audit records in a PDB.
- If you have a high rate of audit record generation and your database supports partitioning, then you may want to use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure to alter the partition interval setting for the internal relational table. See ALTER_PARTITION_INTERVAL Procedure for more information.

32
DBMS_AUDIT_UTIL

The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.

This chapter contains the following topics:

- DBMS_AUDIT_UTIL Overview
- DBMS_AUDIT_UTIL Security Model
- DBMS_AUDIT_UTIL Views
- Summary of DBMS_AUDIT_UTIL Subprograms

32.1 DBMS_AUDIT_UTIL Overview

The functions in the DBMS_AUDIT_UTIL package enable you to format the output of queries to the RLS_INFO column of several audit trail views so that the output appear in separate rows.

These functions use a cursor to find and format each row of the corresponding view. To use the functions in this package, include the function in a query to one of the following views:

- DBA_FGA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_FGA function
- DBA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_STD function
- UNIFIED_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_UNI function
- V$XML_AUDIT_TRAIL dynamic view, for the DECODE_RLS_INFO_ATRAIL_XML function

32.2 DBMS_AUDIT_UTIL Security Model

All DBMS_AUDIT_UTIL subprograms require the user to have EXECUTE privilege on the DBMS_AUDIT_UTIL package.

The SYSDBA administrative privilege and AUDIT_ADMIN and AUDIT_VIEWER roles have the EXECUTE privilege on the DBMS_AUDIT_UTIL package by default. An auditor can view audit data after being granted the AUDIT_VIEWER role.

Oracle strongly recommends that only audit administrators have the EXECUTE privilege on the DBMS_AUDIT_UTIL package and be granted the AUDIT_VIEWER role.

32.3 DBMS_AUDIT_UTIL Views

The views in this section display the audit information used by the DBMS_AUDIT_UTIL package function.

Table 32-1 displays the DBMS_AUDIT_UTIL views.

Table 32-1 Views Used by DBMS_AUDIT_UTIL

View	Description
DBA_FGA_AUDIT_TRAIL	Displays fine-grained audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA function
DBA_AUDIT_TRAIL	Displays standard audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD function
UNIFIED_AUDIT_TRAIL	Displays unified audit trail information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML function
V$XML_AUDIT_TRAIL	Displays XML audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI function

32.4 Summary of DBMS_AUDIT_UTIL Subprograms

This table lists the DBMS_AUDIT_UTIL subprograms and their descriptions.

Table 32-2 DBMS_AUDIT_UTIL Package Subprograms

Subprogram	Description
DECODE_RLS_INFO_ATRAIL_FGA Function	Reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view
DECODE_RLS_INFO_ATRAIL_STD Function	Reformats the output for queries to the RLS_INFO column of the DBA_AUDIT_TRAIL data dictionary view
DECODE_RLS_INFO_ATRAIL_UNI Function	Reformats the output for queries to the RLS_INFO column of the UNIFIED_AUDIT_TRAIL data dictionary view
DECODE_RLS_INFO_ATRAIL_XML Function	Reformats the output for queries to the RLS_INFO column of the V$XML_AUDIT_TRAIL dynamic view

32.4.1 DECODE_RLS_INFO_ATRAIL_FGA Function

This function reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple fine-grained audit policies in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

> **See Also:**
>
> *Oracle Database Security Guide* regarding fine-grained auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_FGA(
  IN_CURSOR                 REF CURSOR              IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_FGA` function are the same as the columns in the `DBA_FGA_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

Usage Notes

- To use this function, include it in a query to the `DBA_FGA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `DBA_FGA_AUDIT_TRAIL` data dictionary view.

Example

```
SELECT DB_USER, OBJECT_NAME, SQL_TEXT
  RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
  FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA
  (CURSOR (SELECT * FROM DBA_FGA_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `DBA_FGA_AUDIT_TRAIL.RLS_INFO` column.

32.4.2 DECODE_RLS_INFO_ATRAIL_STD Function

This function reformats the output for queries to the `RLS_INFO` column of the `DBA_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple standard audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

> **See Also:**
>
> *Oracle Database Security Guide* regarding auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_STD(
  IN_CURSOR                 REF CURSOR              IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_STD` function are the same as the columns in the `DBA_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

Usage Notes

- To use this function, include it in a query to the `DBA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `DBA_AUDIT_TRAIL` data dictionary view.

Example

```
SELECT USERNAME, USERHOST, ACTION, OBJ_NAME, OBJ_PRIVILEGE
  RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
  FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD
  (CURSOR (SELECT * FROM DBA_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `DBA_AUDIT_TRAIL.RLS_INFO` column

32.4.3 DECODE_RLS_INFO_ATRAIL_UNI Function

This function reformats the output for queries to the `RLS_INFO` column of the `V$XML_AUDIT_TRAIL` dynamic view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple XML audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

> **See Also:**
>
> *Oracle Database Security Guide* regarding unified auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_UNI(
  IN_CURSOR                 REF CURSOR              IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_UNI` function are the same as the columns in the `V$XML_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

Usage Notes

- To use this function, include it in a query to the `V$XML_AUDIT_TRAIL` dynamic view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `V$XML_AUDIT_TRAIL` dynamic view.

Example

```
SELECT OBJECT_NAME, SQL_TEXT
  RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
```

```
  FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI
  (CURSOR (SELECT * FROM V$XML_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `V$XML_AUDIT_TRAIL.RLS_INFO` column

32.4.4 DECODE_RLS_INFO_ATRAIL_XML Function

This function reformats the output for queries to the `RLS_INFO` column of the `UNIFIED_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple audit records from unified audit policies. It returns the output in separate rows.

> **See Also:**
>
> *Oracle Database Security Guide* regarding auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_XML(
  IN_CURSOR                 REF CURSOR              IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_XML` function are the same as the columns in the `UNIFIED_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

Usage Notes

- To use this function, include it in a query to the `UNIFIED_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `UNIFIED_AUDIT_TRAIL` data dictionary view.

Example

```
SELECT DBUSERNAME, ACTION_NAME, OBJECT_NAME, SQL_TEXT,
  RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
  FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML
  (CURSOR (SELECT * FROM UNIFIED_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `UNIFIED_AUDIT_TRAIL.RLS_INFO` column

33
DBMS_AUTO_CLUSTERING

The `DBMS_AUTO_CLUSTERING` package contains a collection of subprograms that recommend clustering and zone map schemes for improved query performance.

This chapter contains the following topics:

- DBMS_AUTO_CLUSTERING Overview
- Summary of DBMS_AUTO_CLUSTERING Subprograms

33.1 DBMS_AUTO_CLUSTERING Overview

The `DBMS_AUTO_CLUSTERING` package generates clustering recommendations, such as tables to cluster and clustering schemes. It also verifies the impact of the clustering recommendation and implements the clustering recommendation.

33.2 Summary of DBMS_AUTO_CLUSTERING Subprograms

This table lists the `DBMS_AUTO_CLUSTERING` subprograms and their descriptions.

Table 33-1 DBMS_AUTO_CLUSTERING Package Subprograms

Subprogram	Description
CONFIGURE Procedure	Configures settings related to automatic clustering.
RECOMMEND_CLUSTERING_METHOD Function	Generates a recommendation. No recommendation will be returned if the recommendation criteria are not met. The generated recommendation is stored in the `DBA_AUTO_CLUSTERING_RECOMMENDATION` view. The function will return the recommendation ID when a recommendation is generated and `NULL` when no recommendation is generated.
VERIFY_RECOMMENDATION Procedure	Verifies the performance of the clustering recommendation. It retrieves the information used for generating the recommendation based on input arguments. This procedure finds the original table and the SQL tuning set used for the recommendation task. It creates a table and applies the clustering recommendation to the table. It runs a workload against the clustered table and the original table and returns a detailed report on performance benefits. The verification result can be `ACCEPTED` or `REJECTED`.
APPLY_RECOMMENDATION Procedure	Clusters an input table using the recommendation (identified by `recommendation_id`). The value of the incremental column specifies whether to use full clustering or incremental clustering.
GET_RECOMMENDATION Function	Returns the latest recommendation ID for a given input.

Table 33-1 (Cont.) DBMS_AUTO_CLUSTERING Package Subprograms

Subprogram	Description
REPORT_ACTIVITY Function	Returns a report of the auto-clustering operations executed during a specific period in a database.
REPORT_LAST_ACTIVITY Function	Returns a report of the last automatic indexing operation executed in a database.

33.2.1 CONFIGURE Procedure

This procedure configures settings related to automatic clustering and zone map.

Syntax

```
DBMS_AUTO_CLUSTERING.CONFIGURE (
     parameter_name      IN VARCHAR2,
     parameter_value     IN VARCHAR2,
     allow               IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 33-2 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Automatic clustering configuration setting. It can have one of the following values: • AUTO_CLUSTERING_SCHEMA: Schemas to include or exclude from the automatic clustering recommendation. Its behavior is controlled by allow parameter. The automatic clustering process manages two schema lists – the *inclusion list* and the *exclusion list*. The inclusion list contains the schemas that can use cluster tables. The exclusion list contains the schemas that cannot use cluster tables. When automatic clustering is enabled for a database, both lists are initially empty, and all schemas in the database can use auto-clustering in all modules in the database. If the inclusion list contains at least one module, then only the modules listed in the inclusion list can use auto-clustering. If the inclusion list is empty and the exclusion list contains at least one module, then all the modules can use auto-clustering, except the module listed in the exclusion list. If both the lists (the inclusion list and the exclusion list) contain at least one module, then all the modules can use auto-clustering, except the modules listed in the exclusion list. • AUTO_CLUSTERING_REPORT_RETENTION: Number of days for which automatic clustering logs are retained in the database before they are deleted. As automatic clustering report is generated based on these logs, it cannot be generated for a period beyond the value specified for AUTO_CLUSTERING_REPORT_RETENTION. Default value is 31 days[1]. • AUTO_CLUSTERING_WORKLOAD_WINDOW: Maximum number of hours for which auto-clustering will investigate queries from the latest snapshots from AutoSTS to make recommendations. For example, if the parameter is 24, then auto-clustering will look at statements in latest 24 hours from the AutoSTS. Valid value is an integer value between 1 and 8760 (24*36). Default value is 24. • AUTO_CLUSTERING_WORKLOAD_MIN_TIME: Minimum database time, in seconds, for a query to be considered for auto-clustering recommendation. Queries below this threshold will not be considered for recommendations.

Table 33-2 (Cont.) CONFIGURE Procedure Parameters

Parameter	Description
	Valid value is an integer value between 0 and 3600 (1 hour). Default value is 120 (2 minutes).
parameter_value	Value for the configuration setting specified in the parameter_name. When it is set to NULL, the configuration setting is assigned the default value.
allow	This parameter is applicable only for the AUTO_CLUSTERING_SCHEMA and it can have one of the following values: • TRUE: Add the specified modules to the inclusion list. • FALSE: Add the specified modules to the exclusion list. • NULL: Remove the specified modules from the list to which it is currently added.

[1] Default value for auto partitioning is 90 days and 373 days for auto indexing.

33.2.2 RECOMMEND_CLUSTERING_METHOD Function

This function generates a recommendation. No recommendation will be returned if the recommendation criteria are not met. The generated recommendation can be retrieved from the DBA_AUTO_CLUSTERING_RECOMMENDATION view. The function will return the recommendation ID when a recommendation is generated and NULL when no recommendation is generated.

Syntax

```
DBMS_AUTO_CLUSTERING.RECOMMEND_CLUSTERING_METHOD (
     sqlset_owner       IN  VARCHAR2 DEFAULT 'SYS',
     sqlset_name        IN  VARCHAR2 DEFAULT 'SYS_AUTO_STS',
     table_owner        IN  VARCHAR2 DEFAULT  NULL,
     table_name         IN  VARCHAR2 DEFAULT  NULL,
     report_type        IN  VARCHAR2 DEFAULT 'TEXT',
     report_section     IN  VARCHAR2 DEFAULT 'SUMMARY',
     report_level       IN  VARCHAR2 DEFAULT 'TYPICAL',
     verification       IN  BOOLEAN  DEFAULT  TRUE)
RETURN RAW;
```

Parameters

Table 33-3 RECOMMEND_CLUSTERING_METHOD Procedure Parameters

Parameter	Description
sqlset_owner	Owner of the SQL Tuning set representing the workload to be considered. Default is SYS.

Table 33-3 (Cont.) RECOMMEND_CLUSTERING_METHOD Procedure Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning set representing the workload to be considered. Default is SYS_AUTO_STS.
table_owner, table_name	Name of a table for generating recommendation.
report_type	Type parameter for generating report for the recommendation activity. Default is TEXT.
report_section	Section parameter used to generate persistent report for the recommended clustering method. Default is SUMMARY.
report_level	Level parameter used to generate report for the recommended clustering method. Default is TYPICAL.
verification	Verification parameter indicates whether the generated recommendation is verified as part of RECOMMEND_CLUSTERING_METHOD. Default is TRUE, which means, the generated recommendation is verified to see how it performs based on the workload. If it is set to FALSE, only recommendations are generated, and their performance against workload and schema is not verified.

33.2.3 VERIFY_RECOMMENDATION Procedure

This procedure verifies the performance of the clustering recommendation. It retrieves the information used for generating the recommendation based on the input arguments. This procedure finds the original table and the SQL tuning set used for the recommendation task identified by the recommendation ID. It creates a table and applies the clustering recommendation to the table. It runs a workload against the clustered table and the original table and returns a detailed report on performance benefits. The verification result can be ACCEPTED or REJECTED.

Syntax

```
DBMS_AUTO_CLUSTERING.VERIFY_RECOMMENDATION (
     recommendation_id      IN  RAW,
     table_owner               IN  VARCHAR2 DEFAULT NULL,
     table_name             IN  VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 33-4 VERIFY_RECOMMENDATION Procedure Parameters

Parameter	Description
recommendation_id	Recommendation ID returned from RECOMMEND_CLUSTERING_METHOD function that generates recommendation for several tables in a given workload.
table_owner	Name of a owner to validate as a candidate for automatic clustering within the given recommendation id.
table_name	Name of a table to validate as a candidate for automatic clustering within the given recommendation id.

33.2.4 APPLY_RECOMMENDATION Procedure

This procedure clusters an input table using the recommendation (identified by recommendation_id). The value of the incremental column specifies whether to use full clustering or incremental clustering. Full clustering clusters an input table after applying the recommended clustering clause and performs an alter table move online to cluster data in the table. Incremental clustering applies the recommended clustering clause, and Automatic Data Compression (ADO) background will cluster data in the background.

Syntax

```
DBMS_AUTO_CLUSTERING.APPLY_RECOMMENDATION(
    recommendation_id IN RAW DEFAULT NULL,
    table_name        IN VARCHAR2 DEFAULT NULL,
    table_owner       IN VARCHAR2 DEFAULT NULL,
    apply_mode        IN VARCHAR2 DEFAULT 'FULL',
    zonemap_creation  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 33-5 APPLY_RECOMMENDATION Procedure Parameters

Parameter	Description
recommendation_id	The task ID that recommends clustering for the given table. If not specified, the clustering recommendation made in the latest task will be used.
table_name	Name of the input table.
table_owner	Owner of the input table.
apply_mode	Mode to specify the clustering to be performed: • FULL: full clustering using online redefinition • INCREMENTAL: background incremental clustering

Table 33-5 (Cont.) APPLY_RECOMMENDATION Procedure Parameters

Parameter	Description
zonemap_creation	If this value is set to FALSE, it will not create a zonemap. It will only apply the clustering clause. Default is TRUE.

33.2.5 GET_RECOMMENDATION Function

This function returns the latest recommendation ID for a given input.

Syntax

```
DBMS_AUTO_CLUSTERING.GET_RECOMMENDATION (
     table_owner        IN  VARCHAR2,
     table_name         IN  VARCHAR2,
RETURN RAW;
```

Parameters

Table 33-6 GET_RECOMMENDATION Function Parameters

Parameter	Description
table_owner	Owner of the table to cluster
table_name	Name of the table to cluster

33.2.6 REPORT ACTIVITY Function

This function returns a report of the auto-clustering operations executed during a specific period in a database.

Syntax

```
DBMS_AUTO_CLUSTERING.REPORT_ACTIVITY (
     activity_start IN  TIMESTAMP WITH TIME ZONE DEFAULT
SYSTIMESTAMP-1,
     activity_end   IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP,
     type           IN  VARCHAR2 DEFAULT 'TEXT',
     section        IN  VARCHAR2 DEFAULT 'ALL',
     level          IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 33-7 REPORT ACTIVITY Function Parameters

Parameter	Description
activity_start	Time from when automatic clustering operations are considered for the report. If no value is specified or NULL is specified, then the report is generated for the last automatic clustering operation that was executed.
activity_end	Time until the automatic clustering operations are considered for the report. If no value is specified or NULL is specified, then the report is generated for the last automatic clustering operation that was executed.
type	Format of the report. It can have one of the following values: • TEXT • HTML • XML The default value is TEXT
section	Sections to include in the report. It can have a combination of the following values: • SUMMARY: Include only the summary details section in the report. • ALL: Include all the sections in the report. This is the default value.
level	Level of automatic clustering information to include in the report. It can have one of the following values: • BASIC: Include basic automatic clustering information in the report. • TYPICAL: Include typical automatic clustering information in the report. This is the default value. • ALL: Include all the automatic clustering information in the report.

33.2.7 REPORT_LAST_ACTIVITY Function

This function returns a report of the last automatic clustering operation executed in a database.

Syntax

```
DBMS_AUTO_CLUSTERING.REPORT_LAST_ACTIVITY (
     type             IN  VARCHAR2 DEFAULT 'TEXT',
     section          IN  VARCHAR2 DEFAULT 'ALL',
     level            IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 33-8 REPORT_LAST_ACTIVITY Function Parameters

Parameter	Description
`type`	Format of the report. It can have one of the following values: • `TEXT` • `HTML` • `XML` The default value is `TEXT`.
`section`	Sections to include in the report. It can have a combination of the following values: • `SUMMARY`: Include only the summary details section in the report. • `ALL`: Include all the sections in the report. This is the default value.
`level`	Level of automatic clustering information to include in the report. It can have one of the following values: • `BASIC`: Include basic automatic clustering information in the report. • `TYPICAL`: Include typical automatic clustering information in the report. This is the default value. • `ALL`: Include all the automatic clustering information in the report.

34
DBMS_AUTO_SQLTUNE

The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task. Unlike DBMS_SQLTUNE, the DBMS_AUTO_SQLTUNE package requires the DBA role.

The chapter contains the following topics:

- DBMS_AUTO_SQLTUNE Overview
- DBMS_AUTO_SQLTUNE Security Model
- Summary of DBMS_AUTO_SQLTUNE Subprograms

34.1 DBMS_AUTO_SQLTUNE Overview

The DBMS_AUTO_SQLTUNE package is the interface to SQL Tuning Advisor (DBMS_SQLTUNE) when run within the AutoTask framework.

The database creates the automated system task SYS_AUTO_SQL_TUNING_TASK as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.
The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the SET_AUTO_TUNING_TASK_PARAMETER API to set the ACCEPT_SQL_PROFILES parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the DBA_ADVISOR_EXECUTIONS view for information about task executions. To view reports that span multiple executions, use the REPORT_AUTO_TUNING_TASK Function.

34.2 DBMS_AUTO_SQLTUNE Security Model

This package is available to users with the DBA role. For other users, you must grant the EXECUTE privilege on the package explicitly. Note that the EXECUTE_AUTO_TUNING_TASK procedure is an exception: only SYS can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the ADVISOR privilege to have access to this package.

34.3 Summary of DBMS_AUTO_SQLTUNE Subprograms

The DBMS_AUTO_SQLTUNE package contains EXECUTE, REPORT, and SET subprograms.

Table 34-1 DBMS_AUTO_SQLTUNE Package Subprograms

Subprogram	Description
EXECUTE_AUTO_TUNING_TASK Function and Procedure	Executes the Automatic SQL Tuning task immediately (`SYS` only)
REPORT_AUTO_TUNING_TASK Function	Displays a text report of the automatic tuning task's history
SET_AUTO_TUNING_TASK_PARAMETER Procedures	Changes a task parameter value for the daily automatic runs

34.3.1 EXECUTE_AUTO_TUNING_TASK Function and Procedure

This function and procedure executes the Automatic SQL Tuning task (`SYS_AUTO_SQL_TUNING_TASK`).

Both the function and the procedure run in the context of a new task execution. The difference is that the function returns the name of the new execution.

Syntax

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN DBMS_ADVISOR.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN DBMS_ADVISOR.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 34-2 EXECUTE_AUTO_TUNING_TASK Function and Procedure Parameters

Parameter	Description
`execution_name`	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
`execution_params`	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).
`execution_desc`	A 256-length string describing the execution

Usage Notes

Only `SYS` can invoke this subprogram. A tuning task can be executed multiple times without having to reset it.

Examples

```
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK('SYS_AUTO_SQL_TUNING_TASK');
```

34.3.2 REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

```
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
   begin_exec       IN   VARCHAR2   := NULL,
   end_exec         IN   VARCHAR2   := NULL,
   type             IN   VARCHAR2   := 'TEXT',
   level            IN   VARCHAR2   := 'TYPICAL',
   section          IN   VARCHAR2   := ALL,
   object_id        IN   NUMBER     := NULL,
   result_limit     IN   NUMBER     := NULL)
RETURN CLOB;
```

Parameters

Table 34-3 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
`begin_exec`	Name of the beginning task execution to use. If `NULL`, the report is generated for the most recent task execution.
`end_exec`	Name of the ending task execution to use. If `NULL`, the report is generated for the most recent task execution.
`type`	Type of the report to produce. Possible values are `TEXT` which produces a text report.
`level`	Level of detail in the report: • `BASIC`: simple version of the report. Just show info about the actions taken by the advisor. • `TYPICAL`: show information about every statement analyzed, including requests not implemented. • `ALL`: highly detailed report level, also provides annotations about statements skipped over.
`section`	Section of the report to include: • `SUMMARY`: summary information • `FINDINGS`: tuning findings • `PLAN`: explain plans • `INFORMATION`: general information • `ERROR`: statements with errors • `ALL`: all sections
`object_id`	Advisor framework object id that represents a single statement to restrict reporting to. `NULL` for all statements. Only valid for reports that target a single execution.
`result_limit`	Maximum number of SQL statements to show in the report

Return Values

A `CLOB` containing the desired report.

Examples

```
-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec,
'TEXT',
       'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
       'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
```

34.3.3 SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER` for `SYS_AUTO_SQL_TUNING_TASK`.

Syntax

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 34-4 SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: • MODE: tuning scope (comprehensive, limited) • USERNAME: user name under which the statement is parsed • DAYS_TO_EXPIRE: number of days until the task is deleted • EXECUTION_DAYS_TO_EXPIRE: number of days until the task execution is deleted • DEFAULT_EXECUTION_TYPE: default execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function and Procedure • TIME_LIMIT: global timeout in seconds • LOCAL_TIME_LIMIT: per-statement timeout in seconds • TEST_EXECUTE: – FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) – AUTO - test-execute for an automatically chosen time proportional to the tuning time – OFF - do not test-execute • BASIC_FILTER: basic filter for SQL tuning set • OBJECT_FILTER: object filter for SQL tuning set • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second ranking measure for SQL tuning set • RANK_MEASURE3: third ranking measure for SQL tuning set • RESUME_FILTER: extra filter for SQL tuning sets besides BASIC_FILTER • SQL_LIMIT: maximum number of SQL statements to tune • SQL_PERCENTAGE: percentage filter of SQL tuning set statements The following parameters are supported for the automatic tuning task only: • ACCEPT_SQL_PROFILES: whether the task should accept SQL profiles automatically (TRUE or FALSE) • MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum • MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

35
DBMS_AUTO_INDEX

The DBMS_AUTO_INDEX package provides the interface for managing auto indexes in an Oracle database.

This chapter contains the following topics:

- DBMS_AUTO_INDEX Overview
- Summary of DBMS_AUTO_INDEX Subprograms

35.1 DBMS_AUTO_INDEX Overview

The DBMS_AUTO_INDEX package is the interface for configuring auto indexes and generating reports of auto indexing operations in an Oracle database.

35.2 Summary of DBMS_AUTO_INDEX Subprograms

This table lists the DBMS_AUTO_INDEX package subprograms and briefly describes them.

Table 35-1 DBMS_AUTO_INDEX Package Subprograms

Procedure	Description
CONFIGURE Procedure	Configures settings related to automatic indexing.
DROP_AUTO_INDEXES Procedure	This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting.
DROP_SECONDARY_INDEXES Procedure	Deletes all the indexes, except the ones used for constraints, from a schema or a table.
REPORT_ACTIVITY Function	Returns a report of the automatic indexing operations executed during a specific period in a database.
REPORT_LAST_ACTIVITY Function	Returns a report of the last automatic indexing operation executed in a database.
RECOMMEND Function	Run auto index on demand. This function analyzes all statements within a workload, creates invisible auto indexes and evaluates the performance of the statements in the workload with and without the candidate indexes.

35.2.1 CONFIGURE Procedure

This procedure configures settings related to automatic indexing.

Syntax

```
DBMS_AUTO_INDEX.CONFIGURE (
   parameter_name         IN VARCHAR2,
```

```
parameter_value         IN VARCHAR2,
allow                   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 35-2 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Automatic indexing configuration setting. It can have one of the following values: • AUTO_INDEX_MODE: Modes of operation of auto indexes. It can have one of the following values: – IMPLEMENT: In this mode, new auto indexes are created as *visible* indexes and any existing *invisible* auto indexes are also set to *visible* indexes. In this mode, auto indexes are available to be used in SQL statements. – REPORT ONLY: In this mode, new auto indexes are created as *invisible* indexes and are not available to be used in SQL statements. – OFF: Setting the mode to OFF prevents new auto indexes from being considered and created. However, it does not disable existing auto indexes. • AUTO_INDEX_SCHEMA: Schemas to include or exclude from using auto indexes. Its value is case-sensitive and can include wildcards. Its behavior is controlled by the allow parameter. The automatic indexing process manages two schema lists – the *inclusion list* and the *exclusion list*. The inclusion list contains the schemas that can use auto indexes. The exclusion list contains the schemas that cannot use auto indexes. Initially, both these lists are empty and all the schemas in the database can use auto indexes when automatic indexing is enabled for a database. If the inclusion list contains at least one schema, then only the schemas listed in the inclusion list can use auto indexes. If the inclusion list is empty and the exclusion list contains at least one schema, then all the schemas can use auto indexes, except the schemas listed in the exclusion list. If both the lists (the inclusion list and the exclusion list) contain at least one schema, then all the schemas can use auto indexes, except the schemas listed in the exclusion list. • AUTO_INDEX_RETENTION_FOR_AUTO: Number of days for which the unused auto indexes are retained in the database, after which they are deleted. Default value is 373 days. • AUTO_INDEX_RETENTION_FOR_MANUAL: Number of days for which the unused manually created indexes (non-auto indexes) are retained in the database, after which they are

Table 35-2 (Cont.) CONFIGURE Procedure Parameters

Parameter	Description
	deleted. When it is set to `NULL`, the manually created indexes are not deleted by the automatic indexing process. Default value is `NULL`. • `AUTO_INDEX_REPORT_RETENTION`: Number of days for which automatic indexing logs are retained in the database before they are deleted. As automatic indexing report is generated based on these logs, automatic indexing report cannot be generated for a period beyond the value specified for `AUTO_INDEX_REPORT_RETENTION`. Default value is 373 days. • `AUTO_INDEX_DEFAULT_TABLESPACE`: Tablespace to use to store auto indexes. Default is `NULL`, which means the default permanent tablespace specified during the database creation is used to store auto indexes. Note that you cannot specify an Oracle-owned tablespace (such as `SYSAUX`) as the default tablespace. • `AUTO_INDEX_SPACE_BUDGET`: Percentage of tablespace size to use for auto indexes. This configuration setting can be used only when the default tablespace specified during the database creation is used for storing auto indexes. • `AUTO_INDEX_COMPRESSION`: Values to enable and disable advanced index compression for auto indexes. The supported values are: – `ON`: to enable advanced index compression for auto indexes – `OFF`: to disable advanced index compression for auto indexes The default value is `OFF`. • `AUTO_INDEX_TABLE`: You can use the `AUTO_INDEX_TABLE` configuration setting to specify tables that can use auto indexes. When you enable automatic indexing for a schema, all the tables in that schema can use auto indexes. However, if there is a conflict between the schema level and table level setting, the table level setting takes precedence. The parameter value is `<schema_name>.<table_name>`. You can then specify `TRUE` or `FALSE` to enable or disable auto indexes on the table respectively. To remove all tables from inclusion/exclusion list run the statement: `EXEC DBMS_AUTO_INDEX.CONFIGURE('AUTO_INDEX_TABLE', NULL);`

Table 35-2 (Cont.) CONFIGURE Procedure Parameters

Parameter	Description
parameter_value	Value for the configuration setting specified in parameter_name. When it is set to NULL, the configuration setting is assigned the default value.
allow	This parameter is applicable only for the AUTO_INDEX_SCHEMA configuration setting and it can have one of the following values: • TRUE: Add the specified schema to the inclusion list. • FALSE: Add the specified schema to the exclusion list. • NULL: Remove the specified schema from the list to which it is currently added. Refer to the description of the AUTO_INDEX_SCHEMA configuration setting for more information about the inclusion list and the exclusion list.

Examples

These examples are based on the assumption that the inclusion list and the exclusion list are initially empty.

The following example adds the SH and HR schemas to the exclusion list, so that only the SH and HR schemas cannot use auto indexes.

```
begin
    dbms_auto_index.configure(
         parameter_name  => 'AUTO_INDEX_SCHEMA',
         parameter_value => 'SH',
         allow           => FALSE);

    dbms_auto_index.configure(
         parameter_name  => 'AUTO_INDEX_SCHEMA',
         parameter_value => 'HR',
         allow           => FALSE);
end;
```

The following example removes the HR schema from the exclusion list, so that it can also use auto indexes. Now, only the SH schema cannot use auto indexes, because it is the only schema added to the exclusion list.

```
begin
    dbms_auto_index.configure(
         parameter_name  => 'AUTO_INDEX_SCHEMA',
         parameter_value => 'HR',
         allow           => NULL);
end;
```

The following example removes all the schemas from the exclusion list, so that all the schemas can use auto indexes.

```
begin
    dbms_auto_index.configure(
```

```
        parameter_name  => 'AUTO_INDEX_SCHEMA',
        parameter_value => NULL,
        allow           => TRUE);
end;
```

The following example adds the `HR` schema to the inclusion list, so that only the `HR` schema can use auto indexes.

```
begin
    dbms_auto_index.configure(
        parameter_name  => 'AUTO_INDEX_SCHEMA',
        parameter_value => 'HR',
        allow           => TRUE);
end;
```

The following example sets the retention period for auto indexes to 90 days.

```
begin
    dbms_auto_index.configure(
        parameter_name  => 'AUTO_INDEX_RETENTION_FOR_AUTO',
        parameter_value => '90');
end;
```

The following example sets the retention period for auto indexes to the default value of 373 days.

```
begin
    dbms_auto_index.configure(
        parameter_name  => 'AUTO_INDEX_RETENTION_FOR_AUTO',
        parameter_value => NULL);
end;
```

The following example enables a table:

```
EXEC DBMS_AUTO_INDEX.CONFIGURE('AUTO_INDEX_TABLE', 'SH.SALES', TRUE);
```

To remove all tables from inclusion/exclusion list:

```
EXEC DBMS_AUTO_INDEX.CONFIGURE('AUTO_INDEX_TABLE', NULL);
```

35.2.2 DROP_AUTO_INDEXES Procedure

This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting.

Syntax

```
DBMS_AUTO_INDEX.DROP_AUTO_INDEXES (
   owner           IN  VARCHAR2 DEFAULT NULL,
   index_name      IN  VARCHAR2 DEFAULT NULL,
   allow_recreate  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 35-3 DROP_AUTO_INDEXES Procedure Parameters

Parameter	Description
`owner`	The name of the index owner.

Table 35-3 (Cont.) DROP_AUTO_INDEXES Procedure Parameters

Parameter	Description
index_name	The name of the index.
allow_recreate	Set this parameter to allow or disallow automatic creation of the dropped index again.

Examples

Drop a single index and allow recreate:

```
exec dbms_auto_index.drop_auto_indexes('SH','"SYS_AI_612ud3j5ngf0c"',TRUE);
```

Drop all indexes owned by SH and allow recreate:

```
exec dbms_auto_index.drop_auto_indexes('SH',NULL,TRUE);
```

Drop all indexes owned by HR, disallowing recreate and then change the recreation status back to allow:

```
exec dbms_auto_index.drop_auto_indexes('HR',NULL);
exec dbms_auto_index.drop_auto_indexes('HR', NULL, TRUE);
```

Usage Notes

- If the values of the parameters owner and index_name are explicitly set to `NULL`, all auto indexes which the user has privileges on will be dropped, except the ones used for constraints.
- If owner is explicitly specified and `index_name` is set to `NULL`, all auto indexes within the given schema will be dropped, except the ones used for constraints. The dropped indexes are not recreated automatically by the system by default. Set `allow_recreate` parameter to `TRUE` to change this behavior.
- This procedure updates the `allow_recreate` status associated with the dropped indexes from `FALSE` to `TRUE` and vice-versa.

35.2.3 DROP_SECONDARY_INDEXES Procedure

This procedure deletes all the indexes, except the ones used for constraints, from a schema or a table.

Syntax

```
DBMS_AUTO_INDEX.DROP_SECONDARY_INDEXES (
   ownname     IN  VARCHAR2 DEFAULT NULL,
   tabname     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 35-4 DROP_SECONDARY_INDEXES Procedure Parameters

Parameter	Description
ownname	(Optional) Name of the schema from which all the indexes need to be deleted. **Note:** The indexes used for constraints are not deleted.
tabname	(Optional) Name of the table from which all the indexes need to be deleted. **Note:** The indexes used for constraints are not deleted.

Examples

The following example deletes all the indexes, except the ones used for constraints, from the SH schema.

```
begin
    dbms_auto_index.drop_secondary_indexes('SH');
end;
```

The following example deletes all the indexes, except the ones used for constraints, from the EMP table in the HR schema.

```
begin
    dbms_auto_index.drop_secondary_indexes('HR', 'EMP');
end;
```

The following example deletes all the indexes, except the ones used for constraints, for which the user has the delete privileges from all the schemas in a database.

```
begin
    dbms_auto_index.drop_secondary_indexes;
end;
```

35.2.4 REPORT_ACTIVITY Function

This function returns a report of the automatic indexing operations executed during a specific period in a database.

Syntax

```
DBMS_AUTO_INDEX.REPORT_ACTIVITY (
   activity_start  IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP - 1,
   activity_end    IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP,
   type            IN  VARCHAR2 DEFAULT 'TEXT',
   section         IN  VARCHAR2 DEFAULT 'ALL',
   level           IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 35-5 REPORT_ACTIVITY Function Parameters

Parameter	Description
activity_start	Time starting from which the executed automatic indexing operations are considered for the report. If NULL is specified, the last executed automatic indexing operation is considered for the report. If no value is specified for this parameter, then the current time minus one day (24 hours) is considered at the start time.
activity_end	Time till which the executed automatic indexing operations are considered for the report. If no value is specified, then the current time is considered as the end time.
type	Format of the report. It can have one of the following values: • TEXT • HTML • XML The default value is TEXT.
section	Sections to include in the report. It can have a combination of the following values: • SUMMARY: Include only the summary details section in the report. • INDEX_DETAILS: Include only the auto index details section in the report. • VERIFICATION_DETAILS: Include only the auto index verification details section in the report. • ERRORS: Include only the error details section in the report. • ALL: Include all the sections (summary details, auto index details, auto index verification details, and error details) in the report. This is the default value. A combination of these values can be specified using the + or – operators as shown in the following examples: • SUMMARY +INDEX_DETAILS +ERRORS: Include summary details, auto index details, and error details sections in the report. • ALL -ERRORS: Include all the sections in the report, except the error details section.

Table 35-5 (Cont.) REPORT_ACTIVITY Function Parameters

Parameter	Description
level	Level of automatic indexing information to include in the report. It can have one of the following values: • BASIC: Include basic automatic indexing information in the report. • TYPICAL: Include typical automatic indexing information in the report. This is the default value. • ALL: Include all the automatic indexing information in the report.

Return Value

A report of the automatic indexing operations executed during the specified period in a database.

Examples

The following example generates a typical report of the automatic indexing operations executed in the last 24 hours. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```
declare
  report clob := null;
begin
  report := dbms_auto_index.report_activity();
end;
```

35.2.5 REPORT_LAST_ACTIVITY Function

This function returns a report of the last automatic indexing operation executed in a database.

Syntax

```
DBMS_AUTO_INDEX.REPORT_LAST_ACTIVITY (
   type            IN  VARCHAR2 DEFAULT 'TEXT',
   section         IN  VARCHAR2 DEFAULT 'ALL',
   level           IN  VARCHAR2 DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 35-6 REPORT_LAST_ACTIVITY Function Parameters

Parameter	Description
`type`	Format of the report. It can have one of the following values: • `TEXT` • `HTML` • `XML` The default value is `TEXT`.
`section`	Sections to include in the report. It can have a combination of the following values: • `SUMMARY`: Include only the summary details section in the report. • `INDEX_DETAILS`: Include only the auto index details section in the report. • `VERIFICATION_DETAILS`: Include only the auto index verification details section in the report. • `ERRORS`: Include only the error details section in the report. • `ALL`: Include all the sections (summary details, auto index details, auto index verification details, and error details) in the report. This is the default value. A combination of these values can be specified using the + or – operators as shown in the following examples: • `SUMMARY +INDEX_DETAILS +ERRORS`: Include summary details, auto index details, and error details sections in the report. • `ALL -ERRORS`: Include all the sections in the report, except the error details section.
`level`	Level of automatic indexing information to include in the report. It can have one of the following values: • `BASIC`: Include basic automatic indexing information in the report. • `TYPICAL`: Include typical automatic indexing information in the report. This is the default value. • `ALL`: Include all the automatic indexing information in the report.

Return Value

A report of the last automatic indexing operation executed in a database.

Examples

The following example generates a typical report of the last automatic indexing operation executed in a database. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```
declare
  report clob := null;
begin
  report := dbms_auto_index.report_last_activity();
end;
```

35.2.6 RECOMMEND Function

Run auto indexing on demand.

This function analyzes all statements within a workload, creates invisible auto indexes and evaluates the performance of the statements in the workload both with and without the candidate indexes. If called in `IMPLEMENT` mode, this function marks as visible any indexes that improve performance. If called in `REPORT ONLY` mode, all indexes created in this task are dropped at the end of the task. In that case you can run `DBMS_AUTO_INDEX.REPORT_ACTIVITY()` to view the results.

Syntax

```
DBMS_AUTO_INDEX.RECOMMEND (
   WORKLOAD_START_TIME IN TIMESTAMP DEFAULT NULL,
   WORKLOAD_END_TIME   IN TIMESTAMP DEFAULT NULL,
   AUTO_INDEX_MODE     IN VARCHAR2 )
RETURN VARCHAR2;
```

Parameters

Table 35-7 RECOMMEND Function Parameters

Parameter	Description
`WORKLOAD_START_TIME`	The starting point for analysis within the ASTS (Automatic SQL tuning set) workload. The default NULL means all statements from the start of the workload to `WORKLOAD_END_TIME` are analyzed.
`WORKLOAD_END_TIME`	The end point for analysis within the ASTS workload. The default NULL means that all statements from `WORKLOAD_START_TIME` to the end of the workload are analyzed.
`AUTO_INDEX_MODE`	• `REPORT ONLY` Analysis is performed, but there is no change. Created indexes are dropped. See `DBMS_AUTO_INDEX.REPORT_ACTIVITY()` to view verification details. • `IMPLEMENT` Marks performance-improving indexes as visible. The default is `REPORT ONLY`.

Return Value

The execution name of the task is returned.

Example 35-1 Using the RECOMMEND Function

Execute the function and then call `DBMS_AUTO_INDEX.REPORT_LAST_ACTIVITY` to return the report.

```
var tname varchar2(100)
EXEC :tname := dbms_auto_index.recommend()
SELECT :tname task_name FROM dual;
```

Get the report:

```
set linesize 250
set trims on
set pagesize 1000
set long 10000000
column report format a120
spool report.txt
SELECT dbms_auto_index.report_last_activity('text','all','all') report FROM
dual;
spool off
```

36
DBMS_AUTO_MV

DBMS_AUTO_MV contains subprograms for configuring automatic materialized views.

This chapter contains the following topics:

- Using DBMS_AUTO_MV
- Summary of DBMS_AUTO_MV Subprograms

36.1 Using DBMS_AUTO_MV

The DBMS_AUTO_MV package contains functions and procedures to manage automatic materialized views.

This package is owned by SYS, so EXECUTE package privilege is required by non-SYS users. Grant EXECUTE privilege on the package to the users.

36.2 Summary of DBMS_AUTO_MV Subprograms

This table lists the DBMS_AUTO_MV package subprograms and briefly describes them.

Table 36-1 DBMS_AUTO_MV Package Subprograms

Subprogram	Description
CONFIGURE Procedure	Enables, disables, and configures the various parameters of the automatic materialized view feature.
DROP_AUTO_MVS Procedure	Drops automatic materialized views that were created. This routine can only be executed by DBA.
RECOMMEND Function	This function allows a user to manually generate automatic materialized view recommendations for SQL statements in a given SQL tuning set
REFRESH Procedure	This procedure allows a user to manually refresh all stale automatic materialized views in the system unconditionally.
REPORT_ACTIVITY Function	This function generates a report on the automatic materialized view activities and usage for a specified time duration. The report can be generated in text, HTML, or XML formats as specified by the argument type.
REPORT_LAST_ACTIVITY Function	This function generates a report on the most recent automatic materialized view activities and usage. The report can be generated in text, HTML, or XML formats as specified by the argument type.

36.2.1 CONFIGURE Procedure

This procedure enables, disables, and configures the various parameters of the automatic materialized view feature.

Syntax

```
DBMS_AUTO_MV.CONFIGURE (
   parameter   IN VARCHAR2,
   value       IN VARCHAR2,
   allow       IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 36-2 CONFIGURE Procedure Parameters

Parameter	Description
`parameter`	The name of the parameter to be modified. Parameter names are not case sensitive.
`value`	The value of the specified parameter.
`allow`	This parameter allows or disallows various schemas or app modules. It is applicable only for the `AUTO_MV_SCHEMA` and `AUTO_MV_APP_MODULE` parameters.

Parameters

Table 36-3 CONFIGURE Parameters Names

Parameter	Description
`AUTO_MV_MODE`	Enables, disables, or engages report-only mode. Possible values are: • `OFF`: No recommendations are made. This is the default value. • `REPORT ONLY`: This mode generates recommendations and stores them in the internal repository so they are available to the DBA through `DBA_AUTO_MV_ANALYSIS_RECOMMENDATIONS`. • `IMPLEMENT`: This mode generates, verifies, and publishes recommendations, or drops them.
`AUTO_MV_MAINT_TASK`	Activates and deactivated automatic maintenance of materialized views. • `ENABLE`: Activates automatic maintenance of materialized views. • `DISABLE`: Deactivates the automatic maintenance of materialized views. If automatic maintenance of materialized views is in progress, it finishes the maintenance. This is the default value. • `CLEANUP_AND_DISABLE`: Drops all automatic materialized views, and deactivates automatic maintenance of materialized views. If automatic materialized views maintenance is in progress, it finishes the maintenance before the task is deactivated.

Table 36-3 (Cont.) CONFIGURE Parameters Names

Parameter	Description
AUTO_MV_SPACE_BUDGET	Specifies the amount of space budget available for implementing automatic materialized views. The total space value is the sum of currently space used by all user tables (i.e. not system tables). The calculation does not include user access structures (like indexes or materialized views). Possible values are: • Budget in percent: A positive number ending with % symbol designating the percentage of currently utilized space for all user tables. • Budget in GB: A positive integer ending with GB that indicates the absolute space limit for automatic materialized views. For example, 10GB indicates 10 Gigabytes. The minimum value is 1GB but no maximum value. The default budget is 10% of the total size of user tables.
AUTO_MV_DEFAULT_TABLESPACE	Specifies the tablespace to place automatic materialized views. Possible values are: • Tablespace name: A valid Oracle tablespace name to be used when creating new automatic materialized views. Quoted identifiers are supported. • NULL: A new automatic materialized view is created in the default tablespace of the owner of parent object. If automatic materialized view has more than one parent object, such as materialized views defined on multiple base tables, the default tablespace of the owner of largest base table is selected. This is the default value. If the value is changed dynamically, it takes effect the next time automatic materialized views recommendations are implemented.
AUTO_MV_TEMP_TABLESPACE	Specifies the temporary tablespace while creating or refreshing automatic materialized views. Possible values are: • Tablespace name: A valid Oracle temp tablespace name to be used when creating new automatic materialized views and the data needs to be spilled to temp. • NULL: The temp table space assigned to the owner of the largest parent object of the automatic materialized views. This is the default value. If the value is changed dynamically, it takes effect the next time recommendations are implemented.
AUTO_MV_RETENTION	Specifies the number of days automatic materialized views exists without being utilized by a query. When the expiry period is reached, the materialized view is dropped. Positive integer: An integer between 1 and 373. The default value is 33 days.
AUTO_MV_ANALYZE_REPORT_RETENTION	Specifies the maximum number of days to retain analysis and recommendation history. Positive integer: An integer value between 0 and 90. Value 0 implies that history is not maintained. The default value is 31. The history of analysis and verification is retained in the DBA_AUTO_MV_* dictionary tables.
AUTO_MV_ANALYZE_WORKLOAD_WINDOW	Specifies the maximum number of hours to make recommendations. Positive integer: An integer value between 1 and 8760. The default value is 24.
AUTO_MV_ANALYZE_WORKLOAD_MIN_TIME	Specifies the minimum time in seconds for a query to be considered for automatic materialized views recommendation. Queries below this threshold are not considered for recommendations. Positive value: An integer value between 0 and 3600 (1 hour). The default value is 120 (2 minutes).

Table 36-3 (Cont.) CONFIGURE Parameters Names

Parameter	Description
AUTO_MV_SCHEMA	Specifies the schemas to include or exclude from creation of automatic materialized views. Possible values are: • TRUE: Adds the specified schema to the inclusion list. • FALSE: Adds the specified schema to the exclusion list. • NULL: Removes the specified schema from the list to which it is currently added. If both the lists (the inclusion list and the exclusion list) contain at least one schema, then all the schemas can use automatic materialized views, except the schemas listed in the exclusion list.
AUTO_MV_APP_MODULE	Specifies application modules to include or exclude from creation of automatic materialized views. Possible values are: • TRUE: Adds the specified application module to the inclusion list. • FALSE: Adds the specified application module to the exclusion list. • NULL: Removes the specified application module from the list to which it is currently added. Initially, the inclusion list and the exclusion list are empty and we can create automatic materialized views under all application modules when automatic automatic materialized views are enabled for a database.
AUTO_MV_VERIFY_REPORT_RETENTION	Specifies the maximum number of days to retain the verification history. Positive value: An integer value between 0 and 90 for the number of days the history of analysis and verification is retained in the DBA_AUTO_MV_* dictionary tables . Value 0 implies that history is not maintained. The default value is 31.
AUTO_MV_MAINT_REPORT_RETENTION	Specifies the maximum number of days to retain history of automatic materialized view maintenance. Positive integer: An integer value between 0 and 90 for the number of days the history of automatic materialized view refreshes is retained in the DBA_AUTO_MV_REFRESH_* dictionary tables. Value 0 means no history is maintained. The default value is 31.

Example

```
begin
   dbms_auto_mv.configure ('AUTO_MV_SPACE_BUDGET',  '50%');
end;
begin
   dbms_auto_mv.configure ('AUTO_MV_SCHEMA',  'SH', FALSE);
   dbms_auto_mv.configure ('AUTO_MV_SCHEMA',  'SCOTT');
end;
/
```

36.2.2 DROP_AUTO_MVS Procedure

This procedure drops automatic materialized views that were created. This routine can only be executed by DBA.

Syntax

```
DBMS_AUTO_MV.DROP_AUTO_MVS (
   owner            IN VARCHAR2,
   mv_name          IN VARCHAR2,
   allow_recreate   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 36-4 DROP_AUTO_MVS Procedure Parameters

Parameter	Description
OWNER	Specifies the name of the owner of the automatic materialized views. If OWNER is explicity specified and MV_NAME is set to null, all automatic materialized views which the user has privileges are dropped. If OWNER is explicity specified and MV_NAME is set to null, all automatic materialized views with the given OWNER are dropped. Dropped automatic materialized views are not recreated automatically by the system as default.
MV_NAME	The name of the automatic materialized views.
ALLOW_RECREATE	Enables or disables the automatic creation of dropped automatic materialized views. FALSE disables the automatic creation of dropped automatic materialized views. This is default. TRUE enables the automatic creation of dropped automatic materialized views.

Examples

```
begin
   dbms_auto_mv.DROP_AUTO_MVS ('SH');
end;
/

begin
   dbms_auto_mv.DROP_AUTO_MVS ('SH', 'AUTO_MV$$_G2MKPB9SA1FB7');
end;
/
```

36.2.3 RECOMMEND Function

This function allows a user to manually generate automatic materialized view recommendations for SQL statements in a given SQL tuning set

Syntax

```
DBMS_AUTO_MV.RECOMMEND (
   sts_owner              IN  VARCHAR2  DEFAULT 'SYS',
   sts_name               IN  VARCHAR2  DEFAULT 'SYS_AUTO_STS',
   workload_start_time    IN  TIMESTAMP DEFAULT NULL,
   workload_end_time      IN  TIMESTAMP DEFAULT NULL,
   automv_mode            IN  VARCHAR2  DEFAULT 'REPORT ONLY')
RETURN VARCHAR2;
```

Parameters

Table 36-5 RECOMMEND Function Parameters

Parameter	Description
sts_owner	The name of the owner of the SQL tuning set. The default value is SYS.
sts_name	The name of the SQL tuning set. The default value is SYS_AUTO_STS.
workload_start_time	The start time of the workload window. The value NULL means that the default is chosen. The default is SYSDATE minus the number of hours defined by AUTO_MV_ANALYZE_WORKLOAD_WINDOW.
workload_end_time	The end time of the workload window.
automv_mode	When AUTOMV_MODE is set to REPORT ONLY, which is the default mode, the function will only output the recommendations. If this parameter is set to IMPLEMENT, then the recommended automatic materialized views will be verified and implemented.

Return Value

The execution name (execution_name) to be used in DBA_AUTO_MV% catalog views.

Examples

In the following examples, the default SQL tuning set, SYS_AUTO_STS is used. Make sure that SYS_AUTO_STS contains the required workload to generate the automatic materialized views.

Example 1: Generate and report recommendations using SYS_AUTO_STS for the past 24 hours. Note that the default behavior of this function is REPORT ONLY, so no automatic materialized view will be implemented.

```
var exec_name varchar2(200);
begin
    :exec_name := dbms_auto_mv.recommend();
end;
/

SELECT * FROM DBA_AUTO_MV_ANALYSIS_RECOMMENDATIONS
        WHERE exec_name = :exec_name;
```

Example 2: Generate and publish recommendations using SYS_AUTO_STS for the past 24 hours.

```
var exec_name varchar2(200);
begin
    :exec_name := dbms_auto_mv.recommend(automv_mode=>'IMPLEMENT');
end;
/
```

36.2.4 REFRESH Procedure

This procedure allows a user to manually refresh all stale automatic materialized views in the system unconditionally.

Syntax

```
DBMS_AUTO_MV.REFRESH ();
```

Example

```
begin
    dbms_auto_mv.refresh();
end;
/
```

36.2.5 REPORT_ACTIVITY Function

This function generates a report on the automatic materialized view activities and usage for a specified time duration. The report can be generated in text, HTML, or XML formats as specified by the argument type.

Syntax

```
DBMS_AUTO_MV.REPORT_ACTIVITY (
   activity_start        IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP -1,
   activity_end          IN  TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP,
   type                  IN  VARCHAR2  DEFAULT 'TEXT',
   section               IN  VARCHAR2  DEFAULT 'ALL',
   level                 IN  VARCHAR2  DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 36-6 REPORT_ACTIVITY Function Parameters

Parameter	Description
activity_start	The start time for report generation.
activity_end	The end time for report generation.
type	The format type in which the report needs to be generated. The possible values are: • TEXT • HTML • XML The default value is TEXT.

Table 36-6 (Cont.) REPORT_ACTIVITY Function Parameters

Parameter	Description
section	The section can be a combination of the following: • SUMMARY • MV_DETAILS • QUERY_DETAILS • VERIFICATION_DETAILS • ALL The default value is ALL. You can generate a specific combination of report by using + or – operators. For example, when section is specified as SUMMARY+MV_DETAILS, the generated report will contain only the summary and the details about the automatic materialized view.
level	The level can be either BASIC, TYPICAL, or ALL. When the level is set to BASIC, a minimum set of information regarding the most recent automatic materialized view activity is reported. On the other hand, when the level is set to ALL, a detailed report is generated. The default value is TYPICAL.

Return Value

This functions returns the report as a CLOB.

Examples

Example 1: The following call to REPORT_ACTIVITY() generates an HTML output for all the automatic materialized view activities:

```
select dbms_auto_mv.report_activity(type => 'HTML') from dual;
```

36.2.6 REPORT_LAST_ACTIVITY Function

This function generates a report on the most recent automatic materialized view activities and usage. The report can be generated in text, HTML, or XML formats as specified by the argument type.

Syntax

```
DBMS_AUTO_MV.REPORT_LAST_ACTIVITY (
   type                 IN  VARCHAR2  DEFAULT 'TEXT',
   section              IN  VARCHAR2  DEFAULT 'ALL',
   level                IN  VARCHAR2  DEFAULT 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 36-7 REPORT_LAST_ACTIVITY Function Parameters

Parameter	Description
type	The format type in which the report needs to be generated. The possible values are: • TEXT • HTML • XML The default value is TEXT.
section	The section can be a combination of the following: • SUMMARY • MV_DETAILS • QUERY_DETAILS • VERIFICATION_DETAILS • ALL The default value is ALL. You can generate a specific combination of report by using + or – operators. For example, when section is specified as SUMMARY+MV_DETAILS, the generated report will contain only the summary and the details about the automatic materialized view.
level	The level can be either BASIC, TYPICAL, or ALL. When the level is set to BASIC, a minimum set of information regarding the most recent automatic materialized view activity is reported. On the other hand, when the level is set to ALL, a detailed report is generated. The default value is TYPICAL.

Return Value

This functions returns the report as a CLOB.

Examples

Example 1: The following call to REPORT_LAST_ACTIVITY() generates a TEXT output:

```
select dbms_auto_mv.report_last_activity('TEXT', 'ALL', 'TYPICAL') from dual;
```

Example 2: The following call to REPORT_LAST_ACTIVITY() generates an XML output:

```
select dbms_auto_mv.report_last_activity('XML', 'ALL', 'TYPICAL') from dual;
```

Example 3: The following call to REPORT_LAST_ACTIVITY() generates an HTML output:

```
select dbms_auto_mv.report_last_activity('HTML', 'ALL', 'TYPICAL') from dual;
```

37
DBMS_AUTO_REPORT

The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* for more information about reporting database operations

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_AUTO_REPORT Subprograms

37.1 DBMS_AUTO_REPORT Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR.Captured data are stored in AWR and exposed via 2 views: DBA_HIST_REPORTS and DBA_HIST_REPORTS_DETAILS.

37.2 DBMS_AUTO_REPORT Security Model

This package is available to PUBLIC and performs its own security checking.

37.3 Summary of DBMS_AUTO_REPORT Subprograms

This table describes the parameters of the DBMS_AUTO_REPORT package subprograms.

Table 37-1 DBMS_AUTO_REPORT Package Subprograms

Subprogram	Description
FINISH_REPORT_CAPTURE Procedure	Ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure.
REPORT_REPOSITORY_DETAIL Function	Obtains the stored report for a given report ID
REPORT_REPOSITORY_DETAIL_XML Function	Obtains the stored XML report for a given report ID

Table 37-1 (Cont.) DBMS_AUTO_REPORT Package Subprograms

Subprogram	Description
REPORT_REPOSITORY_LIST_XML Function	Obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR
START_REPORT_CAPTURE Procedure	Captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.
PURGE_ALL_REPORTS Function	Purges all SQL Monitor content from WRP$_ tables associated with a single DBID (if specified), or from all non-local DBIDs if no DBID is specified.
PURGE_REPORTS_BY_RETENTION Function	Purges SQL Monitor reports older than the retention period from WRP$_ tables associated with a specified container DBID, or if no DBID is specified, then it purges old reports from all non-local containers.

37.3.1 FINISH_REPORT_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the `START_REPORT_CAPTURE` procedure.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time*DOP in case of PQ) whose monitoring has completed.

Syntax

```
DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;
```

Related Topics

- START_REPORT_CAPTURE Procedure
  This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

37.3.2 REPORT_REPOSITORY_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (
   rid              IN NUMBER    DEFAULT NULL,
   type             IN VARCHAR2  DEFAULT 'XML',
   base_path        IN VARCHAR2  DEFAULT NULL)
 RETURNS CLOB
```

Parameters

Table 37-2 REPORT_REPOSITORY_DETAIL Function Parameters

Parameter	Description
rid	ID of the stored report which returned by the function

Table 37-2 (Cont.) REPORT_REPOSITORY_DETAIL Function Parameters

Parameter	Description
type	Desired format of the report. Values can be 'XML', 'TEXT', 'HTML', 'EM' or 'ACTIVE'. The last two options generate a report in the same format called active HTML. Default value is 'XML'.
base_path	Unused/Non-operative

Return Values

The persisted report for the given record ID

37.3.3 REPORT_REPOSITORY_DETAIL_XML Function

This procedure obtains the stored XML report for a given report ID.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (
   rid              IN NUMBER    DEFAULT NULL,
   base_path        IN VARCHAR2  DEFAULT NULL)
 RETURNS XMLTYPE
```

Parameters

Table 37-3 *REPORT_REPOSITORY_DETAIL_XML Function Parameters*

Parameter	Description
rid	ID of the stored report which returned by the function
base_path	Unused/Non-operative

Return Values

The persisted XML report for the given record ID

37.3.4 REPORT_REPOSITORY_LIST_XML Function

This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR.

The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (
    active_since              IN DATE     DEFAULT NULL,
    active_upto               IN DATE     DEFAULT NULL,
    snapshot_id               IN NUMBER   DEFAULT NULL,
    dbid                      IN NUMBER   DEFAULT NULL,
    inst_id                   IN NUMBER   DEFAULT NULL,
    con_dbid                  IN NUMBER   DEFAULT NULL,
    session_id                IN NUMBER   DEFAULT NULL,
    session_serial            IN NUMBER   DEFAULT NULL,
```

```
    component_name           IN VARCHAR2 DEFAULT NULL,
    key1                     IN VARCHAR2 DEFAULT NULL,
    key2                     IN VARCHAR2 DEFAULT NULL,
    key3                     IN VARCHAR2 DEFAULT NULL,
    report_level             IN VARCHAR2 DEFAULT 'TYPICAL',
    base_path                IN VARCHAR2 DEFAULT NULL)
RETURNS XMLTYPE
```

Parameters

Table 37-4 *REPORT_REPOSITORY_LIST_XML Function Parameters*

Parameter	Description
active_since	Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.
active_upto	Same as active_since except that it is the end of the time range
snapshot_id	If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.
dbid	If a value is specified, only those data captured for the specified database ID are included in the list report. If no value is specified, no filtering is performed on database ID
inst_id	If a value is specified, only those data captured on the specified instance number are included in the list report. If no value is specified, no filtering is performed on the instance ID.
con_dbid	If a value is specified, only those data captured on the specified container DBID are included in the list report. If no value is specified, no filtering is performed on the container DBID.
session_id	If a value is specified, only those data captured for the specified session ID are included in the list report. If no value is specified, no filtering is performed on session ID.
session_serial	If a value is specified, only those data captured for the specified session are included in the list report. If no value is specified, no filtering is performed on session serial number. This parameter should be used in conjunction with the session_id parameter.
component_name	Can be 'sqlmonitor' for SQL Monitor data or 'rtaddm' for Real-time ADDM data. If a value is specified then data pertaining only to the specified component will be included in the list report. If no value is specified, no filtering is performed.
key1	Key value relevant to a component. For SQL Monitor, key1 is the SQL ID of the captured SQL statement. If a value is specified, only those data having specified value for key1 are included, else no filtering is performed on key1.
key2	Key value relevant to a component. For SQL Monitor, key2 is the SQL execution ID of the captured SQL statement. If a value is specified, only those data having specified value for key2 are included, else no filtering is performed on key2.
key3	Key value relevant to a component. For SQL Monitor, key3 is the SQL execution start time of the captured SQL statement. If a value is specified, then only those data having specified value for key3 are included, else no filtering is performed on key3.
report_level	Currently only 'TYPICAL' is used

Table 37-4 (Cont.) *REPORT_REPOSITORY_LIST_XML Function Parameters*

Parameter	Description
base_path	Unused/Non-operative

37.3.5 START_REPORT_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the FINISH_REPORT_CAPTURE Procedure. In the case of a RAC system, the capture will start on each node of the cluster.

Syntax

```
DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
```

37.3.6 PURGE_ALL_REPORTS Function

This function purges all SQL Monitor content from WRP$_ tables associated with a single DBID (if specified), or from all non-local DBIDs if no DBID is specified.

Syntax

```
DBMS_AUTO_REPORT.PURGE_ALL_REPORTS (
   dbid  IN NUMBER DEFAULT NULL,
);
```

This function does not return a value.

37.3.7 PURGE_REPORTS_BY_RETENTION Function

This function purges SQL Monitor reports older than the retention period from WRP$_ tables associated with a specified container DBID, or if no DBID is specified, then it purges old reports from all non-local containers.

Only the reports that are older than the retention period are purged.

Syntax

```
DBMS_AUTO_REPORT.PURGE_REPORTS_BY_RETENTION (
   dbid  IN NUMBER DEFAULT NULL,
);
```

This function does not return a value.

38
DBMS_AUTO_TASK_ADMIN

The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

> **See Also:**
>
> *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- Deprecated Subprograms
- Security Model
- Constants
- Summary of DBMS_AUTO_TASK_ADMIN Subprograms

38.1 DBMS_AUTO_TASK_ADMIN Deprecated Subprograms

The DBMS_AUTO_TASK_ADMIN OVERRIDE_PRIORITY subprogram has been deprecated.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- OVERRIDE_PRIORITY Procedures

38.2 DBMS_AUTO_TASK_ADMIN Security Model

DBMS_AUTO_TASK_ADMIN is a definer's rights package, and EXECUTE is automatically granted to DBA, IMP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE.

38.3 DBMS_AUTO_TASK_ADMIN Constants

The DBMS_AUTO_TASK_ADMIN package defines several constants that can be used for specifying parameter values.

These constants shown in the following table:

Table 38-1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
PRIORITY_MEDIUM	VARCHAR2	'MEDIUM'	Task with this priority should be executed as time permits
PRIORITY_HIGH	VARCHAR2	'HIGH'	Task with this priority should be executed within the current Maintenance Window
PRIORITY_URGENT	VARCHAR2	'URGENT'	Task with this priority is to be executed at the earliest opportunity

38.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms

This table lists the DBMS_AUTO_TASK_ADMIN subprograms and briefly describes them.

Table 38-2 DBMS_AUTO_TASK_ADMIN Package Subprograms

Method	Description
DISABLE Procedures	Prevents AUTOTASK from executing any requests from a specified client or operation.
ENABLE Procedures	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
GET_CLIENT_ATTRIBUTES Procedure	Returns values of select client attributes
GET_P1_RESOURCES Procedure	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
OVERRIDE_PRIORITY Procedures	Manually overrides task priority.
SET_CLIENT_SERVICE Procedure	Associates an AUTOTASK Client with a specified Service
SET_P1_RESOURCES Procedure	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

38.4.1 DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 38-3 DISABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be disabled

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.
- Auto STS Capture Task is accepted.

38.4.2 ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.

Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation.Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 38-4 ENABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be enabled

Usage Notes

- If `operation` and `window_name` are both `NULL`, the client is enabled.
- If `operation` is not `NULL`, `window_name` is ignored and the specified operation is enabled
- If `operation` is `NULL` and `window_name` is not `NULL`, the client is enabled in the specified window.
- `Auto STS Capture Task` is accepted.

38.4.3 GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
   client_name        IN    VARCHAR2,   service_name       OUT   VARCHAR2,
window_group       OUT   VARCHAR2);
```

Parameters

Table 38-5 GET_CLIENT_ATTRIBUTES Procedure Parameters

Parameter	Description
`client_name`	Name of the client, as found in `DBA_AUTOTASK_CLIENT` View
`service_name`	Service name for client, may be `NULL`
`window_group`	Name of the window group in which the client is active

38.4.4 GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each `AUTOTASK` High Priority Consumer Group.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 38-6 GET_P1_RESOURCES Procedure Parameters

Parameter	Description
`stats_group_pct`	%resources for Statistics Gathering
`seq_group_pct`	%resources for Space Management
`tune_group_pct`	%resources for SQL Tuning
`health_group_pct`	%resources for Health Checks

Usage Notes

Values will add up to 100%.

38.4.5 OVERRIDE_PRIORITY Procedures

This deprecated procedure is used to manually override task priority.

> **Note:**
>
> This subprogram is deprecated and becomes nonoperative with Oracle Database 12*c*.

This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to `URGENT` causes a high priority job to be generated at the start of the maintenance window. Setting `priority` to `CLEAR` removes the override.

Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   task_target_type  IN    VARCHAR2,
   task_target_name  IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Parameters

Table 38-7 OVERRIDE_PRIORITY Procedure Parameters

Parameter	Description
`client_name`	Name of the client, as found in `DBA_AUTOTASK_CLIENT` View
`priority`	`URGENT`, `HIGH`, `MEDIUM` or `LOW`
`operation`	Name of the operation as specified in `DBA_AUTOTASK_OPERATION` View
`task_target_type`	Type of target to be affected, as found in V$`AUTOTASK_TARGET_TYPE` View

Table 38-7 (Cont.) OVERRIDE_PRIORITY Procedure Parameters

Parameter	Description
task_target_name	Name of the specific target to be affected

38.4.6 SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
   client_name         IN    VARCHAR2,
   service_name        IN   VARCHAR2);
```

Parameters

Table 38-8 SET_CLIENT_SERVICE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

38.4.7 SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
   stats_group_pct     IN   NUMBER,
   seg_group_pct       IN   NUMBER,
   tune_group_pct      IN   NUMBER,
   health_group_pct    IN   NUMBER);
```

Parameters

Table 38-9 SET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values must be integers in the range `0` to `100`, and must add up to `100` (percent), otherwise, an exception is raised.

39
DBMS_AUTO_ZONEMAP

The DBMS_AUTO_ZONEMAP package provides autonomous maintenance and creation of zone map.

This chapter contains the following topics:

- DBMS_AUTO_TASK_ADMIN Security Model
- Summary of DBMS_AUTO_ZONEMAP Subprograms

39.1 DBMS_AUTO_TASK_ADMIN Security Model

The subprograms in DBMS_AUTO_TASK_ADMIN package can be executed by users with DBA privileges.

39.2 Summary of DBMS_AUTO_ZONEMAP Subprograms

This table lists the DBMS_AUTO_ZONEMAP package subprograms and briefly describes them.

Table 39-1 DBMS_AUTO_ZONEMAP Package Subprograms

Procedure	Description
ACTIVITY_REPORT Function	This function reports auto zone map activity for a given time window.
CONFIGURE Procedure	This procedure sets configuration options for auto zone map.

39.2.1 ACTIVITY_REPORT Function

This function reports auto zone map activity for a given time window.

Syntax

```
DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT (
   start_time       IN TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
   end_time         IN TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
   type             IN VARCHAR2  DEFAULT NULL,
   section          IN VARCHAR2  DEFAULT NULL,
   level            IN VARCHAR2  DEFAULT NULL);
 RETURNS CLOB
```

Parameters

Table 39-2 ACTIVITY_REPORT Function Parameters

Parameter	Description
`start_time`	Timestamp from which auto zone map executions are observed for the report. If the value is `NULL` , the function reports everything from the beginning of auto zone map maintenance subject to purging. The default value is `NULL`.
`end_time`	Timestamp until which auto zone map executions are observed for the report. If the value is `NULL`, the function reports everything to the end of auto zone map maintenance subject to purging. The default value is `NULL`. **Note:** If you specify `NULL` for both `start_time` and `end_time`, the function will display the report from the last run.
`type`	Output type of the report. The possible values are `TEXT`, `XML`, and `HTML`. The default value is `TEXT`.
`section`	Particular section in the report. The possible values are: • `SUMMARY`: Very high level numbers summary on new zone map created and maintained for the given time window. • `DETAILS`: Detailed summary report on names and other details of new zone map created and maintained for the given time window. It also includes findings details. • `ALL`: In addition to summary and details, it includes time series based execution / action logs. The default value is `ALL`.

Table 39-2 (Cont.) ACTIVITY_REPORT Function Parameters

Parameter	Description
`level`	Format of the report. It represents the level of details with in each section. Possible values are: • `BASIC`: Represents very high level details in executive summary. You will only see numbers on zone map that were created, complete rebuilt and fast rebuilt. In new zone map details section, only new zone map name, date created and base table name re displayed. Under maintenance details section, only zone map name, previous state and current state are displayed. Under findings section, only object name and blacklist reason are displayed. Under action logs section, only important time series based log messages pertaining to zone map creation and maintenance are displayed. • `TYPICAL`: Full overview on executive summary section. Under `new zone map details` section, schema name, column list, and date created are displyed. Under `zone map maintenance details` section, refresh type and date are displayed. In `findings` section, timestamp and exception message are displayed. In `action logs` section more comprehensive logs than basic, which will have information about candidate column list, findings information, and creation DDLs are displayed. This is the default value. • `ALL`: On top of typical level, DOP used for each operation for creating or maintaining zone map, time took to process each DDL and other details in action logs are displayed. All log messages with details on clustering ratios of columns, exception messages and other details are also displayed.

Return Values

Report in `CLOB` format. The default report format is `TEXT`. Possible formats are `TEXT`, `XML`, and `HTML`.

Usage Notes

- DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT(): returns report for all the execution history of last execution in `TEXT` format and all the sections will be displayed with typical level.
- DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT(systimestamp-2, NULL): returns report for all the execution history for last two days in `TEXT` format and all the sections will be displayed with typical level.
- DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT(NULL, systimestamp-1): returns report for all the execution history from beginning to yesterday in `TEXT` format and all the sections will be displayed with typical level.
- DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT(NULL, NULL, ‘HTML’, ‘DETAILS’, ‘BASIC’): returns last execution’s report in `HTML` format and only details section will be displayed with only basic details in each section
- DBMS_AUTO_ZONEMAP.ACTIVITY_REPORT(systimestamp – 2, systimestmap, ‘TEXT’, ‘ALL’,’TYPICAL’): returns report for last 48 hours in text format and all the sections will be displayed with typical details.

39.2.2 CONFIGURE Procedure

This procedure sets configuration options for auto zone map; specifically to enable or disable feature and to control foreground or background mode of the feature.

Syntax

```
DBMS_AUTO_ZONEMAP.CONFIGURE (
   parameter_name       IN    VARCHAR2,
   parameter_value      IN    VARCHAR2);
```

Parameters

Table 39-3 CONFIGURE Procedure Parameters

Parameter	Description
`parameter_name`	`AUTO_ZONEMAP_MODE` is the only configure parameter name that is currently allowed. If you specify any other name, an invalid argument error message is displayed.
`parameter_value`	The four values are allowed for this parameter: • `ON`: Turns on auto zone map feature completely. Both for foreground and background zone map creation and maintenance. • `OFF`: Turns off auto zone map feature completely. Both for foreground and background zone map creation and maintenance. • `FOREGROUND`: Turns on only for foreground zone map creation and maintenance. • `BACKGROUND`: Turns on only for background zone map creation and maintenance.

40
DBMS_AVTUNE

The DBMS_AVTUNE package analyzes query access levels and aggregation workloads for each auto-cache enabled analytic view (AV) and creates or drops AV auto-caches to improve the overall performance of the SQL queries on that AV.

This chapter contains the following topics:

- DBMS_AVTUNE Overview
- DBMS_AVTUNE Security Model
- Summary of DBMS_AVTUNE Subprograms

40.1 DBMS_AVTUNE Overview

This package allows you to create a cache on an existing AV. It also enables the AV for auto caching. You can also create, refresh, and remove a star cache.

Usage Notes

- It is intended that the owner of the AV is also the user calling this package. Calling this package on an AV in another schema is not supported.
- Before you use any other procedure in this package, you need to call the AUTO_CACHE_ENABLE procedure. After the AV is enabled, auto-tuning will continue till the AV is disabled. You can call any other procedures on an enabled AV to manually tune the AV for more fine-grained control of the performance.

40.2 DBMS_AVTUNE Security Model

The DBMS_AVTUNE package runs under AUTHID CURRENT_USER. The SQL generated through use of the package is executed as the current user, and EXECUTE privilege on the package is granted to PUBLIC.

40.3 Summary of DBMS_AVTUNE Subprograms

This table lists the DBMS_AVTUNE package subprograms and briefly describes them.

Table 40-1 DBMS_AVTUNE Package Subprograms

Procedure	Description
AUTO_CACHE_CREATE Procedure	This procedure creates a cache on an existing analytic view.
AUTO_CACHE_DISABLE Procedure	This procedure disables an analytic view for auto caching and removes all auto-caches.
AUTO_CACHE_ENABLE Procedure	This procedure enables analytic views for auto caching and sets auto-cache settings for analytic views. This procedure throws an error if the AV is already enabled.

Table 40-1 (Cont.) DBMS_AVTUNE Package Subprograms

Procedure	Description
AUTO_CACHE_MODIFY Procedure	This procedure modifies tuning parameters originally supplied in the enable call.
AUTO_CACHE_REFRESH Procedure	This procedure forces a refresh immediately of all auto-caches for the analytic view.
AUTO_CACHE_REMOVE Procedure	This procedure manually removes the auto-cache defined for the specified levels.
AUTO_CACHE_TUNE Procedure	This procedure forces the tuning process to run immediately for the analytic view and implement changes.
AUTO_CACHE_STAR_DISABLE Procedure	This procedure removes the star cache on the attribute dimension `dim_name`.
AUTO_CACHE_STAR_ENABLE Procedure	This procedure creates a star cache on the atttribute dimension `dim_name`.
AUTO_CACHE_STAR_MODIFY Procedure	This procedure modifies the parameters specified in the enable call.
AUTO_CACHE_STAR_REFRESH Procedure	This procedure refreshes the star cache for the attribute dimension dim_name.

40.3.1 AUTO_CACHE_CREATE Procedure

This procedure creates a cache on an existing analytic view.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_CREATE (
    av_name         IN  VARCHAR2,
    level_group     IN  LEVEL_LIST,
    av_owner        IN  VARCHAR2);
```

Parameters

Table 40-2 AUTO_CACHE_CREATE Procedure Parameters

Parameter	Description
`av_name`	The name of the analytic view.
`level_group`	Represents the levels to cache.
`av_owner`	The owner of the AV, defaulting to the current schema.

Example

```
execute dbms_avtune.auto_cache_create('UNITS_HCUBE_AVTUNE',
  dbms_avtune.level_list(dbms_avtune.level('PRODUCT', 'ROLLUP', 'CLASS'),
  dbms_avtune.level('TIME', 'CALENDAR', 'YEAR')));
```

40.3.2 AUTO_CACHE_DISABLE Procedure

This procedure disables an analytic view for auto caching and removes all auto-caches.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_DISABLE (
    av_name         IN  VARCHAR2,
    av_owner        IN  VARCHAR2);
```

Parameters

Table 40-3 AUTO_CACHE_DISABLE Procedure Parameters

Parameter	Description
av_name	The name of the analytic view to disable caching on.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.3 AUTO_CACHE_ENABLE Procedure

This procedure enables analytic views for auto caching and sets auto-cache settings for analytic views. This procedure throws an error if the AV is already enabled. It is not possible to update an already enabled AV using this procedure.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_ENABLE (
    av_name           IN   VARCHAR2,
    refresh_intvl     IN   NUMBER,
    num_queries       IN   NUMBER,
    avg_query_time    IN   NUMBER,
    total_cache_pct   IN   NUMBER,
    init_max_pct      IN   NUMBER,
    init_numhier      IN   NUMBER,
    init_fixed_lvls   IN   LEVEL_LIST,
    run_mode          IN   VARCHAR2,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-4 AUTO_CACHE_ENABLE Procedure Parameters

Parameter	Description
av_name	The name of the analytic view to enable caching on.
refresh_intvl	The number of minutes to wait between each cache refresh. The default value is 10 minutes.
num_queries	The minimum number of queries to consider for caches. The default value is 1.
avg_query_time	The average number of seconds each query should take before being considered for caches. The default value is 3.
total_cache_pct	The maximum percentage of the fact table you wish to cache. The default value is 50.

Table 40-4 (Cont.) AUTO_CACHE_ENABLE Procedure Parameters

Parameter	Description
init_max_pct	The maximum percentage of the fact table for the initial cache. The default value is 1%.
init_numhier	The maximum number of hierarchies to use for each dimension in the initial cache.
init_fixed_lvls	The levels you definitely want in the initial cache.
run_mode	This parameter is not used. Always use the default value.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.4 AUTO_CACHE_MODIFY Procedure

This procedure modifies the tuning parameters originally supplied in the enable call. The parameters remain unchanged if NULL is specified.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_MODIFY (
    av_name           IN   VARCHAR2,
    refresh_intvl     IN   NUMBER,
    num_queries       IN   NUMBER,
    avg_query_time    IN   NUMBER,
    total_cache_pct   IN   NUMBER,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-5 AUTO_CACHE_MODIFY Procedure Parameters

Parameter	Description
av_name	The name of the analytic view to enable caching on.
refresh_intvl	The number of minutes to wait between each cache refresh. The default value is 10 minutes.
num_queries	The minimum number of queries to consider for caches. The default value is 1.
avg_query_time	The average number of seconds each query should take before being considered for caches. The default value is 3.
total_cache_pct	The maximum percentage of the fact table you wish to cache. The default value is 50.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.5 AUTO_CACHE_REFRESH Procedure

This procedure forces a refresh immediately of all auto-caches for the analytic view.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_REFRESH (
    av_name           IN   VARCHAR2,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-6 AUTO_CACHE_REFRESH Procedure Parameters

Parameter	Description
av_name	The name of the analytic view.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.6 AUTO_CACHE_REMOVE Procedure

This procedure manually removes the auto-cache defined for the specified levels.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_REMOVE (
    av_name         IN  VARCHAR2,
    level_group     IN  LEVEL_LIST,
    av_owner        IN  VARCHAR2);
```

Parameters

Table 40-7 AUTO_CACHE_REMOVE Procedure Parameters

Parameter	Description
av_name	The name of the analytic view.
level_group	Represents the levels to cache.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.7 AUTO_CACHE_TUNE Procedure

This procedure forces the tuning process to run immediately for the analytic view and implement changes.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_TUNE (
    av_name           IN   VARCHAR2,
    num_queries       IN   NUMBER,
    avg_query_time    IN   NUMBER,
    run_mode          IN   VARCHAR2,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-8 AUTO_CACHE_TUNE Procedure Parameters

Parameter	Description
av_name	The name of the analytic view.
num_queries	The minimum number of queries to consider for caches. The default value is 1.

Table 40-8 (Cont.) AUTO_CACHE_TUNE Procedure Parameters

Parameter	Description
avg_query_time	The average number of seconds each query should take before being considered for caches. The default value is 3.
run_mode	The run_mode parameter is not used. Always use the default value.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.8 AUTO_CACHE_STAR_DISABLE Procedure

This procedure removes the star cache on the attribute dimension dim_name.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_STAR_DISABLE (
    dim_name       IN   VARCHAR2,
    dim_owner      IN   VARCHAR2);
```

Parameters

Table 40-9 AUTO_CACHE_STAR_DISABLE Procedure Parameters

Parameter	Description
dim_name	The name of the attribute dimension.
dim_owner	The owner of the attribute dimension.

40.3.9 AUTO_CACHE_STAR_ENABLE Procedure

This procedure creates a star cache on the atttribute dimension dim_name. The av_name can optionally be passed to qualify the attribute dimension.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_STAR_ENABLE (
    dim_name          IN   VARCHAR2,
    av_name           IN   VARCHAR2,
    refresh_intvl     IN   NUMBER,
    run_mode          IN   VARCHAR2,
    dim_owner         IN   VARCHAR2,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-10 AUTO_CACHE_STAR_ENABLE Procedure Parameters

Parameter	Description
dim_name	The name of the attribute dimension.
av_name	The name of the AV to associate the star cache with, if any. The av_name can optionally be specified to associate the star cache with the given AV. When this is done then the star cache will be refreshed and maintained with the AV instead of independently.

Table 40-10 (Cont.) AUTO_CACHE_STAR_ENABLE Procedure Parameters

Parameter	Description
refresh_intvl	The number of minutes to wait between each cache refresh. The default value is 10 minutes.
run_mode	This parameter is not used. Always use the default value.
dim_owner	The owner of the attribute dimension.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.10 AUTO_CACHE_STAR_MODIFY Procedure

This procedure modifies the parameters specified in the enable call. The parameters remain unchanged if NULL is specified.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_STAR_MODIFY (
    dim_name          IN   VARCHAR2,
    av_name           IN   VARCHAR2,
    refresh_intvl     IN   NUMBER,
    dim_owner         IN   VARCHAR2,
    av_owner          IN   VARCHAR2);
```

Parameters

Table 40-11 AUTO_CACHE_STAR_MODIFY Procedure Parameters

Parameter	Description
dim_name	The name of the attribute dimension.
av_name	The name of the associated analytic view.
refresh_intvl	The number of minutes to wait for each cache refresh. The default value is 10 minutes.
dim_owner	The owner of the attribute dimension.
av_owner	The owner of the AV, defaulting to the current schema.

40.3.11 AUTO_CACHE_STAR_REFRESH Procedure

This procedure refreshes the star cache for the attribute dimension dim_name.

Syntax

```
DBMS_AVTUNE.AUTO_CACHE_STAR_REFRESH (
    dim_name       IN   VARCHAR2,
    dim_owner      IN   VARCHAR2);
```

Parameters

Table 40-12 AUTO_CACHE_STAR_REFRESH Procedure Parameters

Parameter	Description
dim_name	The name of the attribute dimension.

Table 40-12 (Cont.) AUTO_CACHE_STAR_REFRESH Procedure Parameters

Parameter	Description
dim_owner	The owner of the attribute dimension.

41
DBMS_AW_STATS

DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

> **See Also:**
>
> *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

41.1 Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

41.2 Summary of DBMS_AW_STATS Subprograms

DBMS_AW_STATS uses the ANALYZE and CLEAR procedures.

Table 41-1 DBMS_AW_STATS Package Subprograms

Subprogram	Description
ANALYZE Procedure	Generates optimizer statistics on cubes and cube dimensions.
CLEAR Procedure	Clears optimizer statistics from cubes and cube dimensions.

41.2.1 ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension.

These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS".

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
     (inname       IN VARCHAR2);
```

Parameters

Table 41-2 ANALYZE Procedure Parameters

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *owner.cube_name*. For a dimension, the format is *owner.dimension_name*.

Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

Example

This sample script generates optimizer statistics on UNITS_CUBE and its dimensions.

```
BEGIN
     DBMS_AW_STATS.ANALYZE('time');
     DBMS_AW_STATS.ANALYZE('customer');
     DBMS_AW_STATS.ANALYZE('product');
     DBMS_AW_STATS.ANALYZE('channel');
     DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
```

The following statements create and display an execution plan for aSELECT statement that joins columns from UNITS_CUBE_VIEW, CUSTOMER_PRIMARY_VIEW, and the ACCOUNTS table:

```
EXPLAIN PLAN FOR SELECT
     cu.long_description customer,
```

```
                    a.city city,
                    a.zip_pc zip,
                    cu.level_name "LEVEL",
                    round(f.sales) sales
                /* From dimension views and cube view */
                FROM time_calendar_view t,
                    product_primary_view p,
                    customer_view cu,
                    channel_view ch,
                    units_cube_view f,
                    account a
                /* Create level filters instead of GROUP BY */
                WHERE t.long_description = '2004'
                    AND p.level_name ='TOTAL'
                    AND cu.customer_account_id like 'COMP%'
                    AND ch.level_name = 'TOTAL'
                /* Join dimension views to cube view */
                    AND t.dim_key = f.TIME
                    AND p.dim_key = f.product
                    AND cu.dim_key = f.customer
                    AND ch.dim_key = f.channel
                    AND a.account_id = cu.customer_account_id
                ORDER BY zip;

SQL>  SELECT plan_table_output FROM TABLE(dbms_xplan.display());

```

41.2.2 CLEAR Procedure

This procedure clears the statistics generated by the ANALYZE procedure.

Syntax

```
DBMS_AW_STATS.CLEAR (
          inname        IN  VARCHAR2;
```

Parameters

Table 41-3 CLEAR Procedure Parameters

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *owner.cube_name*. For a dimension, the format is *owner.dimension_name*.

Examples

The following scripts clears the statistics from UNITS_CUBE and its dimensions.

```
BEGIN
     DBMS_AW_STATS.clear('units_cube');
     DBMS_AW_STATS.clear('time');
     DBMS_AW_STATS.clear('customer');
     DBMS_AW_STATS.clear('product');
     DBMS_AW_STATS.clear('channel');
END;
/
```

42
DBMS_BLOCKCHAIN_TABLE

A blockchain table is an append-only table designed for centralized blockchain applications. The `DBMS_BLOCKCHAIN_TABLE` package allows you do operations like the following: delete rows in a blockchain table that are beyond the row retention defined for the blockchain table; get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row; sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table; and have the database verify the hashes and digital signatures on some or all rows in a blockchain table. V2 blockchain tables support schema evolution, delegate signatures, and countersignatures in addition to the functionality found in V1 blockchain tables. Blockchain tables support only `DER` encoding for `X.509` certificates, not `PEM` encoding.

This chapter contains the following topics:

- DBMS_BLOCKCHAIN_TABLE Overview
- DBMS_BLOCKCHAIN_TABLE Security Model
- Summary of DBMS_BLOCKCHAIN_TABLE Subprograms

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see Hidden Columns in Blockchain Tables

42.1 DBMS_BLOCKCHAIN_TABLE Overview

In Oracle Blockchain Table, peers are database users who trust the database to maintain a tamper-resistant ledger.

The ledger is implemented as a blockchain table, which is defined and managed by the application. Existing applications can protect against fraud without requiring a new infrastructure or programming model. Although transaction throughput is lower than for a standard table, performance for a blockchain table is better than for a decentralized blockchain.

The `DBMS_BLOCKCHAIN_TABLE` package lets you do the following:

- delete rows in a blockchain table that are beyond the row retention defined for the blockchain table
- get the bytes that are input to the signature algorithm so you can sign a row you inserted into the blockchain table

- get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row
- sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table
- have the database verify the hashes and signatures on some or all rows in a blockchain table
- enable a delegate with sufficient privileges to sign a row inserted by another user
- procure a countersignature for the row that is being signed by the end-user or delegate

42.2 DBMS_BLOCKCHAIN_TABLE Security Model

The `DBMS_BLOCKCHAIN_TABLE` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invoker's rights (run with the privileges of the current user). Thus any user with select privileges on the blockchain table should be able to validate the row contents of that table.

Any user with delete privileges on the blockchain table can delete rows beyond the retention period defined for the blockchain table.

A user that inserted a row into the blockchain table can add a digital signature to the row after the row is added to a chain in the blockchain table. This user can secure a countersignature on this row either when signing the row or at a later time after the row has been signed either by the user or by a delegate.

A delegate signer for a row in a blockchain table needs the `SIGN` privilege on the table. In addition, the ID number of the delegate user may be specified in the hidden column `ORABCTAB_DELEGATE_USER_NUMBER$` when the row is inserted.

A user with the `SIGN` privilege on a blockchain table can secure a countersignature on any row in the blockchain table that has a user signature or a delegate signature. Similarly, the owner of a blockchain table can secure a countersignature on any row in the blockchain table that has a user signature or a delegate signature.

42.3 Summary of DBMS_BLOCKCHAIN_TABLE Subprograms

The `DBMS_BLOCKCHAIN_TABLE` package uses `ADD_INTERVAL_PARTITIONING`, `COUNTERSIGN_ROW`, `COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS`, `DELETE_EXPIRED_ROWS`, `GET_BLOCKCHAIN_DIGEST`, `GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS`, `GET_BYTES_FOR_ROW_HASH`, `GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS`, `GET_BYTES_FOR_ROW_SIGNATURE`, `GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS`, `GET_SIGNED_BLOCKCHAIN_DIGEST`, `GET_SIGNED_BLOCKCHAIN_DIGEST_FOR SELECTED_ROWS`, `SIGN_ROW`, `SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS`, `SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE`, `SIGN_ROW_WITH_COUNTERSIGNATURE`, `VERIFY_ROWS`, `VERIFY_TABLE_BLOCKCHAIN`, and `VERIFY_USER_BLOCKCHAIN_ROWS` subprograms to perform various functions.

Table 42-1 DBMS_BLOCKCHAIN_TABLE Package Subprograms

Subprogram	Description
ADD_INTERVAL_PARTITIONING Procedure	This procedure adds interval partitioning to an existing, non-partitioned, V1 or V2 blockchain table.

Table 42-1 (Cont.) DBMS_BLOCKCHAIN_TABLE Package Subprograms

Subprogram	Description
COUNTERSIGN_ROW Procedure	This procedure procures a countersignature on a specified row in a blockchain table. The countersignature will be produced by signing the row data content using the table owner's private key stored in the database wallet.
COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure	It is an extension of `COUNTERSIGN_ROW` that uses at most three user columns to identify exactly one row in a blockchain table and procure a countersignature on that row.
DELETE_EXPIRED_ROWS Procedure	This procedure deletes rows outside the retention window created before `before_timestamp` if the timestamp is specified; otherwise, this procedure deletes all rows outside the retention window. This procedure commits before deleting any expired rows and commits after deleting any expired rows.
GET_BLOCKCHAIN_DIGEST Function	This function generates and returns a cryptographic hash of the digest for a specified blockchain table.
GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function	This function generates and returns a cryptographic hash of the digest for user-specified rows in a blockchain table.
GET_BYTES_FOR_ROW_HASH Procedure	This procedure returns in `row_data` the bytes for the particular row identified (a series of meta-data-value, column-data-value pairs in column position order) followed by the hash for the previous row in the chain in the data format specified.
GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS Procedure	It is an extension of `GET_BYTES_FOR_ROW_HASH` that uses at most three user columns instead of the `instance identifier`, `chain identifier`, and `sequence number` to uniquely identify the row.
GET_BYTES_FOR_ROW_SIGNATURE Procedure	This procedure returns the bytes used to compute a user signature, a delegate signature, or a countersignature. For a user signature or a delegate signature, the procedure returns in `row_data` the bytes in the hash in the row without any metadata.
GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS Procedure	It is an extension of `GET_BYTES_FOR_ROW_SIGNATURE` that uses at most three user column values instead of the `instance identifier`, `chain identifier`, and `sequence number` to uniquely identify the row.
GET_SIGNED_BLOCKCHAIN_DIGEST Function	This function generates and returns the signed digest for a specified blockchain table using the table owner's private key stored in the database wallet. The `signed_bytes`, `signed_row_indexes`, and `schema_certificate_guid` are also returned.
GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function	This function generates and returns the signed digest for user-specified rows in a blockchain table using the table owner's private key stored in the database wallet. The particular rows in the digest are specified by the `row_selector` parameter. The `signed_bytes`, `signed_row_indexes`, and `schema_certificate_guid` are also returned.
SIGN_ROW Procedure	This procedure can be used by the current user to provide a signature on the row content of a previously inserted row.
SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure	This procedure allows an end user or a delegate to sign a row using a set of at most three user columns that uniquely identify a single row.
SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE Procedure	This procedure uses at most three user column names and values to uniquely identify a single row to sign and countersign.

Table 42-1 (Cont.) DBMS_BLOCKCHAIN_TABLE Package Subprograms

Subprogram	Description
SIGN_ROW_WITH_COUNTERSIGNATURE Procedure	It is an extension of `SIGN_ROW` that enables the user to request a countersignature from the database. The countersignature will be produced by signing the row data content using the table owner's private key stored in the database wallet.
VERIFY_ROWS Procedure	This procedure verifies all rows on all applicable system chains for the integrity of `HASH` column value for rows created in the range of `low_timestamp` to `high_timestamp`. Row signatures can be verified as an option.
VERIFY_TABLE_BLOCKCHAIN Procedure	This procedure verifies all rows whose creation-times fall between the minimum value for the row-creation time from `bytes_previous` and the maximum value for row-creation time from `bytes_latest` and returns the number of successfully verified rows.
VERIFY_USER_BLOCKCHAIN_ROWS Procedure	This procedure verifies rows of one or more user chains when the user chains feature is enabled on the blockchain table.

42.3.1 ADD_INTERVAL_PARTITIONING Procedure

This procedure adds interval partitioning to an existing, non-partitioned, V1 or V2 blockchain table.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.ADD_INTERVAL_PARTITIONING(
    schema_name               IN    VARCHAR2,
    table_name                IN    VARCHAR2,
    interval_number           IN    NUMBER,
    interval_frequency        IN    VARCHAR2,
    first_high_timestamp      IN    TIMESTAMP);
```

Parameters

Table 42-2 ADD_INTERVAL_PARTITIONING Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`interval_number`	Sets how often the database creates partitions for the blockchain table.
`interval_frequency`	Sets the frequency for the value that was set in the `interval_number` setting. Supported values are `YEAR`, `MONTH`, `DAY`, `HOUR`, and `MINUTE`.
`first_high_timestamp`	A timestamp that determines the upper boundary of the first partition in the blockchain table.

Usage Notes

- For an existing, non-partitioned, V1 or V2 immutable table, a procedure with the same name and the same parameters is provided in the `DBMS_IMMUTABLE_TABLE` package.

- Composite partitioning (that is, sub-partitioning) is not supported with the above interval partitioning.

42.3.2 COUNTERSIGN_ROW Procedure

This procedure procures a countersignature on a specified row in a blockchain table. The countersignature will be produced by signing the row data content using the table owner's private key stored in the database wallet. A row in a blockchain table can be countersigned only if the row belongs to the current epoch for the blockchain table.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.COUNTERSIGN_ROW (
   schema_name                      IN VARCHAR2,
   table_name                       IN VARCHAR2,
   instance_id                      IN NUMBER,
   chain_id                         IN NUMBER,
   sequence_id                      IN NUMBER,
   countersignature_algo            IN NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT,
   countersignature_signed_bytes    IN OUT BLOB,
   countersignature                 OUT RAW,
   countersignature_certificate_guid OUT RAW,
   countersignature_content_version  IN VARCHAR2 DEFAULT 'V2_DIGEST',
   pdb_guid                         IN RAW DEFAULT NULL);
```

Parameters

Table 42-3 COUNTERSIGN_ROW Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
instance_id	The instance that inserted the row. Valid values are 1, 2, and so on.
chain_id	The chain containing the row. By default, there are 32 chains in each instance, and they are numbered from 0 to 31.
sequence_id	The position of the row on the specified chain.
countersignature_algo	The digital signature algorithm for the countersignature. The parameter must be one of the following package constants: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
countersignature_signed_bytes	The bytes that are input to the algorithm that generates the countersignature. The caller must pass an empty BLOB for this parameter.
countersignature	The digital signature on the bytes returned in countersignature_signed_bytes.
countersignature_certificate_guid	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the countersignature.
countersignature_content_version	The version of the data contents and layout that are used as input to the countersignature algorithm. Only 'V2_DIGEST' is supported in this release.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

42.3.3 COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure

It is an extension of `COUNTERSIGN_ROW` that uses at most three user columns to identify exactly one row in a blockchain table and procure a countersignature on that row. A row in a blockchain table can be countersigned only if the row belongs to the current epoch for the blockchain table.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS(
   schema_name                       IN      VARCHAR2,
   table_name                        IN      VARCHAR2,
   keycol1_name                      IN      VARCHAR2,
   keycol1_value                     IN      VARCHAR2,
   keycol2_name                      IN      VARCHAR2 DEFAULT NULL,
   keycol2_value                     IN      VARCHAR2 DEFAULT NULL,
   keycol3_name                      IN      VARCHAR2 DEFAULT NULL,
   keycol3_value                     IN      VARCHAR2 DEFAULT NULL,
   countersignature_algo             IN      NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT,
   countersignature_signed_bytes     IN OUT  BLOB,
   countersignature                  OUT     RAW,
   countersignature_certificate_guid OUT     RAW,
   countersignature_content_version  IN      VARCHAR2 DEFAULT 'V2_DIGEST',
   pdb_guid                          IN      RAW DEFAULT NULL);
```

Parameters

Table 42-4 COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`keycol1_name`	The name of the key column.
`keycol1_value`	The value of the key column.
`keycol2_name`	The name of the second column in a composite key.
`keycol2_value`	The value of the second column in a composite key.
`keycol3_name`	The name of the third column in a composite key.
`keycol3_value`	The value of the third column in a composite key.
`countersignature_algo`	The digital signature algorithm for the countersignature. The parameter must be one of the following package constants: • `SIGN_ALGO_RSA_SHA2_256` • `SIGN_ALGO_RSA_SHA2_384` • `SIGN_ALGO_RSA_SHA2_512`
`countersignature_signed_bytes`	The bytes that are input to the algorithm that generates the countersignature. The caller must pass an empty BLOB for this parameter.
`countersignature`	The digital signature on the bytes returned in `countersignature_signed_bytes`.

Table 42-4 (Cont.) COUNTERSIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure Parameters

Parameter	Description
countersignature_certificate_guid	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the countersignature.
countersignature_content_version	The version of the data contents and layout that are used as input to the countersignature algorithm. Only 'V2_DIGEST' is supported in this release.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

42.3.4 DELETE_EXPIRED_ROWS Procedure

This procedure deletes rows outside the retention window created before_timestamp if the timestamp is specified; otherwise, this procedure deletes all rows outside the retention window. The number of rows deleted is returned in number_of_rows_deleted parameter. This procedure commits before deleting any expired rows and commits after deleting any expired rows.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.DELETE_EXPIRED_ROWS(
   schema_name             IN VARCHAR2,
   table_name                 IN VARCHAR2,
   before_timestamp         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   number_of_rows_deleted   OUT NUMBER);
```

Parameters

Table 42-5 DELETE_EXPIRED_ROWS Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
before_timestamp	The end time for the range of rows deleted by the procedure, subject to the row retention time currently associated with the blockchain table. This is an optional parameter. The default value is NULL.
number_of_rows_deleted	The count of the number of rows deleted.

42.3.5 GET_BLOCKCHAIN_DIGEST Function

This function generates and returns a cryptographic hash of the digest for a specified blockchain table.

> **Note:**
>
> Rows inserted into a blockchain table that have not been committed are not guaranteed to be durable. Therefore, a blockchain digest does not include inserted rows that have not been committed.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BLOCKCHAIN_DIGEST(
  schema_name             IN      VARCHAR2,
  table_name              IN      VARCHAR2,
  digest_bytes            IN OUT  BLOB,
  digest_rows_indexes     OUT     SYS.ORABCTAB_ROW_ARRAY_T,
  hash_algo               IN      NUMBER   DEFAULT
DBMS_BLOCKCHAIN_TABLE.HASH_ALGO_DEFAULT)
  RETURN RAW;
```

Parameters

Table 42-6 GET_BLOCKCHAIN_DIGEST Function Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
digest_bytes	The BLOB value that contains a header followed by an array of row-info. This sequence of bytes is input to the cryptographic hash function. The caller must pass an empty BLOB for this parameter.
digest_rows_indexes	This parameter specifies the rows in the blockchain table that were chosen for the digest.
hash_algo	The cryptographic hash algorithm to use. The parameter must be one of the following package constants: • HASH_ALGO_SHA2_256 • HASH_ALGO_SHA2_384 • HASH_ALGO_SHA2_512

Usage Notes

- A blockchain table digest created by the GET_BLOCKCHAIN_DIGEST function has table information specific to a pluggable database. Such a digest can be used only in the pluggable database in which the digest was created and only for the table that was used to create the digest. For DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN, these requirements mean that both blockchain table digests must have been generated in the current pluggable database for the same blockchain table.

  For example, suppose you create a digest for a blockchain table in pluggable database A, use Data Pump to export the blockchain table, and use Data Pump to import the blockchain table into pluggable database B. The blockchain table digest created in

pluggable database A cannot be used in pluggable database B. You need to create a new blockchain table digest in pluggable database B.

> **See Also:**
>
> *Oracle Database Administrator's Guide*

42.3.6 GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function

This function generates and returns a cryptographic hash of the digest for user-specified rows in a blockchain table.

> **Note:**
>
> Rows inserted into a blockchain table that have not been committed are not guaranteed to be durable. Therefore, a blockchain digest does not include inserted rows that have not been committed.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS(
  schema_name             IN      VARCHAR2,
  table_name              IN      VARCHAR2,
  row_selector            IN      VARCHAR2,
  digest_bytes            IN OUT  BLOB,
  row_data_bytes          IN OUT  BLOB,
  digest_rows_indexes     OUT     SYS.ORABCTAB_ROW_ARRAY_T,
  hash_algo               IN      NUMBER   DEFAULT
DBMS_BLOCKCHAIN_TABLE.HASH_ALGO_DEFAULT)
  RETURN RAW;
```

Parameters

Table 42-7 GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`row_selector`	The condition, a where clause without the `WHERE` keyword.
`digest_bytes`	The BLOB value that contains a header followed by an array of row-info. This sequence of bytes is input to the cryptographic hash function. The caller must pass an empty BLOB for this parameter.
`row_data_bytes`	This parameter specifies the content of the rows in the blockchain table that were selected for the digest. The caller must pass an empty BLOB for this parameter.
`digest_rows_indexes`	This parameter specifies the rows in the blockchain table that were selected for the digest.

Table 42-7 (Cont.) GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function Parameters

Parameter	Description
hash_algo	The cryptographic hash algorithm to use. The parameter must be one of the following package constants: • HASH_ALGO_SHA2_256 • HASH_ALGO_SHA2_384 • HASH_ALGO_SHA2_512

Usage Notes

- A blockchain table digest created by the GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS function has table information specific to a pluggable database. Such a digest can be used only in the pluggable database in which the digest was created and only for the table that was used to create the digest. For DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN, these requirements mean that both blockchain table digests must have been generated in the current pluggable database for the same blockchain table.

  For example, suppose you create a digest for a blockchain table in pluggable database A, use Data Pump to export the blockchain table, and use Data Pump to import the blockchain table into pluggable database B. The blockchain table digest created in pluggable database A cannot be used in pluggable database B. You need to create a new blockchain table digest in pluggable database B.

42.3.7 GET_BYTES_FOR_ROW_HASH Procedure

This procedure returns in row_data the bytes for the particular row identified (a series of meta-data-value, column-data-value pairs in column position order) followed by the hash for the previous row in the chain in the data format specified.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_HASH(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   instance_id          IN NUMBER,
   chain_id              IN NUMBER,
   sequence_id              IN NUMBER,
   data_format              IN NUMBER,
   row_data              IN OUT BLOB,
   chain_name            IN VARCHAR2 DEFAULT NULL,
   pdb_guid              IN RAW DEFAULT NULL);
```

Parameters

Table 42-8 GET_BYTES_FOR_ROW_HASH Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
instance_id	The instance that inserted the row. Valid values are 1, 2, and so on.
chain_id	The chain containing the row. By default, there are 32 chains in each instance, and they are numbered from 0 to 31.
sequence_id	The position of the row on the specified chain.
data_format	The version of the data layout for the hash in the specified row. Must be 1 in this release.
row_data	The bytes for the specified row in the specified data format that can be input to the cryptographic hash function to verify the value of the hash in the row. Any bytes in the BLOB are overwritten.
chain_name	The name of the user chain when the bytes for the cryptographic hash on the user chain are desired. Specify NULL when the bytes for the cryptographic hash on the system chain are desired.
pdb_guid	For a V2 blockchain table, the identifier of the pluggable database that inserted the row. Must be NULL for a V1 blockchain table.

Usage Notes

The metadata bytes for a column are 20 bytes that encode the blockchain algorithm version used to hash the row, the column position, the column data type, whether the column value is NULL, and the actual length of the column value in bytes.

For non-character columns, the column data bytes are the actual bytes representing the column value on the disk. For character and character LOB columns, the values are normalized to specific character sets. For CHAR and NCHAR columns, the number of blanks is normalized.

A few metadata bytes are reserved for future use.

> **See Also:**
>
> For more information on normalizations, see *Oracle Database Administrator's Guide*

42.3.8 GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS Procedure

It is an extension of `GET_BYTES_FOR_ROW_HASH` that uses at most three user columns instead of an `instance identifier`, `chain identifier`, and `sequence number` to uniquely identify the row.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS(
  schema_name    IN     VARCHAR2,
  table_name     IN     VARCHAR2,
  data_format    IN     NUMBER,
  row_data       IN OUT BLOB,
  chain_name     IN     VARCHAR2 DEFAULT NULL,
  keycol1_name   IN     VARCHAR2,
  keycol1_value  IN     VARCHAR2,
  keycol2_name   IN     VARCHAR2 DEFAULT NULL,
  keycol2_value  IN     VARCHAR2 DEFAULT NULL,
  keycol3_name   IN     VARCHAR2 DEFAULT NULL,
  keycol3_value  IN     VARCHAR2 DEFAULT NULL,
  pdb_guid       IN     RAW DEFAULT NULL);
```

Parameters

Table 42-9 GET_BYTES_FOR_ROW_HASH_SPECIFIED_BY_KEY_COLUMNS Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`data_format`	The version of the data layout for the hash in the specified row. Must be 1 in this release.
`row_data`	The bytes for the specified row in the specified data format that can be input to the cryptographic hash function to verify the value of the hash in the row. Any bytes in the BLOB are overwritten.
`chain_name`	The name of the user chain when the bytes for the cryptographic hash on the user chain are desired. Specify `NULL` when the bytes for the cryptographic hash on the system chain are desired.
`keycol1_name`	The name of the key column.
`keycol1_value`	The value of the key column.
`keycol2_name`	The name of the second column in a composite key.
`keycol2_value`	The value of the second column in a composite key.
`keycol3_name`	The name of the third column in a composite key.
`keycol3_value`	The value of the third column in a composite key.
`pdb_guid`	For a V2 blockchain table, the identifier of the pluggable database that inserted the row. Must be `NULL` for a V1 blockchain table.

42.3.9 GET_BYTES_FOR_ROW_SIGNATURE Procedure

This procedure returns the bytes used to compute a user signature, a delegate signature, or a countersignature. For a user signature or a delegate signature, the procedure returns in `row_data` the bytes in the hash in the row without any metadata. No other columns are involved, either in the row or in the previous row. For a countersignature, the routine returns in `row_data` the bytes that are input to the digital signature algorithm that computes a countersignature on the row.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_SIGNATURE(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   instance_id          IN NUMBER,
   chain_id          IN NUMBER,
   sequence_id              IN NUMBER,
   data_format              IN NUMBER,
   row_data              IN OUT BLOB,
   pdb_guid              IN RAW DEFAULT NULL,
   signature_type        IN VARCHAR2 DEFAULT 'USER');
```

Parameters

Table 42-10 GET_BYTES_FOR_ROW_SIGNATURE Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`instance_id`	The instance on which the row was inserted. Valid values are `1`, `2`, and so on.
`chain_id`	The chain on which the row was inserted. By default, there are 32 chains in each instance, and they are numbered from 0 to 31.
`sequence_id`	The position of the row on the chain.
`data_format`	The format of the data in `row_data`. Must be `1` in this release.
`row_data`	A sequence of bytes that must be signed. The caller must pass an empty BLOB for this parameter.
`pdb_guid`	For a V2 blockchain table, the identifier of the pluggable database that inserted the row. Must be `NULL` for a V1 blockchain table.
`signature_type`	The valid values for `signature_type` are `USER`, `DELEGATE`, and `COUNTERSIGNATURE`. `DELEGATE` and `USER` may be used interchangeably.

42.3.10 GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS Procedure

It is an extension of `GET_BYTES_FOR_ROW_SIGNATURE` that uses at most three user column values instead of an `instance identifier`, `chain identifier`, and `sequence number` to uniquely identify the row.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS(
  schema_name    IN     VARCHAR2,
  table_name     IN     VARCHAR2,
  data_format    IN     NUMBER,
  row_data       IN OUT BLOB,
  keycol1_name   IN     VARCHAR2,
  keycol1_value  IN     VARCHAR2,
  keycol2_name   IN     VARCHAR2 DEFAULT NULL,
  keycol2_value  IN     VARCHAR2 DEFAULT NULL,
  keycol3_name   IN     VARCHAR2 DEFAULT NULL,
  keycol3_value  IN     VARCHAR2 DEFAULT NULL,
  pdb_guid       IN     RAW DEFAULT NULL,
  signature_type IN     VARCHAR2 DEFAULT 'USER');
```

Parameters

Table 42-11 GET_BYTES_FOR_ROW_SIGNATURE_SPECIFIED_BY_KEY_COLUMNS Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`data_format`	The format of the data in `row_data`. Must be `1` in this release.
`row_data`	A sequence of bytes that must be signed. The caller must pass an empty BLOB for this parameter.
`keycol1_name`	The name of the key column.
`keycol1_value`	The value of the key column.
`keycol2_name`	The name of the second column in a composite key.
`keycol2_value`	The value of the second column in a composite key.
`keycol3_name`	The name of the third column in a composite key.
`keycol3_value`	The value of the third column in a composite key.
`pdb_guid`	For a V2 blockchain table, the identifier of the pluggable database that inserted the row. Must be `NULL` for a V1 blockchain table.
`signature_type`	The valid values for `signature_type` are `USER`, `DELEGATE`, and `COUNTERSIGNATURE`. `DELEGATE` and `USER` may be used interchangeably.

42.3.11 GET_SIGNED_BLOCKCHAIN_DIGEST Function

This function generates and returns the signed digest for a specified blockchain table using the table owner's private key stored in the database wallet. The `signed_bytes`, `signed_row_indexes`, and `schema_certificate_guid` are also returned.

> **Note:**
>
> Rows inserted into a blockchain table that have not been committed are not guaranteed to be durable. Therefore, a signed blockchain digest does not include inserted rows that have not been committed.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_SIGNED_BLOCKCHAIN_DIGEST(
   schema_name               IN      VARCHAR2,
   table_name                   IN      VARCHAR2,
   signed_bytes              IN OUT  BLOB,
   signed_rows_indexes       OUT     SYS.ORABCTAB_ROW_ARRAY_T,
   schema_certificate_guid   OUT     RAW,
   signature_algo            IN      NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT)
   RETURN RAW;
```

Parameters

Table 42-12 GET_SIGNED_BLOCKCHAIN_DIGEST Function Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`signed_bytes`	The BLOB value that contains a header followed by an array of row-info. This sequence of bytes is the digest that is digitally signed. The caller must pass an empty BLOB for this parameter.
`signed_rows_indexes`	This parameter specifies the rows in the blockchain table that were digitally signed.
`schema_certificate_guid`	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the digital signature.
`signature_algo`	The digital signature algorithm to use. The parameter must be one of the following package constants: • `SIGN_ALGO_RSA_SHA2_256` • `SIGN_ALGO_RSA_SHA2_384` • `SIGN_ALGO_RSA_SHA2_512`

Usage Notes

- The database computes the signature on `signed_bytes` using the PKI private key of blockchain table owner.
- The certificate of blockchain table owner must be added to the database using `DBMS_USER_CERTS.ADD_CERTIFICATE`.

- The PKI private key and certificate of blockchain table owner must exist in a wallet located under the `<WALLET_ROOT>/bctable/` directory for a non-container database.
- The PKI private key and certificate of blockchain table owner must exist in a wallet located under the `<WALLET_ROOT>/pdb_guid/bctable/` directory for a container database.
- A blockchain table digest created by the `GET_SIGNED_BLOCKCHAIN_DIGEST` function has table information specific to a pluggable database. Such a digest can be used only in the pluggable database in which the digest was created and only for the table that was used to create the digest. For `DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN`, these requirements mean that both blockchain table digests must have been generated in the current pluggable database for the same blockchain table.

  For example, suppose you create a digest for a blockchain table in pluggable database A, use Data Pump to export the blockchain table, and use Data Pump to import the blockchain table into pluggable database B. The blockchain table digest created in pluggable database A cannot be used in pluggable database B. You need to create a new blockchain table digest in pluggable database B.

Note:

The `bctable` subdirectory is the name of a database component that uses wallets. It is not the name of a blockchain table.

42.3.12 GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function

This function generates and returns the signed digest for user-specified rows in a blockchain table using the table owner's private key stored in the database wallet. The particular rows in the digest are specified by the `row_selector` parameter. The `signed_bytes`, `signed_row_indexes`, and `schema_certificate_guid` are also returned.

Note:

Rows inserted into a blockchain table that have not been committed are not guaranteed to be durable. Therefore, a signed blockchain digest does not include inserted rows that have not been committed.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS(
   schema_name               IN     VARCHAR2,
   table_name                   IN     VARCHAR2,
   row_selector              IN     VARCHAR2,
   signed_bytes              IN OUT BLOB,
   row_data_bytes            IN OUT BLOB,
```

```
   signed_rows_indexes        OUT     SYS.ORABCTAB_ROW_ARRAY_T,
   schema_certificate_guid    OUT     RAW,
   signature_algo             IN      NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT)
   RETURN RAW;
```

Parameters

Table 42-13 GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS Function Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
row_selector	The condition, a where clause without the WHERE keyword.
signed_bytes	The BLOB value that contains a header followed by an array of row-info. This sequence of bytes is the digest that is digitally signed. The caller must pass an empty BLOB for this parameter.
row_data_bytes	This parameter specifies the content of the rows in the blockchain table that were selected for the digest. The caller must pass an empty BLOB for this parameter.
signed_rows_indexes	This parameter specifies the rows in the blockchain table that were digitally signed.
schema_certificate_guid	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the digital signature.
signature_algo	The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512

Usage Notes

- The database computes the signature on signed_bytes using the PKI private key of blockchain table owner.
- The certificate of blockchain table owner must be added to the database using DBMS_USER_CERTS.ADD_CERTIFICATE.
- The PKI private key and certificate of blockchain table owner must exist in a wallet located under the <WALLET_ROOT>/bctable/ directory for a non-container database.
- The PKI private key and certificate of blockchain table owner must exist in a wallet located under the <WALLET_ROOT>/pdb_guid/bctable/ directory for a container database.
- A blockchain table digest created by the GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS function has table information specific to a pluggable database. Such a digest can be used only in the pluggable database in which the digest was created and only for the table that was used to create the digest. For DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN, these requirements mean that both blockchain table digests must have been generated in the current pluggable database for the same blockchain table.

  For example, suppose you create a digest for a blockchain table in pluggable database A, use Data Pump to export the blockchain table, and use Data Pump to import the blockchain table into pluggable database B. The blockchain table digest created in

pluggable database A cannot be used in pluggable database B. You need to create a new blockchain table digest in pluggable database B.

> **Note:**
>
> The `bctable` subdirectory is the name of a database component that uses wallets. It is not the name of a blockchain table.

> **See Also:**

42.3.13 SIGN_ROW Procedure

This procedure can be used by the current user to provide a signature on row content of a previously inserted row. The transaction that inserted the row into the blockchain table must have committed before the `SIGN_ROW` procedure is called.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW(
   schema_name               IN VARCHAR2,
   table_name                IN VARCHAR2,
   instance_id               IN NUMBER,
   chain_id               IN NUMBER,
   sequence_id               IN NUMBER,
   hash                      IN RAW DEFAULT NULL,
   signature                 IN RAW,
   certificate_guid          IN RAW,
   signature_algo            IN NUMBER,
   delegate                  IN BOOLEAN DEFAULT FALSE,
   pdb_guid                  IN RAW DEFAULT NULL);
```

Parameters

Table 42-14 SIGN_ROW Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`instance_id`	The instance on which the row was inserted.
`chain_id`	The chain containing the row to be signed. There are 32 chains in each instance, and they are numbered from 0 to 31.
`sequence_id`	The position of the row on the chain. Valid values are `1`, `2`, and so on.
`hash`	If `non-NULL`, the expected value of the hash in the row to be signed. If `NULL`, the hash in the row to be signed is not checked.
`signature`	The user's digital signature on the hash value stored in the row.
`certificate_guid`	A unique identifier for the certificate stored in the database that may be used to verify the digital signature.

Table 42-14 (Cont.) SIGN_ROW Procedure Parameters

Parameter	Description
signature_algo	The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
delegate	If TRUE, then the row is being signed by a delegate. If FALSE, then the row is being signed by the user that inserted the row.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

> **Note:**
>
> For information on hidden columns in blockchain tables, see Hidden Columns in Blockchain Tables

Usage Notes

- The database will verify that:
  - if delegate is FALSE, the current user's obj# matches the value in the hidden column ORABCTAB_USER_NUMBER$ (ensures that the user owns the row)
  - if delegate is TRUE and the hidden column ORABCTAB_DELEGATE_USER_NUMBER$ is not NULL, the current user's obj# matches the value in this column
  - if delegate is TRUE, the current user has SIGN privilege on the blockchain table
  - the hash (if provided) matches the hash column content for the row
  - the signature column value for the specific row identified by 'instance_id', 'chain_id', and 'sequence_id' is NULL
  - if the verification succeeds, the signature value is stored for the row.
  - The SIGN_ROW procedure depends on information specific to a pluggable database and is applicable only to rows that were inserted in the current pluggable database by users, applications, or utilities other than Data Pump.

    For example, suppose you insert a row into a blockchain table in pluggable database A, commit the INSERT transaction, use Data Pump to export the blockchain table, and use Data Pump to import the blockchain table into pluggable database B. If you try to sign this row in pluggable database B, DBMS_BLOCKCHAIN_TABLE.SIGN_ROW will raise an exception. Hence you should sign all rows in a blockchain table that need to be signed before using Data Pump to create a copy of the blockchain table.

42.3.14 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure

This procedure allows an end user or a delegate to sign a row using a set of at most three user columns that uniquely identify a single row.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS(
    schema_name      IN      VARCHAR2,
    table_name       IN      VARCHAR2,
    hash             IN      RAW DEFAULT NULL,
    signature        IN      RAW,
    certificate_guid IN      RAW,
    signature_algo   IN      NUMBER,
    delegate         IN      BOOLEAN DEFAULT FALSE,
    keycol1_name     IN      VARCHAR2,
    keycol1_value    IN      VARCHAR2,
    keycol2_name     IN      VARCHAR2 DEFAULT NULL,
    keycol2_value    IN      VARCHAR2 DEFAULT NULL,
    keycol3_name     IN      VARCHAR2 DEFAULT NULL,
    keycol3_value    IN      VARCHAR2 DEFAULT NULL,
    pdb_guid         IN      RAW DEFAULT NULL);
```

Parameters

Table 42-15 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
hash	If non-NULL, the expected value of the hash in the row to be signed. If NULL, the hash in the row to be signed is not checked.
signature	The user's digital signature on the hash value stored in the row.
certificate_guid	A unique identifier for the certificate stored in the database that may be used to verify the digital signature.
signature_algo	The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
delegate	If TRUE, then the row is being signed by a delegate. If FALSE, then the row is being signed by the user that inserted the row.
keycol1_name	The name of the key column.
keycol1_value	The value of the key column.
keycol2_name	The name of the second column in a composite key.
keycol2_value	The value of the second column in a composite key.
keycol3_name	The name of the third column in a composite key.
keycol3_value	The value of the third column in a composite key.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

Usage Notes

Only `non-NULL` values can be used for `keycol1_value`, `keycol2_value`, and `keycol3_value`. If a `NULL` value is specified for `keycol2_value` or `keycol3_value`, then the corresponding parameter `keycol2_name` or `keycol3_name` must be `NULL`. Any other combination raises an exception.

42.3.15 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE Procedure

This procedure uses at most three user column names and values to uniquely identify a single row to sign and countersign. A row in a blockchain table can be countersigned only if the row belongs to the current epoch for the blockchain table.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE (
   schema_name                       IN      VARCHAR2,
   table_name                        IN      VARCHAR2,
   hash                              IN      RAW DEFAULT NULL,
   signature                         IN      RAW,
   certificate_guid                  IN      RAW,
   signature_algo                    IN      NUMBER,
   delegate                          IN      BOOLEAN DEFAULT FALSE,
   keycol1_name                      IN      VARCHAR2,
   keycol1_value                     IN      VARCHAR2,
   keycol2_name                      IN      VARCHAR2 DEFAULT NULL,
   keycol2_value                     IN      VARCHAR2 DEFAULT NULL,
   keycol3_name                      IN      VARCHAR2 DEFAULT NULL,
   keycol3_value                     IN      VARCHAR2 DEFAULT NULL,
   countersignature_algo             IN      NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT,
   countersignature_signed_bytes     IN      OUT BLOB,
   countersignature                  OUT     RAW,
   countersignature_certificate_guid OUT     RAW,
   countersignature_content_version  IN      VARCHAR2 DEFAULT 'V2_DIGEST',
   pdb_guid                          IN      RAW DEFAULT NULL);
```

Parameters

Table 42-16 SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the blockchain table.
`hash`	If `non-NULL`, the expected value of the hash in the row to be signed. If `NULL`, the hash in the row to be signed is not checked
`signature`	The user's digital signature on the hash value stored in the row.
`certificate_guid`	A unique identifier for the certificate stored in the database that may be used to verify the digital signature.

Table 42-16 (Cont.) SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE Procedure Parameters

Parameter	Description
signature_algo	The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
delegate	If TRUE, then the row is being signed by a delegate. If FALSE, then the row is being signed by the user that inserted the row.
keycol1_name	The name of the key column.
keycol1_value	The value of the key column.
keycol2_name	The name of the second column in a composite key.
keycol2_value	The value of the second column in a composite key.
keycol3_name	The name of the third column in a composite key.
keycol3_value	The value of the third column in a composite key.
countersignature_algo	The digital signature algorithm for the countersignature. The parameter must be one of the following package constants: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
countersignature_signed_bytes	The bytes that are input to the algorithm that generates the countersignature. The caller must pass an empty BLOB for this parameter.
countersignature	The digital signature on the bytes returned in countersignature_signed_bytes.
countersignature_certificate_guid	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the countersignature.
countersignature_content_version	The version of the data contents and layout that are used as input to the countersignature algorithm. Only 'V2_DIGEST' is supported in this release.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

42.3.16 SIGN_ROW_WITH_COUNTERSIGNATURE Procedure

It is an extension of SIGN_ROW that enables the user to request a countersignature from the database. The countersignature will be produced by signing the row data content using the table owner's private key stored in the database wallet. A row in a blockchain table can be countersigned only if the row belongs to the current epoch for the blockchain table.

If delegate is TRUE, then it is the delegate user that is requesting the countersignature.

The countersignature is stored in the row along with all the meta-information needed to recompute the signed bytes used in its computation.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW_WITH_COUNTERSIGNATURE(
   schema_name                          IN VARCHAR2,
   table_name                           IN VARCHAR2,
```

```
   instance_id                       IN NUMBER,
   chain_id                          IN NUMBER,
   sequence_id                       IN NUMBER,
   hash                              IN RAW DEFAULT NULL,
   signature                         IN RAW,
   certificate_guid                  IN RAW,
   signature_algo                    IN NUMBER,
   delegate                          IN BOOLEAN DEFAULT FALSE,
   countersignature_algo             IN NUMBER DEFAULT
DBMS_BLOCKCHAIN_TABLE.SIGN_ALGO_DEFAULT,
   countersignature_signed_bytes     IN OUT BLOB,
   countersignature                  OUT RAW,
   countersignature_certificate_guid OUT RAW,
   countersignature_content_version  IN VARCHAR2 DEFAULT 'V2_DIGEST',
   pdb_guid                          IN RAW DEFAULT NULL);
```

Parameters

Table 42-17 SIGN_ROW_WITH_COUNTERSIGNATURE Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
instance_id	The instance on which the row was inserted.
chain_id	The chain containing the row to be signed. By default, there are 32 chains in each instance, and they are numbered from 0 to 31.
sequence_id	The position of the row on the chain. Valid values are 1, 2, and so on.
hash	If non-NULL, the expected value of the hash in the row to be signed. If NULL, the hash in the row to be signed is not checked.
signature	The user's digital signature on the hash value stored in the row.
certificate_guid	A unique identifier for the certificate stored in the database that may be used to verify the digital signature.
signature_algo	The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
delegate	If TRUE, then the row is being signed by a delegate. If FALSE, then the row is being signed by the user that inserted the row.
countersignature_algo	The digital signature algorithm for the countersignature. The parameter must be one of the following package constants: • SIGN_ALGO_RSA_SHA2_256 • SIGN_ALGO_RSA_SHA2_384 • SIGN_ALGO_RSA_SHA2_512
countersignature_signed_bytes	The bytes that are input to the algorithm that generates the countersignature. The caller must pass an empty BLOB for this parameter.
countersignature	The digital signature on the bytes returned in countersignature_signed_bytes.
countersignature_certificate_guid	A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the countersignature.

Table 42-17 (Cont.) SIGN_ROW_WITH_COUNTERSIGNATURE Procedure Parameters

Parameter	Description
countersignature_content_version	The version of the data contents and layout that are used as input to the countersignature algorithm. Only 'V2_DIGEST' is supported in this release.
pdb_guid	The identifier of the local pluggable database. This parameter is used by Oracle GoldenGate replication and must be NULL.

Usage Notes

- SYS can always countersign any row of a blockchain table.
- An end-user or a delegate that signs and procures a countersignature using SIGN_ROW_SPECIFIED_BY_KEY_COLUMNS_WITH_COUNTERSIGNATURE or SIGN_ROW_WITH_COUNTERSIGNATURE does not need any additional privileges to procure a countersignature.

42.3.17 VERIFY_ROWS Procedure

Verifies all rows on all applicable system chains for integrity of HASH column value and optionally the SIGNATURE column value for rows created in the range of low_timestamp to high_timestamp. An appropriate exception is thrown if the integrity of chains is compromised.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.VERIFY_ROWS(
   schema_name                  IN VARCHAR2,
   table_name                   IN VARCHAR2,
   low_timestamp                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   high_timestamp               IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   instance_id                  IN NUMBER DEFAULT NULL,
   chain_id                     IN NUMBER DEFAULT NULL,
   number_of_rows_verified      OUT NUMBER,
   verify_signature             IN BOOLEAN DEFAULT TRUE,
   verify_delegate_signature    IN BOOLEAN DEFAULT TRUE,
   verify_countersignature      IN BOOLEAN DEFAULT TRUE,
   pdb_guid                     IN RAW DEFAULT NULL);
```

Parameters

Table 42-18 VERIFY_ROWS Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
low_timestamp	If specified, the low end of the time range for verifying rows. The default value is NULL.
high_timestamp	If specified, the high end of the time range for verifying rows. The default value is NULL.
instance_id	If specified, restricts row verification to rows inserted on the specified instance.
chain_id	If specified, restricts row verification to rows on the specified chain. By default, there are 32 chains in each instance, and they are numbered from 0 to 31.

Table 42-18 (Cont.) VERIFY_ROWS Procedure Parameters

Parameter	Description
number_of_rows_verified	The number of rows verified.
verify_signature	If verify_signature is TRUE, both the hash on each row and any user signature on the row are verified. If verify_signature is FALSE, user signatures are not verified.
verify_delegate_signature	If verify_delegate_signature is TRUE, both the hash on each row and any delegate signature on the row are verified. If verify_delegate_signature is FALSE, delegate signatures are not verified.
verify_countersignature	If verify_countersignature is TRUE, both the hash on each row and any countersignature on the row are verified. If verify_countersignature is FALSE, countersignatures are not verified.
pdb_guid	For a V2 blockchain table, if not NULL, restricts attention to system chains inserted by the specified pluggable database. Must be NULL for a V1 blockchain table.

Usage Notes

- schema_name and table_name are the required input parameters.
- All other input parameters are optional, with the following exception:
  - If chain_id is specified, instance_id must be specified.
- Valid values for instance_id are 1, 2, ... etc.
- If neither instance_id, nor chain_id is specified, then it implies all chains. If only instance_id is specified, then it implies all chains on that instance. If both are specified, then it implies the specific chain provided by the combination.
- If both low_timestamp and high_timestamp are specified, then high_timestamp must be later than low_timestamp.

  If low_timestamp is not specified, then the range is the oldest row in the blockchain table to high_timestamp.

  If high_timestamp is not specified, then the range is low_timestamp to the timestamp of the last row inserted in the table.

42.3.18 VERIFY_TABLE_BLOCKCHAIN Procedure

This procedure verifies signatures and system chains for all rows whose creation-times fall between the minimum value for the row-creation time from bytes_previous and the maximum value for row-creation time from bytes_latest. The OUT parameter number_of_rows_verified returns the number of successfully verified rows.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN(
  bytes_latest              IN    BLOB      DEFAULT NULL,
  bytes_previous            IN    BLOB      DEFAULT NULL,
  number_of_rows_verified   OUT   NUMBER,
  verify_signature          IN    BOOLEAN   DEFAULT TRUE,
  verify_delegate_signature IN    BOOLEAN   DEFAULT TRUE,
  verify_countersignature   IN    BOOLEAN   DEFAULT TRUE,
```

```
  signed_bytes_latest       IN    BLOB      DEFAULT NULL,
  signed_bytes_previous     IN    BLOB      DEFAULT NULL);
```

Parameters

Table 42-19 VERIFY_TABLE_BLOCKCHAIN Procedure Parameters

Parameter	Description
bytes_latest	A digest populated by a call to GET_SIGNED_BLOCKCHAIN_DIGEST, GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS, GET_BLOCKCHAIN_DIGEST, or GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS.
bytes_previous	A digest populated by a call to GET_SIGNED_BLOCKCHAIN_DIGEST, GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS, GET_BLOCKCHAIN_DIGEST, or GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS before the bytes_latest BLOB was populated.
number_of_rows_verified	The count of the rows in the blockchain table that were verified.
verify_signature	If verify_signature is TRUE, both the hash on each row and any user signature on the row are verified. If verify_signature is FALSE, user signatures are not verified.
verify_delegate_signature	If verify_delegate_signature is TRUE, both the hash on each row and any delegate signature on the row are verified. If verify_delegate_signature is FALSE, delegate signatures are not verified.
verify_countersignature	If verify_countersignature is TRUE, both the hash on each row and any countersignature on the row are verified. If verify_countersignature is FALSE, countersignatures are not verified.
signed_bytes_latest	signed_bytes_latest has been deprecated.
signed_bytes_previous	signed_bytes_previous has been deprecated.

Usage Notes

The BLOBs in bytes_latest and bytes_previous must be associated with the same blockchain table. For GET_SIGNED_BLOCKCHAIN_DIGEST and GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS, the relevant BLOB parameter is called signed_bytes. For GET_BLOCKCHAIN_DIGEST and GET_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS, the relevant BLOB parameter is called digest_bytes.

42.3.19 VERIFY_USER_BLOCKCHAIN_ROWS Procedure

This procedure verifies rows of one or more user chains when the user chains feature is enabled for a blockchain table.

Syntax

```
DBMS_BLOCKCHAIN_TABLE.verify_user_blockchain_rows (
   schema_name               IN    VARCHAR2,
   table_name                IN    VARCHAR2,
   row_version_name          IN    VARCHAR2,
   number_of_rows_verified   OUT   NUMBER,
   keycol1_value             IN    VARCHAR2 DEFAULT NULL,
   keycol2_value             IN    VARCHAR2 DEFAULT NULL,
```

```
keycol3_value             IN    VARCHAR2 DEFAULT NULL,
low_timestamp             IN    TIMESTAMP WITH TIME ZONE DEFAULT NULL,
high_timestamp            IN    TIMESTAMP WITH TIME ZONE DEFAULT NULL,
verify_signature          IN    BOOLEAN DEFAULT TRUE,
verify_delegate_signature IN    BOOLEAN DEFAULT TRUE,
verify_countersignature   IN    BOOLEAN DEFAULT TRUE,
pdb_guid                  IN    RAW DEFAULT NULL);
```

Parameters

Table 42-20 VERIFY_USER_BLOCKCHAIN_ROWS Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the blockchain table.
row_version_name	The name of the row version given when the blockchain table was created.
number_of_rows_verified	The number of rows verified.
keycol1_value	The value of the key column.
keycol2_value	The value of the second column in a composite key.
keycol3_value	The value of the third column in a composite key.
low_timestamp	If specified, the low end of the time range for verifying rows. The default value is NULL.
high_timestamp	If specified, the high end of the time range for verifying rows. The default value is NULL
verify_signature	If verify_signature is TRUE, both the hash on each row and any user signature on the row are verified. If verify_signature is FALSE, user signatures are not verified.
verify_delegate_signature	If verify_delegate_signature is TRUE, both the hash on each row and any delegate signature on the row are verified. If verify_delegate_signature is FALSE, delegate signatures are not verified.
verify_countersignature	If verify_countersignature is TRUE, both the hash on each row and any countersignature on the row are verified. If verify_countersignature is FALSE, countersignatures are not verified.
pdb_guid	For a V2 blockchain table, if not NULL, restricts attention to user chains inserted by the specified pluggable database. Must be NULL for a V1 blockchain table.

Usage Notes

The parameters keycol1_value, keycol2_value, and keycol3_value may be used to limit the user chains that are verified. If all three of these parameters are NULL, all user chains are verified. If one or more of these parameters are not NULL, then only user chains matching the non-NULL parameters are verified.

43
DBMS_BLOCKER_RESOLVER

The DBMS_BLOCKER_RESOLVER package provides a method of changing some Blocker Resolver configuration parameters.

This chapter contains the following topics:

- DBMS_BLOCKER_RESOLVER Overview
- DBMS_BLOCKER_RESOLVER Security Model
- DBMS_BLOCKER_RESOLVER Constants
- DBMS_BLOCKER_RESOLVER Exceptions
- Summary of DBMS_BLOCKER_RESOLVER Subprograms

43.1 DBMS_BLOCKER_RESOLVER Overview

The `DBMS_BLOCKER_RESOLVER` package provides a method of changing some Blocker Resolver configuration parameters.

> **Note:**
>
> The `DBMS_HANG_MANAGER` package is deprecated in Oracle Database 23ai. Use `DBMS_BLOCKER_RESOLVER` instead.
> The `DBMS_HANG_MANAGER` package provides a method of changing some configuration parameters and constraints to address session issues. This package is being replaced with `DBMS_BLOCKER_RESOLVER`. `DBMS_HANG_MANAGER` can be removed in a future release.

Blocker Resolver is always enabled on all databases, Automatic Storage Management (ASM) disk groups, and single instance systems (when not using Oracle RAC). Delay resolution is enabled on all instances by default except for single instance systems (when not using Oracle RAC) where it is disabled and cannot be enabled at this time.

> **Note:**
>
> The `DBMS_BLOCKER_RESOLVER` package is intended for use by database administrators (DBA) only. It is not intended for use by application developers.

43.2 DBMS_BLOCKER_RESOLVER Security Model

`DBMS_BLOCKER_RESOLVER` can only be run as the `SYS` user.

43.3 DBMS_BLOCKER_RESOLVER Constants

The table in this topic lists DBMS_BLOCKER_RESOLVER package constants.

Table 43-1 DBMS_BLOCKER_RESOLVER Constants

Name	Type	Value	Description
RESOLUTION_SCOPE	VARCHAR2	resolution scope	Resolution scope parameter name
SENSITIVITY	VARCHAR2	sensitivity	Sensitivity parameter name
BASE_FILE_SIZE_LIMIT	VARCHAR2	base file size limit	Base file size limit parameter name. The default value of this parameter is 100 MB.
BASE_FILE_SET_COUNT	VARCHAR2	base file set count	Base file set count parameter name. The default value is 5 trace files in the circular trace file set.
LWS_FILE_SIZE_LIMIT	VARCHAR2	long waiting session file size limit	Long waiting session file size limit parameter name. The default value of this parameter is 100 MB.
LWS_FILE_SET_COUNT	VARCHAR2	long waiting session set count	Long waiting session set count parameter name. The default value is 5 trace files in the circular trace file set.
RESOLUTION_SCOPE_PROCESS	VARCHAR2	PROCESS	Enables only session and/or process termination
RESOLUTION_SCOPE_INSTANCE	VARCHAR2	INSTANCE	Enables session, process, and instance termination. The latter is used in specific scenarios. The default value is INSTANCE.
SENSITIVITY_NORMAL	VARCHAR2	NORMAL	Sets various Blocker Resolver intervals to their default values. The default value is NORMAL.
SENSITIVITY_HIGH	VARCHAR2	HIGH	Sets the various Blocker Resolver intervals to half of their default values

43.4 DBMS_BLOCKER_RESOLVER Exceptions

The table in this topic lists the exceptions raised by the `DBMS_BLOCKER_RESOLVER` package.

Table 43-2 DBMS_BLOCKER_RESOLVER Package Exceptions

Exception	Error Code	Description
`ERRNUM_INPUT_ERROR`	`-32706`	Invalid user input
`ERRNUM_INTERNAL_ERROR`	`-32707`	Database experienced an error setting a parameter
`ERRNUM_UNSUPPORTED_ERROR`	`-32708`	Operation is not supported on this instance type

43.5 Summary of DBMS_BLOCKER_RESOLVER Subprograms

The `DBMS_BLOCKER_RESOLVER` package includes the `SET` procedure subprogram.

Table 43-3 DBMS_BLOCKER_RESOLVER Package Subprograms

Subprogram	Description
SET Procedure	Sets the specified parameter to the specified value

43.5.1 SET Procedure

This procedure sets the specified parameters to specified values.

Syntax

```
DBMS_BLOCKER_RESOLVER.SET (
   pname   IN  VARCHAR2,
   pvalue  IN  VARCHAR2);
```

Parameters

Table 43-4 SET Procedure Parameters

Parameter	Description
`pname`	Contains the parameter name that needs to be modified.
`pvalue`	Contains the new value for the parameter name specified in `pname`.

44
DBMS_CAPTURE_ADM

The `DBMS_CAPTURE_ADM` package, one of a set of Oracle Replication packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_CAPTURE_ADM Subprograms

44.1 DBMS_CAPTURE_ADM Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

> **See Also:**
>
> *Oracle Database Concepts* for more information about CDBs and PDBs

44.2 DBMS_CAPTURE_ADM Security Model

The DBMS_CAPTURE_ADM security can be controlled in one of two ways.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

Note:

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
- Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

See Also:

Oracle Database XStream Guide for information about configuring an XStream administrator

44.3 Summary of DBMS_CAPTURE_ADM Subprograms

This table lists the `DBMS_CAPTURE_ADM` subprograms and briefly describes them.

Table 44-1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure	Reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures
ABORT_SCHEMA_INSTANTIATION Procedure	Reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` and `PREPARE_TABLE_INSTANTIATION` procedures
ABORT_SYNC_INSTANTIATION Procedure	Reverses the effects of running the `PREPARE_SYNC_INSTANTIATION` procedure
ABORT_TABLE_INSTANTIATION Procedure	Reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure
ALTER_CAPTURE Procedure	Alters a capture process
ALTER_SYNC_CAPTURE Procedure	Alters a synchronous capture

Table 44-1 (Cont.) DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
BUILD Procedure	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure	Creates a capture process
CREATE_SYNC_CAPTURE Procedure	Creates a synchronous capture
DROP_CAPTURE Procedure	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
PREPARE_GLOBAL_INSTANTIATION Procedure	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SYNC_INSTANTIATION Function	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
PREPARE_TABLE_INSTANTIATION Procedure	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure	Sets a capture process parameter to the specified value
START_CAPTURE Procedure	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure	Stops the capture process from mining redo logs

> **Note:**
>
> All subprograms commit unless specified otherwise.

44.3.1 ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
   container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 44-2 ABORT_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
container	Either CURRENT , ALL, or *pdb_name*. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure removes supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

44.3.2 ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
   schema_name  IN  VARCHAR2,
   container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 44-3 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

Table 44-3 (Cont.) ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
container	Either CURRENT , ALL, or *pdb_name*. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure removes supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

44.3.3 ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN  VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN  DBMS_UTILITY.UNCL_ARRAY);
```

Parameters

Table 44-4 ABORT_SYNC_INSTANTIATION Procedure Parameter

Parameter	Description
table_names	When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated. In either version of the procedure, specify the name of each table in the form [*schema_name.*]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

44.3.4 ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation

- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
   table_name  IN  VARCHAR2);
   container   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 44-5 ABORT_TABLE_INSTANTIATION Procedure Parameter

Parameter	Description
`table_name`	The name of the table for which to abort the effects of preparing instantiation, specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`container`	Either `CURRENT` , `ALL`, or *`pdb_name`*. If `CURRENT` is specified, then this procedure removes supplemental logging for the current container. If `ALL` is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If *`pdb_name`* is specified, then this procedure removes supplemental logging for the specified PDB. `ALL` and *`pdb_name`* are valid only when you invoke the procedure from the root.

44.3.5 ALTER_CAPTURE Procedure

This procedure alters a capture process.

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2   DEFAULT NULL,
   remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
   start_scn                  IN  NUMBER     DEFAULT NULL,
   use_database_link          IN  BOOLEAN    DEFAULT NULL,
   first_scn                  IN  NUMBER     DEFAULT NULL,
   negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
   remove_negative_rule_set   IN  BOOLEAN    DEFAULT FALSE,
   capture_user               IN  VARCHAR2   DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER     DEFAULT NULL,
   start_time                 IN  TIMESTAMP  DEFAULT NULL,
   oldest_scn                 IN  NUMBER     DEFAULT NULL);
```

Parameters

Table 44-6 ALTER_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.

Table 44-6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set.
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.
start_scn	A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.

Table 44-6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.
first_scn	The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements: • It must be greater than the current first SCN for the capture process. • It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. • It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure for more information about a LogMiner data dictionary. If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.

Table 44-6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. To change the negative rule set for the capture process, specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.

Table 44-6 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges: • EXECUTE privilege on the rule sets used by the capture process • EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
checkpoint_retention_time	Either the number of days that a capture process retains checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.
start_time	A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time. An error is returned if an invalid time is specified or if the capture process is enabled. The start_scn and start_time parameters are mutually exclusive.
oldest_scn	The oldest SCN of the transactions currently being processed.

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
   FROM DBA_CAPTURE;
```

44.3.6 ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
   capture_name    IN  VARCHAR2,
   rule_set_name   IN  VARCHAR2  DEFAULT NULL,
   capture_user    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 44-7 ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `strmadmin` schema named `sync_cap_rules`, enter `strmadmin.sync_cap_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If `NULL`, then the rule set is not changed.

Table 44-7 (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges: • EXECUTE privilege on the rule sets used by the synchronous capture • EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles.

Usage Notes

If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically.

44.3.7 BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the SQL statement ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure is overloaded. One version of this procedure contains the OUT parameter first_scn, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
   first_scn OUT NUMBER);

DBMS_CAPTURE_ADM.BUILD;
```

Parameters

Table 44-8 BUILD Procedure Parameter

Parameter	Description
first_scn	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes.You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.
- In a CDB, the `BUILD` procedure must be executed from the root.

44.3.8 CREATE_CAPTURE Procedure

This procedure creates a capture process.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

> **See Also:**
>
> DBMS_RULE_ADM for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
   queue_name                 IN  VARCHAR2,
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2   DEFAULT NULL,
   start_scn                  IN  NUMBER     DEFAULT NULL,
   source_database            IN  VARCHAR2   DEFAULT NULL,
   use_database_link          IN  BOOLEAN    DEFAULT FALSE,
   first_scn                  IN  NUMBER     DEFAULT NULL,
   logfile_assignment         IN  VARCHAR2   DEFAULT 'implicit',
   negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
   capture_user               IN  VARCHAR2   DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER     DEFAULT 60,
   start_time                 IN  TIMESTAMP  DEFAULT NULL,
   source_root_name           IN  VARCHAR2   DEFAULT NULL,
   capture_class              IN  VARCHAR2   DEFAULT 'Streams');
```

Parameters

Table 44-9 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the capture process is created.
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.

Table 44-9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
start_scn	A valid SCN for the database from which the capture process starts capturing changes. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive. **See Also:** "Usage Notes" for more information setting the start_scn parameter
source_database	The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually: • Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. • Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. • Prepare source database objects for instantiation.

Table 44-9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
first_scn	The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. **See Also:** "Usage Notes" for more information setting the first_scn parameter
logfile_assignment	If implicit, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR *logminer_session_name* clause. If explicit, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. **See Also:** "Usage Notes" for information about adding redo log files manually

Table 44-9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically. **See Also:** "Usage Notes" for more information about this parameter.
checkpoint_retention_time	Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.

Table 44-9 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
start_time	A valid time from which the capture process starts capturing changes. An error is returned if an invalid time is specified. The start_scn and start_time parameters are mutually exclusive. **See Also:** "Usage Notes" for more information setting the start_time parameter
source_root_name	The global name of the root in the source CDB. If you specify NULL, or if the specified name is the same as the global name of the current root, then local capture is assumed. If not NULL, then remote capture is assumed and a condition is added to the generated rules to filter the LCRs based on the root in the source CDB. **Note:** In a downstream capture configuration, if the capture database is CDB and the source database is a non-CDB, then specify the same value for source_root_name and source_database. The source_root_name parameter does not need to be specified for local capture for either a CDB or a non-CDB.
capture_class	The valid values are 'Streams', 'XStream' or 'GoldenGate'. If NULL is specified, then 'Streams' is assumed. **Note:** The capture_class parameter cannot be set to 'Streams' or NULL when the capture database is a CDB.

Usage Notes

Consider the following usage notes when you run this procedure:

- DBA Role Requirement
- Capture User Requirements
- First SCN and Start SCN Settings
- Explicit Log File Assignment

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the capture_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the capture_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the capture_user to SYS.

Capture User Requirements

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- `EXECUTE` privilege on the rule sets used by the capture process
- `EXECUTE` privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted `EXECUTE` privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

> **Note:**
>
> - A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
> - Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

> **Note:**
>
> When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

first_scn Setting	start_scn Setting	Capture Process Type	Description
Non-NULL	NULL	Local or Downstream	The new capture process is created at the local database with a new LogMiner session starting from the value specified for the first_scn parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.
Non-NULL	Non-NULL	Local or Downstream	If the specified value for the start_scn parameter is greater than or equal to the specified value for the first_scn parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the start_scn parameter is less than the specified value for the first_scn parameter, then an error is raised. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first_scn must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Local	The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: • There is no existing capture process for the local source database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. • There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build. However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Downstream	When the CREATE_CAPTURE procedure creates a downstream capture process, the use_database_link parameter must be set to TRUE when the first_scn parameter is set to NULL. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database. The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: • There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. • There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified start_scn parameter value is less than the current SCN for the source database, then an error is raised.
NULL	NULL	Local or Downstream	The behavior is the same as setting the first_scn parameter to NULL and setting the start_scn parameter to the current SCN of the source database.

> **See Also:**
>
> BUILD Procedure for more information about the BUILD procedure and the LogMiner data dictionary

Explicit Log File Assignment

If you specify explicit for the logfile_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
   file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

> **See Also:**
>
> *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

44.3.9 CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
   queue_name     IN  VARCHAR2,
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2,
   capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 44-10 CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the synchronous capture is created.
capture_name	The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the synchronous capture is created.
rule_set_name	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. If NULL, then an error is returned.

Table 44-10 (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically. **See Also:** "Usage Notes" for more information about this parameter.

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

> **Note:**
>
> A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

44.3.10 DROP_CAPTURE Procedure

This procedure drops a capture process.

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
   capture_name           IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 44-11 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Replication client. Oracle Replication clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

> **See Also:**
>
> STOP_CAPTURE Procedure

The DROP_CAPTURE Procedure and Rules-related Information

When you use this procedure to drop a capture process, rules-related information for the capture process is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Replication rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES

- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- DBA_STREAMS_RULES

44.3.11 INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
   capture_name    IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 44-12 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: • row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. • serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. • session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. • thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. • tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. • username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

44.3.12 PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

Table 44-13 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
`supplemental_logging`	Either `NONE`, `KEYS`, or `ALL`. If `NONE` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If `KEYS` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `KEYS` does not enable supplemental logging of bitmap join index columns. If `ALL` is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Table 44-13 (Cont.) PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
container	Either CURRENT , ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

44.3.13 PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
   schema_name           IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 44-14 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr.

Table 44-14 (Cont.) PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
supplemental_logging	Either NONE, KEYS, ALL, PARTIAL_JSON_OFF, or PARTIAL_JSON_ON. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types. If PARTIAL_JSON_OFF is specified, partial JSON update is disabled at schema level. If PARTIAL_JSON_ON is specified, partial JSON update is enabled at schema level. If PARTIAL_JSON_ON or PARTIAL_JSON_OFF is unspecified, schema level partial JSON setting will be unchanged. If PARTIAL_JSON_OFF has never been specified, by default, partial JSON update is disabled at schema level.
container	Either CURRENT , ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

44.3.14 PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 44-15 PREPARE_SYNC_INSTANTIATION Function Parameter

Parameter	Description
`table_names`	When the `table_names` parameter is `VARCHAR2` datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries. When the `table_names` parameter is `DBMS_UTILITY.UNCL_ARRAY` datatype, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated. In either version of the function, specify the name of each table in the form `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

44.3.15 PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table

This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
   table_name            IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
   container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 44-16 PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

Table 44-16 (Cont.) PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
supplemental_logging	Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.
container	Either CURRENT , ALL, or *pdb_name*. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If *pdb_name* is specified, then this procedure adds supplemental logging for the specified PDB. ALL and *pdb_name* are valid only when you invoke the procedure from the root.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

44.3.16 SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
   capture_name  IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 44-17 SET_PARAMETER Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.

Table 44-17 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the parameter you are setting.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 44-18 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
annotateddlsize	0 or a positive integer up to 4294967296 (4 GB)	0	The maximum length of the DDL text, in bytes, up to which the DDL can be chosen for annotation, if applicable for the DDL. Any DDL text whose size is greater than the specified size is not annotated. The default, 0, indicates that no DDL text processed by this capture process is annotated. Annotating DDL can simplify filtering and transformation of the DDL within Oracle GoldenGate. **Note:** This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.
capture_idkey_objects	Y or N	N	If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs. Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter and *Oracle Database XStream Guide* for more information about ID key LCRs

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
capture_sequence_nextval	Y or N	N	If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as SYS and SYSTEM. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs. If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter and "SET_PARAMETER Procedure" for information about the apply_sequence_nextval apply process parameter
disable_on_limit	Y or N	N	If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CP*nn*) remains the same.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. If N, then the capture process is an archived-log downstream capture process. An error is raised if an attempt is made to set this parameter for a local capture process.
excludetag	Comma-delimited list of Oracle Replication tags	NULL	Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Replication tags. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
excludetrans	Comma-delimited list of transaction names	NULL	Controls whether the capture process captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
excludeuser	Comma-delimited list of user names	NULL	Controls whether the capture process captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
excludeuserid	Comma-delimited list of user ID values	NULL	Controls whether the capture process captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
getapplops	Y or N	Y	If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
getreplicates	Y or N	N	If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets. **Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
ignore_transaction	A valid transaction ID or NULL	NULL	Instructs the capture process to ignore the specified transaction from the source database, effective immediately. The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database. If NULL, then the capture process ignores this parameter. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.
ignore_unsupported_table	A fully qualified table name, *, or -	*	Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table. A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables. When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form *table_owner. table_name*. For example. hr.employees. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure. When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log. When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
include_objects	A list of tables or schema names separated by commas	none	Directs capture to include changes from the specified tables or schemas. An LCR that is selected by include_objects is passed to the outbound server regardless of any further filtering that is specified. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
inline_lob_optimization	Y or N	N	If Y, then LOBs that can be processed inline (such as small LOBs) are included in the LCR directly, rather than sending LOB chunk LCRs. If N, then each LOB column is sent as NULL followed by LOB chunk LCRs to update the LOB column. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
maximum_scn	A valid SCN or INFINITE	INFINITE	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If INFINITE, then the capture process runs regardless of the SCN value.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
max_sga_size	A positive integer	INFINITE	Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log. The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled. **Note:** The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the capture component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
merge_threshold	A negative integer, 0, a positive integer, or INFINITE	60	The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
message_limit	A positive integer or INFINITE	INFINITE	The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.
message_tracking_frequency	0 or a positive integer	2000000	The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is *capture_process_name*:AUTOTRACK, where *capture_process_name* is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically.
parallelism	A positive integer	1	The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the parallelism capture process parameter. So, if parallelism is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES initialization parameter is set appropriately when you set the parallelism capture process parameter. **Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically.
skip_autofiltered_table_ddl	Y or N	Y	If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
split_threshold	0, a positive integer, or INFINITE	1800	The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned. In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes. If 0 (zero), then automatic splitting starts immediately. If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken. This parameters is designed to be used with the merge_threshold parameter.
startup_seconds	0, a positive integer, or INFINITE	0	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.
time_limit	A positive integer or INFINITE	INFINITE	The capture process stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the capture process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.

Table 44-18 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
use_rac_service	Y or N	Y if Replication N if XStream	If Y, then the capture process is run in the owning instance of its queue. If N, then the client specifies where the capture process is to run. **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations. **See Also:** "Usage Notes" for more information about this parameter
write_alert_log	Y or N	Y	If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.
xout_client_exists	Y or N	Y if the capture process sends LCRs to XStream outbound servers N if the capture process sends LCRs to Oracle Apply processes	Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. **Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

Usage Notes

The following usage notes apply to the SET_PARAMETER procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- Parameters that Require XStream Optimizations
- XStream or Oracle GoldenGate Integrated Capture Configurations

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `INFINITE` for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

Parameters that Require XStream Optimizations

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Replication components:

- `capture_idkey_objects`
- `capture_sequence_nextval`
- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `include_objects`
- `inline_lob_optimization`
- `max_sga_size`
- `use_rac_services`

The `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure enables XStream optimizations for Oracle Replication. When XStream optimizations are not enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Replication and the `capture_idkey_objects` parameter is set to `Y`, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
  FROM DBA_XSTREAM_OUT_SUPPORT_MODE
  WHERE SUPPORT_MODE='ID KEY';
```

> **Note:**
>
> Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about ID key LCRs

XStream or Oracle GoldenGate Integrated Capture Configurations

In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- `capture_idkey_objects`
- `capture_sequence_nextval`
- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `include_objects`
- `inline_lob_optimization`
- `max_sga_size`
- `use_rac_services`

You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.

If an integrated configuration performs bi-directional replication, then, to avoid change cycling, the capture process should not capture the changes made by the Oracle GoldenGate Replicat process. To accomplish this goal, use the default settings for the `getapplops` and `getreplicates` parameters and exclude changes made by the user running the Replicat process. To exclude these changes, specify this user in the `excludeuserid` or `excludeuser` parameter. Typically, the user running the Oracle GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by applications or by the Replicat process. For example, an intermediate database in a replication environment might capture all of the changes made to the database, including both application changes and Replicat process changes, and send these changes to a different destination database.

Table 44-19 describes the capture process behavior when at least one of the exclude parameters is non-`NULL`.

Table 44-19 Behavior When at Least One exclude Parameter Is Non-NULL

getapplops Setting	getreplicates Setting	Description
Y	Y	The capture process captures all DML changes.
Y	N	The capture process captures the DML changes made by the users that are not in the `excludeuserid` or `excludeuser` parameters. The capture process captures the DML changes that are not in the transactions in the `excludetrans` parameter. The capture process captures only the DML changes that do not have a tag that is in the `excludetags` parameter.
N	Y	The capture process captures only the DML changes made by the users that are in the `excludeuserid` or `excludeuser` parameters. The capture process captures only the DML changes that are in the transactions in the `excludetrans` parameter. The capture process captures only the DML changes that have a tag that is in the `excludetags` parameter.
N	N	The capture process does not capture any DML changes.

Table 44-19 describes the capture process behavior when all of the exclude parameters are set to `NULL`.

Table 44-20 Behavior When All exclude Parameters Are Set to NULL

getapplops Setting	getreplicates Setting	Description
Y	Y	The capture process captures all DML changes.
Y	N	The capture process captures all DML changes.
N	Y	The capture process does not capture any DML changes.
N	N	The capture process does not capture any DML changes.

See the documentation for the Oracle GoldenGate product for more information:

http://docs.oracle.com/cd/E15881_01/index.htm

> **Note:**
>
> A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process's rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process's rule sets.

44.3.17 START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 44-21 START_CAPTURE Procedure Parameter

Parameter	Description
`capture_name`	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A `NULL` setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup. A capture process (*`cnnn`*) is an Oracle background process.

44.3.18 STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
   capture_name  IN  VARCHAR2,
   force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 44-22 STOP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CP*nn*, where *nn* can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

45
DBMS_CACHEUTIL

The DBMS_CACHEUTIL package provides an interface to control object-level cache fusion locking policies in an Oracle Real Application Clusters (Oracle RAC) environment and to manage assignments to the KEEP buffer pool for Oracle True Cache.

45.1 DBMS_CACHEUTIL Overview

DBMS_CACHEUTIL provides a collection of procedures related to Oracle Real Application Clusters (Oracle RAC) and Oracle True Cache.

With DBMS_CACHEUTIL, you can do the following:

- Control object-level cache fusion locking policies, such as object affinity, read-mostly, and object down-convert in an Oracle RAC environment.

  For example, you can fine-tune cache fusion locking policies for a specific configuration or workload at the object level. This might reduce locking overhead in an Oracle RAC environment and improve performance.

  - Affinity specifies an implicit, exclusive lock for an object to an instance, so that read accesses and updates to the object on this instance become more optimized. However, updates to the object on other instances become less optimized.
  - Read-mostly specifies an implicit, shared lock for an object in the cluster, so that read access to the object becomes more optimized. However, updates to the object on any instances become less optimized.
  - A down-convert converts an object's exclusive locks on an instance to shared mode for all instances in an Oracle RAC environment.

  > **Note:**
  >
  > Object affinity and read-mostly locking optimization works only for the primary RAC database, and it doesn't work for Oracle Active Data Guard.

- Manage object assignments to the KEEP buffer cache for an Oracle True Cache instance. True Cache is an in-memory, consistent, and automatically managed SQL and key-value (object or JSON) cache for Oracle Database.

You can apply the procedures in this package to tables, indexes, lobs, partitions (for partitioned objects), and subpartitions (for composite partitioned objects).

For non-partitioned objects, the input (schema and obj corresponds to OWNER and OBJECT_NAME in DBA_OBJECTS and should uniquely define a segment. That means it should have, for example, a valid DATA_OBJECT_ID in DBA_OBJECTS.

For partitioned or composite partitioned objects, the input (schema, obj, and partition) corresponds to OWNER, OBJECT_NAME, and SUBOBJECT_NAME in DBA_OBJECTS and should uniquely define a segment. That means it should have a valid DATA_OBJECT_ID in DBA_OBJECTS.

Except for depended indexes, this procedure does not apply for the dependent object segments, such as lob and partition or subpartition segments. It should be explicitly called on the segment if necessary.

45.2 DBMS_CACHEUTIL Security Model

The security model describes the privileges needed for using the `DBMS_CACHEUTIL` package.

Use the following for this package:

```
CREATE OR REPLACE PUBLIC SYNONYM dbms_cacheutil FOR sys.dbms_cacheutil

GRANT EXECUTE ON dbms_cacheutil TO dba
```

45.3 Summary of DBMS_CACHEUTIL Subprograms

This table lists the package subprograms in alphabetical order.

Table 45-1 DBMS_CACHEUTIL Package Subprograms

Subprogram	Description
DISSOLVE_AFFINITY Procedure	This procedure dissolves the object affinity from a node in an Oracle RAC environment.
DISSOLVE_READMOSTLY Procedure	This procedure dissolves an object's read-mostly setting in an Oracle RAC environment.
GRAB_AFFINITY Procedure	This procedure sets the object affinity to a node in an Oracle RAC environment.
GRAB_READMOSTLY Procedure	This procedure grabs an object's read-mostly setting in an Oracle RAC environment.
LIST_READMOSTLY Procedure	This procedure lists objects that have the read-mostly property set in an Oracle RAC environment.
OBJECT_DOWNCONVERT Procedure	This procedure down-converts an object's exclusive locks on an instance to shared mode for all instances in an Oracle RAC environment.
TRUE_CACHE_KEEP Procedure	When you call this procedure on a True Cache instance, it assigns the object to the `KEEP` buffer pool on that instance.
TRUE_CACHE_UNKEEP Procedure	When an object on a True Cache instance no longer needs to be in the `KEEP` buffer pool, use this procedure to remove the object's `KEEP` assignment.

45.3.1 DISSOLVE_AFFINITY Procedure

`DISSOLVE_AFFINITY` dissolves the object affinity from a node in an Oracle RAC environment.

Syntax

```
DBMS_CACHEUTIL.DISSOLVE_AFFINITY(
   schema              IN VARCHAR2,
   obj                 IN VARCHAR2,
   partition           IN VARCHAR2 := NULL,
   dissolve_index      IN BOOLEAN := TRUE,
   active_drm          IN BOOLEAN := FALSE);
```

Parameters

Table 45-2 DISSOLVE_AFFINITY Procedure Parameters

Parameter	Description
`schema`	The name of the schema for the object.
`obj`	The name of the object.
`partition`	• If the object is not partitioned, then this is `NULL`. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.
`dissolve_index`	To dissolve affinity for dependent indexes, use `TRUE`.
`active_drm`	For internal use only. Do not use.

45.3.2 DISSOLVE_READMOSTLY Procedure

`DISSOLVE_READMOSTLY` dissolves an object's read-mostly setting in an Oracle RAC environment.

Syntax

```
DBMS_CACHEUTIL.DISSOLVE_READMOSTLY(
   schema              IN VARCHAR2,
   obj                 IN VARCHAR2,
   partition           IN VARCHAR2 := NULL,
   dissolve_index      IN BOOLEAN := TRUE);
```

Parameters

Table 45-3 DISSOLVE_READMOSTLY Procedure Parameters

Parameter	Description
`schema`	The name of the schema for the object.
`obj`	The name of the object.

Table 45-3 (Cont.) DISSOLVE_READMOSTLY Procedure Parameters

Parameter	Description
partition	• If the object is not partitioned, then this is NULL. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.
dissolve_index	To dissolve read-mostly for dependent indexes, use TRUE.

45.3.3 GRAB_AFFINITY Procedure

GRAB_AFFINITY sets the object affinity to a node in an Oracle RAC environment.

This is useful when you know that, for a particular workload, an object will be heavily accessed by one particular Oracle RAC node. Grabbing an object affinity to that node reduces locking overhead and could improve performance.

> **Note:**
>
> The affinity that this procedure grabs can still change by the automatic object affinity policy if the policy decides that it's not optimal to keep the affinity. The CURRENT_MASTER column in the V$GCSPFMASTER_INFO view indicates the current affinity of the particular object segment.

> **Note:**
>
> Object affinity locking optimization works only for the primary RAC database, and it doesn't work for Oracle Active Data Guard.

Syntax

```
DBMS_CACHEUTIL.GRAB_AFFINITY(
   schema              IN VARCHAR2,
   obj                 IN VARCHAR2,
   partition           IN VARCHAR2 := NULL,
   grab_index          IN BOOLEAN := TRUE,
   active_drm          IN BOOLEAN := FALSE);
```

Parameters

Table 45-4 GRAB_AFFINITY Procedure Parameters

Parameter	Description
schema	The name of the schema for the object.
obj	The name of the object.

Table 45-4 (Cont.) GRAB_AFFINITY Procedure Parameters

Parameter	Description
partition	• If the object is not partitioned, then this is NULL. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.
grab_index	To grab affinity for dependent indexes, use TRUE.
active_drm	For internal use only. Do not use.

45.3.4 GRAB_READMOSTLY Procedure

GRAB_READMOSTLY sets an object to read-mostly in an Oracle RAC environment.

This is useful when you know that, for a particular workload, accesses to an object will mostly be READ instead of INSERT or UPDATE. Grabbing read-mostly for the object would reduce locking overhead and could improve performance.

> **Note:**
>
> The read-mostly that this procedure grabs can still change by the automatic read-mostly policy if the policy decides that it's not optimal to keep the read-mostly set. The read-mostly property is persistent across instance lifetimes. You can use the LIST_READMOSTLY procedure included in this package to list the current set of object segments with read-mostly set.

> **Note:**
>
> Read-mostly locking optimization works only for the primary RAC database, and it doesn't work for Oracle Active Data Guard.

Syntax

```
DBMS_CACHEUTIL.GRAB_READMOSTLY(
   schema              IN VARCHAR2,
   obj                 IN VARCHAR2,
   partition           IN VARCHAR2 := NULL,
   grab_index          IN BOOLEAN := TRUE);
```

Parameters

Table 45-5 GRAB_READMOSTLY Procedure Parameters

Parameter	Description
schema	The name of the schema for the object.
obj	The name of the object.

Table 45-5 (Cont.) GRAB_READMOSTLY Procedure Parameters

Parameter	Description
partition	• If the object is not partitioned, then this is NULL. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.
grab_index	To grab read-mostly for dependent indexes, use TRUE.

45.3.5 LIST_READMOSTLY Procedure

This procedure lists objects that have the read-mostly property set in an Oracle RAC environment.

Syntax

```
DBMS_CACHEUTIL.LIST_READMOSTLY;
```

45.3.6 OBJECT_DOWNCONVERT Procedure

OBJECT_DOWNCONVERT down-converts an object's exclusive locks on an instance to shared mode for all instances in an Oracle RAC environment.

This is useful when a particular object is loaded through the buffer cache by an Oracle RAC node and this node holds many exclusive locks for this object, which has caused extra locking overhead. Down-converting locks for this object to shared locks on the RAC node could reduce the locking overhead and improve performance.

Syntax

```
DBMS_CACHEUTIL.OBJECT_DOWNCONVERT(
   schema                IN VARCHAR2,
   obj                   IN VARCHAR2,
   partition             IN VARCHAR2 := NULL,
   downconvert_index     IN BOOLEAN := TRUE);
```

Parameters

Table 45-6 OBJECT_DOWNCONVERT Procedure Parameters

Parameter	Description
schema	The name of the schema for the object.
obj	The name of the object.
partition	• If the object is not partitioned, then this is NULL. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.
downconvert_index	To down-convert dependent indexes, use TRUE.

45.3.7 TRUE_CACHE_KEEP Procedure

When you call this procedure on True Cache, it assigns the object to the `KEEP` buffer pool on that cache.

To use this procedure, the `DB_KEEP_CACHE_SIZE` initialization parameter must be configured on True Cache.

Syntax

```
DBMS_CACHEUTIL.TRUE_CACHE_KEEP(
   schema                 IN VARCHAR2,
   obj                    IN VARCHAR2,
   partition              IN VARCHAR2 := NULL);
```

Parameters

Table 45-7 TRUE_CACHE_KEEP Procedure Parameters

Parameter	Description
`schema`	The name of the schema for the object.
`obj`	The name of the object.
`partition`	• If the object is not partitioned, then this is `NULL`. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.

Related Topics

- Oracle True Cache User's Guide

45.3.8 TRUE_CACHE_UNKEEP Procedure

When an object on True Cache no longer needs to be in the `KEEP` buffer pool, use this procedure to remove the object's `KEEP` assignment.

Syntax

```
DBMS_CACHEUTIL.TRUE_CACHE_UNKEEP(
   schema                 IN VARCHAR2,
   obj                    IN VARCHAR2,
   partition              IN VARCHAR2 := NULL);
```

Parameters

Table 45-8 TRUE_CACHE_UNKEEP Procedure Parameters

Parameter	Description
`schema`	The name of the schema for the object.
`obj`	The name of the object.

Table 45-8 (Cont.) TRUE_CACHE_UNKEEP Procedure Parameters

Parameter	Description
`partition`	• If the object is not partitioned, then this is `NULL`. • If the object is partitioned, use the name of the partition segment. • If it's a composited partitioned object, use the name of the subpartition segment.

46
DBMS_CLOUD

The `DBMS_CLOUD` package provides comprehensive support for working with data in Object Storage.

This chapter contains the following topics:

- DBMS_CLOUD Overview
- Installing the DBMS_CLOUD Package
- DBMS_CLOUD Security Model
- DBMS_CLOUD Exceptions
- Summary of DBMS_CLOUD Subprograms
- DBMS_CLOUD Package File URI Formats
- DBMS_CLOUD Package Format Options
- DBMS_CLOUD Avro and Parquet Support

46.1 DBMS_CLOUD Overview

Using `DBMS_CLOUD` to work with data in Object Storage you can do the following:

- Manage your credentials for accessing Object Store.
- Copy data as-is: External data is loaded into the database in a single one-step operation, without the need to create any objects in the database. The load operation is monitored and tracked inside the database.
- Manage the information about your load operations.
- Validate the content of external data prior to consumption. Prior to consumption of external data you verify its content and identify rows that do not conform to the expected external data format.
- Create an external table. Create the necessary object in the database for flexible and continuous consumption.
- Work with objects in object stores and directories.

46.2 Installing the DBMS_CLOUD Package

The `DBMS_CLOUD` package provides a comprehensive support for working with data in Object Storage starting with Oracle Database 19c and later releases. However, this package is not pre-installed with Oracle Database. You need to manually install the `DBMS_CLOUD` package and also configure users or roles to use this package.

For information on installing the `DBMS_CLOUD` package and configuring users/roles, see the MOS-NOTE with Doc ID 2748362.1.

46.3 DBMS_CLOUD Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles.

46.4 DBMS_CLOUD Exceptions

The following table describes exceptions for `DBMS_CLOUD`.

Exception	Code	Description
`reject_limit`	20003	The reject limit of an external table was reached.
`credential_not_exist`	20004	A credential object does not exist.
`table_not_exist`	20005	A table does not exist.
`unsupported_obj_store`	20006	An unsupported object store URI was provided.
`iden_too_long`	20008	An identifier is too long.
`invalid_format`	20009	A format argument is not valid.
`missing_credential`	20010	Mandatory credential object information was not specified.
`invalid_object_uri`	20011	An invalid object URI was provided.
`invalid_partitioning_clause`	20012	An partitioning clause is missing or was not provided.
`unsupported_feature`	20013	An unsupported feature was used that is not existent in the current database version.
`part_not_exist`	20014	A partition or subpartition does not exist, or a table is not a partitioned external table or hybrid partitioned table.
`invalid_table_name`	20016	An invalid table name was used.
`invalid_schema_name`	20017	An invalid schema name was used.
`invalid_dir_name`	20018	An invalid directory name was used.
`invalid_file_name`	20019	An invalid file name was used.
`invalid_cred_attribute`	20020	Invalid credential attributes were specified.
`table_exist`	20021	A table already exists.
`credential_exist`	20022	A credential object already exists.
`invalid_req_method`	20023	A request method is either too long or invalid.
`invalid_req_header`	20024	An invalid request header was specified.
`file_not_exist`	20025	A file does not exist.
`invalid_response`	20026	An HTTP response was not valid.
`invalid_operation`	20027	An invalid task class or ID was specified.
`invalid_user_name`	20028	An invalid username was specified.

46.5 Summary of DBMS_CLOUD Subprograms

This section covers the `DBMS_CLOUD` subprograms provided with Oracle Database.

Subprogram	Description
COPY_DATA Procedure	This procedure loads data into existing Oracle Database tables from files in the Cloud.

Subprogram	Description
COPY_DATA Procedure for Avro or Parquet Files	This procedure with the `format` parameter `type` set to the value `avro` or `parquet` loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud. Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table.
CREATE_CREDENTIAL Procedure	This procedure stores cloud service credentials in Oracle Database.
CREATE_EXTERNAL_TABLE Procedure	This procedure creates an external table on files in the Cloud. This allows you to run queries on external data from Oracle Database.
CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files	This procedure with the `format` parameter `type` set to the value `avro` or `parquet` creates an external table with either Avro or Parquet format files in the Cloud. This allows you to run queries on external data from Oracle Database.
CREATE_EXTERNAL_PART_TABLE Procedure	This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.
CREATE_HYBRID_PART_TABLE Procedure	This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.
DELETE_ALL_OPERATIONS Procedure	This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.
DELETE_FILE Procedure	This procedure removes the specified file from the specified directory on Oracle Database
DELETE_OBJECT Procedure	This procedure deletes the specified object on object store.
DROP_CREDENTIAL Procedure	This procedure removes an existing credential from Oracle Database.
GET_OBJECT Procedure and Function	This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a `BLOB` to Oracle Database.
LIST_FILES Function	This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.
LIST_OBJECTS Function	This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.
PUT_OBJECT Procedure	This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a `BLOB` from Oracle Database to the Cloud Object Storage.
UPDATE_CREDENTIAL Procedure	This procedure updates cloud service credential attributes in Oracle Database.
VALIDATE_EXTERNAL_TABLE Procedure	This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database.

Subprogram	Description
VALIDATE_EXTERNAL_PART_TABLE Procedure	This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database.
VALIDATE_HYBRID_PART_TABLE Procedure	This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Oracle Database.

46.5.1 COPY_DATA Procedure

This procedure loads data into existing Oracle Database tables from files in the Cloud, or from files in a directory. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```
DBMS_CLOUD.COPY_DATA (
    table_name         IN VARCHAR2,
    credential_name    IN VARCHAR2 DEFAULT NULL,
    file_uri_list      IN CLOB,
    schema_name        IN VARCHAR2,
    field_list         IN CLOB,
    format             IN CLOB);

DBMS_CLOUD.COPY_DATA (
    table_name         IN VARCHAR2,
    credential_name    IN VARCHAR2 DEFAULT NULL,
    file_uri_list      IN CLOB DEFAULT NULL,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    field_list         IN CLOB DEFAULT NULL,
    format             IN CLOB DEFAULT NULL
    operation_id       OUT NOCOPY NUMBER);
```

Parameters

Parameter	Description
`table_name`	The name of the target table on the database. The target table needs to be created before you run `COPY_DATA`.
`credential_name`	The name of the credential to access the Cloud Object Storage. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is: '*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. You can use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. For example: '*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example: '*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example: '"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example: '*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote (') .
schema_name	The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.
field_list	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the target table definition. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see *Oracle® Database Utilities*. For an example using field_list, see CREATE_EXTERNAL_TABLE Procedure.
format	The options describing the format of the source, log, and bad files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro or Parquet file format options, see DBMS_CLOUD Package Format Options for Avro or Parquet.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.

Usage Note

The default record delimiter is detected newline. With detected newline, DBMS_CLOUD tries to automatically find the correct newline character to use as the record delimiter. DBMS_CLOUD first searches for the Windows newline character \r\n. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, DBMS_CLOUD searches for the UNIX/Linux newline character \n, and if it finds one it uses \n as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "KUP-04020:

`found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

See DBMS_CLOUD Package Format Options for information on the `recorddelmiter` format option.

46.5.2 COPY_DATA Procedure for Avro or Parquet Files

This procedure with the `format` parameter `type` set to the value `avro` or `parquet` loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud or from files in a directory.

Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table.

Syntax

```
DBMS_CLOUD.COPY_DATA (
    table_name         IN VARCHAR2,
    credential_name    IN VARCHAR2 DEFAULT NULL,
    file_uri_list      IN CLOB,
    schema_name        IN VARCHAR2 DEFAULT,
    field_list         IN CLOB DEFAULT,
    format             IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the target table on the database. The target table needs to be created before you run `COPY_DATA`.
`credential_name`	The name of the credential to access the Cloud Object Storage. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is: '*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. You can use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. For example: '*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example: '*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example: '"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example: '*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote (') .
schema_name	The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.
field_list	Ignored for Avro or Parquet files. The fields in the source match the external table columns by name. Source data types are converted to the external table column data type. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details on mapping. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details on mapping.
format	The options describing the format of the source files. For Avro or Parquet files, only two options are supported: see DBMS_CLOUD Package Format Options for Avro or Parquet.

Usage Notes

- As with other data files, Avro and Parquet data loads generate logs that are viewable in the tables dba_load_operations and user_load_operations. Each load operation adds a record to dba[*user*]_load_operations that indicates the table containing the logs.

  The log table provides summary information about the load.

- For Avro or Parquet, when the format parameter type is set to the value avro or parquet, the BADFILE_TABLE table is always empty.

  – For Parquet files, PRIMARY KEY constraint errors throw an ORA error.

- If data for a column encounters a conversion error, for example, the target column is not large enough to hold the converted value, the value for the column is set to `NULL`. This does not produce a rejected record.

46.5.3 CREATE_CREDENTIAL Procedure

This procedure stores cloud service credentials in Oracle Database.

Use stored cloud service credentials to access the cloud service for data loading, for querying external data residing in the cloud, or for other cases when you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure is overloaded:

- Use the Oracle Cloud Infrastructure-related parameters, including: `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint` only when you are using Oracle Cloud Infrastructure Signing Keys authentication.
- Use the AWS ARN-related parameter `params`, only when you are using Amazon Resource Names (ARNs) credentials.

Syntax

```
DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name   IN VARCHAR2,
    username          IN VARCHAR2,
    password          IN VARCHAR2 DEFAULT NULL);

DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name IN VARCHAR2,
    user_ocid       IN VARCHAR2,
    tenancy_ocid    IN VARCHAR2,
    private_key     IN VARCHAR2,
    fingerprint     IN VARCHAR2);

DBMS_CLOUD.CREATE_CREDENTIAL (
    credential_name  IN VARCHAR2,
    params           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to be stored. The `credential_name` parameter must conform to Oracle object naming conventions, which do not allow spaces or hyphens.
`username`	The `username` and `password` arguments together specify your cloud service credentials. See the usage notes for what to specify for the `username` and `password` for different cloud services.
`password`	The `username` and `password` arguments together specify your cloud service credentials.
`user_ocid`	Specifies the user's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the User's OCID.
`tenancy_ocid`	Specifies the tenancy's OCID. See Where to Get the Tenancy's OCID and User's OCID for details on obtaining the Tenancy's OCID.

Parameter	Description
private_key	Specifies the generated private key. Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for details on generating a key pair in PEM format.
fingerprint	Specifies a fingerprint. After a generated public key is uploaded to the user's account the fingerprint is displayed in the console. Use the displayed fingerprint for this argument. See How to Get the Key's Fingerprint and How to Generate an API Signing Key for more details.
params	Specifies credential parameters using Amazon Resource Names (ARNs) credentials.

Usage Notes

- This operation stores the credentials in the database in an encrypted format.
- You can see the credentials in your schema by querying the `user_credentials` table.
- The `ADMIN` user can see all the credentials by querying the `dba_credentials` table.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.
- This procedure is overloaded. If you provide one of the key based authentication attributes, `user_ocid`, `tenancy_ocid`, `private_key`, or `fingerprint`, the call is assumed to be an Oracle Cloud Infrastructure Signing Key based credential.
- You can list credentials from the view `ALL_CREDENTIALS`. For example, run the following command to list credentials:

```
SELECT credential_name, username, comments FROM all_credentials;
```

Oracle Cloud Infrastructure Credentials (Auth Tokens)

For Oracle Cloud Infrastructure the `username` is your Oracle Cloud Infrastructure user name. The `password` is your Oracle Cloud Infrastructure auth token. See Working with Auth Tokens.

For example:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'DEF_CRED_NAME',
    username => 'adwc_user@example.com',
    password => 'password' );
END;
/
```

Oracle Cloud Infrastructure Signing Key Based Credentials

Use the Oracle Cloud Infrastructure signing key related parameters, including: `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint` with Oracle Cloud Infrastructure Signing Keys authentication.

For example:

```
BEGIN
   DBMS_CLOUD.CREATE_CREDENTIAL (
       credential_name => 'OCI_KEY_CRED',
       user_ocid       =>
'ocid1.user.oc1..aaaaaaaauq54mi7zdyfhw33ozkwuontjceel7fok5nq3bf2vwetkpqsoa',
       tenancy_ocid    =>
'ocid1.tenancy.oc1..aabbbbbbaafcue47pqmrf4vigneebgbcmmoy5r7xvoypicjqqge32ewnrc
yx2a',
       private_key     =>
'MIIEogIBAAKCAQEAtUnxbmrekwgVac6FdWeRzoXvIpA9+0r1.....wtnNpESQQQ0QLGPD8NM//
JEBg=',
       fingerprint     => 'f2:db:f9:18:a4:aa:fc:94:f4:f6:6c:39:96:16:aa:27');
END;
/
```

Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See How to Generate an API Signing Key for more information.

Oracle Cloud Infrastructure Object Storage Classic Credentials

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, the `username` is your Oracle Cloud Infrastructure Classic user name and the `password` is your Oracle Cloud Infrastructure Classic password.

Amazon Web Services (AWS) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, the `username` is your AWS access key ID and the `password` is your AWS secret access key. See AWS Identity and Access Management.

Microsoft Azure Credentials

If your source files reside in Azure Blob Storage or you are calling an Azure API, the `username` is your Azure storage account name and the `password` is an Azure storage account access key. See About Azure storage accounts.

AWS Amazon Resource Names (ARN) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, use `params` to specify the parameters for the Amazon Resource Names (ARN).

Parameter	Value
`aws_role_arn`	Specifies the Amazon Resource Name (ARN) that identifies the AWS role. If this parameter is not supplied when creating the credential, `ORA-20041` is raised.
`external_id_type`	Optionally set the `external_id_type` to use the Oracle Database compartment OCID, database OCID, or tenancy OCID by supplying one of: `compartment_ocid`, `database_ocid`, or `tenant_ocid`. If this parameter is not given when creating the credential, the default value is `database_ocid`.

For example:

```
BEGIN DBMS_CLOUD.CREATE_CREDENTIAL(
        credential_name      => 'MY_CRED',
        params               => JSON_OBJECT(
               'aws_role_arn'      value 'arn:aws:iam::123456:role/
AWS_ROLE_ARN',
               'external_id_type'  value 'database_ocid'));
END;
/
```

GitHub Personal Access Token

If your source files reside in a GitHub repository or you are calling a GitHub API, the `username` is your GitHub email and the `password` is your GitHub personal access token. See Creating a personal access token for more information.

For example:

```
BEGIN
  DBMS_CLOUD.CREATE_CREDENTIAL(
    credential_name => 'MY_GITHUB_CRED',
    username => 'user@example.com',
    password => 'your_personal_access_token' );
END;
/
```

46.5.4 CREATE_EXTERNAL_TABLE Procedure

This procedure creates an external table on files in the Cloud or from files in a directory. This allows you to run queries on external data from Oracle Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
    table_name       IN VARCHAR2,
    credential_name  IN VARCHAR2 DEFAULT NULL,
    file_uri_list    IN CLOB,
    column_list      IN CLOB,
    field_list       IN CLOB DEFAULT,
    format           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage. This parameter is not used when you specify a directory with `file_uri_list`.

Parameter	Description
file_uri_list	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is:'*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. You can use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. For example:'*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example:'*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example:'"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example:'*MY_DIR*:''filename.ext'. This specifies the filename starts with a quote ('). **Usage Notes** • The procedure DBMS_CLOUD.CREATE_EXTERNAL_TABLE supports external partitioned files in the supported cloud object storage services, including: – Oracle Cloud Infrastructure Object Storage – Azure Blob Storage – Amazon S3 – GitHub Repository The credential is a table level property; therefore, the external files must be on the same object store. See DBMS_CLOUD Package File URI Formats for more information.
column_list	Comma-delimited list of column names and data types for the external table.
field_list	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the *column_list* parameter. This argument's syntax is the same as the field_list clause in regular Oracle external tables. For more information about field_list see *Oracle® Database Utilities*.
format	The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options. For Avro or Parquet format files, see CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files.

- The default record delimiter is `detected newline`. With `detected newline`, `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter. `DBMS_CLOUD` first searches for the Windows newline character `\r\n`. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, `DBMS_CLOUD` searches for the UNIX/Linux newline character `\n`, and if it finds one it uses `\n` as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "`KUP-04020: found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

  See DBMS_CLOUD Package Format Options for information on the `recorddelmiter` format option.

Example

```
BEGIN
   DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
      table_name =>'WEATHER_REPORT_DOUBLE_DATE',
      credential_name =>'OBJ_STORE_CRED',
      file_uri_list =>'&base_URL/
Charlotte_NC_Weather_History_Double_Dates.csv',
      format => json_object('type' value 'csv', 'skipheaders' value '1'),
      field_list => 'REPORT_DATE DATE''mm/dd/yy'',
                     REPORT_DATE_COPY DATE ''yyyy-mm-dd'',
                     ACTUAL_MEAN_TEMP,
                     ACTUAL_MIN_TEMP,
                     ACTUAL_MAX_TEMP,
                     AVERAGE_MIN_TEMP,
                     AVERAGE_MAX_TEMP,
                     AVERAGE_PRECIPITATION',
      column_list => 'REPORT_DATE DATE,
                     REPORT_DATE_COPY DATE,
                     ACTUAL_MEAN_TEMP NUMBER,
                     ACTUAL_MIN_TEMP NUMBER,
                     ACTUAL_MAX_TEMP NUMBER,
                     AVERAGE_MIN_TEMP NUMBER,
                     AVERAGE_MAX_TEMP NUMBER,
                     AVERAGE_PRECIPITATION NUMBER');
   END;
/

SELECT * FROM WEATHER_REPORT_DOUBLE_DATE where
   actual_mean_temp > 69 and actual_mean_temp < 74
```

46.5.5 CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files

This procedure with the `format` parameter `type` set to the value `avro` or `parquet` creates an external table with either Avro or Parquet format files in the Cloud or from files in a directory.

This allows you to run queries on external data from Oracle Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
    table_name       IN VARCHAR2,
    credential_name  IN VARCHAR2 DEFAULT NULL,
    file_uri_list    IN CLOB,
    column_list      IN CLOB,
    field_list       IN CLOB DEFAULT,
    format           IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage. This parameter is not used when you specify a directory with `file_uri_list`.
`file_uri_list`	This parameter specifies either a comma-delimited list of source file URIs or one or more directories and source files. **Cloud source file URIs** You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. The format of the URIs depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats. **Directory** You can specify one directory and one or more file names or use a comma separated list of directories and file names. The format to specify a directory is:'*MY_DIR*:*filename.ext*'. By default the directory name *MY_DIR* is a database object and is case-insensitive. The file name is case sensitive. You can use wildcards to specify file names in a directory. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character. For example:'*MY_DIR*:*" or '*MY_DIR*:test?' To specify multiple directories, use a comma separated list of directories: For example:'*MY_DIR1*:*, *MY_DIR2*:test?' Use double quotes to specify a case-sensitive directory name. For example:'"*my_dir1*":*, "*my_dir2*":Test?' To include a quote character, use two quotes. For example:'*MY_DIR*:''filename.ext'. This specifies the `filename` starts with a quote (`'`).

Parameter	Description
column_list	(Optional) This field, when specified, overrides the format->schema parameter which specifies that the schema, columns, and data types, are derived automatically. See the format parameter for details. When the column_list is specified for Avro or Parquet source, the column names must match those columns found in the file. Oracle data types must map appropriately to the Avro or Parquet data types. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details.
field_list	Ignored for Avro or Parquet files. The fields in the source match the external table columns by name. Source data types are converted to the external table column data type. For Parquet files, see DBMS_CLOUD Package Parquet to Oracle Data Type Mapping for details. For Avro files, see DBMS_CLOUD Package Avro to Oracle Data Type Mapping for details.
format	For Avro or Parquet, there are only two supported parameters. See DBMS_CLOUD Package Format Options for Avro or Parquet for details.

Examples Avro

```
format => '{"type":"avro", "schema": "all"}'
```

```
format => json_object('type' value 'avro', 'schema' value 'first')
```

Examples Parquet

```
format => '{"type":"parquet", "schema": "all"}'
```

```
format => json_object('type' value 'parquet', 'schema' value 'first')
```

Avro or Parquet Column Name Mapping to Oracle Column Names

See DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping for information on column name mapping and column name conversion usage in Oracle SQL.

46.5.6 CREATE_EXTERNAL_PART_TABLE Procedure

This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.

Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    partitioning_clause  IN CLOB,
    column_list          IN CLOB,
```

```
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);

DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_uri_list        IN VARCHAR2,
    column_list          IN CLOB,
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage.
`partitioning_clause`	Specifies the complete partitioning clause, including the location information for individual partitions. If you use the `partitioning_clause` parameter, the `file_uri_list` parameter is not allowed.
`file_uri_list`	There are two options for the `file_uri_list` parameter: • A common-delimited list of individual file URIs without wildcards. • A single file URI with wildcards, and the wildcards can only be after the last slash "/". If you use the parameter `file_uri_list`, the `partitioning_clause` parameter is not allowed. The format of the URIs depends on the Cloud Object Storage service. See DBMS_CLOUD Package File URI Formats for more information.
`column_list`	Comma-delimited list of column names and data types for the external table. This parameter has the following requirements, depending on the type of the data files specified with the `file_uri_list` parameter: • The `column_list` parameter is required with unstructured files. Using unstructured files, for example with CSV text files, the `column_list` parameter must specify all the column names and data types inside the data file as well as the partition columns derived from the object name. • The `column_list` parameter is optional with structured files. For example, with Avro, ORC, or Parquet data files, the `column_list` is not required. When the `column_list` is not included, the `format` parameter `partition_columns` option must include specifications for both column names (`name`) and data types (`type`).
`field_list`	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the *column_list* parameter. This argument's syntax is the same as the `field_list` clause in regular Oracle external tables. For more information about `field_list` see *Oracle® Database Utilities*.

Parameter	Description
format	The format option partition_columns specifies the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column names and data types of partition columns when the partition columns are derived from the file path, depending on the type of data file, structured or unstructured: • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE includes the column_list parameter and the data files are unstructured, such as with CSV text files, partition_columns does not include the data type. For example, use a format such as the following for this type of partition_columns specification: '"partition_columns":["state","zipcode"]' The data type is not required because it is specified in the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column_list parameter. • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE does not include the column_list parameter and the data files are structured, such as Avro, ORC, or Parquet files, the partition_columns option includes both the column name, name sub-clause, and the data type, type sub-clause. For example, the following shows a partition_columns specification: '"partition_columns":[{"name":"country", "type":"varchar2(10)"}, {"name":"year", "type":"number"}, {"name":"month", "type":"varchar2(10)"}]' If the data files are unstructured and the type sub-clause is specified with partition_columns, the type sub-clause is ignored. For object names that are not based on hive format, the order of the partition_columns specified columns must match the order as they appear in the object name in the file path specified in the file_uri_list parameter. To see all the format parameter options describing the format of the source files, see DBMS_CLOUD Package Format Options.

Usage Notes

- You cannot call this procedure with both partitioning_clause and file_uri_list parameters.
- Specifying the column_list parameter is optional with structured data files, including Avro, Parquet, or ORC data files. If column_list is not specified, the format parameter partition_columns option must include both name and type.
- The column_list parameter is required with unstructured data files, such as CSV text files.
- The procedure DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage

  - Azure Blob Storage
  - Amazon S3
  - GitHub Repository

  See DBMS_CLOUD Package File URI Formats for more information.

- When you call `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` with the `file_uri_list` parameter, the types for columns specified in the Cloud Object Store file name must be one of the following types:

  ```
  VARCHAR2(n)
  NUMBER(n)
  NUMBER(p,s)
  NUMBER
  DATE
  TIMESTAMP(9)
  ```

- The default record delimiter is `detected newline`. With `detected newline`, `DBMS_CLOUD` tries to automatically find the correct newline character to use as the record delimiter. `DBMS_CLOUD` first searches for the Windows newline character `\r\n`. If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, `DBMS_CLOUD` searches for the UNIX/Linux newline character `\n`, and if it finds one it uses `\n` as the record delimiter for all files in the procedure. If the source files use a combination of different record delimiters, you may encounter an error such as, "`KUP-04020: found record longer than buffer size supported`". In this case, you need to either modify the source files to use the same record delimiter or only specify the source files that use the same record delimiter.

  See DBMS_CLOUD Package Format Options for information on the `recorddelmiter` format option.

- The external partitioned tables you create with `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` include two invisible columns `file$path` and `file$name`. These columns help identify which file a record is coming from.

  - `file$path`: Specifies the file path text up to the beginning of the object name.
  - `file$name`: Specifies the object name, including all the text that follows the bucket name.

Examples

Example using the `partitioning_clause` parameter:

```
BEGIN
   DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
      table_name =>'PET1',
      credential_name =>'OBJ_STORE_CRED',
      format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'characterset' value 'us7ascii'),
      column_list => 'col1 number, col2 number, col3 number',
      partitioning_clause => 'partition by range (col1)
                              (partition p1 values less than (1000) location
                                  ( ''&base_URL//file_11.txt'')
                               ,
                               partition p2 values less than (2000) location
                                  ( ''&base_URL/file_21.txt'')
```

```
                                        ,
                                        partition p3 values less than (3000)
               location
                                           ( ''&base_URL/file_31.txt'')
                                        )'
                    );
                 END;
               /
```

Example using the `file_uri_list` and `column_list` parameters with unstructured data files:

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
   table_name => 'MYSALES',
   credential_name => 'DEF_CRED_NAME',
   file_uri_list     => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-
string/b/bucketname/o/*.csv',
   column_list       => 'product varchar2(100), units number, country varchar2(100), year
number, month varchar2(2)',
   field_list        => 'product, units', --[Because country, year and month are not in the
file, they are not listed in the field list]
   format            => '{"type":"csv", "partition_columns":["country","year","month"]}');
END;
/
```

Example using the `file_uri_list` without the `column_list` parameter with structured data files:

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
  table_name => 'MYSALES',
  credential_name => 'DEF_CRED_NAME',
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
    table_name      => 'MYSALES',
    credential_name => 'DEF_CRED_NAME',
    file_uri_list   => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-
string/b/bucketname/o/*.parquet',
    format          =>
        json_object('type' value 'parquet', 'schema' value 'first',
                    'partition_columns' value
                          json_array(
                                json_object('name' value 'country', 'type' value
'varchar2(100)'),
                                json_object('name' value 'year', 'type' value 'number'),
                                json_object('name' value 'month', 'type' value 'varchar2(2)')
                          )
         )
    );
END;
/
```

46.5.7 CREATE_HYBRID_PART_TABLE Procedure

This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.

Syntax

```
DBMS_CLOUD.CREATE_HYBRID_PART_TABLE (
    table_name           IN VARCHAR2,
    credential_name      IN VARCHAR2,
    partitioning_clause  IN CLOB,
    column_list          IN CLOB,
    field_list           IN CLOB DEFAULT,
    format               IN CLOB DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`credential_name`	The name of the credential to access the Cloud Object Storage.
`partitioning_clause`	Specifies the complete partitioning clause, including the location information for individual partitions.
`column_list`	Comma-delimited list of column names and data types for the external table.
`field_list`	Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the *column_list* parameter. This argument's syntax is the same as the `field_list` clause in regular Oracle external tables. For more information about `field_list` see *Oracle® Database Utilities*.
`format`	The options describing the format of the source files. For the list of the options and how to specify the values see DBMS_CLOUD Package Format Options.

Usage Note

- The procedure `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3
  - GitHub Repository

  The credential is a table level property; therefore, the external files must be on the same object store.

  See DBMS_CLOUD Package File URI Formats for more information.
- The external partitioned tables you create with `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` include two invisible columns `file$path` and `file$name`. These columns help identify which file a record is coming from.
  - `file$path`: Specifies the file path text up to the beginning of the object name.

- `file$name`: Specifies the object name, including all the text that follows the bucket name.

Example

```
BEGIN
   DBMS_CLOUD.CREATE_HYBRID_PART_TABLE(
      table_name =>'HPT1',
      credential_name =>'OBJ_STORE_CRED',
      format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'characterset' value 'us7ascii'),
      column_list => 'col1 number, col2 number, col3 number',
      partitioning_clause => 'partition by range (col1)
                                (partition p1 values less than (1000)
external location
                                    ( ''&base_URL/file_11.txt'')
                                ,
                                partition p2 values less than (2000)
external location
                                    ( ''&base_URL/file_21.txt'')
                                ,
                                partition p3 values less than (3000)
                                )'
     );
   END;
/
```

46.5.8 DELETE_ALL_OPERATIONS Procedure

This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.

Syntax

```
DBMS_CLOUD.DELETE_ALL_OPERATIONS (
    type      IN VARCHAR DEFAULT NULL);
```

Parameters

Parameter	Description
`type`	Specifies the type of operation to delete. Type values can be found in the `TYPE` column in the `user_load_operations` table. If no `type` is specified all rows are deleted.

Usage Note

- `DBMS_CLOUD.DELETE_ALL_OPERATIONS` does not delete currently running operations (operations in a "Running" status).

46.5.9 DELETE_FILE Procedure

This procedure removes the specified file from the specified directory on Oracle Database.

Syntax

```
DBMS_CLOUD.DELETE_FILE (
      directory_name     IN VARCHAR2,
      file_name          IN VARCHAR2);
```

Parameters

Parameter	Description
directory_name	The name of the directory on the Oracle Database instance.
file_name	The name of the file to be removed.

> **Note:**
>
> To run DBMS_CLOUD.DELETE_FILE, you need to grant write privileges on the directory that contains the file to the user. For example, run the following command as ADMIN to grant write privileges to db_user:
>
> ```
> GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
> ```

Example

```
BEGIN
   DBMS_CLOUD.DELETE_FILE(
      directory_name =>  'DATA_PUMP_DIR',
      file_name => 'exp1.dmp' );
   END;
/
```

46.5.10 DELETE_OBJECT Procedure

This procedure deletes the specified object on object store.

Syntax

```
DBMS_CLOUD.DELETE_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage.
object_uri	Object or file URI for the object to delete. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.
force	Ignore and do not report errors if object does not exist. Valid values are: TRUE and FALSE. The default value is FALSE.

Example

```
BEGIN
   DBMS_CLOUD.DELETE_OBJECT(
       credential_name => 'DEF_CRED_NAME',
       object_uri => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/exp1.dmp' );
   END;
/
```

46.5.11 DROP_CREDENTIAL Procedure

This procedure removes an existing credential from Oracle Database.

Syntax

```
DBMS_CLOUD.DROP_CREDENTIAL (
   credential_name     IN VARCHAR2);
```

Parameters

Parameter	Description
credential_name	The name of the credential to be removed.

46.5.12 GET_OBJECT Procedure and Function

This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a BLOB to Oracle Database.

Syntax

```
DBMS_CLOUD.GET_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       directory_name       IN VARCHAR2,
       file_name            IN VARCHAR2 DEFAULT  NULL,
       startoffset          IN NUMBER DEFAULT  0,
       endoffset            IN NUMBER DEFAULT  0,
       compression          IN VARCHAR2 DEFAULT  NULL);
```

```
DBMS_CLOUD.GET_OBJECT(
       credential_name      IN VARCHAR2 DEFAULT NULL,
       object_uri           IN VARCHAR2,
       startoffset          IN NUMBER DEFAULT  0,
       endoffset            IN NUMBER DEFAULT  0,
       compression          IN VARCHAR2 DEFAULT  NULL)
RETURN BLOB;
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage.
object_uri	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.
directory_name	The name of the directory on the database. [1]
file_name	Specifies the name of the file to create. If file name is not specified, the file name is taken from after the last slash in the object_uri parameter. For special cases, for example when the file name contains slashes, use the file_name parameter.
startoffset	The offset, in bytes, from where the procedure starts reading.
endoffset	The offset, in bytes, until where the procedure stops reading.
compression	Specifies the compression used to store the object. When compression is set to 'AUTO' the file is uncompressed (the value 'AUTO' implies the object specified with object_uri is compressed with Gzip).

> **Note:**
>
> To run DBMS_CLOUD.GET_OBJECT, you need to grant WRITE privileges on the directory to the user. For example, run the following command as ADMIN to grant write privileges to db_user:
>
> ```
> GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
> ```

Return Values

The function form reads from Object Store and DBMS_CLOUD.GET_OBJECT returns a BLOB.

Examples

```
BEGIN
   DBMS_CLOUD.GET_OBJECT(
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt',
     directory_name => 'DATA_PUMP_DIR');
```

```
END;
/
```

To read character data from a file in Object Store:

```
SELECT to_clob(
     DBMS_CLOUD.GET_OBJECT(
       credential_name => 'OBJ_STORE_CRED',
       object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt'))
FROM DUAL;
```

To add an image stored on Object Store in a `BLOB` in the database:

```
DECLARE
   l_blob BLOB := NULL;
BEGIN
   l_blob := DBMS_CLOUD.GET_OBJECT(
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/MyImage.gif' );
END;
/
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

46.5.13 LIST_FILES Function

This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.

Syntax

```
DBMS_CLOUD.LIST_FILES (
    directory_name      IN VARCHAR2)
       RETURN TABLE;
```

Parameters

Parameter	Description
`directory_name`	The name of the directory on the database.

Usage Notes

- `DBMS_CLOUD.LIST_FILES` is only supported for directory objects mapping to Oracle File System (OFS) or Database File System (DBFS) file systems.

- To run DBMS_CLOUD.LIST_FILES, you need to grant read privileges on the directory to the user. For example, run the following command as ADMIN to grant read privileges to db_user:

```
GRANT READ ON DIRECTORY data_pump_dir TO db_user;
```

- This is a pipelined table function with return type as DBMS_CLOUD_TYPES.list_object_ret_t.
- DBMS_CLOUD.LIST_FILES does not obtain the checksum value and returns NULL for this field.

Example

This is a pipelined function that returns a row for each file. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_FILES('DATA_PUMP_DIR');

OBJECT_NAME       BYTES   CHECKSUM      CREATED              LAST_MODIFIED
------------ ---------- ----------    ---------------------
---------------------
cwallet.sso        2965               2018-12-12T18:10:47Z
2019-11-23T06:36:54Z
```

46.5.14 LIST_OBJECTS Function

This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.

Syntax

```
DBMS_CLOUD.LIST_OBJECTS (
       credential_name      IN VARCHAR2,
       location_uri         IN VARCHAR2)
   RETURN TABLE;
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage.
location_uri	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.

Usage Notes

- Depending on the capabilities of the object store, DBMS_CLOUD.LIST_OBJECTS does not return values for certain attributes and the return value for the field is NULL in this case.

  All supported Object Stores return values for the OBJECT_NAME, BYTES, and CHECKSUM fields.

The following table shows support for the fields `CREATED` and `LAST_MODIFIED` by Object Store:

Object Store	CREATED	LAST_MODIFIED
Oracle Cloud Infrastructure Native	Returns timestamp	Returns timestamp
Oracle Cloud Infrastructure Swift	Returns `NULL`	Returns timestamp
Oracle Cloud Infrastructure Classic	Returns `NULL`	Returns timestamp
Amazon S3	Returns `NULL`	Returns timestamp
Azure	Returns timestamp	Returns timestamp
GitHub Repository		

- The checksum value is the MD5 checksum. This is a 32-character hexadecimal number that is computed on the object contents. It is expected to have a different checksum value if `OCI$RESOURCE_PRINCIPAL` credential is used.
- This is a pipelined table function with return type as `DBMS_CLOUD_TYPES.list_object_ret_t`.

Example

This is a pipelined function that returns a row for each object. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_OBJECTS('OBJ_STORE_CRED',
    'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/
bucketname/o/');

OBJECT_NAME   BYTES              CHECKSUM
CREATED         LAST_MODIFIED
------------ ---------- --------------------------------
--------------------- --------------------
cwallet.sso   2965      2339a2731ba24a837b26d344d643dc07
2019-11-23T06:36:54Z
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

46.5.15 PUT_OBJECT Procedure

This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a `BLOB` from Oracle Database to the Cloud Object Storage.

Syntax

```
DBMS_CLOUD.PUT_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       directory_name       IN VARCHAR2,
       file_name            IN VARCHAR2);
```

```
DBMS_CLOUD.PUT_OBJECT (
       credential_name      IN VARCHAR2,
       object_uri           IN VARCHAR2,
       contents             IN BLOB,
       file_name            IN VARCHAR2);
```

Parameters

Parameter	Description
credential_name	The name of the credential to access the Cloud Object Storage.
object_uri	Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see DBMS_CLOUD Package File URI Formats.
directory_name	The name of the directory on the Oracle Database. [1]
file_name	The name of the file in the specified directory.

> **Note:**
>
> To run DBMS_CLOUD.PUT_OBJECT, you need to grant read privileges on the directory to the user. For example, run the following command as ADMIN to grant read privileges to db_user:
>
> ```
> GRANT READ ON DIRECTORY data_pump_dir TO db_user;
> ```

Example

To handle BLOB data after in-database processing and then store the data directly into a file in the object store:

```
DECLARE
      my_blob_data BLOB;
BEGIN
 /* Some processing producing BLOB data and populating my_blob_data */
DBMS_CLOUD.PUT_OBJECT(
     credential_name => 'OBJ_STORE_CRED',
     object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/my_new_file',
     contents => my_blob_data));
END;
/
```

Usage Notes

Depending on your Cloud Object Storage, the size of the object you transfer is limited as follows:

Cloud Object Storage Service	Object Transfer Size Limit
Oracle Cloud Infrastructure Object Storage	50 GB

Cloud Object Storage Service	Object Transfer Size Limit
Amazon S3	5 GB
Azure Blob Storage	256 MB

Oracle Cloud Infrastructure object store does not allow writing files into a public bucket without supplying credentials (Oracle Cloud Infrastructure allows users to download objects from public buckets). Thus, you must supply a credential name with valid credentials to store an object in an Oracle Cloud Infrastructure public bucket using `PUT_OBJECT`.

See DBMS_CLOUD Package File URI Formats for more information.

46.5.16 UPDATE_CREDENTIAL Procedure

This procedure updates cloud service credential attributes in Oracle Database.

Use stored credentials for data loading, for querying external data residing in the Cloud, or wherever you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure lets you update an attribute with a new value for a specified `credential_name`.

Syntax

```
DBMS_CLOUD.UPDATE_CREDENTIAL (
    credential_name   IN VARCHAR2,
    attribute         IN VARCHAR2,
    value             IN VARCHAR2);
```

Parameters

Parameter	Description
`credential_name`	The name of the credential to be stored.
`attribute`	Name of attribute to update: `USERNAME` or `PASSWORD`.
`value`	New value for the selected attribute.

Usage Notes

- The user name is case sensitive. It cannot contain double quotes or spaces.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.

Example

```
BEGIN
  DBMS_CLOUD.UPDATE_CREDENTIAL(
     credential_name => 'OBJ_STORE_CRED',
     attribute => 'PASSWORD',
     value => 'password');
END;
/
```

46.5.17 VALIDATE_EXTERNAL_TABLE Procedure

This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE (
    table_name      IN VARCHAR2,
    schema_name     IN VARCHAR2 DEFAULT,
    rowcount        IN NUMBER DEFAULT,
    stop_on_error   IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE(
    table_name      IN VARCHAR2,
    operation_id    OUT NOCOPY NUMBER,
    schema_name     IN VARCHAR2 DEFAULT NULL,
    rowcount        IN NUMBER DEFAULT 0,
    stop_on_error   IN BOOLEAN DEFAULT TRUE);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`operation_id`	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the `USER_LOAD_OPERATIONS` view.
`schema_name`	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.
`rowcount`	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
`stop_on_error`	Determines if the validate should stop when a row is rejected. The default value is `TRUE` meaning the validate stops at the first rejected row. Setting the value to `FALSE` specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the `rowcount` parameter. If the external table refers to Avro or Parquet files then the validate stops at the first rejected row. When the external table specifies the `format` parameter `type` set to the value `avro` or `parquet`, the parameter `stop_on_error` effectively always has the value `TRUE`. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.

Usage Notes

- `DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE` works with both partitioned external tables and hybrid partitioned tables. This potentially reads data from all external partitions until `rowcount` is reached or `stop_on_error` applies. You do not have control over which partition, or parts of a partition, is read in which order.

46.5.18 VALIDATE_EXTERNAL_PART_TABLE Procedure

This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database. The overloaded form enables you to use the `operation_id` parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
       table_name                 IN VARCHAR2,
       partition_name             IN CLOB DEFAULT,
       schema_name                IN VARCHAR2 DEFAULT,
       rowcount                   IN NUMBER DEFAULT,
       partition_key_validation   IN BOOLEAN DEFAULT,
       stop_on_error              IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
       table_name                 IN VARCHAR2,
       operation_id               OUT NUMBER,
       partition_name             IN CLOB DEFAULT,
       schema_name                IN VARCHAR2 DEFAULT,
       rowcount                   IN NUMBER DEFAULT,
       partition_key_validation   IN BOOLEAN DEFAULT,
       stop_on_error              IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
`table_name`	The name of the external table.
`operation_id`	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the `USER_LOAD_OPERATIONS` view.
`partition_name`	If defined, then only a specific partition is validated. If not specified then read all partitions sequentially until `rowcount` is reached.
`schema_name`	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.
`rowcount`	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
`partition_key_validation`	For internal use only. Do not use this parameter.

Parameter	Description
stop_on_error	Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter. If the external table refers to Avro or Parquet files then the validate stops at the first rejected row. When the external table specifies the format parameter type set to the value avro or parquet, the parameter stop_on_error effectively always has the value TRUE. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.

46.5.19 VALIDATE_HYBRID_PART_TABLE Procedure

This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Oracle Database. The overloaded form enables you to use the operation_id parameter.

Syntax

```
DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (
       table_name                 IN VARCHAR2,
       partition_name             IN CLOB DEFAULT,
       schema_name                IN VARCHAR2 DEFAULT,
       rowcount                   IN NUMBER DEFAULT,
       partition_key_validation   IN BOOLEAN DEFAULT,
       stop_on_error              IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (
       table_name                 IN VARCHAR2,
       operation_id               OUT NUMBER,
       partition_name             IN CLOB DEFAULT,
       schema_name                IN VARCHAR2 DEFAULT,
       rowcount                   IN NUMBER DEFAULT,
       partition_key_validation   IN BOOLEAN DEFAULT,
       stop_on_error              IN BOOLEAN DEFAULT);
```

Parameters

Parameter	Description
table_name	The name of the external table.
operation_id	Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.
partition_name	If defined, then only a specific partition is validated. If not specified then read from all external partitions sequentially until rowcount is reached.
schema_name	The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.

Parameter	Description
rowcount	Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.
partition_key_validation	For internal use only. Do not use this parameter.
stop_on_error	Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter. If the external table refers to Avro or Parquet files then the validate stops at the first rejected row. When the external table specifies the format parameter type set to the value avro or parquet, the parameter stop_on_error effectively always has the value TRUE. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.

46.6 DBMS_CLOUD Package File URI Formats

Describes the format of the source file URIs in operations with DBMS_CLOUD. The format depends on the object storage service you are using.

DBMS_CLOUD guarantees secure communication and any URI that you specify must use HTTPS, with https:// as the prefix for the URI.

Topics

- Oracle Cloud Infrastructure Object Storage Native URI Format
- Oracle Cloud Infrastructure Object Storage Swift URI Format
- Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL
- URI Format Using Public URL
- Oracle Cloud Infrastructure Object Storage Classic URI Format
- Amazon S3 URI Format
- Azure Blob Storage URI Format

46.6.1 Oracle Cloud Infrastructure Object Storage Native URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure native URIs, with the format:

https://objectstorage.*region*.oraclecloud.com/n/*namespace-string*/b/*bucket*/o/*filename*

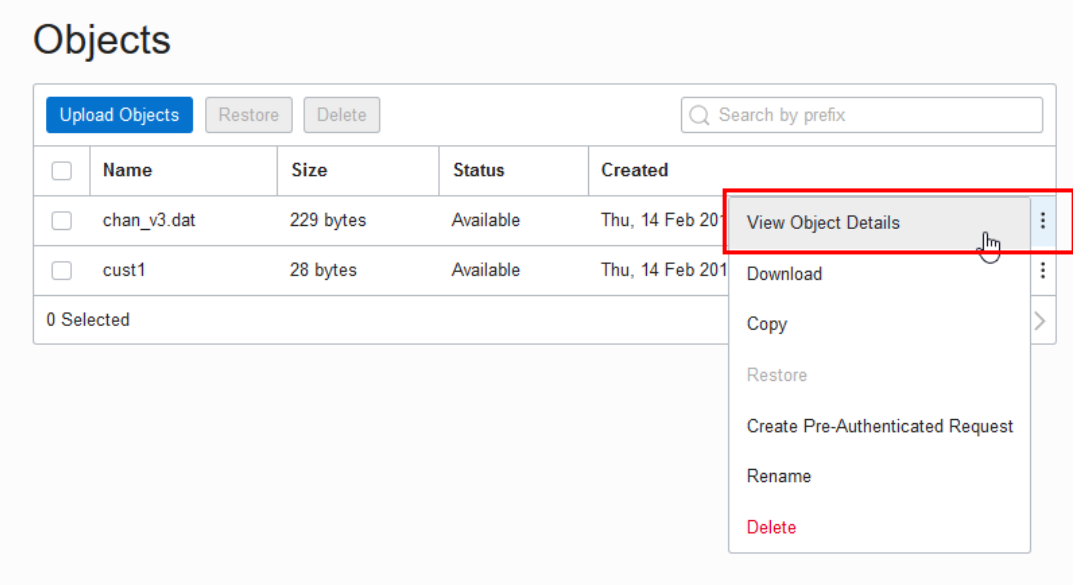
For example, the Native URI for the file `channels.txt` in the *`bucketname`* bucket in the `Phoenix` data center is:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/
bucketname/o/channels.txt
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

You can find the URI from the Oracle Cloud Infrastructure Object Storage "Object Details" in the right hand side ellipsis menu in the Object Store:

1. Open the Oracle Cloud Infrastructure Console by clicking the ☰ next to Oracle Cloud.
2. From the Oracle Cloud Infrastructure left navigation menu click **Core Infrastructure**. Under **Object Storage**, click **Object Storage**.
3. Under List Scope, select a **Compartment**.
4. From the **Name** column, select a bucket.
5. In the Objects area, click **View Object Details**.



6. On the **Object Details** page, the **URL Path (URI)** field shows the URI to access the object.

> **Note:**
>
> The source files need to be stored in an Object Storage tier bucket. Oracle Database does not support buckets in the Archive Storage tier. See Overview of Object Storage for more information.

46.6.2 Oracle Cloud Infrastructure Object Storage Swift URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure Swift URIs with the format:

```
https://swiftobjectstorage.region.oraclecloud.com/v1/namespace-string/bucket/
filename
```

For example, the Swift URI for the file `channels.txt` in the *bucketname* bucket in the `Phoenix` data center is:

```
https://swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1/namespace-string/
bucketname/channels.txt
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See Understanding Object Storage Namespaces for more information.

> **Note:**
>
> The source files need to be stored in an Object Storage tier bucket. Oracle Database does not support buckets in the Archive Storage tier. See Overview of Object Storage for more information.

46.6.3 Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure pre-authenticated URIs. When you create a pre-authenticated request, a unique URL is generated. You can then provide the unique URL to users in your organization, partners, or third parties to access the Object Storage resource target identified in the pre-authenticated request.

> **Note:**
>
> Carefully assess the business requirement for and the security ramifications of pre-authenticated access. When you create the pre-authenticated request URL, note the **Expiration** and the **Access Type** to make sure they are appropriate for your use. A pre-authenticated request URL gives anyone who has the URL access to the targets identified in the request for as long as the request is active. In addition to considering the operational needs of pre-authenticated access, it is equally important to manage its distribution.

The format for pre-authenticated request URLs is:

```
https://objectstorage.region.oraclecloud.com/p/encrypted_string/n/namespace-string/b/
bucket/o/filename
```

For example, a sample pre-authenticated URI for the file `channels.txt` in the *bucketname* bucket in the `Phoenix` data center is:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/p/2xN-uDtWJNsiD910UCYGue/n/namespace-string/b/bucketname/o/channels.txt
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

You can use a pre-authenticated URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Oracle Cloud Infrastructure object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example:

```
BEGIN
  DBMS_CLOUD.COPY_DATA(
     table_name =>'CHANNELS',
     file_uri_list =>'https://objectstorage.us-phoenix-1.oraclecloud.com/p/
unique-pre-authenticated-string/n/namespace-string/b/bucketname/o/
channels.txt',
     format => json_object('delimiter' value ',') );
END;
/
```

> **Note:**
>
> A list of mixed URLs is valid. If the URL list contains both pre-authenticated URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the pre-authenticated URLs the specified `credential_name` is ignored.

See Using Pre-Authenticated Requests for more information.

46.6.4 URI Format Using Public URL

If your source files reside on an Object Store that provides public URLs, you can use public URLs with `DBMS_CLOUD` procedures. Public means the Object Storage service supports anonymous, unauthenticated access to the Object Store files. See your Cloud Object Storage service for details on how to make an object public in a supported Object Store.

> **Note:**
>
> Carefully assess the business requirement for and the security ramifications of using public URLs. When you use public URLs, due to the file content not being authenticated, make sure this is appropriate for your use.

You can use a public URL in any `DBMS_CLOUD` procedure that takes a URL to access files in your object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example the following uses `DBMS_CLOUD.COPY_DATA` without a `credential_name`:

```
BEGIN
  DBMS_CLOUD.COPY_DATA(
     table_name =>'CHANNELS',
     file_uri_list =>'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/chan_v3.dat',
     format => json_object('delimiter' value ',') );
END;
/
```

In this example, *`namespace-string`* is the Oracle Cloud Infrastructure object storage namespace and *`bucketname`* is the bucket name. See Understanding Object Storage Namespaces for more information.

> **Note:**
>
> A list of mixed URLs is valid. If the URL list contains both public URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the public URLs the specified `credential_name` is ignored.

See Public Buckets for information on using Oracle Cloud Infrastructure public buckets.

46.6.5 Oracle Cloud Infrastructure Object Storage Classic URI Format

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, see the REST page for a description of the URI format for accessing your files: About REST URLs for Oracle Cloud Infrastructure Object Storage Classic Resources.

46.6.6 Amazon S3 URI Format

If your source files reside in Amazon S3, see the following for a description of the URI format for accessing your files: Accessing a Bucket.

For example the following refers to the file `channels.txt` in the `adb` bucket in the `us-west-2` region.

```
https://s3-us-west-2.amazonaws.com/adb/channels.txt
```

> **Note:**
>
> `DBMS_CLOUD` only supports native S3 storage, and no S3-compliant APIs or storage devices.

46.6.7 Azure Blob Storage URI Format

If your source files reside in Azure Blob Storage, see the following for a description of the URI format for accessing your files: Resource URI Syntax.

For example the following refers to the file `channels.txt` in the `adb` container in the storage account `db_user`:

```
https://db_user.blob.core.windows.net/adb/channels.txt
```

> **Note:**
>
> You can use Shared Access Signatures (SAS) URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Azure Blob Storage, without the need to create a credential. To use a Shared Access Signature (SAS) URL, either specify the `credential_name` parameter as `NULL`, or do not supply a `credential_name` parameter.
> See Grant Limited Access to Azure Storage Resources Using Shared Access Signatures (SAS) for more information.

46.7 DBMS_CLOUD Package Format Options

The format argument in `DBMS_CLOUD` specifies the format of source files.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value'))
```

Examples:

```
format => json_object('type' VALUE 'CSV')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
                      'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull'
value 'true', 'logretention' value 7)
```

> **Note:**
>
> For Avro or Parquet format options, see DBMS_CLOUD Package Format Options for Avro or Parquet.

Format Option	Description	Syntax
`blankasnull`	When set to `true`, loads fields consisting of spaces as null.	`blankasnull : true` Default value: `False`
`characterset` Valid with `format` JSON and `COPY_DATA`	Specifies the characterset of source files	`characterset`: *string* Default value: Database characterset
`columnpath` Only use with `format` JSON and `COPY_DATA`	Array of JSON path expressions that correspond to the fields that need to be extracted from the JSON records. Each of the JSON path expressions in the array should follow the rules described in SQL/JSON Path Expressions . Only use with format JSON and `DBMS_CLOUD.COPY_DATA`.	JSON Array of json path expressions expressed in string format. For example: 'columnpath' value `'["$.WEATHER_STATION_ID", "$.WEATHER_STATION_NAME"]'`
`compression`	Specifies the compression type of the source file. ZIP archiving format is not supported. Specifying the value `auto` checks for the compression types: `gzip, zlib, bzip2`.	`compression`: `auto|gzip|zlib|bzip2` Default value: Null value meaning no compression.
`conversionerrors`	If a row is rejected because of data type conversion errors, the related columns are stored as null or the row is rejected.	`conversionerrors` : `reject_record | store_null` Default value: `reject_record`

`dateformat`	Specifies the date format in the source file. The format option `AUTO` searches for the following formats:
	`J`
	`MM-DD-YYYYBC`
	`MM-DD-YYYY`
	`YYYYMMDD HHMISS`
	`YYMMDD HHMISS`
	`YYYY.DDD`
	`YYYY-MM-DD`
		`dateformat` : *string*
		Default value: Database date format

`delimiter`	Specifies the field delimiter. To use a special character as the delimiter, specify the HEX value of the ASCII code of the character. For example, the following specifies the TAB character as the delimiter: `format => json_object('delimiter' value 'X''9''')`	`delimiter` : *character* Default value `|` (pipe character)
`enablelogs`	Specifies a boolean value, when set to `TRUE`, logs are generated. When set to `FALSE`, logs are not generated. The value for `enablelogs` must be enclosed in single quotes. For example: `format => JSON_OBJECT('enablelogs' value 'FALSE')`	`enablelogs: false` Default value: `true`

Format Option	Description	Syntax
endquote	Data can be enclosed between two delimiters, specified with quote and endquote. The quote and endquote characters are removed during loading when specified. For example: format => JSON_OBJECT('quote' value '(', 'endquote' value ')')	endquote:character Default value: Null, meaning no endquote.
escape	The character "\" is used as the escape character when specified.	escape : true Default value: false
ignoreblanklines	Blank lines are ignored when set to true.	ignoreblanklines : true Default value: False
ignoremissingcolumns	If there are more columns in the field_list than there are in the source files, the extra columns are stored as null.	ignoremissingcolumns : true Default value False
language	Specifies a language name (for example, FRENCH), from which locale-sensitive information can be derived.	language: *string* Default value: Null See Locale Data in *Oracle Database Globalization Support Guide* for a listing of Oracle-supported languages.
logdir	Specifies a string value that determines the directory object name where the logfile_table or badfile_table files are saved. By default, the logdir is not case-sensitive, but the case is reserved when the specified value is enclosed in double-quotes. For example: format => JSON_OBJECT ('logdir' value 'test_log') The logdir format option specified in the above example saves the logfile_table or badfile_table files in the TEST_LOG directory object. format => JSON_OBJECT ('logdir' value '"test_log"') The logdir format option specified in the above example saves the logfile_table or badfile_table files in the test_log directory object.	logdir: *string* Default value: DATA_PUMP_DIR
logprefix	Specifies a string value that determines the prefix for the logfile_table and badfile_table files. The log table name format is: *logprefix*$*operation_id* By default, the logprefix is in upper case, but the case is reserved when the specified value is enclosed in double-quotes. For example: format => JSON_OBJECT ('logprefix' value 'TEST') Log files then use the TEST prefix, such as: TEST$2_LOG and TEST$2_BAD.	logprefix: *string* Default value: COPY

Format Option	Description	Syntax
`logretention`	Specifies a positive integer duration, in days, for which the `logfile_table` and `badfile_table` files are retained. Valid values: `0` to `99999` For example: `format => JSON_OBJECT ('logretention' value 7)`	`logretention`: *number* Default value: `2`
`numericcharacters`	Specifies the characters to use as the group separator and decimal character. *decimal_character*: The decimal separates the integer portion of a number from the decimal portion. *group_separator*: The group separator separates integer groups (that is, thousands, millions, billions, and so on).	`numericcharacters: 'decimal_character group_separator'` Default value: `"."` See NLS_NUMERIC_CHARACTERS in *Oracle Database Globalization Support Guide* for more information.
`numberformat`	Specifies the number format model. Number format models cause the number to be rounded to the specified number of significant digits. A number format model is composed of one or more number format elements. This is used in combination with `numericcharacters`.	`numberformat: number_format_model` Default value: is derived from the setting of the `NLS_TERRITORY` parameter See Number Format Models in *SQL Language Reference* for more information.

Format Option	Description	Syntax
partition_columns	The format option partition_columns is used with DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE to specify the column names and data types of partition columns when the partition columns are derived from the file path, depending on the type of data file, structured or unstructured: • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE includes the column_list parameter and the data file is unstructured, such as with CSV text files, partition_columns does not include the data type. For example, use a format such as the following for this type of partition_columns specification: '"partition_columns": ["state","zipcode"]' The data type is not required because it is specified in the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE column_list parameter. • When the DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE does not include the column_list parameter and the data files are structured, such as Avro, ORC, or Parquet files, the partition_columns option includes the data type. For example, the following shows a partition_columns specification: '"partition_columns":[{"name":"country", "type":"varchar2(10)"}, {"name":"year", "type":"number"}, {"name":"month", "type":"varchar2(10)"}]' If the data files are unstructured and the type sub-clause is specified with partition_columns, the type sub-clause is ignored. For object names that are not based on hive format, the order of the partition_columns specified columns must match the order as they appear in the object name in the file_uri_list.	
quote	Specifies the quote character for the fields, the quote characters are removed during loading when specified.	quote: *character* Default value: Null meaning no quote

Format Option	Description	Syntax

`recorddelimiter`	Specifies the record delimiter.
	By default, `DBMS_CLOUD` tries to automatically find the correct newline character as the delimiter. It first searches the file for the Windows newline character "`\r\n`". If it finds the Windows newline character, this is used as the record delimiter for all files in the procedure. If a Windows newline character is not found, it searches for the UNIX/Linux newline character "`\n`" and if it finds one it uses "`\n`" as the record delimiter for all files in the procedure.
	Specify this argument explicitly if you want to override the default behavior, for example:
	`format => json_object('recorddelimiter' VALUE '''\r\n''')`
	To indicate that there is no record delimiter you can specify a `recorddelimiter` that does not occur in the input file. For example, to indicate that there is no delimiter, specify the control character 0x01 (SOH) as a value for the `recorddelimiter` and set the `recorddelimiter` value to "`0x''01''`" (this character does not occur in JSON text). For example:
	`format => '{"recorddelimiter" : "0x''01''"}'`
	The `recorddelimiter` is set once per procedure call. If you are using the default value, `detected newline`, then all files use the same record delimiter, if one is detected.
		`recorddelimiter`: *character*
		Default value: detected newline

`rejectlimit`	The operation will error out after specified number of rows are rejected.	`rejectlimit`: *number* Default value: `0`
`removequotes`	Removes any quotes that are around any field in the source file.	`removequotes`: `true` Default value: `False`
`skipheaders`	Specifies how many rows should be skipped from the start of the file.	`skipheaders`: *number* Default value: 0 if not specified, 1 if specified without a value
`territory`	Specifies a territory name to further determine input data characteristics.	`territory`: *string* Default value: Null See Locale Data in *Oracle Database Globalization Support Guide* for a listing of Oracle-supported territories.

`timestampformat`	Specifies the timestamp format in the source file. The format option `AUTO` searches for the following formats:
	`YYYY-MM-DD HH:MI:SS.FF`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`YYYY-MM-DD HH24:MI:SS.FF3`
	`MM/DD/YYYY HH:MI:SS.FF3`
		`timestampformat` : *string*
		Default value: Database timestamp format
		The string can contain wildcard characters such as "$".

Format Option	Description	Syntax

`timestampltzformat`	Specifies the timestamp with local timezone format in the source file. The format option `AUTO` searches for the following formats:
	`DD Mon YYYY HH:MI:SS.FF TZR`
	`MM/DD/YYYY HH:MI:SS.FF TZR`
	`YYYY-MM-DD HH:MI:SS+/-TZR`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`DD.MM.YYYY HH:MI:SS TZR`
		`timestampltzformat` : *string*
		Default value: Database timestamp with local timezone format

`timestamptzformat`	Specifies the timestamp with timezone format in the source file. The format option `AUTO` searches for the following formats:
	`DD Mon YYYY HH:MI:SS.FF TZR`
	`MM/DD/YYYY HH:MI:SS.FF TZR`
	`YYYY-MM-DD HH:MI:SS+/-TZR`
	`YYYY-MM-DD HH:MI:SS.FF3`
	`DD.MM.YYYY HH:MI:SS TZR`
		`timestamptzformat`: *string*
		Default value: Database timestamp with timezone format

`trimspaces`	Specifies how the leading and trailing spaces of the fields are trimmed. See the description of trim_spec.	`trimspaces`: `rtrim| ltrim| notrim| lrtrim| ldrtrim` Default value: `notrim`
`truncatecol`	If the data in the file is too long for a field, then this option will truncate the value of the field rather than reject the row.	`truncatecol`:`true` Default value: `False`
`type`	Specifies the source file type. See the description of `CSV` in field_definitions Clause See DBMS_CLOUD Package Format Options for Avro or Parquet for `type` values `avro` or `parquet`.	`type`: `csv|csv with embedded|csv without embedded` `csv` is the same as `csv without embedded`. Default value: Null

46.8 DBMS_CLOUD Avro and Parquet Support

This section covers the `DBMS_CLOUD` Avro and Parquet support provided with Oracle Database.

Topics

- DBMS_CLOUD Package Format Options for Avro or Parquet
- DBMS_CLOUD Package Avro to Oracle Data Type Mapping
- DBMS_CLOUD Package Parquet to Oracle Data Type Mapping
- DBMS_CLOUD Package Avro and Parquet Complex Types
- DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping

46.8.1 DBMS_CLOUD Package Format Options for Avro or Parquet

The format argument in `DBMS_CLOUD` specifies the format of source files.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value'))
```

Examples:

```
format => json_object('type' VALUE 'CSV')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull' value 'true')
```

Format Option	Description	Syntax
`type`	Specifies the file type.	`type : avro | parquet`
`schema`	When schema is set to `first` or `all`, the external table columns and data types are automatically derived from the Avro or Parquet file metadata. The column names will match those found in Avro or Parquet. The data types are converted from Avro or Parquet data types to Oracle data types. All columns are added to the table. The value `first` specifies to use the metadata from the first Avro or Parquet file in the `file_uri_list` to auto generate the columns and their data types. Use `first` if all of the files have the same schema. The value `all` specifies to use the metadata from all Avro or Parquet files in the `file_uri_list` to auto generate the columns and their data types. Use `all` (slower) if the files may have different schemas. **Default**: If `column_list` is specified, then the `schema` value, if specified is ignored. If `column_list` is not specified then the `schema` default value is `first`. **Note**: For Avro or Parquet format files the `schema` format option is not available and the `column_list` parameter must be specified for partitioned external tables using the `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` procedure.	`schema : first | all`

46.8.2 DBMS_CLOUD Package Avro to Oracle Data Type Mapping

Describes the mapping of Avro data types to Oracle data types.

> **Note:**
>
> Complex types, such as maps, arrays, and structs are supported starting with Oracle Database 19c. See DBMS_CLOUD Package Avro and Parquet Complex Types for information on using Avro complex types.

Avro Type	Oracle Type
INT	NUMBER(10)
LONG	NUMBER(19)

Avro Type	Oracle Type
BOOL	NUMBER(1)
UTF8 BYTE_ARRAY	RAW(2000)
FLT	BINARY_FLOAT
DBL	BINARY_DOUBLE
DECIMAL(p)	NUMBER(p)
DECIMAL(p,s)	NUMBER(p,s)
DATE	DATE
STRING	VARCHAR2
TIME_MILLIS	VARCHAR2(20 BYTE)
TIME_MICROS	VARCHAR2(20 BYTE)
TIMESTAMP_MILLIS	TIMESTAMP(3)
TIMESTAMP_MICROS	TIMESTAMP(6)
ENUM	VARCHAR2(*n*) Where: "*n*" is the actual maximum length of the AVRO ENUM's possible values
DURATION	RAW(2000)
FIXED	RAW(2000)
NULL	VARCHAR2(1) BYTE

See DBMS_CLOUD Package Avro and Parquet Complex Types for information on using Avro complex types.

46.8.3 DBMS_CLOUD Package Parquet to Oracle Data Type Mapping

Describes the mapping of Parquet data types to Oracle data types.

> **Note:**
>
> Complex types, such as maps, arrays, and structs are supported starting with Oracle Database 19c. See DBMS_CLOUD Package Avro and Parquet Complex Types for information on using Parquet complex types.

Parquet Type	Oracle Type
UINT_64	NUMBER(20)
INT_64	NUMBER(19)
UINT_32	NUMBER(10)
INT_32	NUMBER(10)
UINT_16	NUMBER(5)
INT_16	NUMBER(5)
UINT_8	NUMBER(3)
INT_8	NUMBER(3)
BOOL	NUMBER(1)
UTF8 BYTE_ARRAY	VARCHAR2(4000 BYTE)
FLT	BINARY_FLOAT
DBL	BINARY_DOUBLE
DECIMAL(p)	NUMBER(p)

Parquet Type	Oracle Type
DECIMAL(p,s)	NUMBER(p,s)
DATE	DATE
STRING	VARCHAR2(4000)
TIME_MILLIS	VARCHAR2(20 BYTE)
TIME_MILLIS_UTC	VARCHAR2(20 BYTE)
TIME_MICROS	VARCHAR2(20 BYTE)
TIME_MICROS_UTC	VARCHAR2(20 BYTE)
TIMESTAMP_MILLIS	TIMESTAMP(3)
TIMESTAMP_MILLIS_UTC	TIMESTAMP(3)
TIMESTAMP_MICROS	TIMESTAMP(6)
TIMESTAMP_MICROS_UTC	TIMESTAMP(6)
TIMESTAMP_NANOS	TIMESTAMP(9)

See DBMS_CLOUD Package Avro and Parquet Complex Types for information on using Parquet complex types.

46.8.4 DBMS_CLOUD Package Avro and Parquet Complex Types

Describes the mapping of Avro and Parquet complex data types to Oracle data types.

Oracle Database supports complex data types, including the following complex types:

- struct
- list
- map
- union
- array

When you specify a source file type of Avro or Parquet and the source file includes complex columns, Oracle Database queries return JSON for the complex columns. This simplifies processing of query results; you can use Oracle's powerful JSON parsing features consistently across the file types and data types. The following table shows the format for the complex types in Oracle Database:

> **Note:**
>
> The complex fields map to `VARCHAR2` columns and `VARCHAR2` size limits apply.

Type	Parquet	Avro	Oracle
List: sequence of values	List	Array	`VARCHAR2` (JSON format)
Map: list of objects with single key	Map	Map	`VARCHAR2` (JSON format)
Union: values of different type	Not Available	Union	`VARCHAR2` (JSON format)

Type	Parquet	Avro	Oracle
Object: zero or more key-value pairs	Struct	Record	`VARCHAR2` (JSON format)

46.8.5 DBMS_CLOUD Package Avro and Parquet to Oracle Column Name Mapping

Describes rules for how Avro and Parquet column names are converted to Oracle column names.

The following are supported for Avro and Parquet column names, but may require use of double quotes for Oracle SQL references in external tables. Thus, for ease of use and to avoid having to use double quotes when referencing column names, if possible do not use the following in Avro and Parquet column names:

- Embedded blanks
- Leading numbers
- Leading underscores
- Oracle SQL reserved words

The following table shows various types of Avro and Parquet column names, and rules for using the column names in Oracle column names in external tables.

Avro or Parquet Name	CREATE TABLE Name	Oracle CATALOG	Valid SQL	Notes

part, Part, or PART	part, Part, PART	PART	`select part`
			`select Part`
			`select paRt`
			`select PART`
				Oracle implicitly uppercases unquoted column names

Ord No	"Ord No"	Ord No	`select "Ord No"`	Double quotes are required when there are embedded blanks, which also preserves the character case
__index_key__	"__index_key__"	__index_key__	`select "__index_key__"`	Double quotes are required when there is a leading underscore, which also preserves the character case
6Way	"6Way"	6Way	`select "6Way"`	Double quotes are required when there is a leading numeric digit, which also preserves the character case

Avro or Parquet Name	CREATE TABLE Name	Oracle CATALOG	Valid SQL	Notes
create, Create, or CREATE, and so on. (any case variation) partition, Partition, PARTITION, and so on (for an Oracle Reserved word)	"CREATE" "PARTITION"	CREATE PARTITION	`select "CREATE"` `select "PARTITION"`	Double quotes are required around Oracle SQL Reserved words. These are forced to uppercase, but must always be double-quoted when used anywhere in SQL

rowid, Rowid, ROWid, and so on (for ROWID see notes)	rowid		`select "rowid"`
			`select "Rowid"`
			`select "ROWid"`
			`select "rowid"`
				For ROWID, any mixed or lower-case variation of ROWID preserves the case and must always be double-quoted and use the original case variations. Due to the inherent conflict with Oracle ROWID for the table, if you specify upper-case ROWID, it is automatically stored as lower-case "rowid" and must always be double-quoted when referenced.

Notes:

- In general a column name in an external table can be referenced without double quotes.
- Unless there is an embedded blank, a leading underscore ("_") or leading numeric digit ("0" through "9") in the column name, the original case of the column name is preserved, and it must always be referenced with double quotes and using the original case (upper, lower or mixed-case) of the Avro or Parquet column name.
- After using `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` to create an external table with the format specified as `avro` or `parquet`, use the `DESCRIBE` command in SQL*Plus to view the table's column names.
- When Oracle SQL Reserved Words are used in Avro or Parquet column names, they must always be double-quoted when referenced anywhere in SQL. See Oracle SQL Reserved Words for more information.

47
DBMS_COMPARISON

The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Data Structures
- Summary of DBMS_COMPARISON Subprograms

47.1 DBMS_COMPARISON Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARISON Procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE Function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
   - DBA_COMPARISON_SCAN
   - USER_COMPARISON_SCAN

- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the COMPARE function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the RECHECK function, and you can converge a scan using the CONVERGE procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

47.2 DBMS_COMPARISON Security Model

Security on this package can be controlled in one of two ways.

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have the SELECT or READ privilege on each copy of the shared database object:

- The comparison owner at the local database

- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.

> **Note:**
>
> The database administrator (DBA) can assume control over some of the DBMS_COMPARISON functions and procedures owned by other users. This control applies to DROP_COMPARISON and PURGE_COMPARISON. This DBA override can be particularly useful in cleanup operations when comparisons created by another user need to be dropped

47.3 DBMS_COMPARISON Constants

The DBMS_COMPARISON package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 47-1 lists the parameters and enumerated constants.

Table 47-1 DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
comparison_mode	• CMP_COMPARE_MODE_OBJECT	VARCHAR2(30)	CMP_COMPARE_MODE_OBJECT is a database object. This constant can be specified as 'OBJECT'.

Table 47-1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
scan_mode	• CMP_SCAN_MODE_FULL • CMP_SCAN_MODE_RANDOM • CMP_SCAN_MODE_CYCLIC • CMP_SCAN_MODE_CUSTOM	VARCHAR2(30)	CMP_SCAN_MODE_FULL indicates that the entire database object is compared. This constant can be specified as 'FULL'. CMP_SCAN_MODE_RANDOM indicates that a random portion of the database object is compared. This constant can be specified as 'RANDOM'. CMP_SCAN_MODE_CYCLIC indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as 'CYCLIC'. CMP_SCAN_MODE_CUSTOM indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as 'CUSTOM'.
converge_options	• CMP_CONVERGE_LOCAL_WINS • CMP_CONVERGE_REMOTE_WINS	VARCHAR2(30)	CMP_CONVERGE_LOCAL_WINS indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as 'LOCAL'. CMP_CONVERGE_REMOTE_WINS indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as 'REMOTE'.
null_value	• CMP_NULL_VALUE_DEF	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA$STREAMS$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA$STREAMS$NV'.
max_num_buckets	• CMP_MAX_NUM_BUCKETS	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	• CMP_MIN_ROWS_IN_BUCKET	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

47.4 DBMS_COMPARISON Views

The DBMS_COMPARISON package uses several views.

These views are listed below:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

> **See Also:**
>
> *Oracle Database Reference*

47.5 DBMS_COMPARISON Operational Notes

The DBMS_COMPARISON package has certain requirements and operational notes.

These include the following:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Datatype Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11*g* Release 1 (11.1) database.
- The remote database must be an Oracle Database 10*g* Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

> **See Also:**
>
> *Oracle Database Globalization Support Guide* for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The `DBMS_COMPARISON` package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the `DBMS_COMPARISON` package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the columns that exist in both database objects.

> **See Also:**
>
> CREATE_COMPARISON Procedure

Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.
- Timestamp columns are of the following datatypes: `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`
- Interval columns are of the following datatypes: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the DBMS_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or DATE datatype column
- A composite index that only includes number, timestamp, interval, or DATE datatype columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

For the scan modes CMP_SCAN_MODE_FULL and CMP_SCAN_MODE_CUSTOM to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, DATE, VARCHAR2, or CHAR datatype column
- A composite index that only includes number, timestamp, interval, DATE, VARCHAR2, or CHAR columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an NVARCHAR2 column, then the DBMS_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a NUMBER column and an NCHAR column, then the DBMS_COMPARISON package does not support them.

You can specify an index when you create a comparison using the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
  WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
        INDEX_COLUMN    = 'Y';
```

If there are multiple index columns, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

> **See Also:**
>
> - "Constants" for information about scan modes
> - CREATE_COMPARISON Procedure for information about specifying an index for a comparison

Datatype Requirements for the DBMS_COMPARISON Package

The `DBMS_COMPARISON` package can compare data in columns of the following datatypes:

- `VARCHAR2`
- `NVARCHAR2`
- `NUMBER`
- `FLOAT`
- `DATE`
- `BINARY_FLOAT`
- `BINARY_DOUBLE`
- `TIMESTAMP`
- `TIMESTAMP WITH TIME ZONE`
- `TIMESTAMP WITH LOCAL TIME ZONE`
- `INTERVAL YEAR TO MONTH`
- `INTERVAL DAY TO SECOND`
- `RAW`
- `CHAR`
- `NCHAR`

If a column with datatype `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with datatype `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.

The `DBMS_COMPARISON` package cannot compare data in columns of the following datatypes:

- `LONG`
- `LONG RAW`
- `ROWID`
- `UROWID`
- `CLOB`
- `NCLOB`
- `BLOB`
- `BFILE`
- User-defined types (including object types, `REF`s, varrays, and nested tables)

- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the supported columns in a shared database object.

> **See Also:**
>
> - CREATE_COMPARISON Procedure
> - *Oracle Database SQL Language Reference* for more information about datatypes
> - *Oracle Database Globalization Support Guide* for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

> **Note:**
>
> If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the `CONVERGE` procedure is run.

47.6 DBMS_COMPARISON Data Structures

The `DBMS_COMPARISON` package defines a `RECORD` type.

Contains information returned by the `COMPARE` function or `CONVERGE` procedure in the `DBMS_COMPARISON` package.

> **Note:**
>
> The `COMPARE` function only returns a value for the `scan_id` field.

47.6.1 COMPARISON_TYPE Record Type

This record type contains information returned by the `COMPARE` function or `CONVERGE` procedure in the `DBMS_COMPARISON` package.

> **Note:**
>
> The `COMPARE` function only returns a value for the `scan_id` field.

Syntax

```
TYPE COMPARISON_TYPE IS RECORD(
  scan_id            NUMBER,
  loc_rows_merged    NUMBER,
  rmt_rows_merged    NUMBER,
  loc_rows_deleted   NUMBER,
  rmt_rows_deleted   NUMBER);
```

Table 47-2 COMPARISON_TYPE Attributes

Field	Description
`scan_id`	The scan ID of the scan
`loc_rows_merged`	The number of rows in the local database object updated with information from the database object at the remote site
`rmt_rows_merged`	The number of rows in the database object updated at the remote site with information from the database object at the local site
`loc_rows_deleted`	The number of rows deleted from the local database object
`rmt_rows_deleted`	The number of rows deleted from the remote database object

47.7 Summary of DBMS_COMPARISON Subprograms

This table lists the `DBMS_COMPARISON` subprograms and briefly describes them.

Table 47-3 DBMS_COMPARISON Package Subprograms

Subprogram	Description
COMPARE Function	Performs the specified comparison
CONVERGE Procedure	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
CREATE_COMPARISON Procedure	Creates a comparison
DROP_COMPARISON Procedure	Drops a comparison
PURGE_COMPARISON Procedure	Purges the comparison results, or a subset of the comparison results, for a comparison
RECHECK Function	Rechecks the differences in a specified scan for a comparison

47.7.1 COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the `CREATE_COMPARISON` procedure.

> **See Also:**
>
> - "Overview"
> - CREATE_COMPARISON Procedure

Syntax

```
DBMS_COMPARISON.COMPARE(
   comparison_name  IN   VARCHAR2,
   scan_info        OUT  COMPARISON_TYPE,
   min_value        IN   VARCHAR2   DEFAULT NULL,
   max_value        IN   VARCHAR2   DEFAULT NULL,
   perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 47-4 COMPARE Function Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_info`	Information about the compare operation returned in the `COMPARISON_TYPE` datatype. See COMPARISON_TYPE Record Type.
`min_value`	When the scan mode for the comparison is set to `CMP_SCAN_MODE_CUSTOM`, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the `DBA_COMPARISON_COLUMNS` data dictionary view. For a composite index, specify a value for the column with `column_position` equal to `1` in the `DBA_COMPARISON_COLUMNS` view. See the index column requirements under DBMS_COMPARISON Operational Notes. If the scan mode is set to a value other than `CMP_SCAN_MODE_CUSTOM`, then this parameter must be set to `NULL`. If `NULL` and the `scan_mode` parameter is set to `CMP_SCAN_MODE_CUSTOM`, then an error is raised. To determine the scan mode for the comparison, query the `DBA_COMPARISON` data dictionary view. See DBMS_COMPARISON Constants for information about scan modes.

Table 47-4 (Cont.) COMPARE Function Parameters

Parameter	Description
max_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See the index column requirements under DBMS_COMPARISON Operational Notes. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See DBMS_COMPARISON Constants for information about scan modes.
perform_row_dif	If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See DBMS_COMPARISON Overview for information about buckets.

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

47.7.2 CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE(
   comparison_name      IN   VARCHAR2,
   scan_id              IN   NUMBER,
   scan_info            OUT  COMPARISON_TYPE,
   converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
   perform_commit       IN   BOOLEAN   DEFAULT TRUE,
   local_converge_tag   IN   RAW       DEFAULT NULL,
   remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

Table 47-5 CONVERGE Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.

Table 47-5 (Cont.) CONVERGE Procedure Parameters

Parameter	Description
scan_id	The identifier for the scan that contains the differences between the database objects being converged. See "Overview" for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See "Constants" for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes.
local_converge_tag	The Replication tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.
remote_converge_tag	The Replication tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

47.7.3 CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
   comparison_name      IN  VARCHAR2,
   schema_name          IN  VARCHAR2,
```

```
  object_name          IN  VARCHAR2,
  dblink_name          IN  VARCHAR2,
  index_schema_name    IN  VARCHAR2  DEFAULT NULL,
  index_name           IN  VARCHAR2  DEFAULT NULL,
  remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
  remote_object_name   IN  VARCHAR2  DEFAULT NULL,
  comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
  column_list          IN  VARCHAR2  DEFAULT '*',
  scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
  scan_percent         IN  NUMBER    DEFAULT NULL,
  null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
  local_converge_tag   IN  RAW       DEFAULT NULL,
  remote_converge_tag  IN  RAW       DEFAULT NULL,
  max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
  min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 47-6 CREATE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. **See Also:** "Usage Notes" for more information about specifying an index
remote_schema_name	The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.

Table 47-6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
remote_object_name	The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.
comparison_mode	Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.
column_list	Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See "Usage Notes" for information about columns that are required in the column_list parameter.
scan_mode	Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM. If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function. See "Constants" for information about these constants.
scan_percent	The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run. If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored. **Note:** When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See DBMS_COMPARISON Operational Notes for more information about the DBMS_COMPARISON package index requirements for the lead index column.
null_value	The value to substitute for each NULL in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See "Constants" for information about this constant.

Table 47-6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
local_converge_tag	The Oracle Replication tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure for more information.
remote_converge_tag	The Oracle Replication tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared. If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure for more information.
max_num_buckets	Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See "Constants" for information about this constant. See "Overview" for information about buckets. **Note:** If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.
min_rows_in_bucket	Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See "Constants" for information about this constant. See "Overview" for information about buckets.

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in column_list parameter might or might not be used.

The columns in the specified index must meet the requirements described in DBMS_COMPARISON Operational Notes. If the index columns do not meet these requirements, then an error is raised.

> **Note:**
>
> If you do not specify an index when you create a comparison, then the `CREATE_COMPARISON` procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the `CREATE_COMPARISON` procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the `CONVERGE` procedure synchronizes data.

Usage Notes for the column_list Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-`NULL`, then the columns in the specified index must be in the column list. If the `index_name` parameter is `NULL`, then see DBMS_COMPARISON Operational Notes for information about the `DBMS_COMPARISON` index requirements.
- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a `NOT NULL` constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See CONVERGE Procedure.

47.7.4 DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(
   comparison_name  IN  VARCHAR2);
```

Parameters

Table 47-7 DROP_COMPARISON Procedure Parameters

Parameter	Description
`comparison_name`	The name of the comparison.

47.7.5 PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

> **Note:**
>
> At least one of the following parameters must be set to `NULL`: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are `NULL`, then this procedure purges all comparison results for the comparison.

Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER     DEFAULT NULL,
   purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 47-8 PURGE_COMPARISON Procedure Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If `NULL`, then no scan ID is considered when purging comparison results for the comparison. See "Overview" for information about scans.
`purge_time`	The date before which results are purged. If `NULL`, then no date is considered when purging comparison results for the comparison.

47.7.6 RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

> **Note:**
>
> This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the `COMPARE` function.

> **See Also:**
>
> COMPARE Function

Syntax

```
DBMS_COMPARISON.RECHECK(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER,
   perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 47-9 RECHECK Function Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan to recheck. See "Overview" for more information about specifying a scan ID in this parameter.
`perform_row_dif`	If `TRUE`, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If `FALSE`, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" for information about buckets.

Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

48
DBMS_COMPRESSION

The `DBMS_COMPRESSION` package provides an interface to facilitate choosing the correct compression level for an application.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of DBMS_COMPRESSION Subprograms

> **See Also:**

> - *Oracle Database Administrator's Guide*
> - *Oracle Database Concepts*
> - *Oracle Database SQL Language Reference*
> - *Oracle Database Data Warehousing Guide*
> - *Oracle Database VLDB and Partitioning Guide*
> - *Oracle Database Reference*

48.1 DBMS_COMPRESSION Overview

The `DBMS_COMPRESSION` package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

48.2 DBMS_COMPRESSION Security Model

The `DBMS_COMPRESSSION` package is defined with `AUTHID CURRENT USER`, so it executes with the privileges of the current user.

48.3 DBMS_COMPRESSION Constants

The `DBMS_COMPRESSION` package uses constants that can be used for specifying parameter values.

These constants are shown in the following table:

Table 48-1 DBMS_COMPRESSION Constants - Compression Types

Constant	Type	Value	Description
COMP_NOCOMPRESS	NUMBER	1	No compression
COMP_ADVANCED	NUMBER	2	Advanced row compression
COMP_QUERY_HIGH	NUMBER	4	High for query warehouse compression (Hybrid Columnar Compression)
COMP_QUERY_LOW	NUMBER	8	Low for query warehouse compression (Hybrid Columnar Compression)
COMP_ARCHIVE_HIGH	NUMBER	16	High archive compression (Hybrid Columnar Compression)
COMP_ARCHIVE_LOW	NUMBER	32	Low archive compression (Hybrid Columnar Compression)
COMP_BLOCK	NUMBER	64	Compressed block
COMP_LOB_HIGH	NUMBER	128	High compression level for LOB operations
COMP_LOB_MEDIUM	NUMBER	256	Medium compression level for LOB operations
COMP_LOB_LOW	NUMBER	512	Low compression level for LOB operations
COMP_INDEX_ADVANCED_HIGH	NUMBER	1024	High compression level for indexes
COMP_INDEX_ADVANCED_LOW	NUMBER	2048	Low compression level for indexes
COMP_RATIO_LOB_MINROWS	NUMBER	1000	Minimum required number of LOBs in the object for which LOB compression ratio is to be estimated
COMP_BASIC	NUMBER	4096	Basic table compression
COMP_RATIO_LOB_MAXROWS	NUMBER	5000	Maximum number of LOBs used to compute the LOB compression ratio
COMP_INMEMORY_NOCOMPRESS	NUMBER	8192	In-Memory with no compression
COMP_INMEMORY_DML	NUMBER	16384	In-Memory compression level for DML
COMP_INMEMORY_QUERY_LOW	NUMBER	32768	In-Memory compression level optimized for query performance
COMP_INMEMORY_QUERY_HIGH	NUMBER	65536	In-Memory compression level optimized on query performance as well as space saving
COMP_INMEMORY_CAPACITY_LOW	NUMBER	131072	In-Memory low compression level optimizing for capacity
COMP_INMEMORY_CAPACITY_HIGH	NUMBER	262144	In-Memory high compression level optimizing for capacity
COMP_RATIO_MINROWS	NUMBER	1000000	Minimum required number of rows in the object for which HCC ratio is to be estimated

Table 48-1 (Cont.) DBMS_COMPRESSION Constants - Compression Types

Constant	Type	Value	Description
COMP_RATIO_ALLROWS	NUMBER	-1	To indicate the use of all the rows in the object to estimate HCC ratio
OBJTYPE_TABLE	PLS_INTEGER	1	Identifies the object whose compression ratio is estimated as of type table
OBJTYPE_INDEX	PLS_INTEGER	2	Identifies the object whose compression ratio is estimated as of type index

> **Note:**
>
> Hybrid columnar compression is a feature of certain Oracle storage systems. See *Oracle Database Concepts* for more information.

48.4 DBMS_COMPRESSION Data Structures

The DBMS_COMPRESSION package defines a RECORD type and a TABLE type.

RECORD TYPES

COMPREC Record Type

TABLE TYPES

COMPRECLIST Table Type

48.4.1 COMPREC Record Type

The COMPREC record type is a record for calculating an individual index compression ratio on a table.

Syntax

```
TYPE COMPREC IS RECORD(
  ownname           varchar2(255),
  objname           varchar2(255),
  blkcnt_cmp        PLS_INTEGER,
  blkcnt_uncmp      PLS_INTEGER,
  row_cmp           PLS_INTEGER,
  row_uncmp         PLS_INTEGER,
  cmp_ratio         NUMBER,
  objtype           PLS_INTEGER);
```

Fields

Table 48-2 COMPREC Attributes

Field	Description
ownname	Schema of the object owner
objname	Name of the object
blkcnt_cmp	Number of blocks used by the compressed sample of the object
blkcnt_uncmp	Number of blocks used by the uncompressed sample of the object
row_cmp	Number of rows in a block in compressed sample of the object
row_uncmp	Number of rows in a block in uncompressed sample of the object
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp
objtype	Type of the object

48.4.2 COMPRECLIST Table Type

COMPRECLIST is a table type of the COMPREC Record Type.

Syntax

```
TYPE compreclist IS TABLE OF comprec;
```

Related Topics

- COMPREC Record Type
  The COMPREC record type is a record for calculating an individual index compression ratio on a table.

48.5 Summary of DBMS_COMPRESSION Subprograms

The DBMS_COMPRESSION package uses the GET_COMPRESSION_RATIO Procedure and GET_COMPRESSION_TYPE Function subprograms.

Table 48-3 DBMS_COMPRESSION Package Subprograms

Subprogram	Description
GET_COMPRESSION_RATIO Procedure	Analyzes the compression ratio of a table, and gives information about compressibility of a table
GET_COMPRESSION_TYPE Function	Returns the compression type for a specified row

48.5.1 GET_COMPRESSION_RATIO Procedure

Use this procedure to estimate the storage space that you can save by enabling the compression feature for an existing SecureFile LOB. It analyzes the compression ratio of a

table or an index and gives information about compressibility of the object. You can provide various parameters to selectively analyze different compression types.

In Oracle Database 23ai, this procedure has been enhanced to estimate the compression ratio faster for LOBs while using less space. Now you can also estimate the compression ratio for BasicFile LOBs. This helps you decide upfront whether you want to compress BasicFile LOBs, before migrating BasicFile LOBs to SecureFile LOBs. You can also estimate the compression ratio at the LOB byte level and the time taken, in hours, to compress the LOB data in the table.

The compression ratio is estimated for the number of rows in the LOB column that you specify. For example, let's consider that the compression ratio is 2.33. It indicates that after you enable the compression feature, you can save around half of the space for the sampled rows in the LOB column.

Disclaimer: The compression ratio is an approximate value, which is calculated based on the sampled rows in the LOB column. The actual space that you save when you enable compression for the complete table may be different.

Syntax

The syntax to get the compression ratio differs for objects, LOBs, IOTs, and indexes on a table.

- Syntax to get the compression ratio for an object (table or index, default is table).

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   ownname               IN     VARCHAR2,
   objname               IN     VARCHAR2,
   subobjname            IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   row_cmp               OUT    PLS_INTEGER,
   row_uncmp             OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   block_compr_ratio     OUT    PLS_INTEGER,
   byte_comp_ratio       OUT    NUMBER,
   subset_numrows        IN     NUMBER  DEFAULT COMP_RATIO_MINROWS,
   objtype               IN     PLS_INTEGER DEFAULT OBJTYPE_TABLE);
```

- Syntax to get compression ratio for BasicFile and SecureFile LOBs:

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN     VARCHAR2,
   tabowner              IN     VARCHAR2,
   tabname               IN     VARCHAR2,
   lobname               IN     VARCHAR2,
   partname              IN     VARCHAR2,
   comptype              IN     NUMBER,
   blkcnt_cmp            OUT    PLS_INTEGER,
   blkcnt_uncmp          OUT    PLS_INTEGER,
   lobcnt                OUT    PLS_INTEGER,
   cmp_ratio             OUT    NUMBER,
   comptype_str          OUT    VARCHAR2,
   byte_comp_ratio       OUT    NUMBER,
   total_time            OUT    NUMBER
   subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_LOB_MAXROWS);
```

- Syntax to get the compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
  scratchtbsname        IN     VARCHAR2,
  ownname               IN     VARCHAR2,
  tabname               IN     VARCHAR2,
  comptype              IN     NUMBER,
  index_cr              OUT    DBMS_COMPRESSION.COMPRECLIST,
  comptype_str          OUT    VARCHAR2,
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```

- Syntax to get the compression ratio for IOTs.

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
     scratchtbsname       IN     VARCHAR2,
     ownname              IN     VARCHAR2,
     objname              IN     VARCHAR2,
     subobjname           IN     VARCHAR2,
     comptype             IN     NUMBER,
     iotcomp_cr           OUT    DBMS_COMPRESSION.COMPRECLIST,
     comptype_str         OUT    VARCHAR2,
     subset_numrows       IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```

Parameters

Table 48-4 GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
`scratchtbsname`	Temporary scratch tablespace that can be used for analysis
`ownname` / `tabowner`	Schema of the table to analyze
`tabname`	Name of the table to analyze
`objname`	Name of the object
`subobjname`	Name of the partition or sub-partition of the object
`comptype`	Compression types for which analysis should be performed When the object is an index, only the following compression types are valid: `COMP_INDEX_ADVANCED_HIGH` (value `1024`) and `COMP_INDEX_ADVANCED_LOW` (value `2048`). **Note:** The following compression types cannot be specified in this parameter for any type of object: `COMP_BLOCK` (value `64`) and `COMP_BASIC` (value `4096`).
`blkcnt_cmp`	Number of blocks used by compressed sample of the table
`blkcnt_uncmp`	Number of blocks used by uncompressed sample of the table
`row_cmp`	Number of rows in a block in compressed sample of the table
`row_uncmp`	Number of rows in a block in uncompressed sample of the table
`cmp_ratio`	Compression ratio, `blkcnt_uncmp` divided by `blkcnt_cmp`. It provides the ratio of **blocks** occupied by the uncompressed data to the blocks occupied by the compressed data.
`comptype_str`	String describing the compression type
`subset_numrows`	Number of rows sampled to estimate compression ratio.
`objtype`	Type of the object, either `OBJTYPE_TABLE` or `OBJTYPE_INDEX`
`lobname`	Name of the LOB column
`partname`	In case of partitioned tables, the related partition name
`lobcnt`	Number of lobs actually sampled to estimate compression ratio

Table 48-4 (Cont.) GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
byte_comp_ratio	Provides the ratio of bytes of uncompressed data to the bytes of compressed data for LOBs.
index_cr	List of indexes and their estimated compression ratios
iotcomp_cr	Compression ratio for the IOT The first object contains the compression ratio for the whole IOT. The second object contains the compression ratio only for the top index section of the IOT (excludes the overflow segment).
total_time	Provides an estimate of the time taken, in hours, to compress the LOB data in the table.

Example: Estimate the compression ratio for inline and out-of-line LOBs

The following example shows how to estimate the compression ratio for LOBs.

```
SET SERVEROUTPUT ON
DECLARE
    bcmp                    INTEGER;
    buncmp                  INTEGER;
    lobcmp                  INTEGER;
    cr                      NUMBER;
    byte_cr                 NUMBER;
    cstr                    VARCHAR2(2000);
    total_time              NUMBER;
    l_segment_name          VARCHAR2(30);
    l_segment_size_blocks   NUMBER;
    l_segment_size_bytes    NUMBER;
    l_used_blocks           NUMBER;
    l_used_bytes            NUMBER;
    l_expired_blocks        NUMBER;
    l_expired_bytes         NUMBER;
    l_unexpired_blocks      NUMBER;
    l_unexpired_bytes       NUMBER;
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
     scratchtbsname        => 'LOBTBSP',
     tabowner              => 'CMPADV',
     tabname               => p_tablename,
     lobname               => 'C',
     partname              => NULL,
     comptype              => 256,
     blkcnt_cmp            => bcmp,
     blkcnt_uncmp          => buncmp,
     lobcnt                => lobcmp,
     cmp_ratio             => cr,
     comptype_str          => cstr,
     subset_numrows        => 1000,
     byte_comp_ratio       => byte_cr,
     total_time            => total_time
);
DBMS_OUTPUT.put_line('Estimated ratio of blocks used by the uncompressed data
```

```
to the compressed data :  ' || cr);
DBMS_OUTPUT.put_line('Estimated ratio of bytes used by the uncompressed data
to the compressed data  :  ' || byte_cr);
END;
/
```

To understand the output of this procedure, let's consider `tab_inline`, an inline table, and `tab_outofline`, an out-of-line table as shown in the following example.

```
CREATE TABLE tab_inline
(
    a NUMBER,
    c CLOB
)
LOB(c) STORE AS SECUREFILE  (ENABLE STORAGE IN ROW CACHE LOGGING);

CREATE TABLE tab_outofline
(
    a NUMBER,
    c CLOB
)
LOB(c) STORE AS SECUREFILE  (DISABLE STORAGE IN ROW CACHE LOGGING);
```

Data is stored in different ways in `tab_inline` and `tab_outofline`. In the `tab_inline` table, if the LOB is less than 4K, then data is stored in the table segment; otherwise, it is stored in the LOB segment. For the `tab_outofline` table, data of all sizes is stored in the LOB segment.

Let's consider that you have inserted 1000 LOBs of 3K each in both the tables, and then calculate the compression ratios. You can use the `dbms_space.space_usage` procedure to calculate the space used by the data that is stored in the LOB segments.

Sample output of compression ratio for inline LOBs.

```
Estimated block compression ratio : 1
Estimated byte compression ratio           : 57.6
Space used(in bytes)                       : 0
space used(in blocks)                      : 0
```

Sample output of compression ratio for out-of-line LOBs.

```
Estimated block compression ratio : 1
Estimated byte compression ratio           : 56.1
Space used(in bytes)                       : 8 MB
space used(in blocks)                      : 1000
```

In this example, even though the estimated byte and block compression ratios are almost the same for inline and out-of-line LOBs, the space that is used is different. In the case of `tab_inline`, LOB segment is not used so the space used is 0. In both cases, the data is approximately 3KB, which is small. Therefore, the data before and after compression uses the same number of blocks (that is 1 block), so the block compression ratio is 1. However, the byte level compression ratio, `byte_comp_ratio`, which compares the actual number of bytes used by the LOBs before and after compression is 57.6 or 56.1.

Example: Estimate the compression ratio for indexes on a table with low compression type

The following example shows how to estimate the compression ratio for advanced index compression (low):

```
SET SERVEROUTPUT ON
DECLARE
  l_blkcnt_cmp       PLS_INTEGER;
  l_blkcnt_uncmp   PLS_INTEGER
  l_row_cmp       PLS_INTEGER;
  l_row_uncmp       PLS_INTEGER;
  l_cmp_ratio       NUMBER;
  l_comptype_str   VARCHAR2(32767);
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname =>       'USERS' ,
    ownname       =>       'TEST' ,
    objname       =>       'SALES_IDX' ,
    subobjname     =>        NULL ,
    comptype       =>        DBMS_COMPRESSION.COMP_INDEX_ADVANCED_LOW,
    blkcnt_cmp     =>        l_blkcnt_cmp,
    blkcnt_uncmp   =>        l_blkcnt_uncmp,
    row_cmp       =>        l_row_cmp,
    row_uncmp      =>        l_row_uncmp,
    cmp_ratio      =>        l_cmp_ratio,
    comptype_str   =>        l_comptype_str,
    subset_numrows =>        DBMS_COMPRESSION.comp_ratio_minrows,
    objtype       =>        DBMS_COMPRESSION.objtype_index
   );
DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
object   :  ' || l_blkcnt_cmp);
DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the object :  ' || l_blkcnt_uncmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in compressed sample of the
object   :  ' || l_row_cmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in uncompressed sample of
the object :  ' || l_row_uncmp);
DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of
Sample                          :  ' || l_cmp_ratio);
DBMS_OUTPUT.put_line( 'Compression Type                                :  ' ||
l_comptype_str);
END;
/
```

Output of compression advisor estimate for advanced index compression (Low):

```
Number of blocks used by the compressed sample of the object     : 243
Number of blocks used by the uncompressed sample of the object   : 539
Number of rows in a block in compressed sample of the object     : 499
Number of rows in a block in uncompressed sample of the object   : 145
Estimated Compression Ratio of Sample                 : 2.2
Compression Type                        : “Compress Advanced Low”
```

Example: Estimate the compression ratio for LOBs with medium compression type

The following example shows how to estimate the compression ratio for advanced LOB compression (medium):

```
SET SERVEROUTPUT ON
DECLARE
  l_blkcnt_cmp     PLS_INTEGER;
  l_blkcnt_uncmp   PLS_INTEGER;
  l_row_cmp       PLS_INTEGER;
  l_lobcnt       PLS_INTEGER;
  l_cmp_ratio      NUMBER;
  l_comptype_str   VARCHAR2(32767);
BEGIN
   DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname => 'USERS' ,
    tabowner       => 'TEST' ,
    tabname       => 'PARTS' ,
    lobname       =>  'PART_DESCRIPTION' ,
    partname       =>  NULL ,
    comptype       =>  DBMS_COMPRESSION.COMP_LOB_MEDIUM,
    blkcnt_cmp     => l_blkcnt_cmp,
    blkcnt_uncmp   => l_blkcnt_uncmp,
    row_cmp       => l_row_cmp,
    lobcnt       => l_lobcnt,
    cmp_ratio      => l_cmp_ratio,
    comptype_str   => l_comptype_str,
    subset_numrows => DBMS_COMPRESSION.comp_ratio_lob_maxrows
   );
DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
object    :  ' || l_blkcnt_cmp);
DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the object  :  ' || l_blkcnt_uncmp);
DBMS_OUTPUT.put_line( 'Number of rows in a block in compressed sample of the
object    :  ' || l_row_cmp);
DBMS_OUTPUT.put_line( 'Number of LOBS actually
sampled                     :  ' || l_lobcnt);
DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of
Sample                          :  ' || l_cmp_ratio);
DBMS_OUTPUT.put_line( 'Compression
Type                                                :  ' || l_comptype_str);
END;
/
```

Output of compression advisor estimate for advanced LOB compression (Medium):

```
Number of blocks used by the compressed sample of the object   : 199
Number of blocks used by the uncompressed sample of the object     : 389
Number of rows in a block in compressed sample of the object       : 293
Number of LOBS actually sampled                              : 55
Estimated Compression Ratio of Sample                        : 1.9
Compression Type                                      : “Compress Medium”
```

Example: Estimate the compression ratio for IoTs

The following example shows how to estimate the compression ratio for IOTs:

```
SET SERVEROUTPUT ON
DECLARE
  bcmp       INTEGER;
  buncmp     INTEGER;
  rowcmp     INTEGER;
  rowuncmp   INTEGER;
  cr         NUMBER;
  cstr       VARCHAR2(2000);
  iotcomp_cr DBMS_COMPRESSION.COMPRECLIST;
 BEGIN
    DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
    scratchtbsname        => 'USERS',
    ownname               => 'TEST',
    objname               => 'SALES',
    subobjname            =>  NULL,
    comptype              =>  DBMS_COMPRESSION.COMP_INDEX_ADVANCED_LOW,
    iotcomp_cr            =>  iotcomp_cr,
    comptype_str          =>  cstr,
    subset_numrows        =>  DBMS_COMPRESSION.COMP_RATIO_ALLROWS
    );
 --information about the index and the overflow segment
 DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
IOT table                                    : ' || iotcomp_cr(1).blkcnt_cmp);
 DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the IOT table                                 : ' ||
iotcomp_cr(1).blkcnt_uncmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the compressed
sample of the IOT table                       : ' || iotcomp_cr(1).row_cmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the uncompressed
sample of the IOT table                       : ' || iotcomp_cr(1).row_uncmp);
 DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of the
sample                                                    : ' ||
iotcomp_cr(1).cmp_ratio);
 --information about the index segment
 DBMS_OUTPUT.put_line( 'Number of blocks used by the compressed sample of the
index segment of the IOT table              : ' || iotcomp_cr(2).blkcnt_cmp);
 DBMS_OUTPUT.put_line( 'Number of blocks used by the uncompressed sample of
the index segment of the IOT table            : ' ||
iotcomp_cr(2).blkcnt_uncmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the compressed
sample of the index segment of the IOT table   : ' || iotcomp_cr(2).row_cmp);
 DBMS_OUTPUT.put_line( 'Average number of rows in a block in the uncompressed
sample of the index segment of the IOT table : ' || iotcomp_cr(2).row_uncmp);
 DBMS_OUTPUT.put_line( 'Estimated Compression Ratio of the
sample                                                    : ' ||
iotcomp_cr(2).cmp_ratio);
 END;
 /
```

Output of the compression ratio for IOTs:

```
Number of blocks used by the compressed sample of the IOT
table                                    : 5027
Number of blocks used by the uncompressed sample of the IOT
table                                   : 7950
Average number of rows in a block in the compressed sample of the IOT
table                          : 199
Average number of rows in a block in the uncompressed sample of the IOT
table                        : 126
Estimated Compression Ratio of the
sample                                                          : 1.58
Number of blocks used by the compressed sample of the index segment of the IOT
table                : 3238
Number of blocks used by the uncompressed sample of the index segment of the IOT
table             : 6161
Average number of rows in a block in the compressed sample of the index segment of the
IOT table   : 309
Average number of rows in a block in the uncompressed sample of the index segment of the
IOT table : 162
Estimated Compression Ratio of the
sample                                                          : 1.9
```

Usage Notes

- The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.
- From 23ai onwards, this feature has been enhanced to estimate the compression ratio faster for LOBs while using less space. To get a more accurate result, run the following command to switch to the old method. The older method to calculate the compression ratio takes more time to return the results and uses more space.

  ```
  alter session set "_kdlf_new_compression_adv"= FALSE;
  ```

- To understand the impact of compression, use the value of the byte compression ratio for inline LOBs and for out-of-line LOBs, use the value of the block compression ratio and space used.
- You can get more benefits when you compress large volume of data as compared to small volumes of data. If you want to compress small volumes of data, look at the byte ratio instead of the block ratio to understand the impact of compression.

48.5.2 GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (
   ownname      IN    VARCHAR2,
   tabname      IN    VARCHAR2,
   row_id       IN    ROWID,
   subobjname   IN    VARCHAR2 DEFAULT NULL))
  RETURN NUMBER;
```

Parameters

Table 48-5 GET_COMPRESSION_TYPE Function Parameters

Parameter	Description
ownname	Schema name of the table
tabname	Name of table
rowid	Rowid of the row
subobjname	Name of the table partition or subpartition

Return Values

Flag to indicate the compression type (see Table 48-1).

49
DBMS_CONNECTION_POOL

The DBMS_CONNECTION_POOL package provides an interface to manage the Database Resident Connection Pools (DRCP).

The database initialization parameter ENABLE_PER_PDB_DRCP controls whether DRCP is configured in the CDB ROOT DRCP mode or per-PDB DRCP mode. The default value is FALSE, which will configure DRCP at the CDB level.

- If the value of the database configuration parameter ENABLE_PER_PDB_DRCP is set to TRUE, then:
  - Each PDB administrator can manage their pool configuration using the DBMS_CONNECTION_POOL package. If the ROOT tries to manage the pool configuration using the DBMS_CONNECTION_POOL package, then an error is thrown.
  - The values of the num_cbrok and maxconn_cbrok pool parameters from the cpool$ table are ignored. The PDB administrator cannot modify these parameters using the DBMS_CONNECTION_POOL.ALTER_PARAM() procedure. These parameters can be set using the CONNECTION_BROKERS database parameter. Only the ROOT can alter these parameters dynamically.
- If the value of the ENABLE_PER_PDB_DRCP parameter is set to FALSE, then only the ROOT can manage the pool configuration, using the DBMS_CONNECTION_POOL package. If a PDB administrator tries to manage the pool configuration using the DBMS_CONNECTION_POOL package, then an error is thrown.
- The following DRCP parameters can have values ranging from 0 to SB4MAXVAL (2147483647) - 1:
  - minsize
  - num_cbrok
  - maxconn_cbrok

> *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms

49.1 Summary of DBMS_CONNECTION_POOL Subprograms

This table lists the subprograms of the DBMS_CONNECTION_POOL package in an alphabetical order and describes them briefly.

Table 49-1 DBMS_CONNECTION_POOL Package Subprograms

Subprogram	Description
ADD_POOL Procedure	Adds a new pool to the multiple pool DRCP.
ALTER_PARAM Procedure	Alters a specific configuration parameter as a standalone unit, without affecting the other parameters.
CONFIGURE_POOL Procedure	Configures the pool with advanced options.
REMOVE_POOL Procedure	Removes a pool from the multiple pool DRCP.
RESTORE_DEFAULTS Procedure	Restores the pool to the default settings
START_POOL Procedure	Starts the pool for operations. Only after this procedure is called, the pool can be used by the connection clients for creating sessions .
STOP_POOL Procedure	Stops the pool and makes it unavailable for the registered connection clients.

49.1.1 ADD_POOL Procedure

You can use this procedure to add a new DRCP pool.

Syntax

```
DBMS_CONNECTION_POOL.ADD_POOL (
   pool_name                IN VARCHAR2,
   minsize                  IN PLS_INTEGER   DEFAULT 0,
   maxsize                  IN PLS_INTEGER   DEFAULT 40,
   incrsize                 IN PLS_INTEGER   DEFAULT 2,
   session_cached_cursors   IN PLS_INTEGER   DEFAULT 20,
   inactivity_timeout       IN PLS_INTEGER   DEFAULT 300,
   max_think_time           IN PLS_INTEGER   DEFAULT 120,
   max_use_session          IN PLS_INTEGER   DEFAULT 500000,
   max_lifetime_session     IN PLS_INTEGER   DEFAULT 86400,
   max_txn_think_time       IN PLS_INTEGER   DEFAULT 0);
```

Parameters

> **Note:**
>
> If you are aware of the pool configuration at the time of adding the pool, then you can specify the values for the following parameters. Otherwise, you can call the `CONFIGURE_POOL` subprogram later and specify the new pool name and the configuration options.

Table 49-2 ADD_POOL Procedure Parameters

Parameter	Description
`pool_name`	The name of the pool to be added to the DRCP.
`minsize`	The minimum number of pooled servers in the pool. The default value is 0.
`maxsize`	The maximum number of pooled servers allowed in the pool. The default value is 40.

Table 49-2 (Cont.) ADD_POOL Procedure Parameters

Parameter	Description
incrsize	Pool would increment by this number of pooled server when pooled servers are unavailable at application request time. The default value is 2.
session_cached_cursors	The number of session cursors to cache in each pooled server session. The default value is 20. Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter.
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, the connection is closed. The default value is 300.
max_think_time	The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with no open transactions in it. After obtaining a pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_THINK_TIME, the pooled server is freed and the client connection is terminated. The default value is 120.
max_use_session	Maximum number of times a connection can be taken and released to the pool. The default value is 500000.
max_lifetime_session	TTL (Time to live) in seconds for a pooled session. The default value is 86400.
max_txn_think_time	The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with an open transaction. After obtaining the pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_TXN_THINK_TIME, then the pooled server is freed, and the client connection is terminated. The default value of this parameter is the value of the MAX_THINK_TIME parameter. Applications can set the value of the MAX_TXN_THINK_TIME parameter to a value higher than the MAX_THINK_TIME value to allow more time for the connections with open transactions.

Note:

The pool_name parameter has the following validation checks:

- The pool name must be unique.
- It must begin with an alphabetic character.
- It can contain alphanumeric characters in the second and subsequent positions.
- It can contain an underscore (_) in the second and subsequent positions.
- The maximum length allowed for the pool name is 128.

> **See Also:**
>
> For the list and description of all the database resident connection pooling parameters that can be configured using this procedure, see the *Oracle Database Administrator's Guide*.

Examples

```
exec dbms_connection_pool.add_pool('mypool')
```

49.1.2 ALTER_PARAM Procedure

This procedure alters a specific Database Resident Connection Pool (DRCP) configuration parameter as a standalone unit, and does not affect other parameters.

Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
   pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   param_name    IN  VARCHAR2,
   param_value   IN  VARCHAR2);
```

Parameters

Table 49-3 ALTER_PARAM Procedure Parameters

Parameter	Description
`pool_name`	Pool to be configured.
`param_name`	Any parameter name from `CONFIGURE_POOL`. For broker parameters: `NUM_CBROK` and `MAXCONN_CBROK`, these rules apply: • If per-PDB DRCP is enabled, then `ALTER_PARAM()` cannot be used to set these parameters. Using the database initialization parameter `connection_brokers` is the only way to set them. • For the CDB ROOT-level DRCP, if these parameters are not set using `connection_brokers`, then the administrator can use the `ALTER_PARAM()` procedure to set them. Using `connection_brokers` is the recommended way to set these parameters.
`param_value`	Parameter value for `param_name`.

> **See Also:**
>
> For the list and description of all the DRCP parameters that can be configured using this procedure, see the *Oracle Database Administrator's Guide*.

Exceptions

Table 49-4 ALTER_PARAM Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56504	Invalid connection pool configuration parameter name
ORA-56505	Invalid connection pool configuration parameter value
ORA-56507	Connection pool alter configuration failed

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
   'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

49.1.3 CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
   pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   minsize                  IN NUMBER   DEFAULT 4,
   maxsize                  IN NUMBER   DEFAULT 40,
   incrsize                 IN NUMBER   DEFAULT 2,
   session_cached_cursors   IN NUMBER   DEFAULT 20,
   inactivity_timeout       IN NUMBER   DEFAULT 300,
   max_think_time           IN NUMBER   DEFAULT 120,
   max_use_session          IN NUMBER   DEFAULT 500000,
   max_lifetime_session     IN NUMBER   DEFAULT 86400,
   max_txn_think_time       IN NUMBER);
```

Parameters

Table 49-5 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be configured.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsize	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.

Table 49-5 (Cont.) CONFIGURE_POOL Procedure Parameters

Parameter	Description
max_think_time	The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with no open transactions in it. After obtaining a pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_THINK_TIME, the pooled server is freed and the client connection is terminated.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session
max_txn_think_time	The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with an open transaction. After obtaining the pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_TXN_THINK_TIME, then the pooled server is freed, and the client connection is terminated. The default value of this parameter is the value of the MAX_THINK_TIME parameter. Applications can set the value of the MAX_TXN_THINK_TIME parameter to a value higher than the MAX_THINK_TIME value to allow more time for the connections with open transactions.

Exceptions

Table 49-6 CONFIGURE_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- minsize should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- maxsize should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- session_cached_cursors is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the increment and inactivity_timeout. The pool will have reasonable defaults.
- max_use_session and max_lifetime_session allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.

- The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the `maxsize` parameter, ensure that there are enough pooled servers for both authentication and connections.

49.1.4 REMOVE_POOL Procedure

You can use this procedure to remove a pool from DRCP.

Syntax

```
DBMS_CONNECTION_POOL.REMOVE_POOL (
   pool_name      IN  VARCHAR2);
```

Parameters

Table 49-7 REMOVE_POOL Procedure Parameters

Parameter	Description
`pool_name`	The pool to be removed.

> **Note:**
>
> This procedure generates an error if:
>
> - The specified pool does not exist.
> - You try to remove the default pool.
> - You try to remove an active pool without stopping it.

Exceptions

Table 49-8 REMOVE_POOL Procedure Exceptions

Exception	Description
`ORA-56620`	Removing the pool <pool_name> failed because pool doesn't exist.
`ORA-56620`	Removing the pool <pool_name> failed because database is read only.
`ORA-56620`	Removing the pool <pool_name> failed because pool is active.
`ORA-56620`	Removing the pool <pool_name==NULL> failed because pool name cannot be empty.
`ORA-56620`	Removing the pool `SYS_DEFAULT_CONNECTION_POOL` failed because default pool cannot be removed.

> **Note:**
>
> The same error number is used for all exception errors because the error message is a dynamic string.

Examples

```
exec dbms_connection_pool.remove_pool('mypool')
```

49.1.5 RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
   pool_name    IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 49-9 RESTORE_DEFAULTS Procedure Parameters

Parameter	Description
pool_name	Pool to be restored.

Exceptions

Table 49-10 RESTORE_DEFAULTS Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

49.1.6 START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```
DBMS_CONNECTION_POOL.START_POOL (
   pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 49-11 START_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be started.

Exceptions

Table 49-12 START_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

Usage Notes

If the instance is restarted (shutdown followed by startup), DRCP pools are automatically started.

49.1.7 STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
   pool_name    IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   draintime    IN   PLS_INTEGER DEFAULT 2147483647);
```

Parameters

Table 49-13 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be stopped.
draintime	Allows active DRCP pools to be closed after a specified connection drain time, or be closed immediately without waiting for the connections to be idle. draintime can have the following integer values: • 0 to close the bound pooled servers immediately. • x to close the bound pooled servers after x seconds.

Note:

Do not pass the draintime parameter if you want to retain the old behavior of closing the pools only after they become idle and inactive.

Exceptions

Table 49-14 STOP_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

50
DBMS_CQ_NOTIFICATION

The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

> **See Also:**
>
> *Oracle Database Development Guide* regarding implementing database change notification.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Examples
- Data Structures
- Summary of DBMS_CQ_NOTIFICATION Subprograms

50.1 DBMS_CQ_NOTIFICATION Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and |COMMIT|s, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block.The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

50.2 DBMS_CQ_NOTIFICATION Security Model

The `DBMS_CQ_NOTIFICATION` package requires that the user have the `CHANGE NOTIFICATION` system privilege in order to receive notifications, and be granted `EXECUTE` privilege on the `DBMS_CQ_NOTIFICATION` package.

In addition the user is required to have `SELECT` or `READ` privileges on all objects to be registered. Note that if the `SELECT` or `READ` privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

50.3 DBMS_CQ_NOTIFICATION Constants

DBMS_CQ_NOTIFICATION constants are used as flag parameters either during registration or when received during the notification.

The `DBMS_CQ_NOTIFICATION` package has sets of constants:

- `EVENT_STARTUP`, `EVENT_SHUTDOWN`, `EVENT_SHUTDOWN_ANY`, `EVENT_DEREG` describe the type of the notification published by the database.
- `INSERTOP`, `DELETEOP`, `UPDATEOP`, `ALTEROP`, `DROPOP` and `UNKNOWNOP` describe the type of operation on a table (during a notification published by the database).
- `QOS_RELIABLE`, `QOS_DEREG_NFY`, `QOS_ROWIDs` describe registration Quality of Service properties that the client requires. These are specified during registration.

The constants are shown in the following table.

Table 50-1 DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running Oracle Real Application Clusters (Oracle RAC)
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change

Table 50-1 (Cont.) DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
EVENT_QUERYCHANGE	BINARY_INTEGER	7	Notification for query result set change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation
NTFN_GROUPING_CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

50.4 DBMS_CQ_NOTIFICATION Operational Notes

The following are DBMS_CQ_NOTIFICATION operational notes.

Object Level Registration

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

Query Result Change Registration

- The notifications are published by the database when a transaction changes the result set of the registered query and COMMITs.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-`SYS` user?
- If you are attempting DML changes on the registered object, are you `COMMIT`ing the transaction? Please note that the notifications are transactional and will be generated when the transaction `COMMIT`s.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the `JOBQ` process that attempts to execute the procedure. The trace file would be usually named <`ORACLE_SID`>_j*_<`PID`>.`trc`. '

  For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named '`dbs1_j000_12483.trc`.

  Suppose a registration is created with '`chnf_callback` as the notification handler and with `registration_id` 100. Let us suppose the user forgets to define the `chnf_callback` procedure. Then the `JOBQ` trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
   Error in PLSQL notification of msgid:
   Queue :
   Consumer Name :
   PLSQL function :chnf_callback
   Exception Occured, Error msg:
   ORA-00604: error occurred at recursive SQL level 2
   ORA-06550: line 1, column 7:
   PLS-00201: identifier 'CHNF_CALLBACK' must be declared
   ORA-06550: line 1, column 7:
   PL/SQL: Statement ignored
```

50.5 DBMS_CQ_NOTIFICATION Examples

Suppose that a mid-tier application has a lot of queries on the `HR.EMPLOYEES` table. If the `EMPLOYEES` table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

Object Change Registration Example

The `DBMS_CQ_NOTIFICATION` package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                            table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                          row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
   regid           NUMBER;
   tbname          VARCHAR2(60);
   event_type      NUMBER;
   numtables       NUMBER;
   operation_type  NUMBER;
   numrows         NUMBER;
   row_id          VARCHAR2(20);
 BEGIN
     regid      := ntfnds.registration_id;
     numtables  := ntfnds.numtables;
     event_type := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I). Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
      /* Send the table name and operation_type to client side listener using
UTL_HTTP */
      /* If interested in the rowids, obtain them as follows */
      IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
        numrows := ntfnds.table_desc_array(i).numrows;
      ELSE
        numrows :=0;   /* ROWID INFO NOT AVAILABLE */
      END IF;

      /* The body of the loop is not executed when numrows is ZERO */
      FOR j IN 1..numrows LOOP
          Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
          INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
         /* optionally Send out row_ids to client side listener using UTL_HTTP; */
      END LOOP;

    END LOOP;
  END IF;
  COMMIT;
END;
/
```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

Notes

a. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS)

b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.

c. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

   This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

   Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (chnf_callback) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
 qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
         DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

```
UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;COMMIT;
```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;

     REGID     EVENT_TYPE
--------------------------
     20045          6

SQL> SELECT * FROM nftablechanges;

  REGID      TABLE_NAME         TABLE_OPERATION
-----------------------------------------
  20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;

    REGID      TABLE_NAME          ROW_ID
-----------------------------------------------------
    20045     HR.EMPLOYEES    AAAKB/AABAAAJ8zAAF
```

Query Result Change Registration Example

1. Creating a Callback

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
       qid                NUMBER,
       table_name         VARCHAR2(100),
       table_operation    NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
       qid                NUMBER,
       table_name         VARCHAR2(100),
       row_id             VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
  (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
  regid           NUMBER;
  tbname          VARCHAR2(60);
  event_type      NUMBER;
  numtables       NUMBER;
  operation_type  NUMBER;
  numrows         NUMBER;
  row_id          VARCHAR2(2000);
```

```
  numqueries      NUMBER;
  qid NUMBER;
  qop NUMBER;

BEGIN
  regid := ntfnds.registration_id;
  event_type := ntfnds.event_type;
  INSERT INTO nfevents VALUES(regid, event_type);
  numqueries :=0;
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
      numqueries := ntfnds.query_desc_array.count;
      FOR i in 1..numqueries LOOP
         qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
         qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
         INSERT INTO nfqueries VALUES(qid, qop);
         numtables := 0;
         numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
         FOR j IN 1..numtables LOOP
           tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
           operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).Opflags;
           INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
           IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
           THEN
             numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
           ELSE
             numrows :=0;   /* ROWID INFO NOT AVAILABLE */
           END IF;

            /* The body of the loop is not executed when numrows is ZERO */
            FOR k IN 1..numrows LOOP
               Row_id :=
ntfnds.query_desc_array(i).table_desc_array(j).row_desc_array(k).row_id;
               INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);

           END LOOP;  /* loop over rows */
        END LOOP;     /* loop over tables */
      END LOOP;        /* loop over queries */
  END IF;
  COMMIT;
END;
/
```

2. Creates a query registration

```
DECLARE
  reginfo    cq_notification$_reg_info;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  v_cursor   SYS_REFCURSOR;
  regid      NUMBER;
  qosflags   NUMBER;

BEGIN
  /* Register two queries for result-set-change notifications: */

  /* 1. Construct registration information.
        'chnf_callback' is name of notification handler.
        QOS_QUERY specifies result-set-change notifications. */

   qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
               DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
```

```
   reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);

  /* 2. Create registration */

        regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

        OPEN v_cursor FOR
           SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
           FROM HR.employees
           WHERE employee_id = 7902;
        CLOSE v_cursor;

       OPEN v_cursor for
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
       CLOSE v_cursor;

  DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

3. After creating the query registrations, the output from `USER_CQ_NOTIFICATION_QUERIES` would appear as follows.

```
SQL> SELECT queryid, regid, to_char(querytext)
     FROM user_cq_notification_queries;

   QUERYID      REGID
---------- ----------
TO_CHAR(QUERYTEXT)
--------------------------------------------------------------------------------
        22         41
 SELECT HR.DEPARTMENTS.DEPARTMENT_ID  FROM HR.DEPARTMENTS  WHERE HR.DEPARTMENTS.
DEPARTMENT_NAME  = 'IT'

        21         41
 SELECT HR.EMPLOYEES.MANAGER_ID  FROM HR.EMPLOYEES  WHERE HR.EMPLOYEES.EMPLOYEE_
ID  = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid 22
by renaming the department with name 'IT' to FINANCE.

SQL>  update departments set department_name = 'FINANCE' where department_name =
'IT';

1 row updated.

SQL> commit;

Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

     REGID EVENT_TYPE
---------- ----------
        61          7

Event type 7 corresponds to EVENT_QUERYCHANGE
```

```
SQL> select * from nfqueries;

       QID        QOP
---------- ----------
        42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
SQL> select * from nftablechanges;

     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
TABLE_OPERATION
---------------
        42
HR.DEPARTMENTS
              4

TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;
     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
ROW_ID
--------------------------------------------------------------------------------
        61
HR.DEPARTMENTS
AAANkdAABAAALinAAF
```

50.6 DBMS_CQ_NOTIFICATION Data Structures

The `DBMS_CQ_NOTIFICATION` package defines several `OBJECT` types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type

50.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the `SYS.CHNF$_DESC` type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
   registration_id    NUMBER,
   transaction_id     RAW(8),
   dbname             VARCHAR2(30),
   event_type         NUMBER,
   numtables          NUMBER,
   table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY,
   query_desc_array   CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 50-2 CQ_NOTIFICATION$_DESCRIPTOR Object Type

Attribute	Description
`registration_id`	Registration ID returned during registration
`transaction_id`	Transaction ID. `transaction_id` of the transaction that made the change. Will be `NULL` unless the event_type is `EVENT_OBJCHANGE` or `EVENT_QUERYCHANGE`.
`dbname`	Name of database
`event_type`	Database event associated with the notification. Can be one of `EVENT_OBJCHANGE` (change to a registered object), `EVENT_STARTUP`, or `EVENT_QUERYCHANGE`, `EVENT_SHUTDOWN` or `EVENT_DEREG` (registration has been removed due to a timeout or other reason)
`numtables`	Number of modified tables. Will be `NULL` unless the `event_type` is `EVENT_OBJCHANGE`.
`table_desc_array`	Array of table descriptors. Will be `NULL` unless the `event_type` is `EVENT_OBJCHANGE`.
`query_desc_array`	Array of queries changed. This will be `NULL` unless event_type is `EVENT_QUERYCHANGE`

50.6.2 CQ_NOTIFICATION$_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit.

An array of `CQ_NOTIFICATION$_QUERY` descriptors is embedded inside the top level notification descriptor (`CQ_NOTIFICATION$_DESCRIPTOR`) for events of type `EVENT_QUERYCHANGE`. The array corresponds to the `SET` of queryids which were invalidated as a result of the event.

This is a synonym for the base type `SYS.CHNF$_QDESC`.

Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid            NUMBER,
```

```
  queryop            NUMBER,
  table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY);
```

Attributes

Table 50-3 TYPE SYS.CQ_NOTIFICATION$_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

50.6.3 CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_QUERY` objects. It is a synonym for the `SYS.CHNF$_QUERY_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

50.6.4 CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for `EVENT_OBJCHANGE` event types. For query result set changes (event type will be set to `EVENT_QUERYCHANGE`), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type `previously named SYS.CHNF$_TDESC`.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags            NUMBER,
  table_name         VARCHAR2(2*M_IDEN+1),
  numrows            NUMBER,
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

Table 50-4 TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an `OR` of the following bit fields - `INSERTOP`, `UPDATEOP`, `DELETEOP`, `DROPOP`, `ALTEROP`, `ALL_ROWS`. If the `ALL_ROWS` (0x1) bit is set it means that either the entire table is modified (for example, `DELETE * FROM t`) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table

Table 50-4 (Cont.) TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

Attribute	Description
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

50.6.5 CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_TABLE objects. It is a synonym for the SYS.CHNF$_TDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

50.6.6 CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor), if the QOS_ROWIDS option was chosen at registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags            NUMBER,
  row_id             VARCAHR2 (2000));
```

Attributes

Table 50-5 TYPE SYS.CQ_NOTIFICATION$_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

50.6.7 CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION$_ROW objects. It is embedded inside the CQ_NOTIFICATION$_TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF$_RDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

50.6.8 CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named `SYS.CHNF$_REG_INFO`.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  qosflags                      NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

Attributes

Table 50-6 TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
`callback`	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is `<call_backname>(ntfnds IN SYS.chnf$_desc)`
`qosflags`	Quality of service flags. Can be set to an `OR` of the following values: • `QOS_RELIABLE` (`0x1`): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. • `QOS_DEREG_NFY` (`0x2`): The registration will be expunged on the first notification • `QOS_ROWIDS` (`0x4`): The notification needs to include information about the rowids that were modified • `QOS_QUERY (0x8)`: specifies query result change notification as opposed to object change notification • `QOS_BEST_EFFORT (0x10)` or `QOS_BEST_EFFORT (0x16)`: can register simplified versions of queries and minimizes evaluation with some false positives.

Table 50-6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
timeout	If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.
operations_filter	if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types: • 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS) • 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP) • 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP) • 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP) A combination of operations can be specified by using a bitwise OR. Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.
transaction_lag	Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated. **Caution**: This parameter will be honored for object level registrations but ignored for query result change notification registrations.
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	The type of grouping desired. It can be one of two allowed values • DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification • DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

Table 50-6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  qosflags                      NUMBER,
  timeout                       NUMBER);
```

  The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  qosflags                      NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER);
```

  The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  qosflags                      NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

  `CHNF$_DESC` describes the change notification descriptor.

- The init.ora parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

50.7 Summary of DBMS_CQ_NOTIFICATION Subprograms

This table lists the `DBMS_CQ_NOTIFICATION` subprograms and briefly describes them.

Table 50-7 DBMS_CQ_NOTIFICATION Package Subprograms

Subprogram	Description
CQ_NOTIFICATION_QUERYID Function	Returns the queryid of the most recent query that was attempted to be registered in a registration block
DEREGISTER Procedure	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function	Begins a new registration block
REG_END Procedure	Ends the registration boundary
SET_ROWID_THRESHOLD Procedure	Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction

50.7.1 CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
 RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

50.7.2 DEREGISTER Procedure

This procedure describes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (
  regid IN NUMBER);
```

Parameters

Table 50-8 DEREGISTER Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration (or the `SYS` user) will be able to desubscribe the registration.

50.7.3 ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID).

It is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the REG_END Procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (
  regid IN NUMBER);
```

Parameters

Table 50-9 ENABLE_REG Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

50.7.4 NEW_REG_START Function

This procedure begins a new registration block.

Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the `REG_END` procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
 RETURN NUMBER;
```

Parameters

Table 50-10 NEW_REG_START Function Parameters

Parameter	Description
`sys.chnf$_reg_info`	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the `CHANGE NOTIFICATION` system privilege and `SELECT` or `READ` privileges on any objects to be registered.
- The `SYS` user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

50.7.5 REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```

50.7.6 SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (
  tbname     IN  VARCHAR2,
  threshold  IN  NUMBER);
```

Parameters

Table 50-11 SET_ROWID_THRESHOLD Procedure Parameters

Parameter	Description
`tbname`	Table name qualified by the schema name in the form `schemaname.tablename`
`threshold`	Maximum number of modified rows of the table to be published in the change notification

Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.

51
DBMS_CREDENTIAL

The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

> **See Also:**
>
> - *Oracle Database Administrator's Guide* regarding Specifying Job Credentials
> - *Oracle Database Security Guide* regarding Guidelines for Securing External Processes

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_CREDENTIAL Subprograms

51.1 DBMS_CREDENTIAL Overview

Credentials are database objects that hold a username/password pair for authenticating and impersonating EXTPROC callout functions, as well as remote jobs, external jobs and file watchers from the SCHEDULER.

They are created using the CREATE_CREDENTIAL Procedure. The procedure also allows you to specify the Windows domain for remote external jobs executed against a Windows server.

51.2 DBMS_CREDENTIAL Security Model

Every Oracle credential has a unique credential name and you can associate a credential through its unique credential name with EXTPROC by means of a PL/SQL alias library.

In order to associate a credential with a PL/SQL alias library and external procedure, you must have the CREATE AND/OR REPLACE LIBRARY privilege or CREATE AND/OR REPLACE FUNCTION / PROCEDURE privilege and read permission of the DLL or shared object that the alias library to be associated with so that you can create and/or replace function or procedure to make use of the alias library.

Once authenticated, EXTPROC must act on behalf of the client based on client's identity defined in the supplied user credential. If not authenticated, EXTPROC must return an error message.

In order to create or alter a credential, you must have the CREATE CREDENTIAL privilege. If you are attempting to create or alter a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.

51.3 DBMS_CREDENTIAL Operational Notes

As the existing `CREATE OR REPLACE LIBRARY` statement and `CREATE OR REPLACE FUNCTION/PROCEDURE` do not support a `CREDENTIAL` clause, this model requires syntax and semantic changes in `CREATE OR REPLACE LIBRARY` and `CREATE OR REPLACE FUNCTION/PROCEDURE` statement.

For example:

```
CREATE OR REPLACE LIBRARY test
  AS '$ORACLE_HOME/bin/test.so' CREDENTIAL ricky_cred;
CREATE OR REPLACE FUNCTION ftest1
  (x VARCHAR2, y BINARY_INTEGER)
RETURN BINARY_INTEGER
AS LANGUAGE C
LIBRARY test
NAME "negative"
PARAMETERS(x STRING, y INT);
```

The credential name defined in the `CREDENTIAL` clause is a name of a database object. Therefore, do not enclose the credential name with single or double quotes.

An example of a credential being used on an external job:

```
BEGIN
   DBMS_SCHEDULER.CREATE_JOB(
   job_name            => 'example_job',
   job_type            => 'EXECUTABLE',
   job_action          => '/bin/ls',
   credential_name     => 'ricky_cred');
END;
/
```

51.4 Summary of DBMS_CREDENTIAL Subprograms

This table lists the `DBMS_CREDENTIAL` subprograms and briefly describes them.

Table 51-1 DBMS_CREDENTIAL Package Subprograms

Subprogram	Description
CREATE_CREDENTIAL Procedure	Creates a stored username/password pair in a database object called an Oracle credential
DISABLE_CREDENTIAL Procedure	Disables an Oracle credential
DROP_CREDENTIAL Procedure	Drops an Oracle credential
ENABLE_CREDENTIAL Procedure	Enables an Oracle credential
UPDATE_CREDENTIAL Procedure	Updates an existing Oracle credential

51.4.1 CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called an Oracle credential. You can also use this procedure to manage the credentials used for accessing files stored in cloud object storage.

Syntax

```
DBMS_CREDENTIAL.CREATE_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   username          IN  VARCHAR2,
   password          IN  VARCHAR2,
   database_role     IN  VARCHAR2 DEFAULT NULL
   windows_domain    IN  VARCHAR2 DEFAULT NULL,
   comments          IN  VARCHAR2 DEFAULT NULL,
   enabled           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 51-2 ***CREATE_CREDENTIAL Procedure Parameters***

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.
username	User name to login to the operating system or remote database to run a job if this credential is chosen. This cannot be set to NULL.
password	Password to login to the remote operating system to run a job if this credential is chosen. It is case sensitive.
database_role	Whether a database job using this credential should attempt to log in with administrative privileges. Values: SYSDBA, SYSDG, SYSADMIN or SYSBACKUP.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.
comments	A text string that can be used to describe the credential to the user. The Scheduler does not use this field.
enabled	Determines whether the credential is enabled or not

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE CREDENTIAL or CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- Attempting to create a credential with an existing credential name returns an error. To alter an existing credential, users must drop the existing credential first using the DROP_CREDENTIAL Procedure.
- Attempting to drop an existing credential, which is already referenced by alias libraries, returns an error. To drop an existing credential without any checking, users must set the force parameter of DROP_CREDENTIAL Procedure to TRUE.

- You may also alter a credential, by means of the UPDATE_CREDENTIAL Procedure.

Examples

Create a Basic Credential

```
CONN scott
Enter password: password

BEGIN
-- Basic credential.
   DBMS_CREDENTIAL.CREATE_CREDENTIAL(
      credential_name  =>  'JAMES_SMITH',
      username         =>  'james_smith',
      password         =>  'password');
END
```

Create a Windows Credential

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
     credential_name   =>  'JAMES_SMITH_WIN_CREDENTIAL',
     username          =>  'james_smith',
     password          =>  'password',
     windows_domain    =>  'localdomain');
END
```

Display Information about Credentials

Information about credentials is displayed using the `[DBA|ALL|USER] _CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   user_credentials
ORDER BY credential_name;

CREDENTIAL_NAME           USERNAME             WINDOWS_DOMAIN
------------------------- -------------------- --------------------
JAMES_SMITH_CREDENTIAL       james_smith
JAMES_SMITH_WIN_CREDENTIAL   james_smith             LOCALDOMAIN
2 rows selected.

SQL>
```

51.4.2 DISABLE_CREDENTIAL Procedure

This procedure disables an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DISABLE_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 51-3 *DISABLE_CREDENTIAL Procedure Parameters*

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.
force	If FALSE, the credential is not disabled provided it has no dependency on any existing scheduler job or PL/SQL library. An error is returned if the dependency is observed.If TRUE, the credential is disabled whether or not there is any scheduler job or PL/SQL library referencing it.

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled lets an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user of external jobs, database jobs, file transfers, external procedures, and file watching. To enable an existing disabled credential, you need to use the ENABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

51.4.3 DROP_CREDENTIAL Procedure

This procedure drops an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DROP_CREDENTIAL (
   credential_name   IN  VARCHAR2,
   force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 51-4 *DROP_CREDENTIAL Procedure Parameters*

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL.
force	If set to FALSE, the credential must not be referenced by any EXTPROC alias library or an error is raised. If set to TRUE, the credential is dropped whether or not there are extproc alias libraries referencing it. EXTPROC alias libraries that reference the dropped credential become invalid.

Usage Notes

Only the owner of a credential or a user with the `CREATE ANY CREDENTIAL` system privilege may drop the credential.

Examples

```
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('JAMES_SMITH_CREDENTIAL', FALSE);
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('JAMES_SMITH_WIN_CREDENTIAL', FALSE);
```

51.4.4 ENABLE_CREDENTIAL Procedure

This procedure enables an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.ENABLE_CREDENTIAL (
   credential_name   IN  VARCHAR2);
```

Parameters

Table 51-5 ***ENABLE_CREDENTIAL Procedure Parameters***

Parameter	Description
`credential_name`	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to `NULL`. It is converted to upper case unless enclosed in double quotes.

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the `CREATE CREDENTIAL OR CREATE ANY CREDENTIAL` system privilege. To disable a credential in a schema other than your own, you must have the `CREATE CREDENTIAL OR CREATE ANY CREDENTIAL` privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled would allow an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user (external jobs, file transfers, external procedures, file watching). To disable an existing credential, you need to use the DISABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

51.4.5 UPDATE_CREDENTIAL Procedure

This procedure updates an existing Oracle credential.

Syntax

```
DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
   credential_name   IN   VARCHAR2,
   attribute         IN   VARCHAR2,
   value             IN   VARCHAR2);
```

Parameters

Table 51-6 *UPDATE_CREDENTIAL Procedure Parameters*

Parameter	Description
credential_name	Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotation marks.
attribute	Name of attribute to update: USERNAME, PASSWORD, WINDOWS_DOMAIN, DATABASE_ROLE or COMMENTS
value	New value for the selected attribute

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- EXTPROC alias libraries that reference the updated credential will become invalid. A library becomes invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

Examples

Update a Basic Credential

```
CONN scott
Enter password: password

BEGIN
-- Basic credential.
   DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
      credential_name  =>  'JAMES_SMITH_CREDENTIAL',
      attribute        =>  'password',
      value            =>  'password2');

   DBMS_CREDENTIAL.UPDATE_CREDENTIAL (
      credential_name  =>  'JAMES_SMITH_CREDENTIAL',
      attribute        =>  'username',
      value            => 'james_smith');
END;
```

Update a Windows Credential

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.UPDATE_CREDENTIAL(
     credential_name   =>  'JAMES_SMITH_WIN_CREDENTIAL',
     username          =>  'james_smith',
     password          =>  'password',
     windows_domain    =>  'localdomain');
END
```

Display Information about Credentials

Information about credentials is displayed using the `[DBA|ALL|USER] _CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   all_credentials
ORDER BY credential_name;

CREDENTIAL_NAME           USERNAME             WINDOWS_DOMAIN
------------------------- -------------------- --------------------
JAMES_SMITH_CREDENTIAL       james_smith
JAMES_SMITH_WIN_CREDENTIAL   james_smith             LOCALDOMAIN
2 rows selected.

SQL>
```

52
DBMS_CRYPTO

`DBMS_CRYPTO` provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

Note:

- Starting from Oracle Database 23ai Release, the use of the `MD4` algorithm is desupported.
- Starting from Oracle Database 21c Release, the use of the `MD5` and `MD4` algorithms are deprecated.
- Starting from Oracle Database 21c Release, the use of the `SHA-1` algorithm for `SQLNET` and `DBMS_CRYPTO` is deprecated.

Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.

This chapter contains the following topics:

- DBMS_CRYPTO Overview
- DBMS_CRYPTO Security Model
- DBMS_CRYPTO Constants
- DBMS_CRYPTO Datatypes
- DBMS_CRYPTO Algorithms
- DBMS_CRYPTO Restrictions
- DBMS_CRYPTO Exceptions
- DBMS_CRYPTO Operational Notes
- DBMS_CRYPTO Examples
- Summary of DBMS_CRYPTO Subprograms

See Also:

- *Oracle Database Security Guide* for more information about using this package and about encrypting data in general.

52.1 DBMS_CRYPTO Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets. It also supports asymmetric key functions.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key) (deprecated)
- Advanced Encryption Standard (AES)
- MD5 (deprecated), SHA-1 (deprecated), and SHA-2 and SHA-3 cryptographic hashes
- MD5, SHA-1, and SHA-2 and SHA-3 Message Authentication Code (MAC), SHA-3 KMACXOF
- SM2, SM3, SM4 (SM stands for ShangMi)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from six block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 52-1 summarizes the DBMS_CRYPTO package features.

Table 52-1 DBMS_CRYPTO Features

Package Feature	DBMS_CRYPTO
Cryptographic algorithms	DES, 3DES, AES, 3DES_2KEY, SM4
PKENCRYPT and PKDECRYPT algorithm	PKENCRYPT_RSA_PKCS1_OAEP_SHA2, SM4
Padding forms	PAD_PKCS5 (PKCS5 padding), PAD_ZERO (zeroes padding) PAD_NONE (no padding), PAD_ORCL (Oracle padding)
Block cipher chaining modes	CBC, CFB, ECB, OFB, GCM, CCM, XTS
Cryptographic hash algorithms	MD5, SHA-1, SHA-2 (SHA-256, SHA-384, SHA-512), SM3, (MD5 and SHA-1 are deprecated; MD4 is desupported) HASH_SHAKE128, HASH_SHAKE256
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1, HMAC_SH256, HMAC_SH384, HMAC_SH512, HMAC_SHA3_224, HMAC_SHA3_256, HMAC_SHA3_384, HMAC_SHA3_512
Keccak MAC algorithms	KMACXOF_128, KMACXOF_256
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER
Database types	RAW, CLOB, BLOB

The DBMS_CRYPTO package replaces DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, SHA-1, or SHA-2.

52.2 DBMS_CRYPTO Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

52.3 DBMS_CRYPTO Constants

The `DBMS_CRYPTO` package uses the constants listed and described in this topic.

Table 52-2 DBMS_CRYPTO Constants

Name	Type	Value	Description
`AES_CCM_NONE`	`PLS_INTEGER`	`ENCRYPT_AES + CHAIN_CCM + PAD_NONE`	If you are using `DBMS_CRYPTO` to encrypt a plaintext with AES algorithm in CCM mode, then set the `typ` argument of `DBMS_CRYPTO.ENCRYPT` to the value `AES_CCM_NONE` to ensure that padding is disabled, because CCM mode cannot be used together with padding. Provide one extra input AAD (Additional Authenticated Data, optional) and one extra output TAG (non-optional). For example: `ciphertext := dbms_crypto.encrypt (src => plaintext, typ => DBMS_CRYPTO.AES_CCM_NONE , key => key_information, iv => iv_information, aad => aad_information, tag); plaintext := dbms_crypto.decrypt (src => plaintext, typ => DBMS_CRYPTO.AES_CCM_NONE , key => key_information, iv => iv_information, aad => aad_information, tag=> tag_information);`

Table 52-2 (Cont.) DBMS_CRYPTO Constants

Name	Type	Value	Description
AES_GCM_NONE	PLS_INTEGER	ENCRYPT_AES + CHAIN_GCM + PAD_NONE	If you are using DBMS_CRYPTO to encrypt a plaintext with AES algorithm in GCM mode, then set the typ argument of DBMS_CRYPTO.ENCRYPT to the value AES_GCM_NONE to ensure that padding is disabled, because GCM mode cannot be used together with padding. Provide one extra input AAD (Additional Authenticated Data, optional) and one extra output TAG (non-optional). For example: `ciphertext := dbms_crypto.encrypt (src => plaintext, typ => DBMS_CRYPTO.AES_GCM_NONE , key => key_information, iv => iv_information, aad => aad_information, tag); plaintext := dbms_crypto.decrypt (src => plaintext, typ => DBMS_CRYPTO.AES_GCM_NONE , key => key_information, iv => iv_information, aad => aad_information, tag=> tag_information);`
AES_XTS_NONE	PLS_INTEGER	ENCRYPT_AES + CHAIN_XTS + PAD_NONE	Constant for AES encryption algorithm in XTS mode. You can use this constant with DBMS_CRYPTO.ENCRYPT. To use AES with XTS mode, the input must be at least one full block (16 bytes).
DES3_CBC_NONE	PLS_INTEGER	ENCRYPT_3DES + CHAIN_CBC + PAD_NONE	If you are using DBMS_CRYPTO to decipher a triple-DES ciphertext that you created in the past using the desupported DBMS_OBFUSCATION_TOOLKIT, then set the typ argument of DBMS_CRYPTO.decrypt to the value DBMS_CRYPTO.DES3_CBC_NONE to ensure that the PKCS#5 padding is disabled. For example: `plaintext := DBMS_CRYPTO.decrypt (src => ciphertext_from_legacy_DES3Encrypt ,typ => DBMS_CRYPTO.DES3_CBC_NONE ,key => key_information ,iv => hextoraw(DBMS_CRYPTO.LEGACY_DEFAULT_IV) );`
AES_CBC_PKCS5	PLS_INTEGER	ENCRYPT_AES + CHAIN_CBC + PAD_PKCS5	Constant for AES encryption algorithm in CBC mode and PKCS5 padding. You can use this constant with DBMS_CRYPTO.ENCRYPT.

Table 52-2 (Cont.) DBMS_CRYPTO Constants

Name	Type	Value	Description
LEGACY_DEFAULT_IV	VARCHAR2(16)	0123456789ABCDEF	If you did not provide the IV argument when creating a triple-DES ciphertext using the desupported DBMS_OBFUSCATION_TOOLKIT, then provide IV as hextoraw(DBMS_CRYPTO.LEGACY_DEFAULT_IV) when invoking DBMS_CRYPTO to decrypt the triple-DES ciphertext. For example: `plaintext := DBMS_CRYPTO.decrypt (src => ciphertext_from_legacy_DES3Encrypt ,typ => DBMS_CRYPTO.DES3_CBC_NONE ,key => key_information ,iv => hextoraw(dbms_crypto.LEGACY_DEFAULT_IV) );`
SM4_CFB_NONE	PLS_INTEGER	ENCRYPT_SM4 + CHAIN_CFB + PAD_NONE	Cipher suite for the SM4 encryption algorithm in Ciphertext Feedback (CFB) mode. You can only use CFB mode with no padding mode PAD_NONE.
SM4_OFB_NONE	PLS_INTEGER	ENCRYPT_SM4 + CHAIN_OFB + PAD_NONE	Cipher suite for the SM4 encryption algorithm in Output Feedback (OFB) mode. You can only use OFB mode with no padding mode PAD_NONE.

52.4 DBMS_CRYPTO Datatypes

Parameters for the DBMS_CRYPTO subprograms use these datatypes.

Table 52-3 DBMS_CRYPTO Datatypes

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

52.5 DBMS_CRYPTO Algorithms

The DBMS_CRYPTO package contains predefined cryptographic algorithms, modifiers, and cipher suites.

These are shown in the following tables.

Table 52-4 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD5	Produces a 128-bit hash, but is more complex than MD4 (which is desupported). Note that MD5 is deprecated.
HASH_SH1	Secure Hash Algorithm (SHA-1) (deprecated). Produces a 160-bit hash.
HASH_SH256	SHA-2, produces a 256-bit hash.
HASH_SH384	SHA-2, produces a 384-bit hash.
HASH_SH512	SHA-2, produces a 512-bit hash.
HASH_SHA3_224	SHA-3, produces a 224-bit hash.
HASH_SHA3_256	SHA-3, produces a 256-bit hash.
HASH_SHA3_384	SHA-3, produces a 384-bit hash.
HASH_SHA3_512	SHA-3, produces a 512-bit hash.
HASH_SHAKE128	Produces variable length hash with 128-bit security level; used for the DBMS_CRYPTO.HASH_LEN only.
HASH_SHAKE256	Produces variable length hash with 256-bit security level; used for the DBMS_CRYPTO.HASH_LEN only.
HASH_SM3	Produces a 256-bit hash

Table 52-5 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5 (deprecated)	Same as MD5 (deprecated) hash function, except it requires a secret key to verify the hash value.
HMAC_SH1 (deprecated)	Same as SHA hash function, except it requires a secret key to verify the hash value. Complies with IETF RFC 2104 standard.
HMAC_SH256	Same as SHA-2 256-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SH384	Same as SHA-2 384-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SH512	Same as SHA-2 512-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SHA3_224	Same as SHA-3 224-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SHA3_256	Same as SHA-3 256-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SHA3_384	Same as SHA-3 384-bit hash function, except it requires a secret key to verify the hash value.
HMAC_SHA3_512	Same as SHA-3 512-bit hash function, except it requires a secret key to verify the hash value.

Table 52-6 DBMS_CRYPTO KMACXOF Functions

Name	Description
KMACXOF_128	Variable length KMAC with 128-bit security level. KMAC stands for KECCAK Message Authentication Code.

Table 52-6 (Cont.) DBMS_CRYPTO KMACXOF Functions

Name	Description
KMACXOF_256	Variable length KMAC with 256-bit security level.

Table 52-7 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES (deprecated)	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY (deprecated)	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES (deprecated)	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
PKENCRYPT_RSA_PKCS1_OAEP (deprecated)	Public key encryption algorithm; only allowed for decryption.
PKENCRYPT_RSA_PKCS1_OAEP_SHA2	Public key encryption algorithm.
PKENCRYPT_SM2	Provides Chinese SM2 signature and encryption algorithm support
ENCRYPT_SM4	Block cipher used in the Chinese National Standard for Wireless LAN WAPI (WLAN Authentication and Privacy Infrastructure) and also used with Transport Layer Security

Table 52-8 DBMS_CRYPTO Block Cipher Suites

Name	Description
AES_CBC_PKCS5	ENCRYPT_AES + CHAIN_CBC + PAD_PKCS5
AES_CCM_NONE	ENCRYPT_AES + CHAIN_GCM + PAD_NONE
AES_GCM_NONE	ENCRYPT_AES + CHAIN_CCM + PAD_NONE
AES_XTS_NONE	ENCRYPT_AES + CHAIN_XTS + PAD_NONE
DES_CBC_PKCS5	ENCRYPT_DES[1] + CHAIN_CBC[2]+ PAD_PKCS5[3]
DES3_CBC_PKCS5	ENCRYPT_3DES[1] + CHAIN_CBC[2] + PAD_PKCS5[3]

1 See Table 52-7
2 See Table 52-9
3 See Table 52-10

Table 52-9 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.

Table 52-9 (Cont.) DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_CCM	The Counter with CBC-MAC (CCM) mode. It is a generic authenticated encryption block cipher mode. It can be used with AES (AES_CCM_NONE). The encryption of AES_CCM_NONE takes one extra input AAD (Additional Authenticated Data, optional) and one extra output TAG (non-optional). The decryption of AES_CCM_NONE takes two extra inputs AAD and TAG.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_GCM	The Galois/Counter Mode. It is a generic authenticated encryption block cipher mode. It can be used with AES (AES_GCM_NONE). The encryption of AES_GCM_NONE takes one extra input AAD (Additional Authenticated Data, optional) and one extra output TAG (non-optional). The decryption of AES_GCM_NONE takes two extra inputs AAD and TAG.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that *n* bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.
CHAIN_XTS	XEX-based modified-codebook mode with ciphertext stealing (XTS), a chain mode for AES. It can be used with the AES algorithm in DBMS_CRYPTO and PAD_NONE

Table 52-10 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ORCL	Provides padding that adds a single byte containing the pad length to the end of the crypto vector.
PAD_ZERO	Provides padding consisting of zeroes

52.6 DBMS_CRYPTO Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

See Also:

DBMS_CRYPTO Operational Notes for information about the conversion rules for converting datatypes.

DBMS_CRYPTO Examples for examples of using the call to UTL_I18N.STRING_TO_RAW to allow VARCHAR2 to be encrypted.

52.7 DBMS_CRYPTO Exceptions

The following table lists exceptions that have been defined for DBMS_CRYPTO.

Table 52-11 DBMS_CRYPTO Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

52.8 DBMS_CRYPTO Operational Notes

This section describes several DBMS_CRYPTO operational notes.

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both ENCRYPT and DECRYPT procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the ENCRYPT and DECRYPT functions are used to encrypt and decrypt RAW datatypes. Data of type VARCHAR2 must be converted to RAW before you can use DBMS_CRYPTO functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the HASH function and the MAC function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 256 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, the user runs DBMS_CRYPTO.HASH against the stored data to create a hash value. On returning the stored data, the user can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The HASH function included with DBMS_CRYPTO, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The MAC function is also a one-way hash function, but with the addition of a secret key. It works the same way as the DBMS_CRYPTO.HASH function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The DBMS_CRYPTO package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by DBMS_CRYPTO occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys.

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

- *Oracle Database Security Guide* for information about configuring network encryption and SSL
- RANDOMBYTES Function

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:
  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:

  ```
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```
- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:
  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.

2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

   Syntax example:

   ```
   UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
   ```

> **See Also:**
>
> UTL_I18N for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

52.9 DBMS_CRYPTO Examples

The examples in this section demonstrate different types of PL/SQL coding using DBMS_CRYPTO functions.

Example 1: AES Encryption with Cipher Block Chaining and PKCS#5 Compliant Padding

This example shows PL/SQL block encrypting and decrypting pre-defined input_string using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
   input_string       VARCHAR2 (200) :=  'Secret Message';
   output_string      VARCHAR2 (200);
   encrypted_raw      RAW (2000);             -- stores encrypted binary text
   decrypted_raw      RAW (2000);             -- stores decrypted binary text
   num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
   key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
   encryption_type    PLS_INTEGER :=          -- total encryption type

                        DBMS_CRYPTO.ENCRYPT_AES256
                      + DBMS_CRYPTO.CHAIN_CBC
                      + DBMS_CRYPTO.PAD_PKCS5;

   iv_raw             RAW (16);

BEGIN
   DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
   key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
   iv_raw        := DBMS_CRYPTO.RANDOMBYTES (16);
   encrypted_raw := DBMS_CRYPTO.ENCRYPT
      (
         src => UTL_I18N.STRING_TO_RAW (input_string,  'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw,
         iv  => iv_raw
      );

    -- The encrypted value "encrypted_raw" can be used here

    decrypted_raw := DBMS_CRYPTO.DECRYPT
      (
         src => encrypted_raw,
         typ => encryption_type,
```

```
        key => key_bytes_raw,
        iv  => iv_raw
      );

   output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

   DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Example 2: PKENCRYPTION and PKDECRYPTION Functions

```
DECLARE
  ip_str     VARCHAR (200) := 'Secret Message';
  op_str     VARCHAR (200);
  -- Use OpenSSL to generate the private and public key (2048 bit RSA key)
  -- openssl genrsa -out private.pem 2048
  -- openssl rsa -in private.pem -outform PEM -pubout -out public.pem
  pubkey    VARCHAR (2000) := 'public_key';
  prvkey    VARCHAR (2000) := 'private_key';
  enc_raw    RAW (2000);
  dec_raw    RAW (2000);
  eType      PLS_INTEGER := DBMS_CRYPTO.PKENCRYPT_RSA_PKCS1_OAEP_SHA2;
  kType      PLS_INTEGER := DBMS_CRYPTO.KEY_TYPE_RSA;

BEGIN

  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
  DBMS_OUTPUT.PUT_LINE('Original String := ' || ip_str);
  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
  enc_raw:= DBMS_CRYPTO.PKENCRYPT
  (
    src        => UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8'),
    pub_key    => UTL_I18N.STRING_TO_RAW( pubkey, 'AL32UTF8'),
    pubkey_alg => kType,
    enc_alg    => eType
  );

  dec_raw := DBMS_CRYPTO.PKDECRYPT
  (
    src        => enc_raw,
    prv_key    => UTL_I18N.STRING_TO_RAW( prvkey, 'AL32UTF8'),
    pubkey_alg => kType,
    enc_alg    => eType
  );
  op_str := UTL_I18N.RAW_TO_CHAR(dec_raw,'AL32UTF8');
  dbms_output.put_line('-------------------------------------------------');
  dbms_output.put_line('Decrypted String := ' || op_str);
  dbms_output.put_line('-------------------------------------------------');
end;
/
```

Example 3: SIGN and VERIFY Functions

```
DECLARE
  ip_str     VARCHAR2 (200) := 'Secret Message';
  -- Use OpenSSL to generate the private and public key (2048 bit RSA key)
  -- openssl genrsa -out private.pem 2048
  -- openssl rsa -in private.pem -outform PEM -pubout -out public.pem
  pubkey    VARCHAR (2000) := 'public_key';
  prvkey    VARCHAR (2000) := 'private_key';
  sign_raw   RAW (2000);
  returnval  BOOLEAN := false;
```

```
  sType      PLS_INTEGER := DBMS_CRYPTO.SIGN_SHA224_RSA;
  kType      PLS_INTEGER := DBMS_CRYPTO.KEY_TYPE_RSA;
BEGIN
  sign_raw := DBMS_CRYPTO.SIGN
  (
   src        => UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8'),
   prv_key    => UTL_I18N.STRING_TO_RAW( prvkey, 'AL32UTF8'),
   pubkey_alg => kType,
   sign_alg   => sType
  );
  returnval := DBMS_CRYPTO.VERIFY
  (
   src        => UTL_I18N.STRING_TO_RAW( ip_str,'AL32UTF8'),
   sign       => sign_raw,
   pub_key    => UTL_I18N.STRING_TO_RAW( pubkey, 'AL32UTF8'),
   pubkey_alg => kType,
   sign_alg   => sType
  );
  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
  IF returnval THEN
    DBMS_OUTPUT.PUT_LINE('True');
  ELSE
    DBMS_OUTPUT.PUT_LINE('False');
  END IF;
  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
END;
/
```

Example 4: HASH_SHA3_256 and HASH_SHAKE256 Hash Functions

```
DECLARE
  ip_str VARCHAR2 (200) := 'Secret Message';
  output_string VARCHAR2 (2000);
  source_text_raw RAW (2000);
  hash_raw RAW (2000);
BEGIN
  source_text_raw := UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8');
  hash_raw := dbms_crypto.hash(source_text_raw, dbms_crypto.hash_sha3_256);

  output_string := RAWTOHEX(hash_raw);

  DBMS_OUTPUT.PUT_LINE ('Hash string: ' || output_string);
  DBMS_OUTPUT.PUT_LINE (utl_raw.length(hash_raw);
END;
/

HASH_SHAKE256:

DECLARE
  ip_str VARCHAR2 (200) := 'Secret Message';
  output_string VARCHAR2 (2000);
  source_text_raw RAW (2000);
  hash_raw RAW (2000);
  len PLS_INTEGER := 30;
BEGIN
  source_text_raw := UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8');
  hash_raw := dbms_crypto.hash_len(source_text_raw, dbms_crypto.hash_shake256, len);

  output_string := RAWTOHEX(hash_raw);

  DBMS_OUTPUT.PUT_LINE ('Hash string: ' || output_string);
```

```
END;
/
```

Example 5: HMAC_SHA3_256 and SIGN_SHA3_256_RSA Functions

```
DECLARE
  ip_str VARCHAR2 (200) := 'Secret Message';
  output_string VARCHAR2 (2000);
  source_text_raw RAW (2000);
  hmac_raw RAW (2000);
  testkey RAW (2000);
BEGIN
  source_text_raw := UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8');
  -- Use your test key
  testkey := HEXTORAW('');
  hmac_raw := dbms_crypto.mac(source_text_raw, dbms_crypto.HMAC_SHA3_256, testkey);

  output_string := RAWTOHEX(hmac_raw);

  DBMS_OUTPUT.PUT_LINE ('Hmac string: ' || output_string);
END;
/

SIGN_SHA3_256_RSA:

DECLARE
  ip_str VARCHAR2 (200) := 'Secret Message';
  -- Use OpenSSL to generate the private and public key (2048 bit RSA key)
  -- openssl genrsa -out private.pem 2048
  -- openssl rsa -in private.pem -outform PEM -pubout -out public.pem
  pubkey VARCHAR (2000) := 'public_key';
  prvkey VARCHAR (2000) := 'private_key';
  sign_raw RAW (2000);
  returnval BOOLEAN := false;
  sType PLS_INTEGER := DBMS_CRYPTO.SIGN_SHA3_256_RSA;
  kType PLS_INTEGER := DBMS_CRYPTO.KEY_TYPE_RSA;
BEGIN
  sign_raw := DBMS_CRYPTO.SIGN
  (
   src => UTL_I18N.STRING_TO_RAW(ip_str,'AL32UTF8'),
   prv_key => UTL_I18N.STRING_TO_RAW( prvkey, 'AL32UTF8'),
   pubkey_alg => kType,
   sign_alg => sType
  );
  returnval := DBMS_CRYPTO.VERIFY
  (
   src => UTL_I18N.STRING_TO_RAW( ip_str,'AL32UTF8'),
   sign => sign_raw,
   pub_key => UTL_I18N.STRING_TO_RAW( pubkey, 'AL32UTF8'),
   pubkey_alg => kType,
   sign_alg => sType
  );
  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
  IF returnval THEN
    DBMS_OUTPUT.PUT_LINE('True');
  ELSE
    DBMS_OUTPUT.PUT_LINE('False');
  END IF;
  DBMS_OUTPUT.PUT_LINE('-------------------------------------------------');
END;
/
```

52.10 Summary of DBMS_CRYPTO Subprograms

This table lists the `DBMS_CRYPTO` subprograms in alphabetical order and briefly describes them.

Table 52-12 ***DBMS_CRYPTO Package Subprograms***

Subprogram	Description
DECRYPT Function	Decrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures	Decrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
ECDHDERIVE_SHAREDSECRET Function	Derives shared secret using private key of local application and public key from the remote application
ECDH_GENKEYPAIR Function	Generates an EC public/private key pair
ENCRYPT Function	Encrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures	Encrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
HASH Function	Applies one of the supported cryptographic hash algorithms (MD5, SHA-1, or SHA-2) to data.
	Note: Starting from Oracle Database 20c Release, the use of MD5 and SHA-1 are deprecated. MD4 is desupported. Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.
HASH_LEN Function	Similar to the `HASH` function, except that it includes an extra input length that uses the `PLS_INTEGER` type
MAC Function	Applies Message Authentication Code algorithms (MD5, SHA-1, or SHA-2) to data to provide keyed message protection.
	Note: Starting from Oracle Database 20c Release, the use of MD5 and SHA-1 are deprecated. Oracle recommends that you do not use deprecated values in new applications. Support for deprecated features is for backward compatibility only.
KMACXOF Function	Similar to the `MAC` function, except that is includes the `length` and `custStr` fields.

Table 52-12 (Cont.) *DBMS_CRYPTO Package Subprograms*

Subprogram	Description
PKDECRYPT Function	Decrypts `RAW` data using a private key assisted with key algorithm and encryption algorithm and returns decrypted data.
PKENCRYPT Function	Encrypts `RAW` data using a public key assisted with key algorithm and encryption algorithm and returns encrypted data
RANDOMBYTES Function	Returns a `RAW` value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function	Returns a random `BINARY_INTEGER`
RANDOMNUMBER Function	Returns a random 128-bit integer of the `NUMBER` datatype
SIGN Function	Signs `RAW` data using a private key assisted with key algorithm and sign algorithm, and returns a signature
VERIFY Function	Verifies `RAW` data using the signature, public key assisted with key algorithm, and sign algorithm. It returns `TRUE` if the signature was verified

52.10.1 DECRYPT Functions

These functions decrypt `RAW` data using a stream or block cipher with a user-supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW DEFAULT NULL)
 RETURN RAW;

DBMS_CRYPTO.DECRYPT (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv IN RAW DEFAULT NULL,
   aad IN RAW DEFAULT NULL,
   tag IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-13 DECRYPT Function Parameters

Parameter Name	Description
`src`	`RAW` data to be decrypted.

Table 52-13 (Cont.) DECRYPT Function Parameters

Parameter Name	Description
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.
aad	Additional authenticated data, which is any string that you pass to an Oracle Cloud key management service as part of the request.
tag	Authentication tag that is used for the authentication check.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

> **See Also:**
>
> "Usage Notes" for the ENCRYPT function for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

> **See Also:**
>
> DBMS_CRYPTO Operational Notes for a discussion of the VARCHAR2 to RAW conversion rules

52.10.2 DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPT.DECRYPT(
   dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.DECRYPT (
```

```
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW DEFAULT NULL,
   aad IN            RAW DEFAULT NULL,
   tag IN            RAW);

DBMS_CRYPTO.DECRYPT (
  dst IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src IN            BLOB,
  typ IN            PLS_INTEGER,
  key IN            RAW,
  iv  IN            RAW DEFAULT NULL,
  aad IN            RAW DEFAULT NULL,
  tag IN            RAW);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-14 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.
aad	Additional authenticated data, which is any string that you pass to an Oracle Cloud key management service as part of the request.
tag	Authentication tag that is used for the authentication check.

52.10.3 ECDHDERIVE_SHAREDSECRET Function

This function derives shared secret using private key of local application and public key from the remote application.

Syntax

```
DBMS_CRYPTO.
DBMS_CRYPTO.ECDHDERIVE_SHAREDSECRET (
   curveid       IN  BINARY_INTEGER,
   pubkey        IN  RAW,
   privkey       IN  RAW,
   sharedsecret  OUT RAW);
```

Parameters

Table 52-15 HASH Function Parameters

Parameter Name	Description
curveid	Constants to denote the curve name that the algorithm uses. Example: SECP_256_R1
pubkey	Public key from the other side
privkey	Private key
sharedsecret	Shared secret generated from private key and public key from the other side

Usage Note

The supported curve id SECP_256_R1 denotes NIST Recommended Curve secp256r1.

52.10.4 ECDH_GENKEYPAIR Function

This function generates an EC public/private key pair.

Syntax

```
DBMS_CRYPTO.
DBMS_CRYPTO.ECDH_GENKEYPAIR (
   curveid       IN  BINARY_INTEGER,
   pubkey        OUT  RAW,
   privkey       OUT  RAW);
```

Parameters

Table 52-16 HASH Function Parameters

Parameter Name	Description
curveid	Constants to denote the curve name that the algorithm uses. Example: SECP_256_R1
pubkey	Public key
privkey	Private key

Usage Note

The supported curve id SECP_256_R1 denotes NIST Recommended Curve secp256r1.

52.10.5 ENCRYPT Functions

These functions encrypt RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
```

```
   iv  IN RAW DEFAULT NULL)
 RETURN RAW;

DBMS_CRYPTO.ENCRYPT (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW DEFAULT NULL,
   aad IN RAW DEFAULT NULL,
   tag OUT RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-17 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.
aad	Additional authenticated data, which is any string that you pass to an Oracle Cloud key management service as part of the request.
tag	Authentication tag that is used for the authentication check.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 52-9 and Table 52-10 for block cipher chaining and padding modifier constants that have been defined for this package.
- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 52-8 for the block cipher suites already defined as constants for this package.
- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

> **See Also:**
>
> The discussion of conversion rules under DBMS_CRYPTO Operational Notes

52.10.6 ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            CLOB         CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT (
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW DEFAULT NULL,
   aad IN            RAW DEFAULT NULL,
   tag OUT           RAW);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT        NOCOPY BLOB,
   src IN            CLOB CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW DEFAULT NULL,
   aad IN            RAW DEFAULT NULL,
   tag OUT           RAW);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-18 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Table 52-18 (Cont.) ENCRYPT Procedure Parameters

Parameter Name	Description
aad	Additional authenticated data, which is any string that you pass to an Oracle Cloud key management service as part of the request.
tag	Authentication tag that is used for the authentication check.

Usage Notes

- ENCRYPT can use the ENCRYPT_SM4 constant for SM4 encryption algorithm.
- See DBMS_DEBUG Operational Notes for more information about the conversion rules for the ENCRYPT procedure.

52.10.7 HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notes for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 52-4.

Syntax

```
DBMS_CRYPTO.HASH (
   src IN RAW,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.HASH (
   src IN BLOB,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.HASH (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-19 HASH Function Parameters

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.

Usage Notes

- Oracle recommends that you use SHA-2 (SHA-256, SHA-384, SHA-512). SHA-1 (HASH_SH1) is deprecated.
- The HASH function can use the HASH_SM3 constant for the SM3 hash algorithm

52.10.8 HASH_LEN Function

HASH_LEN is an extension of the HASH function that can generate variable length hash output.

HASH_LEN includes an extra input length in PLS_INTEGER type, which is hash length. HASH_LEN only supports two types of hash: SHAKE128 and SHAKE256.

Syntax

```
DBMS_CRYPTO.HASH_LEN (
   src IN RAW,
   typ IN PLS_INTEGER,
   length IN PLS_INTEGER)
 RETURN RAW DETERMINISTIC;

DBMS_CRYPTO.HASH_LEN (
   src IN BLOB,
   typ IN PLS_INTEGER,
   length IN PLS_INTEGER)
 RETURN RAW DETERMINISTIC;

DBMS_CRYPTO.HASH_LEN (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER,
   length IN PLS_INTEGER)
 RETURN RAW DETERMINISTIC;
```

Parameters

Table 52-20 HASH Function Parameters

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.
len	The variable length for SHAKE128 and SHAKE256 hash algorithms.

Usage Notes

`HASH_LEN` can only use hash types `HASH_SHAKE128` and `HASH_SHAKE256`. Other hash types are invalid for this function.

52.10.9 MAC Function

This function applies Message Authentication Code (MAC) algorithms to data to provide keyed message protection.

A MAC is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in HASH Function, but they also include a key. Only someone with the identical key can verify the hash. Also refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notesfor more information about using MACs.

See Table 52-5 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPTO.MAC (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN BLOB,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-21 MAC Function Parameters

Parameter Name	Description
`src`	Source data to which MAC algorithms are to be applied.
`typ`	MAC algorithm to be used.
`key`	Key to be used for MAC algorithm.

52.10.10 KMACXOF Function

KMAC stands for KECCAK Message Authentication Code. This function is similar to the `MAC` function except that is includes the `length` and `custStr` fields.

Syntax

```
DBMS_CRYPTO.KMACXOF(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   length IN PLS_INTEGER,
   custStr IN RAW)
 RETURN RAW;

DBMS_CRYPTO.KMACXOF (
   src IN BLOB,
   typ IN PLS_INTEGER,
   key IN RAW,
   length IN PLS_INTEGER,
   custStr IN RAW)
 RETURN RAW;

DBMS_CRYPTO.KMACXOF (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER,
   key IN RAW,
   length IN PLS_INTEGER,
   custStr IN RAW)
 RETURN RAW;
```

Parameters

Table 52-22 KMACXOF Function Parameters

Parameter Name	Description
`src`	Source data to which KMACXOF algorithms are to be applied.
`typ`	KMACXOF algorithm to be used.
`key`	Key to be used for KMACXOF algorithm.
`length`	Length of KMACXOF output in bytes.
`custStr`	Custom string for KMACXOF.

52.10.11 PKDECRYPT Function

This function decrypts `RAW` data using a private key assisted with key algorithm and encryption algorithm and returns decrypted data.

Syntax

```
DBMS_CRYPTO.PKDECRYPT(
   src IN RAW,
   prv_key IN RAW,
   pubkey_alg IN BINARY_INTEGER,
   enc_alg  IN BINARY_INTEGER)
 RETURN RAW;
```

Parameters

Table 52-23 PKDECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
prv_key	Private key.
pubkey_alg	Specify the KEY_TYPE_RSA RSA key type.
enc_alg	Specify the algorithm PKENCRYPT_RSA_PKCS1_OAEP, for RSA Public Key Cryptosystem with PKCS1 and OAEP padding.

52.10.12 PKENCRYPT Function

This function encrypts RAW data using a public key assisted with key algorithm and encryption algorithm and returns encrypted data.

Syntax

```
DBMS_CRYPTO.PKENCRYPT(
   src IN RAW,
   pub_key IN RAW,
   pubkey_alg IN BINARY_INTEGER,
   enc_alg  IN BINARY_INTEGER)
 RETURN RAW;
```

Parameters

Table 52-24 PKENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
pub_key	Public key.
pubkey_alg	Specify the KEY_TYPE_RSA RSA key type.
enc_alg	Specify the algorithm PKENCRYPT_RSA_PKCS1_OAEP, for RSA Public Key Cryptosystem with PKCS1 and OAEP padding.

Usage Notes

You can use the PKENCRYPT_SM2 constant for the SM2 public key encryption algorithm and the KEY_TYPE_SM2 constant for SM2 key type.

52.10.13 RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 52-25 RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

Usage Note

The number_bytes value should not exceed the maximum length of a RAW variable.

52.10.14 RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle BINARY_INTEGER datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
 RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

52.10.15 RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```

52.10.16 SIGN Function

This function signs RAW data using a private key assisted with key algorithm and sign algorithm, and returns a signature.

Syntax

```
DBMS_CRYPTO.SIGN(
   src IN RAW,
   prv_key IN RAW,
   pubkey_alg IN BINARY_INTEGER,
   sign_alg IN BINARY_INTEGER)
 RETURN RAW;
```

Parameters

Table 52-26 SIGN Function Parameters

Parameter Name	Description
src	RAW data to be signed.
prv_key	Private key.
pubkey_alg	Specify the KEY_TYPE_RSA RSA key type for RSA algorithms and KEY_TYPE_ECDSA ECDSA key type for ECDSA algorithms.
sign_alg	Specify one of the algorithms that are listed in the Usage Notes.

Usage Notes

Table 52-27 Signature Type Algorithms

Hash Algorithm	Description
SIGN_SHA1_RSA	SHA1 hash function with RSA
SIGN_SHA1_RSA_X931	SHA1 hash function with RSA and X931 padding
SIGN_SHA224_ECDSA	SHA 224-bit hash function with ECDSA
SIGN_SHA224_RSA	SHA 224-bit hash function with RSA
SIGN_SHA256_ECDSA	SHA 256-bit hash function with ECDSA
SIGN_SHA256_RSA	SHA 256-bit hash function with RSA
SIGN_SHA256_RSA_X931	SHA 256-bit hash function with RSA and X931 padding
SIGN_SHA3_224_ECDSA	SHA-3 224-bit hash function with ECDSA
SIGN_SHA3_224_RSA	SHA-3 234-bit hash function with RSA
SIGN_SHA3_256_ECDSA	SHA-3 256-bit hash function with ECDSA
SIGN_SHA3_256_RSA	SHA-3 256-bit hash function with RSA
SIGN_SHA3_384_ECDSA	SHA-3 384-bit hash function with ECDSA
SIGN_SHA3_384_RSA	SHA-3 384-bit hash function with RSA
SIGN_SHA3_512_ECDSA	SHA-3 512-bit hash function with ECDSA
SIGN_SHA3_512_RSA	SHA-3 512-bit hash function with RSA
SIGN_SHA384_ECDSA	SHA 384-bit hash function with ECDSA
SIGN_SHA384_RSA	SHA 384-bit hash function with RSA
SIGN_SHA384_RSA_X931	SHA 384-bit hash function with RSA and X931 padding
SIGN_SHA512_ECDSA	SHA 512-bit hash function with ECDSA
SIGN_SHA512_RSA	SHA 512-bit hash function with RSA
SIGN_SHA512_RSA_X931	SHA 512-bit hash function with RSA and X931 padding
SIGN_SM3_SM2	SM3 256-bit hash function with SM2

Usage Notes

You can use the SIGN_SM3_SM2 constant for the SM3_SM2 encryption algorithm

52.10.17 VERIFY Function

This function verifies `RAW` data using the signature, public key assisted with key algorithm, and sign algorithm. It returns `TRUE` if the signature was verified.

Syntax

```
DBMS_CRYPTO.VERIFY(
   src IN RAW,
   sign IN RAW,
   pub_key IN RAW,
   pubkey_alg IN BINARY_INTEGER,
   sign_alg  IN BINARY_INTEGER)
 RETURN BOOLEAN;
```

Parameters

Table 52-28 VERIFY Function Parameters

Parameter Name	Description
`src`	`RAW` data to be verified.
`sign`	Message signature.
`pub_key`	Public key.
`pubkey_alg`	Specify the KEY_TYPE_RSA RSA key type for RSA algorithms and KEY_TYPE_ECDSA ECDSA key type for ECDSA algorithms.
`sign_alg`	Specify one of the algorithms that are listed the Usage Notes.

Usage Notes

Table 52-29 Verify Type Algorithms

Hash Algorithm	Description
`SIGN_SHA1_RSA`	SHA hash function with RSA
`SIGN_SHA1_RSA_X931`	SHA hash function with RSA and X931 padding
`SIGN_SHA224_ECDSA`	SHA 224-bit hash function with ECDSA
`SIGN_SHA224_RSA`	SHA 224-bit hash function with RSA
`SIGN_SHA256_ECDSA`	SHA 256-bit hash function with ECDSA
`SIGN_SHA256_RSA`	SHA 256-bit hash function with RSA
`SIGN_SHA256_RSA_X931`	SHA 256-bit hash function with RSA and X931 padding
`SIGN_SHA3_224_ECDSA`	SHA-3 224-bit hash function with ECDSA
`SIGN_SHA3_224_RSA`	SHA-3 234-bit hash function with RSA
`SIGN_SHA3_256_ECDSA`	SHA-3 256-bit hash function with ECDSA
`SIGN_SHA3_256_RSA`	SHA-3 256-bit hash function with RSA
`SIGN_SHA3_384_ECDSA`	SHA-3 384-bit hash function with ECDSA
`SIGN_SHA3_384_RSA`	SHA-3 384-bit hash function with RSA

Table 52-29 (Cont.) Verify Type Algorithms

Hash Algorithm	Description
SIGN_SHA3_512_ECDSA	SHA-3 512-bit hash function with ECDSA
SIGN_SHA3_512_RSA	SHA-3 512-bit hash function with RSA
SIGN_SHA384_ECDSA	SHA 384-bit hash function with ECDSA
SIGN_SHA384_RSA	SHA 384-bit hash function with RSA
SIGN_SHA384_RSA_X931	SHA 384-bit hash function with RSA and X931 padding
SIGN_SHA512_ECDSA	SHA 512-bit hash function with ECDSA
SIGN_SHA512_RSA	SHA 512-bit hash function with RSA
SIGN_SHA512_RSA_X931	SHA 512-bit hash function with RSA and X931 padding
SIGN_SM3_SM2	SM3 256-bit hash function with SM2

Usage Notes

You can use the SIGN_SM3_SM2 constant for the SM3_SM2 encryption algorithm

53
DBMS_CSX_ADMIN

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_CSX_ADMIN

53.1 DBMS_CSX_ADMIN Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

53.2 DBMS_CSX_ADMIN Security Model

Owned by XDB, the DBMS_CSX_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

53.3 DBMS_CSX_ADMIN Constants

The DBMS_CSX_ADMIN package uses several constants.

These are described in the following table.

Table 53-1 DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace

Table 53-1 (Cont.) DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

53.4 Summary of DBMS_CSX_ADMIN Subprograms

This table lists and describes the DBMS_CSX_ADMIN Package subprograms.

Table 53-2 DBMS_CSX_ADMIN Package Subprograms

Subprogram	Description
GETTOKENTABLEINFO Procedure & Function	Returns the GUID of the token table set where token mappings for this table
GETTOKENTABLEINFOBYTABLESPACE Procedure	Returns the GUID and the token table names for this tablespace
NAMESPACEIDTABLE Function	Returns default namespace-ID token table
PATHIDTABLE Function	Returns the default path-ID token table
QNAMEIDTABLE Function	Returns the default qname-ID token table.

53.4.1 GETTOKENTABLEINFO Procedure & Function

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   ownername       IN   VARCHAR2,
   tablename       IN   VARCHAR2,
   guid            OUT  RAW,
   qnametable      OUT  VARCHAR2,
   nmspctable      OUT  VARCHAR2,
   level           OUT  NUMBER,
   tabno           OUT  NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   tabno           IN   NUMBER,
```

```
  guid           OUT  RAW);
RETURN BOOLEAN;
```

Parameters

Table 53-3 GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
ownername	Owner of the table
tablename	Name of the table
guid	GUID of the token table set used by the given table
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
level	DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise
tabno	Table object number

53.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE  (
   tsname          IN   VARCHAR2,
   tablespaceno    IN   NUMBER,
   guid            OUT  RAW,
   qnametable      OUT  VARCHAR2,
   nmspctable      OUT  VARCHAR2,
   isdefault       OUT  BOOLEAN,
   containTokTab   OUT  BOOLEAN);
```

Parameters

Table 53-4 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
tsname	Tablespace name
tablespaceno	Tablespace number
guid	GUID of the token table set associated with this tablespace (if any)
qnametable	Name of the qname-ID table
nmspctable	Name of the namespace-ID table
isdefault	TRUE if the token table is the default one
containTokTab	TRUE if the tablespace contains its own token table set

53.4.3 NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
  RETURN VARCHAR2;
```

53.4.4 PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE
  RETURN VARCHAR2;
```

53.4.5 QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE
  RETURN VARCHAR2;
```

54
DBMS_CUBE

DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

> **See Also:**
>
> OLAP Technology in the Oracle Database in *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

- Using DBMS_CUBE
- Using SQL Aggregation Management
- Upgrading 10g Analytic Workspaces
- Summary of DBMS_CUBE Subprograms

54.1 Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management".

The metadata for cubes and dimensions is defined in XML documents, called *templates*, which you can derive from relational materialized views using the CREATE_CUBE or DERIVE_FROM_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.

54.1.1 DBMS_CUBE Security Model

Certain roles and system privileges are required to use the DBMS_CUBE package.

To create dimensional objects in the user's own schema:

- `OLAP_USER` role
- `CREATE SESSION` privilege

To create dimensional objects in different schemas:

- `OLAP_DBA` role
- `CREATE SESSION` privilege

To create cube materialized views in the user's own schema:

- `CREATE MATERIALIZED VIEW` privilege
- `CREATE DIMENSION` privilege
- `ADVISOR` privilege

To create cube materialized views in different schemas:

- `CREATE ANY MATERIALIZED VIEW` privilege
- `CREATE ANY DIMENSION` privilege
- `ADVISOR` privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs `SELECT` object privileges on those tables.

54.2 Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in `DBMS_CUBE` that supports the rapid deployment of cube materialized views from existing relational materialized views.

Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, `DBMS_CUBE` also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A `CB$` prefix identifies a cube materialized view.

The `DBMS_CUBE` subprograms also support life-cycle management of cube materialized views.

> **See Also:**
>
> Adding Materialized View Capability to a Cube in *Oracle OLAP User's Guide* for more information about cube materialized views and enhanced OLAP analytics.

54.2.1 Subprograms in SQL Aggregation Management

SQL Aggregation Management includes four subprograms.

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure

54.2.2 Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit `GROUP BY` clause for one or more columns.
- No expressions in the select list or `GROUP BY` clause.
- At least one of these numeric aggregation methods: `SUM`, `MIN`, `MAX`, or `AVG`.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.

  or

  Summary keys with at least one simple column and no hierarchies or levels.
- Numeric datatype of any type for the fact columns. All facts are converted to `NUMBER`.
- Eligible for rewrite. `REWRITE_CAPABILITY` should be `GENERAL`; it cannot be `NONE`. Refer to the `ALL_MVIEWS` entry in the *Oracle Database Reference*.
- Cannot use the `DISTINCT` or `UNIQUE` keywords with an aggregate function in the defining query. For example, `AVG(DISTINCT units)` causes an error in `STRICT` mode and is ignored in `LOOSE` mode.

You can choose between two modes when rendering the cube materialized view, `LOOSE` and `STRICT`. In `STRICT` mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In `LOOSE` mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.

- The AVG function is changed to SUM and COUNT.
- The COUNT function without a SUM, MIN, MAX, or AVG function is ignored.
- The STDDEV and VARIANCE functions are ignored.

You can also choose how conditions in the WHERE clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

54.2.3 Permissions for Managing and Querying Cube Materialized Views

Certain permissions are required to manage and query cube materialized views.

To create cube materialized views, you must have these privileges:

- CREATE [ANY] MATERIALIZED VIEW privilege
- CREATE [ANY] DIMENSION privilege
- ADVISOR privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- GLOBAL QUERY REWRITE privilege
- SELECT or READ privilege on the relational source tables
- SELECT or READ privilege on the analytic workspace (AW$*name*) that supports the cube materialized view
- SELECT or READ privilege on the cube
- SELECT or READ privilege on the dimensions of the cube

Note that you need SELECT or READ privileges on the database objects that *support* the cube materialized views, but not on the cube materialized views.

54.2.4 Example of SQL Aggregation Management

Six examples of SQL Aggregate Management are given. All these examples use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

- About Relational Materialized View CAL_MONTH_SALES_MV
- Creating the Cube Materialized View
- Disabling the Relational Materialized Views
- Creating Execution Plans for Cube Materialized Views
- Maintaining Cube Materialized Views
- New Database Objects

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
     WHERE mview_name='CAL_MONTH_SALES_MV';

QUERY
-----------------------------------------
SELECT   t.calendar_month_desc
  ,        sum(s.amount_sold) AS dollars
  FROM     sales s
  ,        times t
  WHERE    s.time_id = t.time_id
  GROUP BY t.calendar_month_desc
```

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;

DIMENSION_NAME
-----------------------------------
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM
```

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);

BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                'build=immediate');
END;
/
```

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

```
Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212 08:42:58.0
03.
Created cube organized materialized view "CB$CAL_MONTH_SALES" for rewrite at 200
130212 08:42:58.004.
```

The following query lists the materialized views in the SH schema:

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;

Materialized view altered.
```

You can also use the DISABLEQRW parameter in the CREATE_MVIEW function, which disables query rewrite on the source materialized view as described in Table 54-7.

Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the SALES table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
           t.calendar_quarter_desc,
           sum(s.amount_sold) AS dollars
  FROM     sales s,
           times t
  WHERE    s.time_id = t.time_id
  AND      t.calendar_quarter_desc LIKE '2001%'
  GROUP BY t.calendar_quarter_desc
  ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

```
CALENDAR_QUARTER_DESC    DOLLARS
-------------------- ----------
2001-01               6547097.44
2001-02               6922468.39
2001-03               7195998.63
2001-04               7470897.52
```

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB$CAL_MONTH_SALES, instead of recalculating it from the SALES table.

```
SELECT plan_table_output FROM TABLE(dbms_xplan.display());

PLAN_TABLE_OUTPUT
-------------------------------------------------------------------------------------------------------------------
Plan hash value: 2999729407

-------------------------------------------------------------------------------------------------
| Id  | Operation                     | Name              | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------------------------
```

```
|   0 | SELECT STATEMENT               |                    |     1 |    30 |     3  (34)| 00:00:01 |
|   1 |  SORT GROUP BY                 |                    |     1 |    30 |     3  (34)| 00:00:01 |
|*  2 |   MAT_VIEW REWRITE CUBE ACCESS | CB$CAL_MONTH_SALES |     1 |    30 |     2   (0)| 00:00:01 |
-------------------------------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------

   2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND
              "CB$CAL_MONTH_SALES"."SYS_GID"=63)

15 rows selected.
```

Maintaining Cube Materialized Views

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the REFRESH_MVIEW Procedure:

```
BEGIN
     dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212
14:30:59.534.
```

If you want to drop a cube materialized view, use the DROP_MVIEW Procedure so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
     dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including
container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130212 13:38:47.878.
```

New Database Objects

The `CREATE_MVIEW` function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as `ALL_CUBES` and `ALL_CUBE_DIMENSIONS`.

This example created the following supporting objects:

- Analytic workspace `CAL_MONTH_SALES_AW` (`AW$CAL_MONTH_SALES_AW` table)
- Cube `CAL_MONTH_SALES`
- Cube dimension `TIMES_DIM_D1`
- Dimension hierarchy `CAL_ROLLUP`
- Dimension levels `ALL_TIMES_DIM`, `YEAR`, `QUARTER`, and `MONTH`
- Numerous attributes for levels in the `CAL_ROLLUP` hierarchy

54.3 Upgrading 10*g* Analytic Workspaces

You can upgrade an OLAP 10*g* analytic workspace to OLAP 12*c* by saving the OLAP 10*g* objects as an XML template and importing the XML into a different schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

Oracle OLAP metadata is the same in OLAP 11*g* and OLAP 12*c* so you do not need to upgrade an OLAP 11*g* analytic workspace to OLAP 12*c*. This topic describes upgrading an Oracle OLAP 10*g* analytic workspace to OLAP 12*c*.

> **Tip:**
>
> Oracle recommends using Analytic Workspace Manager for performing upgrades. See Upgrading Metadata From Oracle OLAP 10*g* in *Oracle OLAP User's Guide*.

These subprograms in `DBMS_CUBE` support the upgrade process:

- CREATE_EXPORT_OPTIONS Procedure
- CREATE_IMPORT_OPTIONS Procedure
- EXPORT_XML Procedure
- EXPORT_XML_TO_FILE Procedure
- IMPORT_XML Procedure
- INITIALIZE_CUBE_UPGRADE Procedure
- UPGRADE_AW Procedure

Prerequisites:

- The OLAP 10*g* analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10*g* analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12*c*.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12*c* analytic workspace in the same schema as the OLAP 10*g* analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - `SELECT` or `READ` privileges on the OLAP 10*g* analytic workspace (`GRANT SELECT ON` *`schema`*`.AW$`*`analytic_workspace`*).
  - `SELECT` or `READ` privileges on all database tables and views that contain the source data for the OLAP 10*g* analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10*g* user.

  See the *Oracle OLAP User's Guide*.

Correcting Naming Conflicts

The namespaces are different in OLAP 10*g* than those in OLAP 12*c*. For a successful upgrade, you must identify any 10*g* object names that are used multiple times under the 12*c* naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 12*c*:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 12*c* object names do not need to be distinct from 10*g* object names, because they are in different namespaces.
- **Cube**: The names of measures must be unique within a cube.
- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 12*c* analytic workspace.

Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 12*c* naming rules. For example, a 10*g* dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 12*c* namespace, the name is not unique in 12*c*; to a 12*c* client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, a 12*c* client can browse the OLAP 12*c* metadata. You cannot attach an OLAP 12*c* client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10*g* metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 12*c* client, you see the new object names. When using an 10*g* client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10*g,* the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 12*c* objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 12*c* namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.

OLAP 12*c* clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10*g* analytic workspace.

> **See Also:**
>
> "INITIALIZE_CUBE_UPGRADE Procedure"

Rename Table

You can create a rename table that contains new object names for an OLAP 12*c* analytic workspace. You can then use the rename table in the `CREATE_IMPORT_OPTIONS` and `UPGRADE_AW` procedures.

When upgrading within the same schema, you must provide a unique name for the 12*c* analytic workspace. The `UPGRADE_AW` procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 12*c* cubes are created in a different namespace than the 10*g* cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the `CUBE_UPGRADE_INFO` table.

To create a rename table:

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10*g* analytic workspace.
2. Issue a command like the following:

```
CREATE TABLE table_name (
          source_id    VARCHAR2(300),
          new_name     VARCHAR2(30),
          object_type  VARCHAR2(30));
```

3. Populate the rename table with the appropriate values, as follows.

`table_name` is the name of the rename table.

`source_id` is the identifier for an object described in the XML document supplied to IMPORT_XML. The identifier must have this format:

schema_name.object_name[*.subobject_name*]

`new_name` is the object name given during the import to the object specified by `source_id`.

`object_type` is the object type as described in the XML, such as StandardDimension or DerivedMeasure.

For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

```
INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL12', 'AW');
INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE', 'Cube');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS', 'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS', 'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.PRODUCT', 'PRODUCTS', 'StandardDimension');
INSERT INTO my_object_map VALUES('GLOBAL_AW.TIME', 'TIME_PERIODS', 'TimeDimension');
```

> **See Also:**
>
> "CREATE_IMPORT_OPTIONS Procedure"

Simple Upgrade

A simple upgrade creates an OLAP 12*c* analytic workspace from an OLAP 10*g* analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10*g* analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12*c* as the schema owner for the OLAP 12*c* analytic workspace.
2. To rename any objects in the 12*c* analytic workspace, create a rename table as described in the Rename Table section. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure".
4. Use the `DBMS_CUBE.BUILD` procedure to load data into the cube.

Example 54-1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 12*c* analytic workspace named `GLOBAL12` from an OLAP 10*g* analytic workspace named `GLOBAL10`. `GLOBAL10` contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

```
BEGIN

  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12');

  -- Load and aggregate the data
  dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

Custom Upgrade

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10*g* analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12*c* as the schema owner of the OLAP 12*c* analytic workspace.
2. Generate an initialization table, as described in the Initialization Table section. Review the new, default object names and modify them as desired.
3. Create a rename table, as described in the Rename Table section. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 12*c* analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.
4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure". The `SUPPRESS_NAMESPACE` option must be set to `TRUE` for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure".

c. Create an XML template in OLAP 12*c* format, as described in "EXPORT_XML Procedure".

d. Create an OLAP 12*c* analytic workspace from the XML template, as described in "IMPORT_XML Procedure".

5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure".

Example 54-2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the `GLOBAL10` analytic workspace from OLAP 10*g* metadata to OLAP 12*c* metadata in the `GLOBAL_AW` schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```
CREATE TABLE my_object_map(
       source_id    VARCHAR2(300),
       new_name     VARCHAR2(30),
       object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL12', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```
set serverout on

DECLARE
  importClob    clob;
  exportClob    clob;
  exportOptClob clob;
  importOptClob clob;

BEGIN

  -- Create table of reconciled names
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob,
suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

   -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from a 10g analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob,
out_xml=>importClob);

  -- Load and aggregate the data
```

```
  dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

54.4 Summary of DBMS_CUBE Subprograms

This table lists and describes the DBMS_CUBE procedure subprograms.

Table 54-1 DBMS_CUBE Subprograms

Subprogram	Description
BUILD Procedure	Loads data into one or more cubes and dimensions, and prepares the data for querying.
CREATE_EXPORT_OPTIONS Procedure	Creates an input XML document of processing options for the EXPORT_XML procedure.
CREATE_IMPORT_OPTIONS Procedure	Creates an input XML document of processing options for the IMPORT_XML procedure.
CREATE_MVIEW Function	Creates a cube materialized view from the definition of a relational materialized view.
DERIVE_FROM_MVIEW Function	Creates an XML template for a cube materialized view from the definition of a relational materialized view.
DROP_MVIEW Procedure	Drops a cube materialized view.
EXPORT_XML Procedure	Exports the XML of an analytic workspace to a CLOB.
EXPORT_XML_TO_FILE Procedure	Exports the XML of an analytic workspace to a file.
IMPORT_XML Procedure	Creates, modifies, or drops an analytic workspace by using an XML template
INITIALIZE_CUBE_UPGRADE Procedure	Processes Oracle OLAP 10*g* objects with naming conflicts to enable Oracle 12*c* clients to access them.
REFRESH_MVIEW Procedure	Refreshes a cube materialized view.
UPGRADE_AW Procedure	Upgrades an analytic workspace from Oracle OLAP 10*g* to 12*c*.
VALIDATE_XML Procedure	Checks the XML to assure that it is valid, without committing the results to the database.

54.4.1 BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (
       script                IN  VARCHAR2,
       method                IN  VARCHAR2        DEFAULT NULL,
       refresh_after_errors  IN  BOOLEAN         DEFAULT FALSE,
       parallelism           IN  BINARY_INTEGER  DEFAULT 0,
       atomic_refresh        IN  BOOLEAN         DEFAULT FALSE,
       automatic_order       IN  BOOLEAN         DEFAULT TRUE,
       add_dimensions        IN  BOOLEAN         DEFAULT TRUE,
       scheduler_job         IN  VARCHAR2        DEFAULT NULL,
       master_build_id       IN  BINARY_INTEGER  DEFAULT 0,
```

```
nested                IN  BOOLEAN         DEFAULT FALSE);
job_class             IN  VARCHAR2        DEFAULT 'DEFAULT_JOB_CLASS'
```

Parameters

Table 54-2 BUILD Procedure Parameters

Parameter	Description
script	A list of cubes and dimensions and their build options (see "SCRIPT Parameter").
method	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects. • C: Complete refresh clears all dimension values before loading. (Default) • F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. • ?: Fast refresh if possible, and otherwise a complete refresh. • P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. • S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" for additional details. Methods do not apply to dimensions.
refresh_after_errors	TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build.
parallelism	Number of parallel processes to allocate to this job (see Usage Notes).
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
automatic_order	TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.
add_dimensions	TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
master_build_id	A unique name for the build.

Table 54-2 (Cont.) BUILD Procedure Parameters

Parameter	Description
nested	TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.
job_class	The class this job is associated with.

SCRIPT Parameter

The SCRIPT parameter identifies the objects to include in the build, and specifies the type of processing to perform on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,...]
```

Where:

VALIDATE checks all steps of the build and sends the planned steps to CUBE_BUILD_LOG without executing the steps. You can view all generated SQL in the OUTPUT column of the log table.

NO COMMIT builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command".

objects is the qualified name of one or more cubes or dimensions, separated by commas, in the form *[aw_name.]object*, such as UNITS_CUBE or GLOBAL.UNITS_CUBE.

SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

> **Note:**
>
> A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

- AGGREGATE USING [MEASURE]

  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

- ANALYZE

  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]

Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The 'C' (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

- VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)
- LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)
- AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

These optional arguments control the load method, and can be combined with any of the refresh options:

- PARALLEL: Each partition is cleared separately. (Default)
- SERIAL: All partitions are cleared together.

If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- COMPILE [SORT | NO SORT | SORT ONLY]

  Creates the supporting structures for the dimension. (Dimensions only)

  These options control the use of a sort order attribute:

  - SORT: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
  - NO SORT: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.
  - SORT ONLY: The compile step only runs the sort.

- EXECUTE PLSQL string

  Executes a PL/SQL command or script in the database.

- EXECUTE OLAP DML string [PARALLEL | SERIAL]

  Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:

  - PARALLEL: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.
  - SERIAL: Execute the command or program once for the entire cube. (Default)

- [INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (*dimension.hierarchy*)] VALUES (*dim_key, parent, level_name*)

  Adds a dimension member to one or more hierarchies. INSERT throws an error if the member already exists, while MERGE does not. See "Dimension Maintenance Example".

  dimension.hierarchy: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, "PRODUCT"."PRIMARY".

dim_key: The DIM_KEY value of the dimension member.

parent: The parent of the dimension key.

level_name: The level of the dimension key.

- UPDATE [ALL HIERARCHIES | HIERARCHIES (*dimension.hierarchy*)] SET PARENT = *parent*, LEVEL=*level_name* WHERE MEMBER = *dim_key*

  Alters the level or parent of an existing dimension member. See INSERT for a description of the options. Also see "Dimension Maintenance Example".

- DELETE FROM DIMENSION WHERE MEMBER=*dim_key*

  Deletes a dimension member. See "Dimension Maintenance Example".

  dim_key: The DIM_KEY value of the dimension member to be deleted.

- SET *dimension.attribute[qdr]* = CAST('*attribute_value*' AS VARCHAR2))

  Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example".

  dimension.attribute: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT"."LONG_DESCRIPTION".

  qdr: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.

  attribute_value: The value of the attribute, such as 'Optical Mouse'.

- FOR *dimension_clause measure_clause* BUILD (*commands*)

  Restricts the build to particular measures and dimension values, using the following arguments. See "FOR Clause Example".

  – *dimension_clause*:

    dimension ALL | NONE | WHERE *condition* | LEVELS (*level* [, *level*...])

    dimension is the name of a dimension of the cube.

    ALL sets the dimension status to all members before executing the list of commands.

    NONE loads values for no dimension members.

    WHERE loads values for those dimension members that match the condition.

    LEVELS loads values for dimension members in the named levels.

    level is a level of the named dimension.

  – *measure_clause*:

    MEASURES (*measure* [, *measure*...])

    measure is the name of a measure in the cube.

  – *commands*: Any of the other USING commands.

- LOAD [SYNCH | NO SYNCH | RETAIN] [PRUNE | PARALLEL | SERIAL] [WHERE *condition*]

  Loads data into the dimension or cube.

  – WHERE limits the load to those values in the mapped relational table that match *condition*.

  – *condition* is a valid predicate based on the columns of the mapped table. See the "Examples".

These optional arguments apply only to dimensions:

- `SYNCH` matches the dimension keys to the relational data source. (Default)
- `NO SYNCH` loads new dimension keys but does not delete old keys.

  If the parent of a dimension key has changed in the relational data source, this option allows the load to change the parent/child relation in the analytic workspace.
- `RETAIN` loads new dimension keys but does not delete old keys.

  This option does not allow the parent of a dimension key to change. If the parent has changed, the load rejects the record. The rejection generates an error in the rejected records log, if the log is enabled.

These optional arguments apply only to cubes:

- `PRUNE`: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.
- `PARALLEL`: Each partition is loaded separately. (Default)
- `SERIAL`: All partitions are loaded in one `SELECT` statement.

- `MODEL model_name [PARALLEL | SERIAL]`

  Executes a model previously created for the cube. It accepts these arguments:
  - `PARALLEL`: The model runs separately on each partition.
  - `SERIAL`: The model runs on all cubes at the same time. (Default)
- `SET`

  Supports write-back to the cube using the syntax described in "SCRIPT Parameter: USING Clause: SET command". (Cubes only)
- `SOLVE [PARALLEL | SERIAL]`

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

  It accepts these arguments:
  - `PARALLEL`: Each partition is solved separately. (Default)
  - `SERIAL`: All partitions are solved at the same time.

SCRIPT Parameter: USING Clause: AGGREGATE command

The `AGGREGATE` command in a script specifies the aggregation rules for one or more measures.

> **Note:**
>
> The `AGGREGATE` command is available only for uncompressed cubes.

`AGGREGATE` has the following syntax:

```
{ AGGREGATE USING MEASURE
     WHEN measure1 THEN operator1
     WHEN measure2 THEN operator2...
```

```
          ELSE default_operator
|
 [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

USING MEASURE Clause

This clause enables you to specify different aggregation operators for different measures in the cube.

Operator Clause

The `operator_clause` has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

`WEIGHTBY` multiplies each data value by an expression before aggregation.

`SCALEBY` adds the value of an expression to each data value before aggregation.

Table 54-3 Aggregation Operators

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
NO AGGREGATION	No option	Do not aggregate the values of the dimension or dimensions. Leave all aggregated values as NA.
SUM	SCALEBY | WEIGHTBY	Adds data values. (Default)

Processing Options

You can specify these processing options for aggregation:

- `(ALLOW | DISALLOW) OVERFLOW`

  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

  – `ALLOW`: A calculation that generates overflow executes without error and produces null results. (Default)

  - DISALLOW: A calculation involving overflow stops executing and generates an error message.

- (ALLOW | DISALLOW) DIVISION BY ZERO

  Specifies whether to allow division by zero.

  - ALLOW: A calculation involving division by zero executes without error but returns a null value. (Default)
  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.

- (CONSIDER | IGNORE) NULLS

  Specifies whether nulls are included in the calculations.

  - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- MAINTAIN COUNT

  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

SCRIPT Parameter: USING Clause: SET command

The SET command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

target is a a measure or a qualified data reference.

expression returns values of the appropriate datatype for *target*.

Qualified Data References

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

```
expression [ { dimension = member }[ , { dimension = member } ...] ]
```

Where:

expression is a dimensional expression, typically the name of a measure.

dimension is a primary dimension of expression.

member is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

```
global.sales[global.time = 'CY2007'
]
```

The next example returns Sales values only for the United States in calendar year 2007:

```
sales[customer = 'US', time = 'CY2007'
]
```

See the Examples for qualified data references in SET commands.

Usage Notes

Build Methods

The `C`, `S`, and `?` methods always succeed and can be used on any cube.

The `F` and `P` methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the `PARALLELISM` argument of the `BUILD` procedure.
- Setting of the `JOB_QUEUE_PROCESSES` database initialization parameter.

Suppose `UNITS_CUBE` has 12 partitions, `PARALLELISM` is set to 10, and `JOB_QUEUE_PROCESSES` is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the PARALLEL_DEGREE_POLICY database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

Build Logs

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected records log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the `DBMS_CUBE_LOG` package.

You can also create the cube log file by running `$ORACLE_HOME/olap/admin/utlolaplog.sql`. This script creates three additional views:

- `CUBE_BUILD_LATEST`: Returns rows only from the last build.
- `CUBE_BUILD_REPORT`: Returns one row for each command with elapsed times.
- `CUBE_BUILD_REPORT_LATEST`: Returns a report like `CUBE_BUILD_REPORT` only from the last build.

This report shows a successfully completed build of the objects in the GLOBAL analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
     FROM cube_build_report_latest;

COMMAND                   STATUS     BUILD_OBJECT                   TYPE
------------------------- ---------- ------------------------------ ----------
BUILD                     COMPLETED                                 BUILD
FREEZE                    COMPLETED                                 BUILD
LOAD NO SYNCH             COMPLETED  CHANNEL                        DIMENSION
COMPILE                   COMPLETED  CHANNEL                        DIMENSION
UPDATE/COMMIT             COMPLETED  CHANNEL                        DIMENSION
LOAD NO SYNCH             COMPLETED  CUSTOMER                       DIMENSION
COMPILE                   COMPLETED  CUSTOMER                       DIMENSION
UPDATE/COMMIT             COMPLETED  CUSTOMER                       DIMENSION
LOAD NO SYNCH             COMPLETED  PRODUCT                        DIMENSION
COMPILE                   COMPLETED  PRODUCT                        DIMENSION
UPDATE/COMMIT             COMPLETED  PRODUCT                        DIMENSION
LOAD NO SYNCH             COMPLETED  TIME                           DIMENSION
COMPILE                   COMPLETED  TIME                           DIMENSION
UPDATE/COMMIT             COMPLETED  TIME                           DIMENSION
COMPILE AGGMAP            COMPLETED  PRICE_CUBE                     CUBE
UPDATE/COMMIT             COMPLETED  PRICE_CUBE                     CUBE
COMPILE AGGMAP            COMPLETED  UNITS_CUBE                     CUBE
UPDATE/COMMIT             COMPLETED  UNITS_CUBE                     CUBE
DBMS_SCHEDULER.CREATE_JOB COMPLETED  PRICE_CUBE                     CUBE
DBMS_SCHEDULER.CREATE_JOB COMPLETED  UNITS_CUBE                     CUBE
BUILD                     COMPLETED                                 BUILD
LOAD                      COMPLETED  PRICE_CUBE                     CUBE
SOLVE                     COMPLETED  PRICE_CUBE                     CUBE
UPDATE/COMMIT             COMPLETED  PRICE_CUBE                     CUBE
BUILD                     COMPLETED                                 BUILD
LOAD                      COMPLETED  UNITS_CUBE                     CUBE
SOLVE                     COMPLETED  UNITS_CUBE                     CUBE
UPDATE/COMMIT             COMPLETED  UNITS_CUBE                     CUBE
ANALYZE                   COMPLETED  PRICE_CUBE                     CUBE
ANALYZE                   COMPLETED  UNITS_CUBE                     CUBE
THAW                      COMPLETED                                 BUILD

31 rows selected.
```

Examples

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

```
BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
    method=>'CCS',
    parallelism=>2);
END;
/
```

The following example loads only the selection of data identified by the WHERE clause:

```
BEGIN
  DBMS_CUBE.BUILD(q'!
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
     WHERE UNITS_FACT.MONTH_ID LIKE '2006%'
     AND UNITS_FACT.SALES > 5000)!');
END;
/
```

FOR Clause Example

In this example, the Time dimension is partitioned by calendar year, and `DBMS_CUBE` builds only the partition identified by `CY2006`. The `HIER_ANCESTOR` is an analytic function in the OLAP expression syntax.

```
BEGIN
   dbms_cube.build(q'!
   UNITS_CUBE USING
   (
   FOR "TIME"
     WHERE HIER_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) = 'CY2006'
     BUILD (LOAD, SOLVE)
   )!',
   parallelism=>1);
END;
/
```

The next example uses a `FOR` clause to limit the build to the `SALES` measure in 2006. All objects are built using the complete (`C`) method.

```
BEGIN
  DBMS_CUBE.BUILD(
  script => '
  GLOBAL."TIME",
  GLOBAL.CHANNEL,
  GLOBAL.CUSTOMER,
  GLOBAL.PRODUCT,
  GLOBAL.UNITS_CUBE USING
  (
    FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
      BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE ''2006%'')
   )',
  method => 'C',
  parallelism => 2);
END;
/
```

Write-Back Examples

The following examples show various use of the `SET` command in a `USING` clause.

This example sets Sales Target to Sales increased by 5%:

```
DBMS_CUBE.BUILD('UNITS_CUBE USING(
   SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');
```

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING(
  SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
  = 29.99, SOLVE)');
```

The next example contains two SET commands, but does not reaggregate the cube:

```
DBMS_CUBE.BUILD('PRICE_CUBE USING(
   SET PRICE_CUBE.UNIT_PRICE["TIME"=''2006.12'', "PRODUCT"=''DLX MOUSE'']
   = 29.49,
   SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE'']
   = 29.99)');
```

Dimension Maintenance Example

This script shows dimension maintenance. It adds a new dimension member named `OPT MOUSE` to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

```
BEGIN
dbms_output.put_line('Add optical mouse');
dbms_cube.build(q'!
   "PRODUCT" using (MERGE INTO ALL HIERARCHIES
   VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY"))
!');

dbms_output.put_line('Alter optical mouse');
dbms_cube.build(q'!
   "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."PRIMARY")
   SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM"
   WHERE MEMBER = 'ITEM_OPT MOUSE')
!');

dbms_output.put_line('Provide attributes to optical mouse');
dbms_cube.build(q'!
   "PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"["PRODUCT" = 'ITEM_OPT MOUSE']
    = CAST('Optical Mouse' AS VARCHAR2))
!');

dbms_output.put_line('Delete optical mouse');
dbms_cube.build(q'!
   "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
!');

END;
/
```

OLAP DML Example

This example uses the OLAP DML to add comments to the cube build log:

```
BEGIN
 DBMS_CUBE.BUILD(q'!
  global.units_cube USING (
   EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
   EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
   EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
   EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel ''CALENDAR_YEAR'')' parallel)!',
  parallelism=>2,
  add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```
SELECT partition, slave_number, TO_CHAR(output) output
   FROM cube_build_log
   WHERE command = 'OLAP DML'
   AND status = 'COMPLETED'
   ORDER BY slave_number, time;

               .
```

54.4.2 CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure and the EXPORT_XML_TO_FILE Procedure.

Syntax

```
DBMS_CUBE.CREATE_EXPORT_OPTIONS (
          out_options_xml        IN/OUT  CLOB,
          target_version         IN      VARCHAR2  DEFAULT NULL,
          suppress_owner         IN      BOOLEAN   DEFAULT FALSE,
          suppress_namespace     IN      BOOLEAN   DEFAULT FALSE,
          preserve_table_owners  IN      BOOLEAN   DEFAULT FALSE,
          metadata_changes       IN      CLOB      DEFAULT NULL);
```

Parameters

Table 54-4 CREATE_EXPORT_OPTIONS Procedure Parameters

Parameter	Description
`out_options_xml`	Contains the generated XML document, which can be passed into the `options_xml` parameter of the EXPORT_XML Procedure.
`target_version`	Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 12.1 or 12.1.0.1.0. This parameter defaults to the current database version, and so can typically be omitted.
`suppress_owner`	Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter `True` to drop the owner from the XML, or enter `False` to retain it. Enter `True` if you plan to import the exported metadata into a different schema.
`suppress_namespace`	Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter `True` to drop the namespace from the XML, or enter `False` to retain it (default). Enter `True` when upgrading to Oracle OLAP 12*c* metadata. Namespaces allow objects created in Oracle 10*g* to coexist with objects created in Oracle 12*c*. You cannot set or change namespaces.
`preserve_table_owners`	Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter `True` to retain the table owner, or enter `False` to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to `True` to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.
`metadata_changes`	Contains an 12*c* XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.

Examples

The following example generates an XML document of export options:

```
DECLARE
   optionsClob  CLOB;

BEGIN
   dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
   dbms_cube.create_export_options(out_options_xml=>optionsClob,
suppress_namespace=>TRUE);
   dbms_output.put_line(optionsClob);
END;
/
```

The `DBMS_OUTPUT.PUT_LINE` procedure displays this XML document (formatted for readability:

```
<?xml version="1.0"?>
<Export TargetVersion="12.1.0.1">
  <ExportOptions>
```

```
    <Option Name="SuppressOwner" Value="FALSE"/>
    <Option Name="SuppressNamespace" Value="TRUE"/>
    <Option Name="PreserveTableOwners" Value="FALSE"/>
  </ExportOptions>
</Export>
```

The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the `CHANNEL` dimension.

```
DECLARE
  importClob         clob;
  exportClob         clob;
  overClob           clob;
  exportOptClob      clob;
  importOptClob      clob;

BEGIN
  dbms_lob.createtemporary(overClob, TRUE);
  dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
  dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3"
MinimumDatabaseVersion="12.1.0.1">');
  dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
  dbms_lob.writeappend(overClob,75, '<Description Type="Description" Language="AMERICAN"
Value="Sales Channel"/>');
  dbms_lob.writeappend(overClob,20, '</StandardDimension>');
  dbms_lob.writeappend(overClob,11, '</Metadata>');
  dbms_lob.close(overClob);

  -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob,
suppress_namespace=>TRUE, metadata_changes=>overClob);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>
'MY_OBJECT_MAP');

   -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from a 10g analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob,
out_xml=>importClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

The following is the content of `exportClob` (formatting added for readability). The XML document changes the description of Channel to Sales Channel.

```
<Metadata Version="1.3" MinimumDatabaseVersion="12.1.0.1">
  <StandardDimension Name="CHANNEL">
    <Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  </StandardDimension>
</Metadata>
```

Related Topics

- EXPORT_XML Procedure
  This procedure writes OLAP metadata to a CLOB.
- EXPORT_XML_TO_FILE Procedure
  This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the `IMPORT_XML` procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

54.4.3 CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure.

Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS (
          out_options_xml  IN/OUT  CLOB,
          validate_only    IN      BOOLEAN   DEFAULT FALSE,
          rename_table     IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 54-5 CREATE_IMPORT_OPTIONS Procedure Parameters

Parameter	Description
`out_options_xml`	Contains the generated XML document, which can be passed to the `options_xml` parameter of the IMPORT_XML Procedure.
`validate_only`	`TRUE` causes the `IMPORT_XML` procedure to validate the metadata described in the input file or the `in_xml` parameter, without committing the changes to the metadata.
`rename_table`	The name of a table identifying new names for the imported objects, in the form [*schema_name*.]*table_name*. The `IMPORT_XML` procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.

Usage Notes

See the information about using a rename table in DBMS_CUBE - Upgrading 10g Analytic Workspaces.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure".

```
DECLARE
importClob  clob;

BEGIN
```

```
  dbms_lob.createtemporary(importClob, TRUE);

  dbms_cube.create_import_options(out_options_xml => importClob, rename_table =>
'MY_OBJECT_MAP', validate_only => TRUE);

  dbms_output.put_line(importClob);
END;
/
```

It generates the following XML document:

```
<?xml version="1.0"?>
<Import>
  <ImportOptions>
    <Option Name="ValidateOnly" Value="TRUE"/>
    <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>
  </ImportOptions>
</Import>
```

Related Topics

- IMPORT_XML Procedure
  This procedure creates, modifies, or drops an analytic workspace by using an XML template.

54.4.4 CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

Syntax

```
DBMS_CUBE.CREATE_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
     RETURN VARCHAR2;
```

Parameters

Table 54-6 CREATE_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View". A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Parameters in the form '*parameter1=value1*, *parameter2=value2*,...'. See "SQL Aggregation Management Parameters".

SQL Aggregation Management Parameters

The CREATE_MVIEW and DERIVE_FROM_MVIEW functions use the SQL aggregation management (SAM) parameters described in Table 54-7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java

applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

Table 54-7 SQL Aggregation Management Parameters

Parameter	Description
ADDTOPS	Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named ALL_*dimension* with level members All_*dimension*. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.
ADDUNIQUEKEYPREFIX	Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as CITY_NEW_YORK and STATE_NEW_YORK. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.
ATRMAPTYPE	Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both. HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default) DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy. BOTH: Maps attributes to both dimension and hierarchy levels. AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.
AWNAME	Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is *fact_tablename*_AW*n*.
BUILD	Specifies whether a data refresh will immediately follow creation of the cube materialized view. IMMEDIATE: Refreshes immediately. DEFERRED: Does not perform a data refresh. (Default) **Note**: Only the CREATE_MVIEW function uses this parameter.

Table 54-7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
CUBEMVOPTION	Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions. COMPLETE_REFRESH: Creates a complete refresh cube materialized view (full update). FAST_REFRESH: Creates a fast refresh materialized view (incremental update). REWRITE_READY: Runs validation checks for a rewrite cube materialized view, but does not create it. REWRITE: Creates a rewrite cube materialized view. REWRITE_WITH_ATTRIBUTES: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default) **Note**: *The following settings do not create a cube materialized view.* Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view. NONE: Does not create a cube materialized view. COMPLETE_REFRESH_READY: Runs validation checks for a complete refresh cube materialized view, but does not create it. FAST_REFRESH_READY: Runs validation checks for fast refresh, but does not create the cube materialized view.
CUBENAME	Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is *fact_tablename_Cn*.
DIMJAVABINDVARS	Supports access by Java programs to the XML document. TRUE: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template. FALSE: Generates an XML template that does not support Java bind variables. (Default)
DISABLEQRW	Controls disabling of query rewrite on the source relational materialized view. TRUE: Issues an ALTER MATERIALIZED VIEW *mview_name* DISABLE QUERY REWRITE command. FALSE: No action. **Note**: Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.
EXPORTXML	Exports the XML that defines the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.

Table 54-7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
FILTERPARTITIONANCESTORLEVELS	Controls the generation of aggregate values above the partitioning level of a partitioned cube. TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL. FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)
LOGDEST	Directs and stores log messages. By default, the messages are not available. SERVEROUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer. TRACEFILE: Sends messages to the session trace file.
PARTITIONOPTION	Controls partitioning of the cube. NONE: Prevents partitioning. DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default) FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning. *dimension.hierarchy.level*: Partitions the cube using the specified dimension, hierarchy, and level.
POPULATELINEAGE	Controls the appearance of attributes in a cube materialized view. TRUE: Includes all dimension attributes in the cube materialized view. (Default) FALSE: Omits all dimension attributes from the cube materialized view.
PRECOMPUTE	Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session. *precompute_percentage*[:*precompute_top_percentage*] Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.
REMAPCOMPOSITEKEYS	Controls how multicolumn keys are rendered in the cube. TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default) FALSE: Creates a unique key attribute for each column.

Table 54-7 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
RENDERINGMODE	Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See "Requirements for the Relational Materialized View". LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default) STRICT: Any loss in fidelity raises an exception so that no XML template is created.
SEEFILTERS	Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored. TRUE: Renders valid conditions in the XML template. (Default) FALSE: Ignores all conditions.
UNIQUENAMES	Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects. TRUE: Modifies all relational names when they are rendered in the cube.(Default) FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.
UNKNOWNKEYASDIM	Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query. TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies. FALSE: Raises an exception when no relational dimension is found for the column. (Default)
VALIDATEXML	Controls whether the generated XML document is validated. TRUE: Validates the template using the VALIDATE_XML procedure. (Default) FALSE: No validation is done.

Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management"

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);
```

```
BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/
```

The next example sets several parameters for creating a cube materialized view from FWEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- ADDTOPS: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- PRECOMPUTE: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- EXPORTXML: Creates a text file for the XML document.
- BUILD: Performs a data refresh.

```
DECLARE
     salescubemv   varchar2(30);
     sam_param     clob := 'ADDTOPS=FALSE,
                            PRECOMPUTE=40:10,
                            EXPORTXML=WORK_DIR/sales.xml,
                            BUILD=IMMEDIATE';

BEGIN
     salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                    sam_param);
END;
/
```

54.4.5 DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

Syntax

```
DBMS_CUBE.DERIVE_FROM_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
     RETURN CLOB;
```

Parameters

Table 54-8 DERIVE_FROM_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View". A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.

Table 54-8 (Cont.) DERIVE_FROM_MVIEW Function Parameters

Parameter	Description
sam_parameters	Optional list of parameters in the form '*parameter1=value1*, *parameter2=value2*,...'. See "SQL Aggregation Management Parameters".

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the IMPORT_XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management".

Examples

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALES_MV relational materialized view in the SH schema.

```
DECLARE
     salescubexml  clob := null;
     sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';

BEGIN
     salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',
     sam_param);
END;
/
```

54.4.6 DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```
DBMS_CUBE.DROP_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL);
```

Parameters

Table 54-9 DROP_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view
mvname	Name of the cube materialized view

Table 54-9 (Cont.) DROP_MVIEW Procedure Parameters

Parameter	Description
sam_parameters	EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.

Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management".

Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

```
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES"
including container analytic workspace "SH"."CAL_MONTH_SALES_AW"
at 20130213 16:31:40.056.
```

This query against the data dictionary confirms that the materialized views have been dropped.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

54.4.7 EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

Syntax

```
DBMS_CUBE.EXPORT_XML
       (object_ids            IN      VARCHAR2,
        out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids            IN      VARCHAR2,
        options_xml           IN      CLOB,
        out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids            IN      VARCHAR2,
        options_dirname       IN      VARCHAR2,
        options_filename      IN      VARCHAR2,
        out_xml               IN/OUT  CLOB;
```

Parameters

Table 54-10 EXPORT_XML Procedure Parameters

Parameter	Description
object_ids	Any of these identifiers. • The name of a schema, such as GLOBAL. • The fully qualified name of an analytic workspace in the form *owner.aw_name*.AW, such as GLOBAL.GLOBAL.AW. • Cube • Dimension • Named build process • Measure folder You can specify multiple objects by separating the names with commas. **Note**: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.
options_dirname	The case-sensitive name of a database directory that contains *options_filename*.
options_filename	A file containing an XML document of export options.
options_xml	A CLOB variable that contains an XML document of export options. Use the CREATE_EXPORT_OPTIONS Procedure to generate this document.
out_xml	A CLOB variable that will store the XML document of OLAP metadata for the objects listed in *object_ids*.

Export Options

The default settings for the export options are appropriate in many cases, so you can omit the *options_xml* parameter or the *options_dirname* and *options_filename* parameters. However, when upgrading Oracle OLAP 10*g* metadata to OLAP 12*c*, you must specify an XML document

that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure.

Usage Notes

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

For an example of using `EXPORT_XML` in an upgrade to the same schema, see "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

The following PL/SQL script copies an OLAP 12*c* analytic workspace named `GLOBAL12` from the `GLOBAL_AW` schema to the `GLOBAL` schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the `INITIALIZE_CUBE_UPGRADE` procedure.
- Call the `CREATE_EXPORT_OPTIONS` procedure with the additional parameter setting `SUPPRESS_NAMESPACE=>TRUE`.

The PL/SQL client must be connected to the database as `GLOBAL`. The `GLOBAL` user must have `SELECT` permissions on `GLOBAL_AW.AW$GLOBAL` and on all relational data sources.

```
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_owner=>TRUE,
preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL12.AW', options_xml=>optionsClob,
out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml=>exportClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');

END;
/
```

54.4.8 EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the `IMPORT_XML` procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading OLAP standard form metadata contained in an Oracle OLAP 10*g* analytic workspace to OLAP 12*c* format.

Syntax

```
DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        options_dirname        IN      VARCHAR2,
        options_filename       IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;
```

Parameters

Table 54-11 EXPORT_XML_TO_FILE Procedure Parameters

Parameter	Description
`object_ids`	Any of these identifiers. • The name of a schema, such as `GLOBAL`. • The fully qualified name of an analytic workspace in the form *`owner.aw_name`*`.AW`, such as `GLOBAL.GLOBAL.AW`. • Cube • Dimension • Named build process • Measure folder You can specify multiple objects by separating the names with commas. **Note**: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when you export a cube, you must also export the dimensions of the cube.
`options_dirname`	The case-sensitive name of a database directory that contains `options_filename`. See "Export Options".
`options_filename`	The name of a file containing an XML document of export options. See "Export Options".
`output_dirname`	The case-sensitive name of a database directory where *`output_filename`* is created.
`output_filename`	The name of the template file created by the procedure.

Export Options

The default settings for the export options are appropriate in most cases, and you can omit the *`options_dirname`* and *`options_filename`* parameters. However, when upgrading Oracle OLAP

10*g* metadata to OLAP 12*c*, you must specify an XML document that changes the default settings, like the following:

```
<?xml version="2.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure.

Usage Notes

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Examples

The following example generates an XML file named global.xml in OLAP 12*c* format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the `GLOBAL_AW` schema. The output file is generated in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 12*c* format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the `GLOBAL_AW` schema. Both the options file and the output file are in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR', 'options.xml',
'WORK_DIR', 'global.xml');
```

54.4.9 IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
       (dirname               IN      VARCHAR2,
        filename              IN      VARCHAR2 );

DBMS_CUBE.IMPORT_XML
       (dirname               IN      VARCHAR2,
        filename              IN      VARCHAR2,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
       (input_dirname         IN      VARCHAR2,
        input_filename        IN      VARCHAR2
        options_dirname       IN      VARCHAR2,
        options_filename      IN      VARCHAR2,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB );
```

```
DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML

       (in_xml                IN      CLOB,
        options_xml           IN      CLOB,
        out_xml               IN/OUT  CLOB );
```

Parameters

Table 54-12 IMPORT_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
filename	A file containing an XML document describing an analytic workspace.
in_xml	A CLOB containing an XML document describing an analytic workspace.
input_dirname	The case-sensitive name of a database directory containing the XML document describing an analytic workspace.
input_filename	A file containing an XML document describing an analytic workspace.
options_dirname	The case-sensitive name of a database directory containing a file of import options.
options_filename	A file of import options.
options_xml	An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure to generate this document.
out_xml	An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

Usage Notes

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure with the EXPORTXML parameter.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

```
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example exports an OLAP 10*g* template and uses IMPORT_XML to validate it before an upgrade to 12*c*.

```
DECLARE
```

```
  exportOptClob clob;
  importOptClob clob;
  importClob    clob;
  exportClob    clob;

BEGIN

  -- Create a CLOB for the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob,
suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Create a CLOB for import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_only=>TRUE);

  -- Create a CLOB for the change log
  dbms_lob.createtemporary(importClob, TRUE);

  -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
  dbms_cube.initialize_cube_upgrade;

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

  /* Import metadata from the CLOB. No objects are committed to the database
     because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to
     TRUE.
  */

  dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob,
out_xml=>importClob);

   -- Output the metadata changes
  dbms_output.put_line('This is the validation log:');
  dbms_output.put_line(importClob);

END;
/
```

The contents of `importClob` show that the XML is valid. Otherwise, error messages appear in the `<RootCommitResult>` element.

```
This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>

</RootCommitResult>
```

For an example of `IMPORT_XML` within the context of an upgrade from 10*g* to 12*c* metadata, see the Custom Upgrade section of "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

54.4.10 INITIALIZE_CUBE_UPGRADE Procedure

This procedure processes analytic workspaces created in Oracle OLAP 10*g* so they can be used by Oracle OLAP 12*c* clients. It processes all analytic workspaces in the current schema. Run this procedure once for each schema in which there are 10*g* analytic workspaces.

Without this processing step, 12*c* clients cannot connect to a database containing a 10*g* analytic workspace with subobjects of a dimension or cube having the same name. Additionally, some `DBMS_CUBE` procedures and functions, such as `EXPORT_XML` and `EXPORT_XML_TO_FILE`, do not work on the 10*g* metadata.

After processing, OLAP 12*c* clients can connect and use the alternate names provided by `INITIALIZE_CUBE_UPGRADE` for the conflicting subobjects. OLAP 10*g* clients continue to use the original names.

`INITIALIZE_CUBE_UPGRADE` does not upgrade any OLAP 10*g* objects to OLAP 12*c* format.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

Usage Notes

This procedure creates and populates a table named `CUBE_UPGRADE_INFO`. If it already exists, the table is truncated and repopulated.

While the 10*g* namespace allowed subobjects with the same name in the same dimension or cube, the 12*c* namespace does not. When `INITIALIZE_CUBE_UPGRADE` detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in `CUBE_UPGRADE_INFO` providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the `CONFLICT` column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL `INSERT` and `UPDATE` if you want to customize the names of OLAP 10*g* objects on OLAP 12*c* clients.

The `UPGRADE_AW`, `EXPORT_XML` and `EXPORT_XML_TO_FILE` procedures use the names specified in the `NEW_NAME` column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of `CUBE_UPGRADE_INFO`.

Column	Datatype	NULL	Description
`OWNER`	`VARCHAR2`	`NOT NULL`	Owner of the analytic workspace.
`AW`	`VARCHAR2`	`NOT NULL`	Name of the analytic workspace.
`AWXML_ID`	`VARCHAR2`	`NOT NULL`	Full logical name of the object requiring modification, in the form *`simple_name.[subtype_name].object_type`*. For example, `TIME.DIMENSION` and `PRODUCT.COLOR.ATTRIBUTE`.
`NEW_NAME`	`VARCHAR2`	`NOT NULL`	The name the object will have in Oracle 12*c* after the upgrade.
`OBJECT_CLASS`	`VARCHAR2`	--	`DerivedMeasure` for calculated measures, or empty for all other object types.

Column	Datatype	NULL	Description
CONFLICT	NUMBER	--	Indicates the reason that the row was added to CUBE_UPGRADE_INFO: • 0: The object does not have a naming conflict but appears in the table for other reasons. • 1: Two objects have the same name and would create a conflict in the OLAP 12*c* namespace. The object type (such as level or hierarchy) will be added to the names.

Examples

The following command creates and populates the CUBE_UPGRADE_INFO table:

```
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10*g* analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of CONFLICT is 0.

```
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;

AWXML_ID                                   NEW_NAME                    CONFLICT
------------------------------------------ ------------------------- ----------
CUSTOMER.MARKET_SEGMENT.HIERARCHY          MARKET_SEGMENT_HIERARCHY           1
CUSTOMER.MARKET_SEGMENT.LEVEL              MARKET_SEGMENT_LEVEL               1
UNITS_CUBE.EXTENDED_COST.MEASURE           EXTENDED_COST                      0
UNITS_CUBE.EXTENDED_MARGIN.MEASURE         EXTENDED_MARGIN                    0
UNITS_CUBE.CHG_SALES_PP.MEASURE            CHG_SALES_PP                       0
UNITS_CUBE.CHG_SALES_PY.MEASURE            CHG_SALES_PY                       0
UNITS_CUBE.PCTCHG_SALES_PP.MEASURE         PCTCHG_SALES_PP                    0
UNITS_CUBE.PCTCHG_SALES_PY.MEASURE         PCTCHG_SALES_PY                    0
UNITS_CUBE.PRODUCT_SHARE.MEASURE           PRODUCT_SHARE                      0
UNITS_CUBE.CHANNEL_SHARE.MEASURE           CHANNEL_SHARE                      0
UNITS_CUBE.MARKET_SHARE.MEASURE            MARKET_SHARE                       0
UNITS_CUBE.CHG_EXTMRGN_PP.MEASURE          CHG_EXTMRGN_PP                     0
UNITS_CUBE.CHG_EXTMRGN_PY.MEASURE          CHG_EXTMRGN_PY                     0
UNITS_CUBE.PCTCHG_EXTMRGN_PP.MEASURE       PCTCHG_EXTMRGN_PP                  0
UNITS_CUBE.PCTCHG_EXTMRGN_PY.MEASURE       PCTCHG_EXTMRGN_PY                  0
UNITS_CUBE.CHG_UNITS_PP.MEASURE            CHG_UNITS_PP                       0
UNITS_CUBE.EXTMRGN_PER_UNIT.MEASURE        EXTMRGN_PER_UNIT                   0
UNITS_CUBE.SALES_YTD.MEASURE               SALES_YTD                          0
UNITS_CUBE.SALES_YTD_PY.MEASURE            SALES_YTD_PY                       0
UNITS_CUBE.PCTCHG_SALES_YTD_PY.MEASURE     PCTCHG_SALES_YTD_PY                0
UNITS_CUBE.SALES_QTD.MEASURE               SALES_QTD                          0
UNITS_CUBE.CHG_UNITS_PY.MEASURE            CHG_UNITS_PY                       0
```

54.4.11 REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```
DBMS_CUBE.REFRESH_MVIEW (
          mvowner              IN  VARCHAR2,
          mvname               IN  VARCHAR2,
          method               IN  VARCHAR2       DEFAULT NULL,
          refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,
          parallelism          IN  BINARY_INTEGER DEFAULT 0,
```

```
atomic_refresh       IN  BOOLEAN        DEFAULT FALSE,
scheduler_job        IN  VARCHAR2       DEFAULT NULL,
sam_parameters       IN  CLOB           DEFAULT NULL,
nested               IN  BOOLEAN        DEFAULT FALSE );
```

Parameters

Table 54-13 REFRESH_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view.
mvname	Name of the cube materialized view.
method	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes. • C: Complete refresh clears all dimension values before loading. (Default) • F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. • ?: Fast refresh if possible, and otherwise a complete refresh. • P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. • S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" for the BUILD procedure for additional details.
refresh_after_errors	TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build.
parallelism	Number of parallel processes to allocate to this job. See the "Usage Notes" for the BUILD procedure for additional details.
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
sam_parameters	None.
nested	TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.

Usage Notes

REFRESH_MVIEW changes *mvname* to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube materialized view. See the "BUILD Procedure" for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named CB$FWEEK_PSCAT_SALES.

```
SET serverout ON format wrapped

EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');
```

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);
```

After successfully refreshing the cube materialized view, REFRESH_MVIEW returns a message like the following:

```
Completed refresh of cube mview "SH"."CB$FWEEK_PSCAT_SALES" at 20130212 15:04:46.370.
```

54.4.12 UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 12*c* analytic workspace from a copy of the metadata contained in an OLAP 10*g* analytic workspace. The original OLAP 10*g* analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 12*c* analytic workspace.

UPGRADE_AW automatically runs INITIALIZE_CUBE_UPGRADE if the CUBE_UPGRADE_INFO table does not exist. If it does exist, then UPGRADE_AW does not overwrite it, thus preserving any changes you made to the table.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

```
DBMS_CUBE.UPGRADE_AW
       (sourceaw              IN  VARCHAR2,
        destaw                IN  VARCHAR2,
        upgoptions            IN  CLOB DEFAULT NULL);
```

Parameters

Table 54-14 UPGRADE_AW Procedure Parameters

Parameter	Description
sourceaw	The name of a 10*g* analytic workspace.
destaw	A new name for the generated 12*c* analytic workspace. It cannot be the same as *sourceaw*.

Table 54-14 (Cont.) UPGRADE_AW Procedure Parameters

Parameter	Description
upgoptions	One or more of these upgrade options, as a string in the form '*OPTION=VALUE*'. Separate multiple options with commas. • PRESERVE_TABLE_OWNERS: YES preserves the original source table mappings. Use this option when creating an OLAP 12*c* analytic workspace in a different schema from the 10*g* analytic workspace, and you want the new objects mapped to tables in the original schema. (Default) NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 12*c* analytic workspace in a different schema from the 10*g* analytic workspace, and you want the new objects mapped to tables in the destination schema. • RENAME_TABLE: The name of a table that specifies new names for objects as they are created in OLAP 12*c* format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See "CREATE_IMPORT_OPTIONS Procedure" for information about creating a rename table. • TARGET_VERSION: The version of the upgrade, specified by a 2- to 5-part number, such as 11.2 or 11.2.0.2.0. If you enter an unsupported version number, then the closest version below it is used.

Examples

This example upgrades an OLAP 10*g* analytic workspace named GLOBAL10 to an OLAP 12*c* analytic workspace named GLOBAL12, using a rename table named MY_OBJECT_MAP:

```
BEGIN

  -- Upgrade the analytic workspace
  dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12', upgoptions =>
'RENAME_TABLE=MY_OBJECT_MAP');

  -- Load and aggregate the data
  dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

54.4.13 VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
       (dirname               IN  VARCHAR2,
        filename              IN  VARCHAR2 );

DBMS_CUBE.VALIDATE_XML
       (in_xml                IN  CLOB );
```

Parameters

Table 54-15 VALIDATE_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory.
filename	The name of a file containing an XML template.
IN_XML	The name of a CLOB containing an XML template.

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;

*
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same
name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same
name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1
```

After the problems are corrected, the procedure reports no errors:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');

PL/SQL procedure successfully completed.
```

This example loads an XML template into a temporary CLOB, then validates it. The script is named `GLOBAL.XML`, and it is located in a database directory named `XML_DIR`.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
```

```
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

     -- Validate the xml
     DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

55
DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- DBMS_CUBE_ADVISE Security Model
- Summary of DBMS_CUBE_ADVISE Subprograms

> **See Also:**
>
> *Oracle OLAP User's Guide* for information about cube materialized views

55.1 DBMS_CUBE_ADVISE Security Model

The MV_CUBE_ADVICE function requires the ADVISOR privilege.

55.2 Summary of DBMS_CUBE_ADVISE Subprograms

This table lists and describes the DBMS_CUBE_ADVISE subprograms.

Table 55-1 Summary of DBMS_CUBE_ADVISE Subprograms

Subprogram	Description
MV_CUBE_ADVICE Function	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
SET_CNS_EXCEPTION_LOG Procedure	Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.
TRACE Procedure	Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.

55.2.1 MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

Syntax

```
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
          owner         IN  VARCHAR2  DEFAULT USER,
```

```
        mvname       IN  VARCHAR2,
        reqtype      IN  VARCHAR2  DEFAULT '0',
        validate     IN  NUMBER    DEFAULT 0)
    RETURN COAD_ADVICE_T  PIPELINED;
```

Parameters

Table 55-2 MV_CUBE_ADVICE Function Parameters

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE
reqtype	Type of advice to generate: • 0: All applicable advice types • 1: Column NOT NULL constraints • 2: Primary key constraints • 3: Foreign key constraints • 4: Relational dimension objects • 5: Cube materialized view logs with primary key
validate	Validation option: • 0: Validate the constraints • 1: Do not validate the constraints

Returns

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 55-3 describes the columns.

Table 55-3 MV_CUBE_ADVICE Return Values

Column	Datatype	Description
OWNER	VARCHAR2(30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2(30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2(30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2(65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.
ADVICETYPE	NUMBER(38,0)	Type of recommendation: • 1: Create NOT NULL constraints on the foreign key columns • 2: Create primary key constraints on the master table • 3: Create primary key constraints on the master view • 4: Create foreign key constraints on the master table • 5: Create foreign key constraints on the master view • 6: Create relational dimensions on the master dimension tables • 7: Create a materialized view log • 8: Compile the materialized view

Table 55-3 (Cont.) MV_CUBE_ADVICE Return Values

Column	Datatype	Description
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
      FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));

APIOBJECT    SQLOBJECT       SQLTEXT
------------ --------------- --------------------------------------------
UNITS_CUBE   UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add constra
                             int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"
                             , "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d
                             isable novalidate

UNITS_CUBE   CB$UNITS_CUBE   alter materialized view "GLOBAL"."CB$UNITS_CU
                             BE" compile
```

55.2.2 SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by `MV_CUBE_ADVICE`.

Syntax

```
DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
       exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);
```

Parameters

Table 55-4 SET_CNS_EXCEPTION_LOG Procedure Parameters

Parameter	Description
`exceptlogtab`	The name of an existing exception log.

Usage Notes

To create an exception log, use the `utlexcpt.sql` or the `utlexpt1.sql` script before executing `SET_CNS_EXCEPTION_LOG`.

The `validate` parameter of `MV_CUBE_ADVICE` must be set to `1`.

Examples

The `utlexcpt.sql` script creates a table named `EXCEPTIONS`, and the `SET_CNS_EXCEPTION_LOG` procedure identifies it as the exception log for `MV_CUBE_ADVICE`. The `ALTER TABLE` statement now includes the clause `VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS"`.

```
SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

APIOBJECT    SQLOBJECT       TYPE SQLTEXT
------------ --------------- ---- ----------------------------------------------
UNITS_CUBE   UNITS_FACT         2 alter table "GLOBAL"."UNITS_FACT" add constrai
                                  nt "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID",
                                  "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely en
                                  able validate exceptions into "GLOBAL"."EXCEPT
                                  IONS"

UNITS_CUBE   CB$UNITS_CUBE      8 alter materialized view "GLOBAL"."CB$UNITS_CUB
                                  E" compile
```

55.2.3 TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the `MV_CUBE_ADVICE` function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
     diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 55-5 TRACE Procedure Parameters

Parameter	Description
`diaglevel`	`0` to turn tracing off, or `1` to turn tracing on.

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus `SERVEROUTPUT` setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]

PL/SQL procedure successfully completed.

SQL> SELECT sqlobject, sqltext, droptext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
     WHERE apiobject='UNITS_CUBE';

SQLOBJECT       SQLTEXT                                  DROPTEXT
--------------- ---------------------------------------- ----------------------------------------
UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add co alter table "GLOBAL"."UNITS_FACT" drop c
                nstraint "COAD_PK000222" PRIMARY KEY ("C onstraint "COAD_PK000222" cascade
                HANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MO
                NTH_ID") rely disable novalidate

CB$UNITS_CUBE   alter materialized view "GLOBAL"."CB$UNI alter materialized view "GLOBAL"."CB$UNI
                TS_CUBE" compile                         TS_CUBE" compile

56
DBMS_CUBE_LOG

DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

> **See Also:**
>
> OLAP Technology in the Oracle Database in*Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

- Using DBMS_CUBE_LOG
- Summary of DBMS_CUBE_LOG Subprograms

56.1 Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs that enable you to track the progress of long running processes, then use the results to profile performance characteristics.

They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube, such as hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

- Logging Types
- Logging Targets
- Verbosity Levels
- Security Model
- Creating Cube Logs
- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

56.1.1 DBMS_CUBE_LOG — Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable.

The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

`DBMS_CUBE_LOG` provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function

56.1.2 DBMS_CUBE_LOG — Logging Targets

The `TABLE_CREATE` procedure creates database tables for storing the logs. Using the `ENABLE` procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file.

These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See ENABLE Procedure for more information about creating multiple targets.

`DBMS_CUBE_LOG` provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- TARGET_FILE Function
- TARGET_LOB Function
- TARGET_TABLE Function
- TARGET_TRACE Function

56.1.3 DBMS_CUBE_LOG — Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- `LOWEST`: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- `LOW`: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- `MEDIUM`: Logs messages at the level used by Analytic Workspace Manager.
- `HIGH`: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- `HIGHEST`: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

`DBMS_CUBE_LOG` provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other `DBMS_CUBE_LOG` procedures and functions. Refer to these descriptions:

- LEVEL_LOWEST Function
- LEVEL_LOW Function
- LEVEL_MEDIUM Function
- LEVEL_HIGH Function
- LEVEL_HIGHEST Function

56.1.4 DBMS_CUBE_LOG Security Model

The `TABLE_CREATE` procedure requires the `CREATE TABLE` privilege.

56.1.5 DBMS_CUBE_LOG — Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the `TABLE_CREATE` procedure.

The following command creates a Cube Build log with the default name of `CUBE_BUILD_LOG`:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the `TABLE_CREATE` procedure to create the table.
2. Execute the `ENABLE` procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of CUBE_OPERATIONS_LOG and the default verbosity level:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the ENABLE procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named rejects.log in the WORK_DIR database directory:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
     dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
     'WORK_DIR/rejects.log');
```

56.1.6 DBMS_CUBE_LOG — Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log are refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is CUBE_BUILD_LOG. The following table describes its contents.

> **Note:**
>
> To manage a Cube Build log, use only the TABLE_CREATE and VERSION procedures.

Column	Datatype	NULL	Description
BUILD_ID	NUMBER	--	A unique sequence number for the build. The same number is used for slave processes in a parallel build.
SLAVE_NUMBER	NUMBER	--	A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.
STATUS	VARCHAR2(10)	--	The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.
COMMAND	VARCHAR2(25)	--	The name of the command being executed, such as BUILD, LOAD, and SOLVE.
BUILD_OBJECT	VARCHAR2(500)	--	The name of the cube or cube dimension being processed.
BUILD_OBJECT_TYPE	VARCHAR2(10)	--	The type of object: CUBE, DIMENSION, or BUILD.
OUTPUT	CLOB	--	Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.

Column	Datatype	NULL	Description
AW	VARCHAR2(30)	--	The name of the analytic workspace that contains the objects of the build.
OWNER	VARCHAR2(30)		The owner of the analytic workspace and all the objects of the build.
PARTITION	VARCHAR2(10)	--	The name of the partition being processed, or NULL when the current operation does not correspond to a partition.
SCHEDULER_JOB	VARCHAR2(100)	--	A user-specified string to identify the build.
TIME	TIMESTAMP(6)	--	The time the row is added to the table.
BUILD_SCRIPT	CLOB	--	The cube build script. Populated only in rows where COMMAND is BUILD.
BUILD_TYPE	VARCHAR2(22)	--	The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.
COMMAND_DEPTH	NUMBER(2)	--	The nesting depth of the command. For example, COMPILE HIERARCHIES is a component step of COMPILE, so if COMPILE has a depth of 1, then COMPILE HIERARCHIES has a depth of 2.
BUILD_SUB_OBJECT	VARCHAR2(30)	--	The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.
REFRESH_METHOD	VARCHAR2(1)	--	The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.
SEQ_NUMBER	NUMBER	--	Not currently used.
COMMAND_NUMBER	NUMBER	--	The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.
IN_BRANCH	NUMBER(1)	--	Not currently used.
COMMAND_STATUS_NUMBER	NUMBER	--	Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.

56.1.7 DBMS_CUBE_LOG — Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log.

The checks include:

- Circularity: Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.

- Hierarchy type: Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.
- Level options: Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is `CUBE_DIMENSION_COMPILE`. The following table describes its contents.

Column	Datatype	NULL	Description
`ID`	`NUMBER`	--	Current operation identifier
`SEQ_NUMBER`	`NUMBER`	--	Sequence number in the Cube Build log
`ERROR#`	`NUMBER(8)`	`NOT NULL`	Number of the error being reported
`ERROR_MESSAGE`	`VARCHAR2(2000)`	--	Error message associated with the error
`DIMENSION`	`VARCHAR2(100)`	--	Name of the dimension being compiled
`DIMENSION_MEMBER`	`VARCHAR2(100)`	--	Faulty dimension member
`MEMBER_ANCESTOR`	`VARCHAR2(100)`	--	Parent of `DIMENSION_MEMBER`
`HIERARCHY1`	`VARCHAR2(100)`	--	First hierarchy involved in the error
`HIERARCHY2`	`VARCHAR2(100)`	--	Second hierarchy involved in the error
`ERROR_CONTEXT`	`CLOB`	--	Additional information about the error

56.1.8 DBMS_CUBE_LOG — Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the `SQL_ID` column, you can join the Cube Operations log to dynamic performance views such as `V$SQL`, `V$SESSION`, and `V$SESSION_LONGOPS` to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is `CUBE_OPERATIONS_LOG`. The following table describes its contents.

Column	Datatype	NULL	Description
`INST_ID`	`NUMBER`	`NOT NULL`	Instance identifier
`SID`	`NUMBER`	`NOT NULL`	Session identifier
`SERIAL#`	`NUMBER`	`NOT NULL`	Session serial number
`USER#`	`NUMBER`	`NOT NULL`	User identifier
`SQL_ID`	`VARCHAR2(13)`	--	Executing SQL statement identifier
`JOB`	`NUMBER`	--	Job identifier
`ID`	`NUMBER`	--	Current operation identifier
`PARENT_ID`	`NUMBER`	--	Parent operation identifier
`SEQ_NUMBER`	`NUMBER`	--	Sequence number in the Cube Build log
`TIME`	`TIMESTAMP(6) WITH TIME ZONE`	`NOT NULL`	Time the record was added to the Cube Operations log
`LOG_LEVEL`	`NUMBER(4)`	`NOT NULL`	Verbosity level of the record, as specified by the `DBMS_CUBE_LOG.ENABLE` procedure.

Column	Datatype	NULL	Description
DEPTH	NUMBER(4)	--	Nesting depth of the record. For example, a level of 0 indicates that the operation and suboperation are not nested within other operations and suboperations.
OPERATION	VARCHAR2(15)	NOT NULL	Current operation, such as AGGREGATE, ROWSOURCE, or SQLIMPORT.
SUBOPERATION	VARCHAR2(20)	--	Current suboperation, such as Loading or Import
STATUS	VARCHAR2(10)	NOT NULL	Current status of the operation, such as START, TRACE, COMPLETED, or Failed.
NAME	VARCHAR2(20)	NOT NULL	Name of the record, such as ROWS LOADED, AVE_ROW_LEN, and PAGEPOOLSIZE
VALUE	VARCHAR2(4000)	--	Value of NAME
DETAILS	CLOB	--	Additional information about NAME.

56.1.9 DBMS_CUBE_LOG — Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field generates an error in the log, resulting in multiple rows with the same rowid4

in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.

Column	Datatype	NULL	Description
ID	NUMBER	--	Current operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
ERROR#	NUMBER(8)	NOT NULL	Number of the error triggered by the record
ERROR_MESSAGE	VARCHAR2	--	Error message associated with the error
RECORD#	NUMBER(38)	--	Input record number
SOURCE_ROW	ROWID	--	Rowid of the row in the source table; null when the source is a view or a query

56.2 Summary of DBMS_CUBE_LOG Subprograms

This table lists and describes the DBMS_CUBE_LOG subprograms.

Table 56-1 DBMS_CUBE_LOG Subprograms

Subprogram	Description
DEFAULT_NAME Function	Returns the default table names of the various log types.
DISABLE Procedure	Turns logging off for the duration of a session.
ENABLE Procedure	Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.

Table 56-1 (Cont.) DBMS_CUBE_LOG Subprograms

Subprogram	Description
FLUSH Procedure	Forces all buffered messages to be written to the logs.
GET_LOG Procedure	Returns the current settings for the level and location of a particular log.
GET_LOG_SPEC Function	Retrieves a description of all active logs.
GET_PARAMETER Function	Returns the current values of the options that control various aspects of logging.
LEVEL_HIGH Function	Returns the integer value of the high verbosity level.
LEVEL_HIGHEST Function	Returns the integer value of the highest verbosity level.
LEVEL_LOW Function	Returns the integer value of the low verbosity level.
LEVEL_LOWEST Function	Returns the integer value of the lowest verbosity level.
LEVEL_MEDIUM Function	Returns the integer value of the medium verbosity level.
SET_LOG_SPEC Procedure	Sets all logging to the values specified in the input string.
SET_PARAMETER Procedure	Sets options that control various aspects of logging.
TABLE_CREATE Procedure	Creates the table targets for the OLAP logs.
TARGET_FILE Function	Returns the integer value of a disk file target.
TARGET_LOB Function	Returns the integer value of a LOB target.
TARGET_TABLE Function	Returns the integer value of a database table target
TARGET_TRACE Function	Returns the integer value of a trace file target.
TYPE_BUILD Function	Returns the integer value of the Cube Build log.
TYPE_DIMENSION_COMPILE Function	Returns the integer value of the Cube Dimension Compile log.
TYPE_OPERATIONS Function	Returns the integer value of the Cube Operations log.
TYPE_REJECTED_RECORDS Function	Returns the integer value of the Cube Rejected Records log.
VERSION Function	Returns the version number of a specific log table or the current version number of a specific log type.

56.2.1 DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS)
    RETURN VARCHAR2;
```

Parameters

Table 56-2 DEFAULT_NAME Function Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE • 4: TYPE_BUILD See "Logging Types".

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;

DEFAULT_NAME
------------------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Default Name" from dual;

Default Name
-------------------------
CUBE_REJECTED_RECORDS
```

56.2.2 DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

Table 56-3 DISABLE Procedure Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types".
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. • 1: TARGET_TABLE • 2: TARGET_TRACE • 3: TARGET_FILE • 4: TARGET_LOB See "Logging Targets"

Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```

56.2.3 ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```
DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
```

```
LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
LOG_LOCATION   IN/OUT CLOB );
```

Parameters

Table 56-4 ENABLE Procedure Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types".
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. • 1: TARGET_TABLE • 2: TARGET_TRACE • 3: TARGET_FILE • 4: TARGET_LOB See "Logging Targets"
log_level	One of the following log verbosity levels. Each level adds new types of messages to the previous level. • 1: LEVEL_LOWEST • 2: LEVEL_LOW • 3: LEVEL_MEDIUM • 4: LEVEL_HIGH • 5: LEVEL_HIGHEST See "Verbosity Levels".
log_location	The full identity of the log, such as *owner.table_name* when log_target is a table.

Examples

The following command enables all cube logs:

```
EXECUTE dbms_cube_log.enable;
```

The following PL/SQL procedure sets the log level to LEVEL_LOWEST:

```
BEGIN
     dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
     dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
          dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```

56.2.4 FLUSH Procedure

This procedure forces all buffered messages to be written to the logs.

The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```
DBMS_CUBE_LOG.FLUSH ( );
```

Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```

56.2.5 GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```
DBMS_CUBE_LOG.GET_LOG (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT TARGET_TABLE,
          LOG_LEVEL      OUT  BINARY_INTEGER,
          LOG_LOCATION   OUT  VARCHAR2 );
```

Parameters

Table 56-5 GET_LOG Procedure Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE See "Logging Types".
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. • 1: TARGET_TABLE • 2: TARGET_TRACE • 3: TARGET_FILE • 4: TARGET_LOB See "Logging Targets"
log_level	One of the following log verbosity levels. Each level adds new types of messages to the previous level. • 1: LEVEL_LOWEST • 2: LEVEL_LOW • 3: LEVEL_MEDIUM • 4: LEVEL_HIGH • 5: LEVEL_HIGHEST See "Verbosity Levels".
log_location	The full identity of the log, such as *owner.table_name* when log_target is a table.

Usage Notes

If `log_type` is not active, then `log_level` and `log_location` are null. Use `DBMS_CUBE_LOG.ENABLE` to activate a log.

Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```
SET serverout ON format wrapped

DECLARE
     myloglevel  binary_integer;
     mylogtarget varchar2(128);

BEGIN
     dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
     dbms_cube_log.target_table, myloglevel, mylogtarget);

     dbms_output.put_line('Log Level: ' || myloglevel);
     dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

```
Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
```

56.2.6 GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
     RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to `SET_LOG_SPEC`.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```
SELECT dbms_cube_log.get_log_spec FROM dual;

GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

56.2.7 GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the `SET_PARAMETER` function.

Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER )
     RETURN BINARY_INTEGER;
```

Parameters

Table 56-6 GET_PARAMETER Function Parameters

Parameter	Description
`log_type`	One of the following log types: • 1: `TYPE_OPERATIONS` • 2: `TYPE_REJECTED_RECORDS` • 3: `TYPE_DIMENSION_COMPILE` See "Logging Types".
`log_parameter`	One of the following options: • 1: `MAX_ERRORS` • 2: `FLUSH_INTERVAL` • 3: `LOG_FULL_RECORD` • 4: `LOG_EVERY_N` • 5: `ALLOW_ERRORS` See "SET_PARAMETER Procedure".

Returns

The value of the specified *`log_parameter`*.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the `SET_PARAMETER` procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -
     "Maximum Records" FROM dual;

Maximum Records
---------------
            100
```

56.2.8 LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGH ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to high:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_high);
```

56.2.9 LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
     RETURN BINARY_INTEGER;
```

Returns

5

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to highest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_highest);
```

56.2.10 LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_low);
```

56.2.11 LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOWEST ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to lowest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```

56.2.12 LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to medium:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_medium);
```

56.2.13 SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

```
DBMS_CUBE_LOG.SET_LOG_SPEC (
          LOG_SPEC       IN   VARCHAR2 );
```

Parameters

Table 56-7 SET_LOG_SPEC Procedure Parameters

Parameter	Description
log_spec	A string consisting of *type*(*target*) pairs. *Type* can be: • OPERATIONS • REJECTED_RECORDS • DIMENSION_COMPILE *Target* can be: • TABLE • TRACE • FILE • LOB

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```
BEGIN
     dbms_cube_log.disable;
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

     dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

```
Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
```

56.2.14 SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging.

To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.SET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER,
          VALUE          IN   BINARY_INTEGER );
```

Parameters

Table 56-8 SET_PARAMETER Procedure Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE • 4: TYPE_BUILD See "Logging Types".
log_parameter	One of the following parameters: • 1: MAX_ERRORS Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log. • 2: FLUSH_INTERVAL The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering. • 3: LOG_FULL_RECORD Controls logging of rejected records. Set this parameter to one of the following constants: 0: FULL_RECORD_AUTO: Log the full record when no row ID is available. 1: FULL_RECORD_ALWAYS: Always log the full record. 2: FULL_RECORD_NEVER: Never log the full record. • 4: LOG_EVERY_N Enters a progress message every *n* rows during data maintenance. • 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.
value	The new value of *log_parameter*.

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:

```
BEGIN
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

     dbms_output.put_line('Max rejected records: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));
```

```
     dbms_output.put_line('Buffer time: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
          ' seconds');
END;
/
```

The procedure displays this information:

```
Max rejected records: 150

Buffer time: 5 seconds
```

56.2.15 TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the `CREATE TABLE` privilege to use this procedure.

`TABLE_CREATE` also upgrades existing log tables to the current version while preserving the data.

Syntax

```
DBMS_CUBE_LOG.TABLE_CREATE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          TBLNAME        IN   VARCHAR2        DEFAULT );
```

Parameters

Table 56-9 TABLE_CREATE Procedure Parameters

Parameter	Description
`log_type`	One of the following log types: • 1: `TYPE_OPERATIONS` • 2: `TYPE_REJECTED_RECORDS` • 3: `TYPE_DIMENSION_COMPILE` • 4: `TYPE_BUILD` See "Logging Types".
`tblname`	A table name for the log. These are the default names: • `CUBE_OPERATIONS_LOG` • `CUBE_REJECTED_RECORDS` • `CUBE_DIMENSION_COMPILE` • `CUBE_BUILD_LOG`

Examples

This example creates a Cube Operations log table named `CUBE_OPERATIONS_LOG`:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named `CUBE_REJECTED_RECORDS`:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named `MY_BUILD_LOG`:

```
EXECUTE dbms_cube_log.table_create -
     (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```

56.2.16 TARGET_FILE Function

This function returns the integer value of a file target in `DBMS_CUBE_LOG` subprograms.

Syntax

```
DBMS_CUBE_LOG.TARGET_FILE ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the *`LOG_LEVEL`* parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```

56.2.17 TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

```
DBMS_CUBE_LOG.TARGET_LOB ()
     RETURN BINARY_INTEGER;
```

Returns

```
4
```

Usage Notes

Use this function instead of its binary integer equivalent for the *`LOG_LEVEL`* parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log LOB:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```

56.2.18 TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE ()
     RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TARGET` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```

56.2.19 TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()
     RETURN BINARY_INTEGER;
```

Returns

```
2
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TARGET` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```

56.2.20 TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

```
DBMS_CUBE_LOG.TYPE_BUILD ()
     RETURN BINARY_INTEGER;
```

Returns

```
4
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_BUILD_LOG
```

56.2.21 TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_DIMENSION_COMPILE
```

56.2.22 TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

```
DBMS_CUBE_LOG.TYPE_OPERATIONS ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_OPERATIONS_LOG
```

56.2.23 TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

Syntax

```
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
     RETURN BINARY_INTEGER;
```

Returns

```
2
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Rejected Records log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_REJECTED_RECORDS
```

56.2.24 VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

Syntax

```
DBMS_CUBE_LOG.VERSION (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT 1,
          TBLNAME        IN   VARCHAR2        DEFAULT NULL)
     RETURN BINARY_INTEGER;
```

Parameters

Table 56-10 VERSION Function Parameters

Parameter	Description
log_type	One of the following log types: • 1: TYPE_OPERATIONS • 2: TYPE_REJECTED_RECORDS • 3: TYPE_DIMENSION_COMPILE • 4: TYPE_BUILD See "Logging Types".
tblname	The name of the log table whose version is returned.

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

```
SELECT dbms_cube_log.version FROM dual;

   VERSION
----------
         2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
     'CUBE_REJECTED_RECORDS') version FROM dual;

   VERSION
----------
         2
```

57
DBMS_DATA_MINING

The `DBMS_DATA_MINING` package is the application programming interface for creating, evaluating, and querying Oracle Machine Learning for SQL models.

In Oracle Database Release 21c, Oracle Data Mining has been rebranded to Oracle Machine Learning for SQL (Oracle Machine Learning for SQL). The PL/SQL package name, however, has not changed and remains `DBMS_DATA_MINING`.

This chapter contains the following topics:

- Overview
- Security Model
- Mining Functions
- Model Settings
- Algorithm Specific Settings
- Solver Settings
- Datatypes
- Summary of DBMS_DATA_MINING Subprograms

> **See Also:**
>
> - *Oracle Machine Learning for SQL Concepts*
> - *Oracle Machine Learning for SQL User's Guide*
> - DBMS_DATA_MINING_TRANSFORM
> - DBMS_PREDICTIVE_ANALYTICS

57.1 DBMS_DATA_MINING Overview

Oracle Machine Learning for SQL supports both supervised and unsupervised machine learning. Supervised machine learning predicts a target value based on historical data. Unsupervised machine learning discovers natural groupings and does not use a target. You can use Oracle Machine Learning for SQL procedures on structured data and unstructured text.

Supervised machine learning techniques include:

- Classification
- Regression
- Feature Selection (Attribute Importance)
- Time Series

Unsupervised machine learning techniques include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection

The steps you use to build and apply a machine learning model depend on the machine learning technique and the algorithm being used. The algorithms supported by Oracle Machine Learning for SQL are listed in the following table.

Table 57-1 Oracle Machine Learning for SQL Algorithms

Algorithm	Abbreviation	Function
Apriori	AR	Association
CUR Matrix Decomposition	CUR	Attribute importance
Decision Tree	DT	Classification
Expectation Maximization	EM	Clustering
Explicit Semantic Analysis	ESA	Feature extraction, classification
Exponential Smoothing	ESM	Time series
Generalized Linear Models	GLM	Classification, regression
k-Means	KM	Clustering
Minimum Descriptor Length	MDL	Attribute importance
Multivariate State Estimation Technique - Sequential Probability Ratio Test	MSET-SPRT	Anomaly detection, classification
Naive Bayes	NB	Classification
Neural Network	NN	Classification, regression
Non-Negative Matrix Factorization	NMF	Feature extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Random Forest	RF	Classification
Singular Value Decomposition and Principal Component Analysis	SVD and PCA	Feature extraction
Support Vector Machine	SVM	Classification, regression, anomaly detection
XGBoost	XGBoost	Classification, regression

Oracle Machine Learning for SQL supports more than one algorithm for the classification, regression, clustering, and feature extraction machine learning techniques. Each of these machine learning techniques has a default algorithm, as shown in the following table.

Table 57-2 Oracle Machine Learning for SQL Default Algorithms

Mining Function	Default Algorithm
Classification	Naive Bayes
Clustering	*k*-Means
Feature Extraction	Non-Negative Matrix Factorization
Feature Selection	Minimum Descriptor Length

Table 57-2 (Cont.) Oracle Machine Learning for SQL Default Algorithms

Mining Function	Default Algorithm
Regression	Support Vector Machine
Time Series	Exponential Smoothing

57.2 DBMS_DATA_MINING Security Model

The `DBMS_DATA_MINING` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_DATA_MINING` package exposes APIs that are leveraged by the Oracle Machine Learning for SQL. Users who wish to create machine learning models in their own schema require the `CREATE MINING MODEL` system privilege. Users who wish to create machine learning models in other schemas require the `CREATE ANY MINING MODEL` system privilege.

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing machine learning models in other schemas include `ALTER ANY MINING MODEL`, `DROP ANY MINING MODEL`, `SELECT ANY MINING MODEL`, `COMMENT ANY MINING MODEL`, and `AUDIT ANY`.

Individual object privileges on machine learning models, `ALTER MINING MODEL` and `SELECT MINING MODEL`, can be used to selectively grant privileges on a model to a different user.

>
> *Oracle Data Mining User's Guide* for more information about the security features of Oracle Machine Learning for SQL

57.3 DBMS_DATA_MINING — Machine Learning Functions

A machine learning **function** refers to the methods for solving a given class of machine learning problems.

The machine learning function must be specified when a model is created. You specify a machine learning function with the `mining_function` parameter of the CREATE_MODEL Procedure or the CREATE_MODEL2 Procedure.

Table 57-3 Machine Learning Functions

Value	Description
`ASSOCIATION`	Association is a descriptive machine learning function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.

Table 57-3 (Cont.) Machine Learning Functions

Value	Description
ATTRIBUTE_IMPORTANCE	Attribute importance is a predictive machine learning function, also known as feature selection. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute importance models can use Minimum Description Length (MDL) or CUR Matrix Decomposition. MDL is the default.
CLASSIFICATION	Classification is a predictive machine learning function. A classification model uses historical data to predict a categorical target. Classification models can use: Decision Tree, logistic regression, Multivariate State Estimation Technique - Sequential Probability Ratio Test, Naive Bayes, Support Vector Machine (SVM), or XGBoost. The default is Naive Bayes. The classification function can also be used for **anomaly detection**. For anomaly detection, you can use the Multivariate State Estimation Technique - Sequential Probability Ratio Test algorithm or the SVM algorithm with a null target (One-Class SVM), or the EM algorithm with a null target (EM Anomaly).
CLUSTERING	Clustering is a descriptive machine learning function. A clustering model identifies natural groupings within a data set. Clustering models can use *k*-Means, O-Cluster, or Expectation Maximization. The default is *k*-Means.
FEATURE_EXTRACTION	Feature extraction is a descriptive machine learning function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models can use Explicit Semantic Analysis, Non-Negative Matrix Factorization, Singular Value Decomposition, or Principal Component Analysis. Non-Negative Matrix Factorization is the default.
REGRESSION	Regression is a predictive machine learning function. A regression model uses historical data to predict a numerical target. Regression models can use linear regression, Support Vector Machine, or XGBoost. The default is Support Vector Machine.
TIME_SERIES	Time series is a predictive machine learning function. A time series model forecasts the future values of a time-ordered series of historical numeric data over a user-specified time window. Time series models use the Exponential Smoothing algorithm.

Oracle Machine Learning for SQL Concepts for more information about mining functions

57.4 DBMS_DATA_MINING — Model Settings

Oracle Machine Learning for SQL uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a machine learning function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, then you must create a settings table. The settings table must have the column names and data types shown in the following table.

Table 57-4 Required Columns in the Model Settings Table

Column Name	Data Type
SETTING_NAME	VARCHAR2(30)
SETTING_VALUE	VARCHAR2(4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure. You can also provide these settings through the CREATE_MODEL2 Procedure.

The settings used by a model can be found by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view displays the model settings used by the machine learning models to which you have access. All of the default and user-specified setting values are included in the view.

See Also:

- ALL_MINING_MODEL_SETTINGS in *Oracle Database Reference*
- *Oracle Machine Learning for SQL User's Guide* for information about specifying model settings

57.4.1 DBMS_DATA_MINING — Algorithm Names

The ALGO_NAME setting specifies the model algorithm.

The values for the ALGO_NAME setting are listed in the following table.

Table 57-5 Algorithm Names

ALGO_NAME Value	Description	Machine Learning Function
ALGO_AI_MDL	Minimum Description Length	Attribute importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association rules
ALGO_CUR_DECOMPOSITION	CUR Matrix Decomposition	Attribute importance
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_EXPECTATION_MAXIMIZATION	Expectation Maximization	Clustering, Classification

Table 57-5 (Cont.) Algorithm Names

ALGO_NAME Value	Description	Machine Learning Function
ALGO_EXPLICIT_SEMANTIC_ANALYS	Explicit Semantic Analysis	Feature extraction Classification
ALGO_EXPONENTIAL_SMOOTHING	Exponential Smoothing	Time series
ALGO_EXTENSIBLE_LANG	Language used for extensible algorithm	All mining functions supported
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification, regression; also feature selection and generation
ALGO_KMEANS	Enhanced *k*-Means	Clustering
ALGO_MSET_SPRT	Multivariate State Estimation Technique - Sequential Probability Ratio Test	Classification
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_NEURAL_NETWORK	Neural Network	Classification
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature extraction
ALGO_O_CLUSTER	O-Cluster	Clustering
ALGO_RANDOM_FOREST	Random Forest	Classification
ALGO_SINGULAR_VALUE_DECOMP	Singular Value Decomposition	Feature extraction
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and regression
ALGO_XGBOOST	XGBoost	Classification and regression

Oracle Machine Learning for SQL Concepts for information about algorithms

57.4.2 DBMS_DATA_MINING — Automatic Data Preparation

Oracle Machine Learning for SQL supports fully Automatic Data Preparation (ADP), user-directed general data preparation, and user-specified embedded data preparation. The `PREP_*` settings enable the user to request fully automated or user-directed general data preparation. By default, fully Automatic Data Preparation (`PREP_AUTO_ON`) is enabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. Instead of fully ADP, the user can request that the data be shifted and/or scaled with the `PREP_SCALE*` and `PREP_SHIFT*` settings. The transformation instructions are stored with the model and reused whenever the model is applied. The model settings can be viewed in `USER_MINING_MODEL_SETTINGS`.

You can choose to supplement Automatic Data Preparations by specifying additional transformations in the `xform_list` parameter when you build the model. See "CREATE_MODEL Procedure" and "CREATE_MODEL2 Procedure".

If you do not use ADP *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL`, you must implement your own transformations separately in the build, test, and

scoring data. You must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, OML4SQL embeds the transformation definitions in the model and prepares the test and scoring data to match the build data.

The values for the `PREP_*` setting are described in the following table.

Table 57-6 PREP_* Setting

Setting Name	Setting Value	Description
`PREP_AUTO`	• `PREP_AUTO_ON` • `PREP_AUTO_OFF`	This setting enables fully automated data preparation. The default is `PREP_AUTO_ON`.
`PREP_SCALE_2DNUM`	• `PREP_SCALE_STDDEV` • `PREP_SCALE_RANGE`	This setting enables scaling data preparation for two-dimensional numeric columns. `PREP_AUTO` must be `OFF` for this setting to take effect. The following are the possible values: • `PREP_SCALE_STDDEV`: A request to divide the column values by the standard deviation of the column and is often provided together with `PREP_SHIFT_MEAN` to yield z-score normalization. • `PREP_SCALE_RANGE`: A request to divide the column values by the range of values and is often provided together with `PREP_SHIFT_MIN` to yield a range of [0,1].
`PREP_SCALE_NNUM`	`PREP_SCALE_MAXABS`	This setting enables scaling data preparation for nested numeric columns. `PREP_AUTO` must be `OFF` for this setting to take effect. If specified, then the valid value for this setting is `PREP_SCALE_MAXABS`, which yields data in the range of [-1,1].
`PREP_SHIFT_2DNUM`	• `PREP_SHIFT_MEAN` • `PREP_SHIFT_MIN`	This setting enables centering data preparation for two-dimensional numeric columns. `PREP_AUTO` must be `OFF` for this setting to take effect. The following are the possible values: • `PREP_SHIFT_MEAN`: Results in subtracting the average of the column from each value. • `PREP_SHIFT_MIN`: Results in subtracting the minimum of the column from each value. .

57.4.3 DBMS_DATA_MINING — Machine Learning Function Settings

The settings described in this table apply to a machine learning function.

Table 57-7 Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description
Association	ASSO_MAX_RULE_LENGTH	TO_CHAR(2<= *numeric_expr* <=20)	Maximum rule length for association rules. Default is 4.
Association	ASSO_MIN_CONFIDENCE	TO_CHAR(0<= *numeric_expr* <=1)	Minimum confidence for association rules. Default is 0.1.
Association	ASSO_MIN_SUPPORT	TO_CHAR(0<= *numeric_expr* <=1)	Minimum support for association rules Default is 0.1.
Association	ASSO_MIN_SUPPORT_INT	a positive integer	Minimum absolute support that each rule must satisfy. The value must be an integer. The default is 1.
Association	ASSO_MIN_REV_CONFIDENCE	TO_CHAR(0<= *numeric_expr* <=1)	Sets the Minimum Reverse Confidence that each rule should satisfy. The Reverse Confidence of a rule is defined as the number of transactions in which the rule occurs divided by the number of transactions in which the consequent occurs. The value is real number between 0 and 1. The default is 0.
Association	ASSO_IN_RULES	NULL	Sets Including Rules applied for each association rule: it specifies the list of items that at least one of them must appear in each reported association rule, either as antecedent or as consequent. It is a comma separated string containing the list of including items. If not set, the default behavior is, the filtering is not applied. For example, `INSERT INTO sett_tab (setting_name, setting_value) VALUES (dbms_data_mining.asso_in_rules, '''a'','b''');`

Table 57-7 (Cont.) Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description
Association	ASSO_EX_RULES	NULL	Sets Excluding Rules applied for each association rule: it specifies the list of items that none of them can appear in each reported association rules. It is a comma separated string containing the list of excluded items. No rule can contain any item in the list. The default is NULL. For example, `INSERT INTO sett_tab (setting_name, setting_value) VALUES (dbms_data_mining.asso_ex_rules, '''a'',''b''');`
Association	ASSO_ANT_IN_RULES	NULL	Sets Including Rules for the antecedent: it specifies the list of items that at least one of them must appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of including items. The antecedent part of each rule must contain at least one item in the list. The default is NULL. For example, `INSERT INTO sett_tab (setting_name, setting_value) VALUES (dbms_data_mining.asso_ant_in_rules, '''a'',''b''');`
Association	ASSO_ANT_EX_RULES	NULL	Sets Excluding Rules for the antecedent: it specifies the list of items that none of them can appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of excluded items. No rule can contain any item in the list in its antecedent part. The default is NULL. For example, `INSERT INTO sett_tab (setting_name, setting_value) VALUES (dbms_data_mining.asso_ant_ex_rules, '''a'',''b''');`

Table 57-7 (Cont.) Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description

Association	ASSO_CONS_IN_RULES	NULL	Sets Including Rules for the consequent: it specifies the list of items that at least one of them must appear in the consequent part of each reported association rule. It is a comma separated string containing the list of including items. The consequent of each rule must be an item in the list.
			The default is NULL.
			For example,
			`INSERT INTO sett_tab (setting_name, setting_value) VALUES`
			`(dbms_data_mining.asso_cons_in_rules, '''a'',''b''');`

Association	ASSO_CONS_EX_RULES	NULL	Sets Excluding Rules for the consequent: it specifies the list of items that none of them can appear in the consequent part of each reported association rule. It is a comma separated string containing the list of excluded items. No rule can have any item in the list as its consequent.
			The excluding rule can be used to reduce the data that must be stored, but the user may be required to build an extra model for executing different including or Excluding Rules.
			The default is NULL.
			For example,
			`INSERT INTO sett_tab (setting_name, setting_value) VALUES`
			`(dbms_data_mining.asso_cons_ex_rules, '''a'',''b''');`

Table 57-7 (Cont.) Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description
Association	ASSO_AGGREGATES	NULL	Specifies the columns to be aggregated. It is a comma separated string containing the names of the columns for aggregation. The number of columns in the list must be <= 10. You can set ASSO_AGGREGATES if ODMS_ITEM_ID_COLUMN_NAME is set indicating transactional input data. See DBMS_DATA_MINING - Global Settings. The data table must have valid column names such as ITEM_ID and CASE_ID which are derived from ODMS_ITEM_ID_COLUMN_NAME and case_id_column_name respectively. Numeric values are supported. ITEM_VALUE is not a mandatory value. The default is NULL. For each item, the user may supply several columns to aggregate. It requires more memory to buffer the extra data. Also, the performance impact can be seen because of the larger input data set and more operation.
Association	ASSO_ABS_ERROR	0<ASSO_ABS_ERRORMAX(ASSO_MIN_SUPPORT, ASSO_MIN_CONFIDENCE).	Specifies the absolute error for the association rules sampling. A smaller value of ASSO_ABS_ERROR obtains a larger sample size which gives accurate results but takes longer computational time. Set a reasonable value for ASSO_ABS_ERROR, such as its default value, to avoid large sample size. The default value is 0.5 * MAX(ASSO_MIN_SUPPORT, ASSO_MIN_CONFIDENCE).
Association	ASSO_CONF_LEVEL	0 ASSO_CONF_LEVEL 1	Specifies the confidence level for an association rules sample. A larger value of ASSO_CONF_LEVEL obtains a larger sample size. Any value between 0.9 and 1 is suitable. The default value is 0.95.
Classification	CLAS_COST_TABLE_NAME	*table_name*	(Decision tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only decision tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See "ADD_COST_MATRIX Procedure" for the column requirements. See *Oracle Machine Learning for SQL Concepts* for information about costs.

Table 57-7 (Cont.) Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description
Classification	CLAS_PRIORS_TABLE_NAME	*table_name*	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See *Oracle Machine Learning for SQL User's Guide* for the column requirements. See *Oracle Machine Learning for SQL Concepts* for additional information about priors.
Classification	CLAS_WEIGHTS_TABLE_NAME	*table_name*	(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See *Oracle Machine Learning for SQL User's Guide* for the column requirements. See *Oracle Machine Learning for SQL Concepts* for additional information about class weights.
Classification	CLAS_WEIGHTS_BALANCED	ON OFF	This setting indicates that the algorithm must create a model that balances the target distribution. This setting is most relevant in the presence of rare targets, as balancing the distribution may enable better average accuracy (average of per-class accuracy) instead of overall accuracy (which favors the dominant class). The default value is OFF.
Classification	CLAS_MAX_SUP_BINS	For Decision Tree: 2 <= *a number* <=2147483647 For Random Forest: 2 <= *a number* <=254	This parameter specifies the maximum number of bins for each attribute. The default value is 32. See, DBMS_DATA_MINING — Automatic Data Preparation

Table 57-7 (Cont.) Machine Learning Function Settings

Machine Learning Function	Setting Name	Setting Value	Description
Clustering	CLUS_NUM_CLUSTERS	*TO_CHAR(numeric_expr >=1)*	The maximum number of leaf clusters generated by a clustering algorithm. The algorithm may return fewer clusters, depending on the data. Enhanced *k*-Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points. When Expectation maximization (EM) is used for clustering, it may return fewer clusters than the number specified by CLUS_NUM_CLUSTERS depending on the data. The number of clusters returned by EM cannot be greater than the number of components, which is governed by algorithm-specific settings. (See *Expectation Maximization Settings for Learning* table) Depending on these settings, there may be fewer clusters than components. If component clustering is disabled, the number of clusters equals the number of components. The setting can be used only for EM Clustering algorithm. For EM Clustering algorithm, the default value of CLUS_NUM_CLUSTERS is system-determined. For *k*-Means and O-Cluster, the default is 10.
Feature extraction	FEAT_NUM_FEATURES	TO_CHAR(*numeric_expr* >=1)	The number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm. If the matrix rank is smaller than this number, fewer features will be returned. For CUR Matrix Decomposition, the FEAT_NUM_FEATURES value is the same as the CURS_SVD_RANK value.

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for information about machine learning functions

57.4.4 DBMS_DATA_MINING — Global Settings

The configuration settings in this table are applicable to any type of model, but are currently only implemented for specific algorithms.

Table 57-8 Global Settings

Setting Name	Setting Value	Description
ODMS_BOXCOX	ODMS_BOXCOX_ENABLE ODMS_BOXCOX_DISABLE	This setting enables the Box-Cox variance-stabilization transformation. It is useful when the variance increases as the target value increases. It reduces variance and transforms a multiplicative relationship with the target, with a simpler additive relationship. This setting is applicable only to the Exponential Smoothing algorithm. When a value for EXSM_MODEL setting is not specified, the default value is ODMS_BOXCOX_ENABLE and when a value for the EXSM_MODEL setting is provided, the default value is ODMS_BOXCOX_DISABLE.
ODMS_EXPLOSION_MIN_SUPP	A positive integer	It is the minimum required support for categorical values that must be included in the explosion mapping. It removes categorical values with insufficient row instances to have a statistically significant effect on the model, however, they could potentially degrade performance. The default is system determined depending on the number of rows in the dataset. A value of 1 results into mapping all categorical values.
ODMS_ITEM_ID_COLUMN_NAME	*column_name*	(Association rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in a native transactional format, consisting of two columns: • Case ID, either categorical or numeric • Item ID, either categorical or numeric **Note:** Oracle Machine Learning does not support BOOLEAN values for this setting. A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data. Association rules function is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms). For more information about single-record and multi-record case data, see *Oracle SQL Developer Data Modeler User's Guide*.

Table 57-8 (Cont.) Global Settings

Setting Name	Setting Value	Description
ODMS_ITEM_VALUE_COLUMN_NAME	*column_name*	(Association rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format. If ASSO_AGGREGATES is used, then the build data must include the following three columns and the columns specified in the AGGREGATES setting. • Case ID, either categorical or numeric • Item ID, either categorical or numeric, specified by ODMS_ITEM_ID_COLUMN_NAME • Item value, either categorical or numeric, specified by ODMS_ITEM_VALUE_COLUMN_NAME **Note:** Oracle Machine Learning does not support BOOLEAN values for this setting. If ASSO_AGGREGATES, Case ID, and Item ID column are present, then the Item Value column may or may not appear. The Item Value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples). For details on ASSO_AGGREGATES, see DBMS_DATA_MINING - Mining Function Settings.
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE ODMS_MISSING_VALUE_DELETE_ROW ODMS_MISSING_VALUE_AUTO	Indicates how to treat missing values in the training data. This setting does not affect the scoring data. The default value is ODMS_MISSING_VALUE_AUTO. ODMS_MISSING_VALUE_MEAN_MODE replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time where appropriate. ODMS_MISSING_VALUE_AUTO performs different strategies for different algorithms. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, then you must perform the transformation explicitly. The value ODMS_MISSING_VALUE_DELETE_ROW applies to all algorithms.

Table 57-8 (Cont.) Global Settings

Setting Name	Setting Value	Description
ODMS_ROW_WEIGHT_COLUMN_NAME	*column_name*	(GLM only) Name of a column in the training data that contains a weighting factor for the rows. The column data type must be numeric. Oracle Machine Learning does not support BOOLEAN values for this setting. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.
ODMS_TEXT_POLICY_NAME	The name of an Oracle Text POLICY created using CTX_DDL.CREATE_POLICY.	Affects how individual tokens are extracted from unstructured text. For details about CTX_DDL.CREATE_POLICY, see *Oracle Text Reference*.
ODMS_TEXT_MAX_FEATURES	1 <= *value*	The maximum number of distinct features, across all text attributes, to use from a document set passed to CREATE_MODEL. The default is 3000. ESA has the default value of 300000.
ODMS_TEXT_MIN_DOCUMENTS	Non-negative value	This is a text processing setting the controls how in how many documents a token needs to appear to be used as a feature. The default is 1. ESA has a default of 3.
ODMS_PARTITION_COLUMNS	Comma separated list of machine learning attributes	This setting indicates a request to build a partitioned model. The setting value is a comma-separated list of the machine learning attributes used to determine the in-list partition key values. Oracle Machine Learning supports numeric and categorical values including BOOLEAN for this setting. These machine learning attributes are taken from the input columns unless an XFORM_LIST parameter is passed to CREATE_MODEL or CREATE_MODEL2. If the XFORM_LIST parameter is passed to during model building, then the machine learning attributes are taken from the attributes produced by these transformations.
ODMS_MAX_PARTITIONS	1< value <= 1000000	This setting indicates the maximum number of partitions allowed for the model. The default is 1000.
ODMS_SAMPLING	ODMS_SAMPLING_ENABLE ODMS_SAMPLING_DISABLE	This setting allows the user to request a sampling of the build data. The default is ODMS_SAMPLING_DISABLE.
ODMS_SAMPLE_SIZE	0 < Value	This setting determines how many rows will be sampled (approximately). It can be set only if ODMS_SAMPLING is enabled. The default value is the system determined.

Table 57-8 (Cont.) Global Settings

Setting Name	Setting Value	Description
ODMS_PARTITION_BUILD_TYPE	ODMS_PARTITION_BUILD_INTRA ODMS_PARTITION_BUILD_INTER ODMS_PARTITION_BUILD_HYBRID	This setting controls the parallel build of partitioned models. ODMS_PARTITION_BUILD_INTRA — Each partition is built in parallel using all replicas. ODMS_PARTITION_BUILD_INTER — Each partition is built entirely in a single slave, but multiple partitions may be built at the same time since multiple replicas are active. ODMS_PARTITION_BUILD_HYBRID — It is a combination of the other two types and is recommended for most situations to adapt to dynamic environments. The default mode is ODMS_PARTITION_BUILD_HYBRID
ODMS_TABLESPACE_NAME	*tablespace_name*	This setting controls the storage specifications. If you explicitly sets this to the name of a tablespace (for which you have sufficient quota), then the specified tablespace storage creates the resulting model content. If you do not provide this setting, then the default tablespace of the user creates the resulting model content.
ODMS_RANDOM_SEED	The value must be a non-negative integer	The hash function with a random number seed generates a random number with uniform distribution. Users can control the random number seed by this setting. The default is 0. This setting is used by Random Forest, Neural Network, and CUR Matrix Decomposition.
ODMS_DETAILS	• ODMS_ENABLE • ODMS_DISABLE	This setting reduces the space that is used while creating a model, especially a partitioned model. The default value is ODMS_ENABLE. When the setting is ODMS_ENABLE, it creates model tables and views when the model is created. You can query the model with SQL. When the setting is ODMS_DISABLE, model views are not created and tables relevant to model details are not created either. The reduction in space depends on the model. Reduction on the order of 10x can be achieved.

57.5 DBMS_DATA_MINING — Algorithm Specific Model Settings

Oracle Machine Learning for SQL uses algorithm specific settings to define the characteristics of a model.

All settings have default values. If you want to override one or more of the settings for a model, then you must specify those settings.

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure. You can also provide these settings through the CREATE_MODEL2 Procedure.

The settings used by a model can be found by querying the data dictionary view `ALL_MINING_MODEL_SETTINGS`. This view displays the model settings used by the machine learning models to which you have access. All of the default and user-specified setting values are included in the view.

See Also:

- `ALL_MINING_MODEL_SETTINGS` in *Oracle Database Reference*
- *Oracle Machine Learning for SQL User's Guide* for information about specifying model settings

57.5.1 DBMS_DATA_MINING — Algorithm Settings: ALGO_EXTENSIBLE_LANG

The settings listed in the following table configure the behavior of the machine learning model with an extensible algorithm. The model is built in the R language.

The `RALG_*_FUNCTION` specifies the R script that is used to build, score, and view an R model and must be registered in the Oracle Machine Learning for R script repository. The R scripts are registered through Oracle Machine Learning for R with special privileges. When `ALGO_EXTENSIBLE_LANG` is set to R in the `MINING_MODEL_SETTING` table, the machine learning model is built in the R language. After the R model is built, the names of the R scripts are recorded in the `MINING_MODEL_SETTING` table in the `SYS` schema. The scripts must exist in the script repository for the R model to function. The amount of R memory used to build, score, and view the R model through these R scripts can be controlled by Oracle Machine Learning for R.

All algorithm-independent `DBMS_DATA_MINING` subprograms can operate on an R model for machine learning functions such as association, attribute importance, classification, clustering, feature extraction, and regression.

The supported `DBMS_DATA_MINING` subprograms include, but are not limited, to the following:

- ADD_COST_MATRIX Procedure
- COMPUTE_CONFUSION_MATRIX Procedure
- COMPUTE_LIFT Procedure
- COMPUTE_ROC Procedure

- CREATE_MODEL Procedure
- DROP_MODEL Procedure
- EXPORT_MODEL Procedure
- GET_MODEL_COST_MATRIX Function
- IMPORT_MODEL Procedure
- REMOVE_COST_MATRIX Procedure
- RENAME_MODEL Procedure

Table 57-9 ALGO_EXTENSIBLE_LANG Settings

Setting Name	Setting Value	Description
RALG_BUILD_FUNCTION	R_BUILD_FUNCTION_SCRIPT_NAME	Specifies the name of an existing registered R script for the R algorithm machine learning model build function. The R script defines an R function for the first input argument for training data and returns an R model object. For clustering and feature extraction machine learning function model build, the R attributes dm$nclus and dm$nfeat must be set on the R model to indicate the number of clusters and features respectively. The RALG_BUILD_FUNCTION must be set along with ALGO_EXTENSIBLE_LANG in the model_setting_table.
RALG_BUILD_PARAMETER	SELECT *value* param_name, ...FROM DUAL	Specifies a list of numeric and string scalar for optional input parameters of the model build function.
RALG_SCORE_FUNCTION	R_SCORE_FUNCTION_SCRIPT_NAME	Specifies the name of an existing registered R script to score data. The script returns a data.frame containing the corresponding prediction results. The setting is used to score data for machine learning functions such as regression, classification, clustering, and feature extraction. This setting does not apply to the association and the attribute importance functions.
RALG_WEIGHT_FUNCTION	R_WEIGHT_FUNCTION_SCRIPT_NAME	Specifies the name of an existing registered R script for the R algorithm that computes the weight (contribution) for each attribute in scoring. The script returns a data.frame containing the contributing weight for each attribute in a row. This function setting is needed for the PREDICTION_DETAILS SQL function.
RALG_DETAILS_FUNCTION	R_DETAILS_FUNCTION_SCRIPT_NAME	Specifies the name of an existing registered R script for the R algorithm that produces the model information. This setting is required to generate a model view.
RALG_DETAILS_FORMAT	SELECT *type_value column_name*, ... FROM DUAL	Specifies the SELECT query for the list of numeric and string scalars for the output column type and the column name of the generated model view. This setting is required to generate a model view.

57.5.2 DBMS_DATA_MINING — Algorithm Settings: CUR Matrix Decomposition

The following settings affects the behavior of the CUR Matrix Decomposition algorithm.

Table 57-10 CUR Matrix Decomposition Settings

Setting Name	Setting Value	Description
CURS_APPROX_ATTR_NUM	The value must be a positive integer	Defines the approximate number of attributes to be selected. The default value is the number of attributes.
CURS_ROW_IMPORTANCE	CURS_ROW_IMP_ENABLE CURS_ROW_IMP_DISABLE	Defines the flag indicating whether or not to perform row selection. The default value is CURS_ROW_IMP_DISABLE.
CURS_APPROX_ROW_NUM	The value must be a positive integer	Defines the approximate number of rows to be selected. This parameter is only used when users decide to perform row selection (CURS_ROW_IMP_ENABLE). The default value is the total number of rows.
CURS_SVD_RANK	The value must be a positive integer	Defines the rank parameter used in the column/row leverage score calculation. If users do not provide an input value, the value is determined by the system.

57.5.3 DBMS_DATA_MINING — Algorithm Settings: Decision Tree

These settings configure the behavior of the Decision Tree algorithm. Note that the Decision Tree settings are also used to configure the behavior of Random Forest as it constructs each individual decision tree.

Table 57-11 Decision Tree Settings

Setting Name	Setting Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY TREE_IMPURITY_GINI	Tree impurity metric for Decision Tree. Tree algorithms seek the best test question for splitting data at each node. The best splitter and split values are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is by a metric. Decision trees can use either Gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses TREE_IMPURITY_GINI.
TREE_TERM_MAX_DEPTH	For Decision Tree: 2<= *a number* <=20 For Random Forest: 2<= *a number* <=100	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node). For Decision Tree, the default is 7. For Random Forest, the default is 16.
TREE_TERM_MINPCT_NODE	0<= *a number*<=10	The minimum number of training rows in a node expressed as a percentage of the rows in the training data. Default is 0.05, indicating 0.05%.
TREE_TERM_MINPCT_SPLIT	0 < *a number* <=20	The minimum number of rows required to consider splitting a node expressed as a percentage of the training rows. Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	*a number*>=0	The minimum number of rows in a node. Default is 10.
TREE_TERM_MINREC_SPLIT	a number > 1	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if the number of records is below this value. Default is 20.

57.5.4 DBMS_DATA_MINING — Algorithm Settings: Expectation Maximization

These algorithm settings configure the behavior of the Expectation Maximization algorithm.

> **See Also:**
>
> *Oracle Data Mining Concepts* for information about Expectation Maximization

Table 57-12 Expectation Maximization Settings for Data Preparation and Analysis

Setting Name	Setting Value	Description
EMCS_ATTRIBUTE_FILTER	EMCS_ATTR_FILTER_ENABLE EMCS_ATTR_FILTER_DISABLE	Whether or not to include uncorrelated attributes in the model. When EMCS_ATTRIBUTE_FILTER is enabled, uncorrelated attributes are not included. **Note:** This setting applies only to attributes that are not nested. For Clustering, the default is system-determined. For anomaly detection, the default is EMCS_ATTR_FILTER_DISABLE.
EMCS_MAX_NUM_ATTR_2D	TO_CHAR(*numeric_expr* >=1)	Maximum number of correlated attributes to include in the model. Note: This setting applies only to attributes that are not nested (2D). Default is 50.
EMCS_NUM_DISTRIBUTION	EMCS_NUM_DISTR_BERNOULLI EMCS_NUM_DISTR_GAUSSIAN EMCS_NUM_DISTR_SYSTEM	The distribution for modeling numeric attributes. Applies to the input table or view as a whole and does not allow per-attribute specifications. The options include Bernoulli, Gaussian, or system-determined distribution. When Bernoulli or Gaussian distribution is chosen, all numeric attributes are modeled using the same type of distribution. When the distribution is system-determined, individual attributes may use different distributions (either Bernoulli or Gaussian), depending on the data. Default is EMCS_NUM_DISTR_SYSTEM.
EMCS_NUM_EQUIWIDTH_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Number of equi-width bins that will be used for gathering cluster statistics for numeric columns. Default is 11.

Table 57-12 (Cont.) Expectation Maximization Settings for Data Preparation and Analysis

Setting Name	Setting Value	Description
EMCS_NUM_PROJECTIONS	TO_CHAR(*numeric_expr* >=1)	Specifies the number of projections that will be used for each nested column. If a column has fewer distinct attributes than the specified number of projections, the data will not be projected. The setting applies to all nested columns. Default is 50.
EMCS_NUM_QUANTILE_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Specifies the number of quantile bins that will be used for modeling numeric columns with multivalued Bernoulli distributions. Default is system-determined.
EMCS_NUM_TOPN_BINS	TO_CHAR(1 <*numeric_expr* <=255)	Specifies the number of top-N bins that will be used for modeling categorical columns with multivalued Bernoulli distributions. Default is system-determined.

Table 57-13 Expectation Maximization Settings for Learning

Setting Name	Setting Value	Description
EMCS_CONVERGENCE_CRITERION	EMCS_CONV_CRIT_HELDASIDE EMCS_CONV_CRIT_BIC	The convergence criterion for EM. The convergence criterion may be based on a held-aside data set, or it may be Bayesian Information Criterion. Default is system determined.
EMCS_LOGLIKE_IMPROVEMENT	TO_CHAR(0 < *numeric_expr* < 1)	When the convergence criterion is based on a held-aside data set (EMCS_CONVERGENCE_CRITERION = EMCS_CONV_CRIT_HELDASIDE), this setting specifies the percentage improvement in the value of the log likelihood function that is required for adding a new component to the model. Default value is 0.001.
EMCS_NUM_COMPONENTS	TO_CHAR(*numeric_expr* >=1)	Maximum number of components in the model. If model search is enabled, the algorithm automatically determines the number of components based on improvements in the likelihood function or based on regularization, up to the specified maximum. For EM Clustering, the number of components must be greater than or equal to the number of clusters. Default is 20 for both EM Clustering and EM Anomaly.
EMCS_NUM_ITERATIONS	TO_CHAR(*numeric_expr* >=1)	Specifies the maximum number of iterations in the EM algorithm. Default is 100.
EMCS_MODEL_SEARCH	EMCS_MODEL_SEARCH_ENABLE EMCS_MODEL_SEARCH_DISABLE (default).	This setting enables model search in EM where different model sizes are explored and a best size is selected. The default is EMCS_MODEL_SEARCH_DISABLE.

Table 57-13 (Cont.) Expectation Maximization Settings for Learning

Setting Name	Setting Value	Description
EMCS_REMOVE_COMPONENTS	EMCS_REMOVE_COMPS_ENABLE (default) EMCS_REMOVE_COMPS_DISABLE	This setting allows the EM algorithm to remove a small component from the solution. The default is EMCS_REMOVE_COMPS_ENABLE.
EMCS_RANDOM_SEED	Non-negative integer	This setting controls the seed of the random generator used in EM. The default is 0.

Table 57-14 Expectation Maximization Settings for Component Clustering

Setting Name	Setting Value	Description
EMCS_CLUSTER_COMPONENTS	EMCS_CLUSTER_COMP_ENABLE EMCS_CLUSTER_COMP_DISABLE	Enables or disables the grouping of EM components into high-level clusters. When disabled, the components themselves are treated as clusters. The setting can be used only for EM Clustering. When component clustering is enabled, model scoring through the SQL CLUSTER function will produce assignments to the higher level clusters. When clustering is disabled, the CLUSTER function will produce assignments to the original components. Default is EMCS_CLUSTER_COMP_ENABLE.
EMCS_CLUSTER_THRESH	TO_CHAR(*numeric_expr* >=1)	Dissimilarity threshold that controls the clustering of EM components. When the dissimilarity measure is less than the threshold, the components are combined into a single cluster. The setting can be used only for EM Clustering. A lower threshold may produce more clusters that are more compact. A higher threshold may produce fewer clusters that are more spread out. Default is 2.
EMCS_LINKAGE_FUNCTION	EMCS_LINKAGE_SINGLE EMCS_LINKAGE_AVERAGE EMCS_LINKAGE_COMPLETE	Allows the specification of a linkage function for the agglomerative clustering step. The setting can be used only for EM Clustering. EMCS_LINKAGE_SINGLE uses the nearest distance within the branch. The clusters tend to be larger and have arbitrary shapes. EMCS_LINKAGE_AVERAGE uses the average distance within the branch. There is less chaining effect and the clusters are more compact. EMCS_LINKAGE_COMPLETE uses the maximum distance within the branch. The clusters are smaller and require strong component overlap. Default is EMCS_LINKAGE_SINGLE.

Table 57-15 Expectation Maximization Settings for Cluster Statistics

Setting Name	Setting Value	Description
EMCS_CLUSTER_STATISTICS	EMCS_CLUS_STATS_ENABLE EMCS_CLUS_STATS_DISABLE	Enables or disables the gathering of descriptive statistics for clusters (centroids, histograms, and rules). When statistics are disabled, model size is reduced, and GET_MODEL_DETAILS_EM only returns taxonomy (hierarchy) and cluster counts. The setting can be used only for EM Clustering. Default is EMCS_CLUS_STATS_ENABLE.
EMCS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0 < *numeric_expr* < 1)	Minimum support required for including an attribute in the cluster rule. The support is the percentage of the data rows assigned to a cluster that must have non-null values for the attribute. The setting can be used only for EM Clustering. Default is 0.1.

Table 57-16 Expectation Maximization Settings for Anomaly Detection

Setting Name	Setting Value	Description
EMCS_OUTLIER_RATE	TO_CHAR(0 < numeric_expr < 1)	The desired rate of outliers in the training data. The setting can be used only for EM Anomaly. Default is 0.05.

  The configuration settings in this table are applicable to any type of model, but are currently only implemented for specific algorithms.

57.5.5 DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis

Explicit Semantic Analysis (ESA) is a useful technique for extracting meaningful and interpretable features.

The settings listed in the following table configure the ESA values.

Table 57-17 Explicit Semantic Analysis Settings

Setting Name	Setting Value	Description
ESAS_EMBEDDINGS	ESAS_EMBEDDINGS_ENABLE ESAS_EMBEDDINGS_DISABLE	This setting applies to feature extraction models. The default value is ESAS_EMBEDDINGS_DISABLE. When you set ESAS_EMBEDDINGS_ENABLE: • ESA generates embeddings during scoring • The FEATURE_ID of the generated embeddings is of the datatype NUMBER • The CASE_ID_COLUMN_NAME argument of the DBMS_DATA_MINING.CREATE_MODEL and DBMS_DATA_MINING.CREATE_MODEL2 function is optional. .
ESAS_EMBEDDING_SIZE	A positive integer less than or equal to 4096	This setting applies to feature extraction models. This setting specifies the size of the vectors representing embeddings. You can set this parameter only if you have enabled ESAS_EMBEDDINGS. The default size is 1024. If this value is less than the number of distinct features in the training set, then the actual number of explicit features is used as the size of embedding vectors instead.
ESAS_MIN_ITEMS	Text input 100 Non-text input is 0	This setting determines the minimum number of non-zero entries that need to be present in an input row. The default is 100 for text input and 0 for non-text input.
ESAS_TOPN_FEATURES	A positive integer	This setting controls the maximum number of features per attribute. The default is 1000.
ESAS_VALUE_THRESHOLD	Non-negative number	This setting thresholds a small value for attribute weights in the transformed build data. The default is 1e-8.

57.5.6 DBMS_DATA_MINING — Algorithm Settings: Exponential Smoothing

These settings configure the behavior of the Exponential Smoothing (ESM) algorithm.

The settings listed in the following table specify the setting names and possible values for Exponential Smoothing. The Constant Value column specifies constants using the prefix `DBMS_DATA_MINING`.

For Global settings, see DBMS_DATA_MINING — Global Settings.

Table 57-18 Exponential Smoothing Settings

Setting Name	Setting Value	Description
EXSM_MODEL	EXSM_SIMPLE EXSM_SIMPLE_MULT_ERR EXSM_HOLT EXSM_HOLT_DAMPED EXSM_MULT_TREND EXSM_MULT_TREND_DAMPED EXSM_SEASON_ADD EXSM_SEASON_MUL EXSM_WINTERS EXSM_WINTERS_DAMPED EXSM_ADDWINTERS EXSM_ADDWINTERS_DAMPED EXSM_WINTERS_MUL_TREND EXSM_WINTERS_MUL_TREND_DMP	This setting specifies the model. EXSM_SIMPLE: Simple exponential smoothing model is applied. EXSM_SIMPLE_MULT_ERR: Simple exponential smoothing model with multiplicative error is applied. EXSM_HOLT: Holt linear exponential smoothing model is applied. EXSM_HOLT_DAMPED: Holt linear exponential smoothing model with damped trend is applied. EXSM_MULT_TREND: Exponential smoothing model with multiplicative trend is applied. EXSM_MULT_TREND_DAMPED: Exponential smoothing model with multiplicative damped trend is applied. EXSM_SEASON_ADD: Exponential smoothing with additive seasonality, but no trend, is applied. EXSM_SEASON_MUL: Exponential smoothing with multiplicative seasonality, but no trend, is applied. EXSM_WINTERS: Holt-Winters triple exponential smoothing model, additive trend, multiplicative seasonality is applied. EXSM_WINTERS_DAMPED: Holt-Winters multiplicative exponential smoothing model with damped trend, additive trend, multiplicative seasonality is applied. EXSM_ADDWINTERS: Holt-Winters additive exponential smoothing model, additive trend, additive seasonality is applied. EXSM_ADDWINTERS_DAMPED: Holt-Winters additive exponential smoothing model with damped trend, additive trend, additive seasonality is applied. EXSM_WINTERS_MUL_TREND: Holt-Winters multiplicative exponential smoothing model with multiplicative trend, multiplicative trend, multiplicative seasonality is applied. EXSM_WINTERS_MUL_TREND_DMP: Holt-Winters multiplicative exponential smoothing model with damped multiplicative trend, multiplicative trend, multiplicative seasonality is applied. The default value is EXSM_SIMPLE.

Table 57-18 (Cont.) Exponential Smoothing Settings

Setting Name	Setting Value	Description
EXSM_SEASONALITY	positive integer > 1	This setting specifies a positive integer value as the length of seasonal cycle. The value it takes must be larger than 1. For example, setting value 4 means that every group of four observations forms a seasonal cycle. This setting is only applicable and must be provided for models with seasonality, otherwise the model throws an error. When EXSM_INTERVAL is not set, this setting applies to the original input time series. When EXSM_INTERVAL is set, this setting applies to the accumulated time series.
EXSM_INTERVAL	EXSM_INTERVAL_YEAR EXSM_INTERVAL_QTR EXSM_INTERVAL_MONTH EXSM_INTERVAL_WEEK EXSM_INTERVAL_DAY EXSM_INTERVAL_HOUR EXSM_INTERVAL_MINUTE EXSM_INTERVAL_SECOND	This setting only applies and must be provided when the time column (case_id column) has datetime type. It specifies the spacing interval of the accumulated equally spaced time series. The model throws an error if the time column of input table is of datetime type and setting EXSM_INTERVAL is not provided. The model throws an error if the time column of input table is of oracle number type and setting EXSM_INTERVAL is provided.
EXSM_INITVL_OPTIMIZE	EXSM_INITVL_OPTIMIZE_ENABLE EXSM_INITVL_OPTIMIZE_DISABLE	The setting EXSM_INITVL_OPTIMIZE determines whether initial values are optimized during model build. The default value is EXSM_INITVL_OPTIMIZE_ENABLE.

Note:

EXSM_INITVL_OPTIMIZE can only be set to EXSM_INITVL_OPTIMIZE_DISABLE if the user has set EXSM_MODEL to EXSM_HW or EXSM_HW_ADDSEA. If EXSM_MODEL is set to another model type or is not specified, error 40213 (conflicting settings) is thrown and the model is not built.

Table 57-18 (Cont.) Exponential Smoothing Settings

Setting Name	Setting Value	Description
EXSM_ACCUMULATE	EXSM_ACCU_TOTAL EXSM_ACCU_STD EXSM_ACCU_MAX EXSM_ACCU_MIN EXSM_ACCU_AVG EXSM_ACCU_MEDIAN EXSM_ACCU_COUNT	This setting only applies and must be provided when the time column has datetime type. It specifies how to generate the value of the accumulated time series from the input time series.
EXSM_SETMISSING	Specify an option: EXSM_MISS_MIN EXSM_MISS_MAX EXSM_MISS_AVG EXSM_MISS_MEDIAN EXSM_MISS_LAST EXSM_MISS_FIRST EXSM_MISS_PREV EXSM_MISS_NEXT EXSM_MISS_AUTO	This setting specifies how to handle missing values, which may come from input data and/or the accumulation process of time series. You can specify either a number or an option. If a number is specified, all the missing values are set to that number. EXSM_MISS_MIN: Replaces missing value with minimum of the accumulated time series. EXSM_MISS_MAX: Replaces missing value with maximum of the accumulated time series. EXSM_MISS_AVG: Replaces missing value with average of the accumulated time series. EXSM_MISS_MEDIAN: Replaces missing value with median of the accumulated time series. EXSM_MISS_LAST: Replaces missing value with last non-missing value of the accumulated time series. EXSM_MISS_FIRST: Replaces missing value with first non-missing value of the accumulated time series. EXSM_MISS_PREV: Replaces missing value with the previous non-missing value of the accumulated time series. EXSM_MISS_NEXT: Replaces missing value with the next non-missing value of the accumulated time series. EXSM_MISS_AUTO: EXSM model treats the input data as an irregular (non-uniformly spaced) time series. If this setting is not provided, EXSM_MISS_AUTO is the default value. In such a case, the model treats the input time series as irregular time series, viewing missing values as gaps.
EXSM_PREDICTION_STEP	It must be set to a number between 1-30.	This setting specifies how many steps ahead the predictions are to be made. If it is not set, the default value is 1: the model gives one-step-ahead prediction. A value greater than 30 results in an error.

Table 57-18 (Cont.) Exponential Smoothing Settings

Setting Name	Setting Value	Description
EXSM_CONFIDENCE_LEVEL	It must be a number between 0 and 1, exclusive.	This setting specifies the desired confidence level for prediction. The lower and upper bounds of the specified confidence interval is reported. If this setting is not specified, the default confidence level is 95%.
EXSM_OPT_CRITERION	EXSM_OPT_CRIT_LIK EXSM_OPT_CRIT_MSE EXSM_OPT_CRIT_AMSE EXSM_OPT_CRIT_SIG EXSM_OPT_CRIT_MAE	This setting specifies the desired optimization criterion. The optimization criterion is useful as a diagnostic for comparing models' fit to the same data. EXSM_OPT_CRIT_LIK: Minus twice the log-likelihood of a model. EXSM_OPT_CRIT_MSE: Mean square error of a model. EXSM_OPT_CRIT_AMSE: Average mean square error over user-specified time window. EXSM_OPT_CRIT_SIG: Model's standard deviation of residuals. EXSM_OPT_CRIT_MAE: Mean absolute error of a model. The default value is EXSM_OPT_CRIT_LIK.
EXSM_NMSE	positive integer	This setting specifies the length of the window used in computing the error metric average mean square error (AMSE).
EXSM_SERIES_LIST	Comma delimited list of time series columns	This setting allows you to forecast up to twenty predictor series in addition to the target series. The column names in EXSM_SERIES_LIST are enclosed in single quotes. **Note:** The list is enclosed in single quotes, not the individual column names. For example: `INSERT INTO <settings_table_name VALUES(dbms_data_mining.exsm_series_list, '<column1>,<column2>,<column3>,<column4>');` For the prefix DM$ must be added to the build and scoring data sets and column names must be less than 125 characters long. See Model Detail Views for Exponential Smoothing.

57.5.7 DBMS_DATA_MINING — Algorithm Settings: Generalized Linear Model

The settings listed in the following table configure the behavior of the Generalized Linear Model algorithm.

Table 57-19 DBMS_DATA_MINING GLM Settings

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR(0< *numeric_expr* <1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_FTR_GEN_METHOD	GLMS_FTR_GEN_QUADRATIC GLMS_FTR_GEN_CUBIC	Whether feature generation is quadratic or cubic. When feature generation is enabled, the algorithm automatically chooses the most appropriate feature generation method based on the data.
GLMS_FTR_GENERATION	GLMS_FTR_GENERATION_ENABLE GLMS_FTR_GENERATION_DISABLE	Whether or not feature generation is enabled for GLM. By default, feature generation is not enabled. **Note:** Feature generation can only be enabled when feature selection is also enabled.
GLMS_FTR_SEL_CRIT	GLMS_FTR_SEL_AIC GLMS_FTR_SEL_SBIC GLMS_FTR_SEL_RIC GLMS_FTR_SEL_ALPHA_INV	Feature selection penalty criterion for adding a feature to the model. When feature selection is enabled, the algorithm automatically chooses the penalty criterion based on the data.
GLMS_FTR_SELECTION	GLMS_FTR_SELECTION_ENABLE GLMS_FTR_SELECTION_DISABLE	Whether or not feature selection is enabled for GLM. By default, feature selection is not enabled.
GLMS_MAX_FEATURES	TO_CHAR(0 < *numeric_expr* <= 2000)	When feature selection is enabled, this setting specifies the maximum number of features that can be selected for the final model. By default, the algorithm limits the number of features to ensure sufficient memory.

Table 57-19 (Cont.) DBMS_DATA_MINING GLM Settings

Setting Name	Setting Value	Description
GLMS_PRUNE_MODEL	GLMS_PRUNE_MODEL_ENABLE GLMS_PRUNE_MODEL_DISABLE	Prune enable or disable for features in the final model. Pruning is based on T-Test statistics for linear regression, or Wald Test statistics for logistic regression. Features are pruned in a loop until all features are statistically significant with respect to the full data. When feature selection is enabled, the algorithm automatically prunes based on the data.
GLMS_REFERENCE_CLASS_NAME	*target_value*	The target value used as the reference class in a binary logistic regression model. Probabilities are produced for the other class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE GLMS_RIDGE_REG_DISABLE	Enable or disable ridge regression. Ridge applies to both regression and classification machine learning functions. When ridge is enabled, prediction bounds are not produced by the PREDICTION_BOUNDS SQL function. **Note**: Ridge may only be enabled when feature selection is not specified, or has been explicitly disabled. If ridge regression and feature selection are both explicitly enabled, then an exception is raised.
GLMS_RIDGE_VALUE	TO_CHAR (*numeric_expr* > 0)	The value of the ridge parameter. This setting is only used when the algorithm is configured to use ridge regression. If ridge regression is enabled internally by the algorithm, then the ridge parameter is determined by the algorithm.
GLMS_ROW_DIAGNOSTICS	GLMS_ROW_DIAG_ENABLE GLMS_ROW_DIAG_DISABLE (default).	Enable or disable row diagnostics.
GLMS_CONV_TOLERANCE	The range is (0, 1) non-inclusive.	Convergence Tolerance setting of the GLM algorithm The default value is system-determined.
GLMS_NUM_ITERATIONS	Positive integer	Maximum number of iterations for the GLM algorithm. The default value is system-determined.
GLMS_BATCH_ROWS	0 or Positive integer	Number of rows in a batch used by the SGD solver. The value of this parameter sets the size of the batch for the SGD solver. An input of 0 triggers a data driven batch size estimate. The default is 2000

Table 57-19 (Cont.) DBMS_DATA_MINING GLM Settings

Setting Name	Setting Value	Description
GLMS_SOLVER	GLMS_SOLVER_SGD (StochasticGradient Descent) GLMS_SOLVER_CHOL (Cholesky) GLMS_SOLVER_QR GLMS_SOLVER_LBFGS_ADMM	This setting allows the user to choose the GLM solver. The solver cannot be selected if GLMS_FTR_SELECTION setting is enabled. The following are the options: • GLMS_SOLVER_SGD: Optimizes generalized linear models by iteratively updating parameters using a subset of the data to minimize errors. : • GLMS_SOLVER_CHOL: Solves generalized linear models using the Cholesky decomposition method, which provides a stable and efficient solution by transforming the model into a simpler form. • GLMS_SOLVER_QR: Utilizes the QR decomposition technique to solve generalized linear models, ensuring numerical stability and accuracy by decomposing the problem into orthogonal and triangular components. • GLMS_SOLVER_LBFGS_ADMM: Combines L-BFGS, an approximation of the Broyden-Fletcher-Goldfarb-Shanno optimization algorithm, with ADMM for solving large-scale generalized linear model problems efficiently. The default value is system determined.
GLMS_SPARSE_SOLVER	GLMS_SPARSE_SOLVER_ENABLE GLMS_SPARSE_SOLVER_DISABLE (default).	This setting allows the user to use sparse solver if it is available. The default value is GLMS_SPARSE_SOLVER_DISABLE.
GLMS_LINK_FUNCTION	GLMS_IDENTITY_LINK GLMS_LOGIT_LINK GLMS_PROBIT_LINK GLMS_CLOGLOG_LINK GLMS_CAUCHIT_LINK	This setting allows the user to specify the link function for building a GLM model. The link functions are specific to the mining function. For classification, the following are applicable: • GLMS_LOGIT_LINK (default) • GLMS_PROBIT_LINK • GLMS_CLOGLOG_LINK • GLMS_CAUCHIT_LINK For regression, the following is applicable: • GLMS_IDENTITY_LINK (default)

57.5.8 DBMS_DATA_MINING — Algorithm Settings: *k*-Means

The settings listed in the following table configure the behavior of the *k*-Means algorithm.

Table 57-20 k-Means Settings

Setting Name	Setting Value	Description
KMNS_CONV_TOLERANCE	TO_CHAR(0<*numeric_expr*<1)	Minimum Convergence Tolerance for *k*-Means. The algorithm iterates until the minimum Convergence Tolerance is satisfied or until the maximum number of iterations, specified in KMNS_ITERATIONS, is reached. Decreasing the Convergence Tolerance produces a more accurate solution but may result in longer run times. The default Convergence Tolerance is 0.001.
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN	Distance function for *k*-Means. The default distance function is KMNS_EUCLIDEAN.
KMNS_ITERATIONS	TO_CHAR(*positive_numeric_expr*)	Maximum number of iterations for *k*-Means. The algorithm iterates until either the maximum number of iterations is reached or the minimum Convergence Tolerance, specified in KMNS_CONV_TOLERANCE, is satisfied. The default number of iterations is 20.
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0<=*numeric_expr*<=1)	Minimum percentage of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. If the data is sparse or includes many missing values, a minimum support that is too high can cause very short rules or even empty rules. The default minimum support is 0.1.
KMNS_NUM_BINS	TO_CHAR(*numeric_expr*>0)	Number of bins in the attribute histogram produced by *k*-means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. The default number of histogram bins is 11.

Table 57-20 (Cont.) k-Means Settings

Setting Name	Setting Value	Description
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for *k*-means. The split criterion controls the initialization of new *k*-Means clusters. The algorithm builds a binary tree and adds one new cluster at a time. When the split criterion is based on size, the new cluster is placed in the area where the largest current cluster is located. When the split criterion is based on the variance, the new cluster is placed in the area of the most spread-out cluster. The default split criterion is the KMNS_VARIANCE.
KMNS_RANDOM_SEED	Non-negative integer	This setting controls the seed of the random generator used during the *k*-Means initialization. It must be a non-negative integer value. The default is 0.
KMNS_DETAILS	KMNS_DETAILS_NONE KMNS_DETAILS_HIERARCHY KMNS_DETAILS_ALL	This setting determines the level of cluster detail that are computed during the build. KMNS_DETAILS_NONE: No cluster details are computed. Only the scoring information is persisted. KMNS_DETAILS_HIERARCHY: Cluster hierarchy and cluster record counts are computed. This is the default value. KMNS_DETAILS_ALL: Cluster hierarchy, record counts, descriptive statistics (means, variances, modes, histograms, and rules) are computed.
KMNS_WINSORIZE	KMNS_WINSORIZE_ENABLE KMNS_WINSORIZE_DISABLE	To winorize data, enable or disable this parameter. Data is restricted in a window size of six standard deviations around the mean value when winsorize is enabled. This functionality can be used with AUTO_DATA_PREP turned ON and OFF. The values outside the range are replaced with the ends of the interval. Winsorize is not enabled by default. **Note:** Winsorize is only available when the KMNS_EUCLIDEAN distance function is used. An exception is raised if Winsorize is enabled and other distance functions are set.

57.5.9 DBMS_DATA_MINING - Algorithm Settings: Multivariate State Estimation Technique - Sequential Probability Ratio Test

Settings that configure the training calibration behavior of the Multivariate State Estimation Technique - Sequential Probability Ratio Test algorithm.

Table 57-21 MSET-SPRT Settings

Setting Name	Setting Value	Description
MSET_ADB_HEIGHT	A positive double	Estimates the band within which signal values normally oscillate. The default value is 0.05.
MSET_ALERT_COUNT	A positive integer	The number of the last *n* signals (the alert window) that should have passed the threshold to raise an alert. The alert count should be lower or equal to the alert window. The default value is 5.
MSET_ALERT_WINDOW	A positive integer greater than or equal to MSET_ALERT_COUNT	The number of signals to consider in the SPRT hypothesis consolidation logic. The default value is 5.
MSET_ALPHA_PROB	A positive double between 0 and 1	False Alarm Probability FAP (false positive). The default is 0.01.
MSET_BETA_PROB	A positive double between 0 and 1	Missed Alarm Probability MAP (false negative). The default is 0.10.
MSET_HELDASIDE	A positive integer	The approximate number of data rows used for MSET model calibration. You can use ODMS_RANDOM_SEED to change the held-aside sample. The default value is 10000.
MSET_MEMORY_VECTORS	A positive integer	The default value is data driven.

Table 57-21 (Cont.) MSET-SPRT Settings

Setting Name	Setting Value	Description
MSET_PROJECTION_THRESHOLD	A positive integer >0, <=10000	Specifies whether to use random projections. When the number of sensors exceeds the setting value, random projections are used. To turn off random projections, set the threshold to a value that is equal to or greater than the number of sensors. The default value is 500.
MSET_STD_TOLERANCE	A positive integer	The tolerance in standard deviations used in the SPRT calculation. The default value is 3.

57.5.11 DBMS_DATA_MINING — Algorithm Settings: Neural Network

The settings listed in the following table configure the behavior of the Neural Network algorithm.

Table 57-23 DBMS_DATA_MINING Neural Network Settings

Setting Name	Setting Value	Description
NNET_SOLVER	One of the following strings: • NNET_SOLVER_ADAM • NNET_SOLVER_LBFGS	Specifies the method of optimization. The default value is system determined.

NNET_ACTIVATIONS	One or more of the following strings:
	• NNET_ACTIVATIONS_ARCTAN
	• NNET_ACTIVATIONS_BIPOLAR_SIG
	• NNET_ACTIVATIONS_LINEAR
	• NNET_ACTIVATIONS_LOG_SIG
	• NNET_ACTIVATIONS_RELU
	• NNET_ACTIVATIONS_TANH
		Specifies the activation functions for the hidden layers. You can specify a single activation function, which is then applied to each hidden layer, or you can specify an activation function for each layer individually. Different layers can have different activation functions.
		To apply a different activation function to one or more of the layers, you must specify an activation function for each layer. The number of activation functions you specify must be consistent with the NNET_HIDDEN_LAYERS and NNET_NODES_PER_LAYER values.
		For example, if you have three hidden layers, you could specify the use of the same activation function for all three layers with the following settings value:
		`('NNET_ACTIVATIONS', 'NNET_ACTIVATIONS_TANH')`
		The following settings value specifies a different activation function for each layer:
		`('NNET_ACTIVATIONS', '''NNET_ACTIVATIONS_TANH'', ''NNET_ACTIVATIONS_LOG_SIG'', ''NNET_ACTIVATIONS_ARCTAN''')`
		Note:
		You specify the different activation functions as strings within a single string. All quotes are single and two single quotes are used to escape a single quote in SQL statements and PL/SQL blocks.
		The default value is NNET_ACTIVATIONS_LOG_SIG.

Table 57-23 (Cont.) DBMS_DATA_MINING Neural Network Settings

Setting Name	Setting Value	Description
NNET_HELDASIDE_MAX_FAIL	A positive integer	With NNET_REGULARIZER_HELDASIDE, the training process is stopped early if the network performance on the validation data fails to improve or remains the same for NNET_HELDASIDE_MAX_FAIL epochs in a row. The default value is 6.
NNET_HELDASIDE_RATIO	0 <= *numeric_expr* <=1	Define the held ratio for the held-aside method. The default value is 0.25.
NNET_HIDDEN_LAYERS	A positive integer	Defines the topology by the number of hidden layers. The default value is 1.
NNET_ITERATIONS	A positive integer	Specifies the maximum number of iterations in the Neural Network algorithm. For the DMSSET_NN_SOLVER_LBFGS solver, the default value is 200. For the DMSSET_NN_SOLVER_ADAM solver, the default value is 10000.
NNET_NODES_PER_LAYER	A positive integer or a list of positive integers	Defines the topology by the number of nodes per layer. Different layers can have different numbers of nodes. To specify the same number of nodes for each layer, you can provide a single value, which is then applied to each layer. To specify a different number of nodes for one or more layers, provide a list of comma-separated positive integers, one for each layer. For example, '10, 20, 5' for three layers. The setting values must be consistent with the NNET_HIDDEN_LAYERS value. The default number of nodes per layer is the number of attributes or 50 (if the number of attributes > 50).
NNET_REG_LAMBDA	TO_CHAR(*numeric_expr* >=0)	Defines the L2 regularization parameter lambda. This can not be set together with NNET_REGULARIZER_HELDASIDE. The default value is 1.
NNET_REGULARIZER	One of the following strings: • NNET_REGULARIZER_HELDASIDE • NNET_REGULARIZER_L2 • NNET_REGULARIZER_NONE	Regularization setting for Neural Network algorithm. If the total number of training rows is greater than 50000, the default is NNET_REGULARIZER_HELDASIDE. If the total number of training rows is less than or equal to 50000, the default is NNET_REGULARIZER_NONE.
NNET_TOLERANCE	TO_CHAR(0< *numeric_expr* <1)	Defines the convergence tolerance setting of the Neural Network algorithm. The default value is 0.000001.

Table 57-23 (Cont.) DBMS_DATA_MINING Neural Network Settings

Setting Name	Setting Value	Description
NNET_WEIGHT_LOWER_BOUND	A real number	The setting specifies the lower bound of the region where weights are randomly initialized. NNET_WEIGHT_LOWER_BOUND and NNET_WEIGHT_UPPER_BOUND must be set together. Setting one and not setting the other raises an error. NNET_WEIGHT_LOWER_BOUND must not be greater than NNET_WEIGHT_UPPER_BOUND. The default value is -sqrt(6/(l_nodes+r_nodes)). The value of l_nodes for: • input layer dense attributes is (1+number of dense attributes) • input layer sparse attributes is number of sparse attributes • each hidden layer is (1+number of nodes in that hidden layer) The value of r_nodes is the number of nodes in the layer that the weight is connecting to.
NNET_WEIGHT_UPPER_BOUND	A real number	This setting specifies the upper bound of the region where weights are initialized. It should be set in pairs with NNET_WEIGHT_LOWER_BOUND and its value must not be smaller than the value of NNET_WEIGHT_LOWER_BOUND. If not specified, the values of NNET_WEIGHT_LOWER_BOUND and NNET_WEIGHT_UPPER_BOUND are system determined. The default value is sqrt(6/(l_nodes+r_nodes)). See NNET_WEIGHT_LOWER_BOUND.

The settings listed in the following table configure the behavior of the Non-negative Matrix Factorization algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Database Reference* for information about *_MINING_MODEL_SETTINGS.

Table 57-24 NMF Settings

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NONNEGATIVE_SCORING	NMFS_NONNEG_SCORING_ENABLE NMFS_NONNEG_SCORING_DISABLE	Whether negative numbers should be allowed in scoring results. When set to NMFS_NONNEG_SCORING_ENABLE, negative feature values will be replaced with zeros. When set to NMFS_NONNEG_SCORING_DISABLE, negative feature values will be allowed. Default is NMFS_NONNEG_SCORING_ENABLE
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= *numeric_expr* <=500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(*numeric_expr*)	Random seed for NMF algorithm. Default is -1.

57.5.14 DBMS_DATA_MINING — Algorithm Settings: Random Forest

These settings configure the behavior of the Random Forest algorithm. Random Forest makes use of the Decision Tree settings to configure the construction of individual trees.

Table 57-26 Random Forest Settings

Setting Name	Setting Value	Description
RFOR_MTRY	a number >= 0	Size of the random subset of columns to be considered when choosing a split at a node. For each node, the size of the pool remains the same, but the specific candidate columns change. The default is half of the columns in the model signature. The special value 0 indicates that the candidate pool includes all columns.
RFOR_NUM_TREES	1<= *a number* <=65535	Number of trees in the forest Default is 20.
RFOR_SAMPLING_RATIO	0< *a fraction*<=1	Fraction of the training data to be randomly sampled for use in the construction of an individual tree. The default is half of the number of rows in the training data.

57.5.15 DBMS_DATA_MINING — Algorithm Constants and Settings: Singular Value Decomposition

The following settings configure the behavior of the Singular Value Decomposition algorithm.

Table 57-27 Singular Value Decomposition Settings

Setting Name	Setting Value	Description
SVDS_U_MATRIX_OUTPUT	SVDS_U_MATRIX_ENABLE SVDS_U_MATRIX_DISABLE	Indicates whether or not to persist the **U** Matrix produced by SVD. The U matrix in SVD has as many rows as the number of rows in the build data. To avoid creating a large model, the U matrix is persisted only when SVDS_U_MATRIX_OUTPUT is enabled. When SVDS_U_MATRIX_OUTPUT is enabled, the build data must include a case ID. If no case ID is present and the U matrix is requested, then an exception is raised. Default is SVDS_U_MATRIX_DISABLE.
SVDS_SCORING_MODE	SVDS_SCORING_SVD SVDS_SCORING_PCA	Whether to use SVD or PCA scoring for the model. When the build data is scored with SVD, the projections will be the same as the U matrix. When the build data is scored with PCA, the projections will be the product of the U and S matrices. Default is SVDS_SCORING_SVD.
SVDS_SOLVER	SVDS_SOLVER_TSSVD SVDS_SOLVER_TSEIGEN SVDS_SOLVER_SSVD SVDS_SOLVER_STEIGEN	This setting indicates the solver to be used for computing SVD of the data. In the case of PCA, the solver setting indicates the type of SVD solver used to compute the PCA for the data. When this setting is not specified the solver type selection is data driven. If the number of attributes is greater than 3240, then the default wide solver is used. Otherwise, the default narrow solver is selected. The following are the group of solvers: • Narrow data solvers: for matrices with up to 11500 attributes (TSEIGEN) or up to 8100 attributes (TSSVD). • Wide data solvers: for matrices up to 1 million attributes. For narrow data solvers: • Tall-Skinny SVD uses QR computation TSVD (SVDS_SOLVER_TSSVD) • Tall-Skinny SVD uses eigenvalue computation, TSEIGEN (SVDS_SOLVER_TSEIGEN), is the default solver for narrow data. For wide data solvers: • Stochastic SVD uses QR computation SSVD (SVDS_SOLVER_SSVD), is the default solver for wide data solvers. • Stochastic SVD uses eigenvalue computations, STEIGEN (SVDS_SOLVER_STEIGEN).

Table 57-27 (Cont.) Singular Value Decomposition Settings

Setting Name	Setting Value	Description
SVDS_TOLERANCE	Range [0, 1]	This setting is used to prune features. Define the minimum value the eigenvalue of a feature as a share of the first eigenvalue to not to prune. Default value is data driven.
SVDS_RANDOM_SEED	Range [0 - 4,294,967,296]	The random seed value is used for initializing the sampling matrix used by the Stochastic SVD solver. The default is 0. The SVD Solver must be set to SSVD or STEIGEN.
SVDS_OVER_SAMPLING	Range [1, 5000].	This setting is configures the number of columns in the sampling matrix used by the Stochastic SVD solver. The number of columns in this matrix is equal to the requested number of features plus the oversampling setting. The SVD Solver must be set to SSVD or STEIGEN.
SVDS_POWER_ITERATIONS	Range [0, 20].	The power iteration setting improves the accuracy of the SSVD solver. The default is 2. The SVD Solver must be set to SSVD or STEIGEN.

57.5.16 DBMS_DATA_MINING — Algorithm Settings: Support Vector Machine

The settings listed in the following table configure the behavior of the Support Vector Machine algorithm.

Table 57-28 SVM Settings

Setting Name	Setting Value	Description
SVMS_COMPLEXITY_FACTOR	TO_CHAR(*numeric_expr* >0)	Regularization setting that balances the complexity of the model against model robustness to achieve good generalization on new data. SVM uses a data-driven approach to finding the complexity factor. Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.

Table 57-28 (Cont.) SVM Settings

Setting Name	Setting Value	Description
SVMS_CONV_TOLERANCE	TO_CHAR(*numeric_expr* >0)	Convergence tolerance for SVM algorithm. Default is 0.0001.
SVMS_EPSILON	TO_CHAR(*numeric_expr* >0)	Regularization setting for regression, similar to complexity factor. Epsilon specifies the allowable residuals, or noise, in the data. Value of epsilon factor for SVM regression. Default is 0.1.
SVMS_KERNEL_FUNCTION	SVMS_GAUSSIAN SVMS_LINEAR	Kernel for Support Vector Machine. Linear or Gaussian. The default value is SVMS_LINEAR.
SVMS_OUTLIER_RATE	TO_CHAR(*0< numeric_expr* <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is 0.01.
SVMS_STD_DEV	TO_CHAR(*numeric_expr* >0)	Controls the spread of the Gaussian kernel function. SVM uses a data-driven approach to find a standard deviation value that is on the same scale as distances between typical cases. Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.
SVMS_NUM_ITERATIONS	Positive integer	This setting sets an upper limit on the number of SVM iterations. The default is system determined because it depends on the SVM solver.
SVMS_NUM_PIVOTS	Range [1; 10000]	This setting sets an upper limit on the number of pivots used in the Incomplete Cholesky decomposition. It can be set only for non-linear kernels. The default value is 200.
SVMS_BATCH_ROWS	Positive integer	This setting applies to SVM models with linear kernel. This setting sets the size of the batch for the SGD solver. An input of 0 triggers a data driven batch size estimate. The default is 20000.
SVMS_REGULARIZER	SVMS_REGULARIZER_L1 SVMS_REGULARIZER_L2	This setting controls the type of regularization that the SGD SVM solver uses. The setting can be used only for linear SVM models. The default is system determined because it depends on the potential model size.
SVMS_SOLVER	SVMS_SOLVER_SGD (Sub-Gradient Descend) SVMS_SOLVER_IPM (Interior Point Method)	This setting allows the user to choose the SVM solver. The SGD solver cannot be selected if the kernel is non-linear. The default value is system determined.

57.5.17 DBMS_DATA_MINING — Algorithm Settings: XGBoost

Settings that configure the behavior of the XGBoost gradient boosting algorithm.

The XGBoost settings are case sensitive. Enter the settings as they appear in the settings table. These settings match the XGBoost settings available in open source. OML4SQL XGBoost is based on the 1.7.4 version of XGBoost.
For Global settings, see DBMS_DATA_MINING — Global Settings.

For generic machine learning technique settings, see DBMS_DATA_MINING — Machine Learning Functions.

Table 57-29 General Settings

Setting Name	Setting Value	Description

`xgboost_booster`	A string that is one of the following:
	`dart`
	`gblinear`
	`gbtree`
		The booster to use:
		• `dart`
		• `gblinear`
		• `gbtree`
		The `dart` and `gbtree` boosters use tree-based models whereas `gblinear` uses linear functions.
		The default value is `gbtree`.

`xgboost_num_round`	A non-negative integer.	The number of rounds for boosting. The default value is `10`.

Table 57-30 Settings for Tree Boosting

Setting Name	Setting Value	Description
`xgboost_alpha`	A non-negative number	L1 regularization term on weights. Increasing this value makes the model more conservative. The default value is `0`.
`xgboost_colsample_bylevel`	A number in the range (0, 1]	Subsample ratio of columns for each split, in each level. Subsampling occurs each time a new split is made. This parameter has no effect when `tree_method` is set to `hist`. The default value is `1`.
`xgboost_colsample_bynode`	A number in the range (0, 1]	The subsample ratio of columns for each node (split). Subsampling occurs once every time a new split is evaluated. Columns are subsampled from the set of columns chosen for the current level. The default value is `1`.

Table 57-30 (Cont.) Settings for Tree Boosting

Setting Name	Setting Value	Description
xgboost_colsample_bytree	A number in the range (0, 1]	Subsample ratio of columns when constructing each tree. Subsampling occurs once in every boosting iteration. The default value is 1.
xgboost_eta	A number in the range [0, 1]	Step-size shrinkage used in the update step to prevent overfitting. After each boosting step, eta shrinks the feature weights to make the boosting process more conservative. The default value is 0.3.
xgboost_gamma	A number in the range [0, ∞]	Minimum loss reduction required to make a further partition on a leaf node of the tree. The larger gamma value is, the more conservative the algorithm is. The default value is 0.
xgboost_grow_policy	A string; one of the following: • depthwise • lossguide	Controls the way new nodes are added to the tree: • depthwise splits at nodes closest to the root • lossguide splits at nodes with the highest loss change Valid only if tree_method is set to hist. The default value is depthwise.
xgboost_interaction_constraints	[[x0,x1,x2],[x0,x4],[x5,x6]] where xn are feature names or columns	This setting specifies permitted interactions in the model. Specify the constrains in the form of a nested list where each inner list is a group of features (column names) that are allowed to interact with each other. If a single column is passed in the interactions then, the input is ignored. Here, features x0, x1, and x2 are allowed to interact with each other but with no other feature. Similarly, x0 and x4 are allowed to interact with each other but with no other feature and so on. This setting is applicable to 2-Dimensional features. An error occurs if you pass columns of non-supported type and non-existing feature names.
xgboost_lambda	A non-negative number	L2 regularization term on weights. The default value is 1.
xgboost_max_bin	A non-negative integer	Maximum number of discrete bins to bucket continuous features. Increasing this number improves the optimality of splits at the cost of higher computation time. This parameter is valid only when tree_method is set to hist. The default value is 256.

Table 57-30 (Cont.) Settings for Tree Boosting

Setting Name	Setting Value	Description
xgboost_max_delta_step	A number in the range [0, ∞]	Maximum delta step allowed for each leaf output. Setting this to a positive value can help make the update step more conservative. Usually this parameter is not needed, but it might help in logistic regression when the class is extremely imbalanced. Setting it to value from 1 to 10 might help control the update. The default value is 0, which means there is no constraint.
xgboost_max_depth	An integer in the range [0, ∞]	Maximum depth of a tree. Increasing this value makes the model more complex and more likely to overfit. Setting this to 0 indicates no limit. **Note:** You must set a max_depth limit when the grow_policy setting is depthwise. The default value is 6.
xgboost_max_leaves	A non-negative number	Maximum number of nodes to add. Use this setting only when grow_policy is set to lossguide. The default value is 0.
xgboost_min_child_weight	A number in the range [0, ∞]	Minimum sum of instance weight (hessian) needed in a child. If the tree partition step results in a leaf node with a sum of instance weight less than min_child_weight, then the building process stops partitioning. In a linear regression task, this corresponds to the minimum number of instances needed in each node. The larger min_child_weight is, the more conservative the algorithm is. The default value is 1.
xgboost_decrease_constraints	[x4,x5]	This setting specifies the features (column names) that must obey decreasing constraint. The feature names are separated by a comma. For example, setting value 'x4,x5' sets decreasing constraint on features x4 and x5. This setting applies to numeric columns and 2-Dimensional features. An error occurs if you pass columns of non-supported type and non-existing feature names.

Table 57-30 (Cont.) Settings for Tree Boosting

Setting Name	Setting Value	Description
xgboost_increase_constraints	[x0,x3]	This setting specifies the features (column names) that must obey increasing constraint. The feature names are separated by a comma. For example, setting value 'x0,x3' sets increasing constraint on features x0 and x3. This setting is applicable to 2-Dimensional features. An error occurs if you pass columns of non-supported type and non-existing feature names.
xgboost_num_parallel_tree	A non-negative integer	Number of parallel trees constructed during each iteration. Use this option to support a boosted random forest. The default value is 1.
xgboost_scale_pos_weight	A non-negative number	Controls the balance of positive and negative weights, which is useful for unbalanced classes. A typical value to consider: sum(negative cases) / sum(positive cases). The default value is 1.
xgboost_sketch_eps	A number in the range (0, 1)	Increases enumeration accuracy. Valid only for the approximate greedy tree method. Compared to directly selecting the number of bins, this setting comes with a theoretical guarantee with sketch accuracy. You usually do not need to change this setting, but you might consider setting a lower number for more accurate enumeration. The default value is 0.03.
xgboost_subsample	A number in the range (0, 1]	Subsample ratio of the training instances. A setting of 0.5 means that XGBoost randomly samples half of the training data prior to growing trees, which prevents overfitting. Subsampling occurs once in every boosting iteration. The default value is 1.
xgboost_tree_method	A string that is one of the following: • approx • auto • exact • hist	Tree construction algorithm used in XGBoost: • approx: Approximate greedy algorithm using sketching and histogram. • auto: Use a heuristic to choose the faster algorithm: – For a small to medium sized data set, uses the exact greedy algorithm. – For a very large data set, uses the approximate greedy algorithm. • exact: Exact greedy algorithm. • hist: Fast histogram optimized approximate greedy algorithm; uses some performance improvements such as bins caching. The default value is auto.

Table 57-30 (Cont.) Settings for Tree Boosting

Setting Name	Setting Value	Description
xgboost_updater	A comma-separated string; one or more of the following: • grow_colmaker • grow_histmaker • grow_skmaker • grow_quantile_histmaker • prune • sync	Defines the sequence of tree updaters to run, which provides a modular way to construct and to modify the trees. This is an advanced parameter that is usually set automatically, depending on some other parameters. However, you can also explicitly specify a settting. The setting values are: • grow_colmaker: Non-distributed column-based construction of trees. • grow_histmaker: Distributed tree construction with row-based data splitting based on a global proposal of histogram counting. • grow_skmaker: Uses the approximate sketching algorithm. • grow_quantile_histmaker: Grow tree using quantized histogram. • prune: Prunes the splits where loss < min_split_loss (or gamma). • sync: Synchronizes trees in all distributed nodes.

Table 57-31 Settings for the Dart Booster

Setting Name	Setting Value	Description
xgboost_one_drop	A number that is 0 or 1	When set to 1, at least one tree is always dropped during the dropout. When set to 0, at least one tree is not always dropped during the dropout. The default value is 0.
xgboost_normalize_type	A string; either: • forest • tree	Type of normalization algorithm: • forest: New trees have the same weight as the sum of the dropped trees (forest): – The weight of new trees is 1 / (1 + learning_rate) – Dropped trees are scaled by a factor of 1 / (1 + learning_rate) • tree: New trees have the same weight as dropped trees: – The weight of new trees is 1 / (k + learning_rate) – Dropped trees are scaled by a factor of k / (k + learning_rate) The default value is tree.
xgboost_rate_drop	A number in the range [0.0, 1.0]	Dropout rate (a fraction of the previous trees to drop during the dropout). The default value is 0.0.
xgboost_sample_type	A string; either: • uniform • weighted	Type of sampling algorithm: • uniform: Dropped trees are selected uniformly • weighted: Dropped trees are selected in proportion to weight The default value is uniform.

Table 57-31 (Cont.) Settings for the Dart Booster

Setting Name	Setting Value	Description
xgboost_skip_drop	A number in the range [0.0, 1.0]	Probability of skipping the dropout procedure during a boosting iteration. If a dropout is skipped, new trees are added in the same manner as gbtree. A non-zero skip_drop has higher priority than rate_drop or one_drop. The default value is 0.0.

Table 57-32 Settings for the Linear Booster

Setting Name	Setting Value	Description
xgboost_alpha	A non-negative number	L1 regularization term on weights, normalized to the number of training examples. Increasing this value makes the model more conservative. The default value is 0.
xgboost_feature_selector	A string that is one of the following: • cyclic • greedy • random • shuffle • thrifty	Feature selection and ordering method: • cyclic: Deterministic selection by cycling through the features one at a time. • greedy: Selects the coordinate with the greatest gradient magnitude. This method: – Has O(num_feature^2) complexity – Is fully deterministic – Allows restricting the selection to the top_k features per group with the largest magnitude of univariate weight change, by setting the top_k parameter; doing so reduces the complexity to O(num_feature*top_k). • random: A random (with replacement) coordinate selector. • shuffle: Similar to cyclic but with random feature shuffling prior to each update. • thrifty: Thrifty, approximately-greedy feature selector. Prior to cyclic updates, reorders features in descending magnitude of their univariate weight changes. This operation is multithreaded and is a linear complexity approximation of the quadratic greedy selection. Restricts the selection per group to the top_k features with the largest magnitude of univariate weight change. The default value is cyclic.
xgboost_lambda	A non-negative number	L2 regularization term on weights, normalized to the number of training examples. Increasing this value makes the model more conservative. The default value is 0.
xgboost_top_k	A non-negative integer	Number of top features to select for the greedy or thrifty feature selector. The value of 0 uses all of the features. The default value is 0.

Table 57-32 (Cont.) Settings for the Linear Booster

Setting Name	Setting Value	Description
xgboost_updater	A string that is one of the following: • coord_descent • shotgun	Algorithm to fit the linear model: • coord_descent: Ordinary coordinate descent algorithm; multithreaded but still produces a deterministic solution. • shotgun: Parallel coordinate descent algorithm based on the shotgun algorithm; uses "hogwild" parallelism and therefore produces a nondeterministic solution on each run. The default value is shotgun.

Table 57-33 Settings for Tweedie Regression

Setting Name	Setting Value	Description
xgboost_tweedie_variance_power	A number in the range (1, 2)	Controls the variance of the Tweedie distribution var(y) ~ E(y)^tweedie_variance_power. A setting closer to 1 shifts towards a Poisson distribution. A setting closer to 2 shifts towards a gamma distribution. The default value is 1.5.

Some XGBoost objectives apply only to classification function models and other objectives apply only to regression function models. If you specify an incompatible objective value, an error is raised. In the DBMS_DATA_MINING.CREATE_MODEL procedure, if you specify DBMS_DATA_MINING.CLASSIFICATION as the function, then the only objective values that you can use are the binary and multi values. The one exception is binary: logitraw, which produces a continuous value and applies only to a regression model. If you specify DBMS_DATA_MINING.REGRESSION as the function, then you can specify binary: logitraw or any of the count, rank, reg, and survival values as the objective.

Table 57-34 Settings for Learning Tasks

Setting Name	Setting Value	Description
xgboost_objective	For a classification model, a string that is one of the following: • binary:hinge • binary:logistic • multi:softmax • multi:softprob For a regression model, a string that is one of the following: • binary:logitraw • count:poisson • rank:map • rank:ndcg • rank:pairwise • reg:gamma • reg:logistic • reg:tweedie • survival:aft • survival:cox • reg:squarederror • reg:squaredlogerror	**Settings for a Classification model:** • binary:hinge: Hinge loss for binary classification. This setting makes predictions of 0 or 1, rather than producing probabilities. • binary:logistic: Logistic regression for binary classification. The output is the probability. • multi:softmax: Performs multiclass classification using the softmax objective; you must also set num_class(*number_of_classes*). • multi:softprob: : Same as softmax, except the output is a vector of ndata * nclass, which can be further reshaped to an ndata * nclass matrix. The result contains the predicted probability of each data point belonging to each class. The default objective value for classification is multi:softprob. **Settings for a Regression model:** • binary:logitraw: Logistic regression for binary classification; the output is the score before logistic transformation. • count:poisson: Poisson regression for count data; the output is the mean of the Poisson distribution. The max_delta_step value is set to 0.7 by default in Poisson regression to safeguard optimization. • rank:map: Using LambdaMART, performs list-wise ranking in which the Mean Average Precision (MAP) is maximized. • rank:ndcg: Using LambdaMART, performs list-wise ranking in which the Normalized Discounted Cumulative Gain (NDCG) is maximized. • rank:pairwise: Performs ranking by minimizing the pairwise loss. • reg:gamma: Gamma regression with log-link; the output is the mean of the gamma distribution. This setting might be useful for any outcome that might be gamma-distributed, such as modeling insurance claims severity. • reg:logistic: Logistic regression. • reg:tweedie: Tweedie regression with log-link. This setting might be useful for any outcome that might be Tweedie-distributed, such as modeling total loss in insurance. • survival:aft: Applies the Accelerated Failure Time (AFT) model for censored survival time data. When you select this option, eval_metric uses aft-nloglik as the default value. • survival:cox: Cox regression for right-censored survival time data (negative values are considered right-censored). Predictions are returned on the hazard ratio scale (that is, as HR = exp(marginal_prediction) in the proportional hazard function h(t) = h0(t) * HR).

Table 57-34 (Cont.) Settings for Learning Tasks

Setting Name	Setting Value	Description
		• `reg:squarederror`: Regression with squared loss. • `reg:squaredlogerror`: Regression with squared log loss. All input labels must be greater than -1. The default `objective` value for regression is `reg:squarederror`.
`xgboost_aft_loss_distribution`	[normal, logistic, extreme]	Specifies the distribution of the Z term in the AFT model. It specifies the Probabilty Density Function used by `survival:aft` objective and `aft-nloglik` evaluation metric. The default value is `normal`.
`xgboost_aft_loss_distribution_scale`	A positive number	Specifies the scaling factor σ, which scales the size of Z term in the AFT model. The default value is `1`.
`xgboost_aft_right_bound_column_name`	*column_name*	Specifies the column containing the right bounds of the labels for an AFT model. You cannot select this parameter for a non-AFT model. **Note:** Oracle Machine Learning does not support `BOOLEAN` values for this setting.
`xgboost_base_score`	A number	Initial prediction score of all instances, global bias. For a sufficient number of iterations, changing this value does not have much effect. The default value is `0.5`.

Table 57-34 (Cont.) Settings for Learning Tasks

Setting Name	Setting Value	Description
xgboost_eval_metric	A comma-separated string; one or more of the following: • aft-nloglik • auc • aucpr • cox-nloglik • error • error@*t* • gamma-deviance • gamma-nloglik • logloss • mae • map • map@*n* • merror • mlogloss • ndcg • ndcg@*n* • poisson-nloglik • rmse • tweedie-nloglik@*rho* • ndcg- • map- • rmsle	Evaluation metrics for validation data. You can specify one or more of these evaluation metrics: • aft-nloglik: Sets the eval_metric to negative log likelihood of AFT model. • auc: Area under the curve. • aucpr: Area under the PR curve. • cox-nloglik: Negative partial log-likelihood for Cox proportional hazards regression. • error: Binary classification error rate, calculated as the number of wrong cases divided by the number of all cases. For the predictions, the evaluation regards the instances with a prediction value larger than 0.5 as positive instances, and the others as negative instances. • error@*t*: You can specify a binary classification threshold value other than 0.5 by specifying a numerical value *t*; for example, error@0.8. • gamma-deviance: Residual deviance for gamma regression. • gamma-nloglik: Negative log-likelihood for gamma regression. • logloss: Negative log-likelihood. • mae: Mean absolute error. • map: Mean average precision. • map@*n*: Assigns the integer *n* as the cut-off value for the top positions in the lists for evaluation. • merror: Multiclass classification error rate calculated as the number of wrong cases divided by the number of all cases; the objective must be multi:softprob or multi:softmax. • mlogloss: Multiclass logloss; the objective must be multi:softprob or multi:softmax. • ndcg: Normalized Discounted Cumulative Gain. • ndcg@*n*: Assigns the integer *n* as the cut-off value for the top positions in the lists for evaluation. • poisson-nloglik: Negative log-likelihood for Poisson regression • rmse: Root Mean Square Error. • tweedie-nloglik@*rho*: Negative log-likelihood for Tweedie regression (at a specified value rho of the tweedie_variance_power parameter); rho must be a number in the range (1, 2); for example, tweedie-nloglik@1.8. • ndcg- and map-: In XGBoost, NDCG and MAP will evaluate the score of a list without any positive samples as 1. By adding "-" in the evaluation metric XGBoost will evaluate these score as 0 to be consistent under some conditions. • rmsle: It is root mean square log error. This is the default metric of reg:squaredlogerror objective. This metric reduces errors generated by outliers in

Table 57-34 (Cont.) Settings for Learning Tasks

Setting Name	Setting Value	Description
		dataset. But because log function is employed, `rmsle` might output nan when prediction value is less than -1. A default metric is assigned according to the objective: • `error` for classification • `mean average precision` for ranking • `rmse` for regression
`xgboost_seed`	A non-negative integer	Random number seed. The default value is `0`.

57.6 DBMS_DATA_MINING — Solver Settings

Oracle Machine Learning for SQL algorithms can use different solvers. Solver settings can be provided at build time in the settings table.

Related Topics

- DBMS_DATA_MINING - Solver Settings: Adam
  These settings configure the behavior of the Adaptive Moment Estimation (Adam) solver.
- DBMS_DATA_MINING — Solver Settings: ADMM
  The settings listed in the following table configure the behavior of Alternating Direction Method of Multipliers (ADMM). The Generalized Linear Model (GLM) algorithm uses these settings.
- DBMS_DATA_MINING — Solver Settings: LBFGS
  The settings listed in the following table configure the behavior of L-BFGS. Neural Network and Generalized Linear Model (GLM) use these settings.

57.6.1 DBMS_DATA_MINING - Solver Settings: Adam

These settings configure the behavior of the Adaptive Moment Estimation (Adam) solver.

Neural Network models use these settings.

Table 57-35 DBMS_DATA_MINING Adam Settings

Setting Name	Setting Value	Description
ADAM_ALPHA	A non-negative double precision floating point number in the interval (0; 1]	The learning rate for Adam. The default value is 0.001.
ADAM_BATCH_ROWS	A positive integer	The number of rows per batch. The default value is 10000.
ADAM_BETA1	A positive double precision floating point number in the interval [0; 1)	The exponential decay rate for the 1st moment estimates. The default value is 0.9.
ADAM_BETA2	A positive double precision floating point number in the interval [0; 1)	The exponential decay rate for the 2nd moment estimates. The default value is 0.99.
ADAM_GRADIENT_TOLERANCE	A positive double precision floating point number	The gradient infinity norm tolerance for Adam. The default value is 1E-9.

Related Topics

- DBMS_DATA_MINING — Algorithm Settings: Neural Network

57.6.2 DBMS_DATA_MINING — Solver Settings: ADMM

The settings listed in the following table configure the behavior of Alternating Direction Method of Multipliers (ADMM). The Generalized Linear Model (GLM) algorithm uses these settings.

Table 57-36 DBMS_DATA_MINING ADMM Settings

Settings Name	Setting Value	Description
ADMM_CONSENSUS	A positive integer	It is a ADMM's consensus parameter. The value must be a positive number. The default value is 0.1.
ADMM_ITERATIONS	A positive integer	The number of ADMM iterations. The value must be a positive integer. The default value is 50.
ADMM_TOLERANCE	A positive integer	It is a tolerance parameter. The value must be a positive number. The default value is 0.0001

57.6.3 DBMS_DATA_MINING — Solver Settings: LBFGS

The settings listed in the following table configure the behavior of L-BFGS. Neural Network and Generalized Linear Model (GLM) use these settings.

Table 57-37 DBMS_DATA_MINING L-BFGS Settings

Setting Name	Setting Value	Description
LBFGS_GRADIENT_TOLERANCE	TO_CHAR (*numeric_expr* >0)	Defines gradient infinity norm tolerance for L-BFGS. Default value is 1E-9.
LBFGS_HISTORY_DEPTH	The value must be a positive integer.	Defines the number of historical copies kept in L-BFGS solver. The default value is 20.
LBFGS_SCALE_HESSIAN	LBFGS_SCALE_HESSIAN_ENABLE LBFGS_SCALE_HESSIAN_DISABLE	Defines whether to scale Hessian in L-BFGS or not. Default value is LBFGS_SCALE_HESSIAN_ENABLE.

57.7 DBMS_DATA_MINING Datatypes

The DBMS_DATA_MINING package defines object data types for processing transactional data. The package also defines a type for user-specified transformations. These types are called DM_NESTED_*n*, where *n* identifies the Oracle data type of the nested attributes.

The Oracle Machine Learning for SQL object data types are described in the following table:

Table 57-38 DBMS_DATA_MINING Summary of Data Types

Datatype	Description
DM_NESTED_BINARY_DOUBLE	The name and value of a numerical attribute of type BINARY_DOUBLE.
DM_NESTED_BINARY_DOUBLES	A collection of DM_NESTED_BINARY_DOUBLE.
DM_NESTED_BINARY_FLOAT	The name and value of a numerical attribute of type BINARY_FLOAT.
DM_NESTED_BINARY_FLOATS	A collection of DM_NESTED_BINARY_FLOAT.
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute of type CHAR, VARCHAR, or VARCHAR2.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute of type NUMBER or FLOAT.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL.
ORA_MINING_VARCHAR2_NT	A table of VARCHAR2(4000).
TRANSFORM_LIST	A list of user-specified transformations for a model. Accepted as a parameter by the CREATE_MODEL Procedure. This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.

For more information about processing nested data, see *Oracle Machine Learning for SQL User's Guide*.

> **Note:**
>
> Starting from Oracle Database 12*c* Release 2, *GET_MODEL_DETAILS are deprecated and are replaced with *Model Detail Views*. See *Oracle Machine Learning for SQL User's Guide*.

57.7.1 Deprecated Types

This topic contains tables listing deprecated types.

The DBMS_DATA_MINING package defines object datatypes for storing information about model attributes. Most of these types are returned by the table functions GET_*n*, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms".

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference.*

Table 57-39 DBMS_DATA_MINING Summary of Deprecated Datatypes

Datatype	Description
DM_CENTROID	The centroid of a cluster.
DM_CENTROIDS	A collection of DM_CENTROID. A member of DM_CLUSTER.
DM_CHILD	A child node of a cluster.
DM_CHILDREN	A collection of DM_CHILD. A member of DM_CLUSTER.
DM_CLUSTER	A cluster. A cluster includes DM_PREDICATES, DM_CHILDREN, DM_CENTROIDS, and DM_HISTOGRAMS. It also includes a DM_RULE. See also, DM_CLUSTER Fields.
DM_CLUSTERS	A collection of DM_CLUSTER. Returned by GET_MODEL_DETAILS_KM Function, GET_MODEL_DETAILS_OC Function, and GET_MODEL_DETAILS_EM Function. See also, DM_CLUSTER Fields.
DM_CONDITIONAL	The conditional probability of an attribute in a Naive Bayes model.
DM_CONDITIONALS	A collection of DM_CONDITIONAL. Returned by GET_MODEL_DETAILS_NB Function.
DM_COST_ELEMENT	The actual and predicted values in a cost matrix.
DM_COST_MATRIX	A collection of DM_COST_ELEMENT. Returned by GET_MODEL_COST_MATRIX Function.
DM_EM_COMPONENT	A component of an Expectation Maximization model.
DM_EM_COMPONENT_SET	A collection of DM_EM_COMPONENT. Returned by GET_MODEL_DETAILS_EM_COMP Function.
DM_EM_PROJECTION	A projection of an Expectation Maximization model.
DM_EM_PROJECTION_SET	A collection of DM_EM_PROJECTION. Returned by GET_MODEL_DETAILS_EM_PROJ Function.
DM_GLM_COEFF	The coefficient and associated statistics of an attribute in a Generalized Linear Model.
DM_GLM_COEFF_SET	A collection of DM_GLM_COEFF. Returned by GET_MODEL_DETAILS_GLM Function.
DM_HISTOGRAM_BIN	A histogram associated with a cluster.
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER. See also, DM_CLUSTER Fields.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by GET_FREQUENT_ITEMSETS Function.
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by GET_MODEL_DETAILS_GLOBAL Function.
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.

Table 57-39 (Cont.) DBMS_DATA_MINING Summary of Deprecated Datatypes

Datatype	Description
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by GET_MODEL_DETAILS_NB Function.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by GET_MODEL_DETAILS_NMF Function.
DM_PREDICATE	Antecedent and consequent in a rule.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE and DM_CLUSTER. Predicates are returned by GET_ASSOCIATION_RULES Function, GET_MODEL_DETAILS_EM Function, GET_MODEL_DETAILS_KM Function, and GET_MODEL_DETAILS_OC Function. See also, DM_CLUSTER Fields.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by GET_MODEL_DETAILS_AI Function.
DM_RULE	A rule that defines a conditional relationship. The rule can be one of the association rules returned by GET_ASSOCIATION_RULES Function, or it can be a rule associated with a cluster in the collection of clusters returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function. See also, DM_CLUSTER Fields.
DM_RULES	A collection of DM_RULE. Returned by GET_ASSOCIATION_RULES Function. See also, DM_CLUSTER Fields.
DM_SVD_MATRIX	A factorized matrix S, V, or U returned by a Singular Value Decomposition model.
DM_SVD_MATRIX_SET	A collection of DM_SVD_MATRIX. Returned by GET_MODEL_DETAILS_SVD Function.
DM_SVM_ATTRIBUTE	The name, value, and coefficient of an attribute in a Support Vector Machine model.
DM_SVM_ATTRIBUTE_SET	A collection of DM_SVM_ATTRIBUTE. Returned by GET_MODEL_DETAILS_SVM Function. Also a member of DM_SVM_LINEAR_COEFF.
DM_SVM_LINEAR_COEFF	The linear coefficient of each attribute in a Support Vector Machine model.
DM_SVM_LINEAR_COEFF_SET	A collection of DM_SVM_LINEAR_COEFF. Returned by GET_MODEL_DETAILS_SVM Function for an SVM model built using the linear kernel.

Table 57-39 (Cont.) DBMS_DATA_MINING Summary of Deprecated Datatypes

Datatype	Description
DM_TRANSFORM	The transformation and reverse transformation expressions for an attribute.
DM_TRANSFORMS	A collection of DM_TRANSFORM. Returned by GET_MODEL_TRANSFORMATIONS Function.

Return Values for Clustering Algorithms

The table contains description of DM_CLUSTER return value columns, nested table columns, and rows.

Table 57-40 DM_CLUSTER Return Values for Clustering Algorithms

Return Value	Description
DM_CLUSTERS	A set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE)
DM_PREDICATE	The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

DM_CLUSTER Fields

The following table describes DM_CLUSTER fields.

Table 57-41 DM_CLUSTER Fields

Column Name	Description
id	Cluster identifier
cluster_id	The ID of a cluster in the model
record_count	Specifies the number of records
parent	Parent ID

Table 57-41 (Cont.) DM_CLUSTER Fields

Column Name	Description
tree_level	Specifies the number of splits from the root
dispersion	A measure used to quantify whether a set of observed occurrences are dispersed compared to a standard statistical model.
split_predicate	The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) / *=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) Note: The Expectation Maximization algorithm uses all the fields except dispersion and split_predicate.
child	The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child.
centroid	The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER)
histogram	The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)

Table 57-41 (Cont.) DM_CLUSTER Fields

Column Name	Description
rule	The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER)

Usage Notes

- The table function pipes out rows of type DM_CLUSTER. For information on Oracle Machine Learning for SQL data types and piped output from table functions, see "Data Types".
- For descriptions of predicates (DM_PREDICATE) and rules (DM_RULE), see GET_ASSOCIATION_RULES Function.

57.8 Summary of DBMS_DATA_MINING Subprograms

This table summarizes the subprograms included in the DBMS_DATA_MINING package.

The GET_* interfaces are replaced by model views. Oracle recommends that users leverage model detail views instead. For more information, refer to Model Detail Views in *Oracle Machine Learning for SQL User's Guide* and Static Data Dictionary Views: ALL_ALL_TABLES to ALL_OUTLINES in *Oracle Database Reference*.

Table 57-42 DBMS_DATA_MINING Package Subprograms

Subprogram	Purpose
ADD_COST_MATRIX Procedure	Adds a cost matrix to a classification model
ADD_PARTITION Procedure	Adds single or multiple partitions in an existing partition model
ALTER_REVERSE_EXPRESSION Procedure	Changes the reverse transformation expression to an expression that you specify
APPLY Procedure	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure	Computes the confusion matrix for a classification model
COMPUTE_CONFUSION_MATRIX_PART Procedure	Computes the evaluation matrix for partitioned models
COMPUTE_LIFT Procedure	Computes lift for a classification model
COMPUTE_LIFT_PART Procedure	Computers lift for partitioned models
COMPUTE_ROC Procedure	Computes Receiver Operating Characteristic (ROC) for a classification model
COMPUTE_ROC_PART Procedure	Computes Receiver Operating Characteristic (ROC) for a partitioned model

Table 57-42 (Cont.) DBMS_DATA_MINING Package Subprograms

Subprogram	Purpose
CREATE_MODEL Procedure	Creates a model
CREATE_MODEL2 Procedure	Creates a model without extra persistent stages
Create Model Using Registration Information	Fetches setting information from JSON object
DROP_ALGORITHM Procedure	Drops the registered algorithm information.
DROP_PARTITION Procedure	Drops a single partition
DROP_MODEL Procedure	Drops a model
EXPORT_MODEL Procedure	Exports a model to a dump file
EXPORT_SERMODEL Procedure	Exports a model in a serialized format
FETCH_JSON_SCHEMA Procedure	Fetches and reads JSON schema from `all_mining_algorithms` view
GET_MODEL_COST_MATRIX Function	Returns the cost matrix for a model
IMPORT_MODEL Procedure	Imports a model into a user schema
IMPORT_ONNX_MODEL Procedure	Imports an ONNX model into the Database
IMPORT_SERMODEL Procedure	Imports a serialized model back into the database
JSON Schema for R Extensible Algorithm	Displays flexibility in creating JSON schema for R Extensible
REGISTER_ALGORITHM Procedure	Registers a new algorithm
RANK_APPLY Procedure	Ranks the predictions from the `APPLY` results for a classification model
REMOVE_COST_MATRIX Procedure	Removes a cost matrix from a model
RENAME_MODEL Procedure	Renames a model

Deprecated GET_MODEL_DETAILS

Starting from Oracle Database 12*c* Release 2, the following `GET_MODEL_DETAILS` are deprecated:

Table 57-43 Deprecated `GET_MODEL_DETAILS` Functions

Subprogram	Purpose
GET_ASSOCIATION_RULES Function	Returns the rules from an association model
GET_FREQUENT_ITEMSETS Function	Returns the frequent itemsets for an association model
GET_MODEL_DETAILS_AI Function	Returns details about an attribute importance model
GET_MODEL_DETAILS_EM Function	Returns details about an Expectation Maximization model
GET_MODEL_DETAILS_EM_COMP Function	Returns details about the parameters of an Expectation Maximization model
GET_MODEL_DETAILS_EM_PROJ Function	Returns details about the projects of an Expectation Maximization model
GET_MODEL_DETAILS_GLM Function	Returns details about a Generalized Linear Model model

Table 57-43 (Cont.) Deprecated `GET_MODEL_DETAILS` Functions

Subprogram	Purpose
GET_MODEL_DETAILS_GLOBAL Function	Returns high-level statistics about a model
GET_MODEL_DETAILS_KM Function	Returns details about a *k*-Means model
GET_MODEL_DETAILS_NB Function	Returns details about a Naive Bayes model
GET_MODEL_DETAILS_NMF Function	Returns details about a Non-Negative Matrix Factorization model
GET_MODEL_DETAILS_OC Function	Returns details about an O-Cluster model
GET_MODEL_SETTINGS Function	Returns the settings used to build the given model This function is replaced with `USER/ALL/DBA_MINING_MODEL_SETTINGS`
GET_MODEL_SIGNATURE Function	Returns the list of columns from the build input table This function is replaced with `USER/ALL/DBA_MINING_MODEL_ATTRIBUTES`
GET_MODEL_DETAILS_SVD Function	Returns details about a Singular Value Decomposition model
GET_MODEL_DETAILS_SVM Function	Returns details about a Support Vector Machine model with a linear kernel
GET_MODEL_TRANSFORMATIONS Function	Returns the transformations embedded in a model This function is replaced with `USER/ALL/DBA_MINING_MODEL_XFORMS`
GET_MODEL_DETAILS_XML Function	Returns details about a Decision Tree model
GET_TRANSFORM_LIST Procedure	Converts between two different transformation specification formats

57.8.1 ADD_COST_MATRIX Procedure

The `ADD_COST_MATRIX` procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored.

You can also specify a cost matrix inline when you invoke an Oracle Machine Learning for SQL function for scoring. To view the scoring matrix for a model, query the `DM$VC` prefixed model view. Refer to Model Detail View for Classification Algorithm.

To obtain the default scoring matrix for a model, query the `DM$VC` prefixed model view. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See REMOVE_COST_MATRIX Procedure.

> **See Also:**
>
> - "Biasing a Classification Model" in *Oracle Machine Learning for SQL Concepts* for more information about costs
> - *Oracle Database SQL Language Reference* for syntax of inline cost matrix
> - Specifying Costs in *Oracle Machine Learning for SQL User's Guide*

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
       model_name                IN VARCHAR2,
       cost_matrix_table_name    IN VARCHAR2,
       cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);
       partition_name            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-44 ADD_COST_MATRIX Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is assumed.
`cost_matrix_table_name`	Name of the cost matrix table (described in Table 57-45).
`cost_matrix_schema_name`	Schema of the cost matrix table. If no schema is specified, then the current schema is used.
`partition_name`	Name of the partition in a partitioned model

Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the machine learning model.
2. The cost matrix table must have the columns shown in Table 57-45.

Table 57-45 Required Columns in a Cost Matrix Table

Column Name	Data Type
`ACTUAL_TARGET_VALUE`	Valid target data type
`PREDICTED_TARGET_VALUE`	Valid target data type
`COST`	`NUMBER`, `FLOAT`, `BINARY_DOUBLE`, or `BINARY_FLOAT`

> **See Also:**
>
> *Oracle Machine Learning for SQL User's Guide* for valid target data types

3. The types of the actual and predicted target values must be the same as the type of the model target. For example, if the target of the model is `BINARY_DOUBLE`, then the actual and

predicted values must be BINARY_DOUBLE. If the actual and predicted values are CHAR or VARCHAR, then ADD_COST_MATRIX treats them as VARCHAR2 internally.

If the types do not match, or if the actual or predicted value is not a valid target value, then the ADD_COST_MATRIX procedure raises an error.

> **Note:**
>
> If a reverse transformation is associated with the target, then the actual and predicted values must be consistent with the target after the reverse transformation has been applied.
>
> See "Reverse Transformations and Model Transparency" under the "About Transformation Lists" section in DBMS_DATA_MINING_TRANSFORM Operational Notes for more information.

4. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.
5. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 57-7.

   The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.
6. Scoring on a partitioned model is partition-specific. Scoring cost matrices can be added to or removed from an individual partition in a partitioned model. If PARTITION_NAME is NOT NULL, then the model must be a partitioned model. The COST_MATRIX is added to that partition of the partitioned model.

   If the PARTITION_NAME is NULL, but the model is a partitioned model, then the COST_MATRIX table is added to every partition in the model.

Example

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value           NUMBER,
  predicted_target_value        NUMBER,
  cost                          NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;

EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
```

```
   FROM mining_data_apply_v
   WHERE PREDICTION(nb_sh_clas_sample COST MODEL
      USING cust_marital_status, education, household_size) = 1
   GROUP BY cust_gender
   ORDER BY cust_gender;

C        CNT    AVG_AGE
- ---------- ----------
F         72         39
M        555         44
```

57.8.2 ADD_PARTITION Procedure

ADD_PARTITION procedure supports a single or multiple partition addition to an existing partitioned model.

The ADD_PARTITION procedure derives build settings and user-defined expressions from the existing model. The target column must exist in the input data query when adding partitions to a supervised model.

Syntax

```
DBMS_DATA_MINING.ADD_PARTITION (
      model_name                IN VARCHAR2,
      data_query                IN CLOB,
      add_options               IN VARCHAR2 DEFAULT ERROR);
```

Parameters

Table 57-46 ADD_PARTITION Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
data_query	An arbitrary SQL statement that provides data to the model build. The user must have privilege to evaluate this query.
add_options	Allows users to control the conditional behavior of ADD for cases where rows in the input dataset conflict with existing partitions in the model. The following are the possible values: • REPLACE: Replaces the existing partition for which the conflicting keys are found. • ERROR: Terminates the ADD operation without adding any partitions. • IGNORE: Eliminates the rows having the conflicting keys.

> **Note:**
>
> For better performance, Oracle recommends using DROP_PARTITION followed by the ADD_PARTITION instead of using the REPLACE option.

57.8.3 ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

Syntax

```
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (
        model_name             VARCHAR2,
        expression             CLOB,
        attribute_name         VARCHAR2 DEFAULT NULL,
        attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-47 ALTER_REVERSE_EXPRESSION Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`expression`	An expression to replace the reverse transformation associated with the attribute.
`attribute_name`	Name of the attribute. Specify `NULL` if you wish to apply *`expression`* to a cluster, feature, or One-Class SVM prediction.
`attribute_subname`	Name of the nested attribute if *`attribute_name`* is a nested column, otherwise `NULL`.

Usage Notes

1. For purposes of model transparency, Oracle Machine Learning for SQL provides reverse transformations for transformations that are embedded in a model. Reverse transformations are applied to the attributes returned in model detail views and to the scored target of predictive models.

   > **See Also:**
   >
   > - "About Transformation Lists" under DBMS_DATA_MINING_TRANSFORM Operational Notes
   > - Model Detail Views in *Oracle Machine Learning for SQL User's Guide*

2. If you alter the reverse transformation for the target of a model that has a cost matrix, you must specify a transformation expression that has the same type as the actual and predicted values in the cost matrix. Also, the reverse transformation that you specify must result in values that are present in the cost matrix.

> **See Also:**
>
> "ADD_COST_MATRIX Procedure" and *Oracle Machine Learning for SQL Concepts* for information about cost matrixes.

3. To prevent reverse transformation of an attribute, you can specify `NULL` for *`expression`*.
4. The reverse transformation expression can contain a reference to a PL/SQL function that returns a valid Oracle data type. For example, you could define a function like the following for a categorical attribute named `blood_pressure` that has values 'Low', 'Medium' and 'High'.

```
CREATE OR REPLACE FUNCTION numx(c char) RETURN NUMBER IS
  BEGIN
    CASE c WHEN ''Low'' THEN RETURN 1;
           WHEN ''Medium'' THEN RETURN 2;
           WHEN ''High'' THEN RETURN 3;
           ELSE RETURN null;
    END CASE;
  END numx;
```

   Then you could invoke `ALTER_REVERSE_EXPRESION` for `blood_pressure` as follows.

```
EXEC dbms_data_mining.alter_reverse_expression(
             '<model_name>', 'NUMX(blood_pressure)', 'blood_pressure');
```

5. You can use `ALTER_REVERSE_EXPRESSION` to label clusters produced by clustering models and features produced by feature extraction.

   You can use `ALTER_REVERSE_EXPRESSION` to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for information about anomaly detection

Examples

1. In this example, the target (`affinity_card`) of the model `CLASS_MODEL` is manipulated internally as `yes` or `no` instead of `1` or `0` but returned as `1`s and `0`s when scored. The `ALTER_REVERSE_EXPRESSION` procedure causes the target values to be returned as `TRUE` or `FALSE`.

```
DECLARE
        v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
  BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
          'affinity_card', NULL,
          'decode(affinity_card, 1, ''yes'', ''no'')',
          'decode(affinity_card, ''yes'', 1, 0)');
    dbms_data_mining.CREATE_MODEL(
      model_name             => 'CLASS_MODEL',
      mining_function        => dbms_data_mining.classification,
      data_table_name        => 'mining_data_build',
      case_id_column_name    => 'cust_id',
```

```
      target_column_name     => 'affinity_card',
      settings_table_name    => NULL,
      data_schema_name       => 'oml_user',
      settings_schema_name   => NULL,
      xform_list             => v_xlst );
  END;
/
SELECT cust_income_level, occupation,
          PREDICTION(CLASS_MODEL USING *) predict_response
      FROM mining_data_test WHERE age = 60 AND cust_gender IN 'M'
      ORDER BY cust_income_level;

```

57.8.4 APPLY Procedure

The APPLY procedure applies a machine learning model to the data of interest, and generates the results in a table. The APPLY procedure is also referred to as **scoring**.

For predictive machine learning functions, the APPLY procedure generates predictions in a target column. For descriptive machine learning functions such as Clustering, the APPLY process assigns each case to a cluster with a probability.

In Oracle Machine Learning for SQL, the APPLY procedure is not applicable to Association models and Attribute Importance models.

> **Note:**
>
> Scoring can also be performed directly in SQL using the OML4SQL functions. See
>
> - Oracle Machine Learning for SQL Functions in *Oracle Database SQL Language Reference*
> - Scoring and Deployment in *Oracle Machine Learning for SQL User's Guide*

Syntax

```
DBMS_DATA_MINING.APPLY (
      model_name           IN VARCHAR2,
      data_table_name      IN VARCHAR2,
      case_id_column_name  IN VARCHAR2,
      result_table_name    IN VARCHAR2,
      data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-48 *APPLY Procedure Parameters*

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
data_table_name	Name of table or view containing the data to be scored
case_id_column_name	Name of the case identifier column
result_table_name	Name of the table in which to store apply results
data_schema_name	Name of the schema containing the data to be scored

Usage Notes

1. The data provided for `APPLY` must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model: both at build time and apply time. (See "Automatic Data Preparation".)
2. `APPLY` creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 57-49 through Table 57-53. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in `APPLY` output.

   > **Note:**
   >
   > Make sure that the case ID column does not have the same name as one of the columns that will be created by `APPLY`. For example, when applying a Classification model, the case ID in the scoring data must not be `PREDICTION` or `PROBABILITY` (See Table 57-49).

3. The data type for the `PREDICTION`, `CLUSTER_ID`, and `FEATURE_ID` output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure".
4. If the model is partitioned, the `result_table_name` can contain results from different partitions depending on the data from the input data table. An additional column called `PARTITION_NAME` is added to the result table indicating the partition name that is associated with each row.

   For a non-partitioned model, the behavior does not change.

Classification

The results table for Classification has the columns described in Table 57-49. If the target of the model is categorical, the `PREDICTION` column will have a `VARCHAR2` data type. If the target has a binary type, the `PREDICTION` column will have the binary type of the target.

Table 57-49 APPLY Results Table for Classification

Column Name	Data type
Case ID column name	Type of the case ID
PREDICTION	Type of the target
PROBABILITY	BINARY_DOUBLE

Anomaly Detection

The results table for Anomaly Detection has the columns described in Table 57-50.

Table 57-50 APPLY Results Table for Anomaly Detection

Column Name	Data Type
Case ID column name	Type of the case ID
PREDICTION	NUMBER
PROBABILITY	BINARY_DOUBLE

Regression

The results table for Regression has the columns described in APPLY Procedure.

Table 57-51 APPLY Results Table for Regression

Column Name	Data Type
Case ID column name	Type of the case ID
PREDICTION	Type of the target

Clustering

Clustering is an unsupervised machine learning function, and hence there are no targets. The results of an APPLY procedure contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 57-52.

Table 57-52 APPLY Results Table for Clustering

Column Name	Data Type
Case ID column name	Type of the case ID
CLUSTER_ID	NUMBER
PROBABILITY	BINARY_DOUBLE

Feature Extraction

Feature Extraction is also an unsupervised machine learning function, hence there are no targets. The results of an APPLY procedure will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 57-53.

Table 57-53 APPLY Results Table for Feature Extraction

Column Name	Data Type
Case ID column name	Type of the case ID
FEATURE_ID	NUMBER
MATCH_QUALITY	BINARY_DOUBLE

Examples

This example applies the GLM Regression model `GLMR_SH_REGR_SAMPLE` to the data in the `MINING_DATA_APPLY_V` view. The `APPLY` results are output of the table `REGRESSION_APPLY_RESULT`.

```
SQL> BEGIN
       DBMS_DATA_MINING.APPLY (
       model_name     => 'glmr_sh_regr_sample',
       data_table_name     => 'mining_data_apply_v',
       case_id_column_name => 'cust_id',
       result_table_name   => 'regression_apply_result');
    END;
    /

SQL> SELECT * FROM regression_apply_result WHERE cust_id >  101485;

   CUST_ID PREDICTION
---------- ----------
    101486 22.8048824
    101487 25.0261101
    101488 48.6146619
    101489   51.82595
    101490 22.6220714
    101491 61.3856816
    101492 24.1400748
    101493  58.034631
    101494 45.7253149
    101495 26.9763318
    101496 48.1433425
    101497 32.0573434
    101498 49.8965531
    101499  56.270656
    101500 21.1153047
```

57.8.5 COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

`COMPUTE_CONFUSION_MATRIX` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for more details about confusion matrixes and other test metrics for classification
>
> "COMPUTE_LIFT Procedure"
>
> "COMPUTE_ROC Procedure"

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
      accuracy                    OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      confusion_matrix_table_name  IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL,
      score_criterion_type         IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 57-54 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Output parameter containing the overall percentage accuracy of the predictions.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
confusion_matrix_table_name	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure").

Table 57-54 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure"). See the Usage Notes for additional information.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name    VARCHAR2);
```

- A cost matrix must have the columns described in Table 57-55.

Table 57-55 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	Type of the target column in the build data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
cost	BINARY_DOUBLE

> **See Also:**

> *Oracle Machine Learning for SQL Concepts* for more information about confusion matrixes

Examples

These examples use the Naive Bayes model nb_sh_clas_sample.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
       SELECT cust_id,
              PREDICTION(nb_sh_clas_sample USING *) prediction,
              PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
       FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
   v_accuracy    NUMBER;
      BEGIN
        DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                  accuracy                     => v_accuracy,
                  apply_result_table_name      => 'nb_apply_results',
                  target_table_name            => 'mining_data_test_v',
                  case_id_column_name          => 'cust_id',
                  target_column_name           => 'affinity_card',
                  confusion_matrix_table_name  => 'nb_confusion_matrix',
                  score_column_name            => 'PREDICTION',
                  score_criterion_column_name  => 'PROBABILITY'
                  cost_matrix_table_name       =>  null,
                  apply_result_schema_name     =>  null,
                  target_schema_name           =>  null,
                  cost_matrix_schema_name      =>  null,
                  score_criterion_type         => 'PROBABILITY');
        DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
      END;
      /
```

The confusion matrix and model accuracy are shown as follows.

```
 **** MODEL ACCURACY ****: .7847

SQL>SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         60
                  0                      0        891
                  1                      1        286
                  0                      1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
                  0                      0          0
                  0                      1        .75
                  1                      0        .25
                  1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
    DBMS_DATA_MINING.APPLY(
          model_name          => 'nb_sh_clas_sample',
```

```
          data_table_name     => 'mining_data_test_v',
          case_id_column_name => 'cust_id',
          result_table_name   => 'nb_apply_results');
 END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by APPLY.

```
DECLARE
  v_accuracy    NUMBER;
     BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                accuracy                     => v_accuracy,
                apply_result_table_name      => 'nb_apply_results',
                target_table_name            => 'mining_data_test_v',
                case_id_column_name          => 'cust_id',
                target_column_name           => 'affinity_card',
                confusion_matrix_table_name  => 'nb_confusion_matrix',
                score_column_name            => 'PREDICTION',
                score_criterion_column_name  => 'PROBABILITY',
                cost_matrix_table_name       => 'nb_cost_matrix',
                apply_result_schema_name     => null,
                target_schema_name           => null,
                cost_matrix_schema_name      => null,
                score_criterion_type         => 'COST');
       DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
    END;
    /
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

Compute a Confusion Matrix Based on Embedded Costs

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN    DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
         SELECT cust_id,
              PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
              PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
          FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
   v_accuracy         NUMBER;
```

```
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
         accuracy                      => v_accuracy,
         apply_result_table_name       => 'nb_apply_results',
         target_table_name             => 'mining_data_test_v',
         case_id_column_name           => 'cust_id',
         target_column_name            => 'affinity_card',
         confusion_matrix_table_name   => 'nb_confusion_matrix',
         score_column_name             => 'PREDICTION',
         score_criterion_column_name   => 'COST',
         cost_matrix_table_name        => null,
         apply_result_schema_name      => null,
         target_schema_name            => null,
         cost_matrix_schema_name       => null,
         score_criterion_type          => 'COST');
END;
/
```

The results are:

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

57.8.6 COMPUTE_CONFUSION_MATRIX_PART Procedure

The `COMPUTE_CONFUSION_MATRIX_PART` procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

`COMPUTE_CONFUSION_MATRIX_PART` provides support to computation of evaluation metrics per-partition for partitioned models. For non-partitioned models, refer to COMPUTE_CONFUSION_MATRIX Procedure.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

`COMPUTE_CONFUSION_MATRIX_PART` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for more details about confusion matrixes and other test metrics for classification
>
> "COMPUTE_LIFT_PART Procedure"
>
> "COMPUTE_ROC_PART Procedure"

Syntax

```
DBMS_DATA_MINING.compute_confusion_matrix_part(
      accuracy                    OUT DM_NESTED_NUMERICALS,
      apply_result_table_name     IN  VARCHAR2,
      target_table_name           IN  VARCHAR2,
      case_id_column_name         IN  VARCHAR2,
      target_column_name          IN  VARCHAR2,
      confusion_matrix_table_name IN  VARCHAR2,
      score_column_name           IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name IN  VARCHAR2 DEFAULT 'PROBABILITY',
      score_partition_column_name IN  VARCHAR2 DEFAULT 'PARTITION_NAME',
      cost_matrix_table_name      IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name    IN  VARCHAR2 DEFAULT NULL,
      target_schema_name          IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name     IN  VARCHAR2 DEFAULT NULL,
      score_criterion_type        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-57 COMPUTE_CONFUSION_MATRIX_PART Procedure Parameters

Parameter	Description
accuracy	Output parameter containing the overall percentage accuracy of the predictions The output argument is changed from NUMBER to DM_NESTED_NUMERICALS
apply_result_table_name	Table containing the predictions
target_table_name	Table containing the known target values from the test data
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
confusion_matrix_table_name	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure").

Table 57-57 (Cont.) COMPUTE_CONFUSION_MATRIX_PART Procedure Parameters

Parameter	Description
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, then the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is PROBABILITY, which is the default name created by the APPLY procedure (See "APPLY Procedure"). See the Usage Notes for additional information.
score_partition_column_name	(Optional) Parameter indicating the column which contains the name of the partition. This column slices the input test results such that each partition has independent evaluation matrices computed.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to COSTS, the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, then the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, then the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, then the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is PROBABILITY. To use costs as the scoring criterion, specify COST. If score_criterion_type is set to COST but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX_PART may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.

- Instead of passing a cost matrix to `COMPUTE_CONFUSION_MATRIX_PART`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.
- The predictions that you pass to `COMPUTE_CONFUSION_MATRIX_PART` are in a table or view specified in `apply_result_table_name`.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name    VARCHAR2);
```

- A cost matrix must have the columns described in Table 57-55.

Table 57-58 Columns in a Cost Matrix

Column Name	Data Type
`actual_target_value`	Type of the target column in the test data
`predicted_target_value`	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
`cost`	`BINARY_DOUBLE`

> **See Also:**
>
> *Oracle Machine Learning for SQL User's Guide* for valid target data types
>
> *Oracle Machine Learning for SQL Concepts* for more information about cost matrixes

- The confusion matrix created by `COMPUTE_CONFUSION_MATRIX_PART` has the columns described in Table 57-56.

Table 57-59 Columns in a Confusion Matrix Part

Column Name	Data Type
`actual_target_value`	Type of the target column in the test data
`predicted_target_value`	Type of the predicted target in the test data. The type of the predicted target is the same as the type of the actual target unless the predicted target has an associated reverse transformation.
`value`	`BINARY_DOUBLE`

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for more information about confusion matrixes

Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
       SELECT cust_id,
              PREDICTION(nb_sh_clas_sample USING *) prediction,
              PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
       FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
   v_accuracy    NUMBER;
      BEGIN
        DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
                   accuracy                     => v_accuracy,
                   apply_result_table_name      => 'nb_apply_results',
                   target_table_name            => 'mining_data_test_v',
                   case_id_column_name          => 'cust_id',
                   target_column_name           => 'affinity_card',
                   confusion_matrix_table_name  => 'nb_confusion_matrix',
                   score_column_name            => 'PREDICTION',
                   score_criterion_column_name  => 'PROBABILITY'
                   score_partition_column_name  => 'PARTITION_NAME'
                   cost_matrix_table_name       =>  null,
                   apply_result_schema_name     =>  null,
                   target_schema_name           =>  null,
                   cost_matrix_schema_name      =>  null,
                   score_criterion_type         => 'PROBABILITY');
        DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
      END;
      /
```

The confusion matrix and model accuracy are shown as follows.

```
 **** MODEL ACCURACY ****: .7847

SELECT * FROM NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         60
                  0                      0        891
                  1                      1        286
                  0                      1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
 SELECT * from NB_COST_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
```

```
------------------ --------------------- ----------
                 0                     0          0
                 0                     1        .75
                 1                     0        .25
                 1                     1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
    DBMS_DATA_MINING.APPLY(
          model_name          => 'nb_sh_clas_sample',
          data_table_name     => 'mining_data_test_v',
          case_id_column_name => 'cust_id',
          result_table_name   => 'nb_apply_results');
 END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named '`PROBABILITY`', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy    NUMBER;
     BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
                accuracy                     => v_accuracy,
                apply_result_table_name      => 'nb_apply_results',
                target_table_name            => 'mining_data_test_v',
                case_id_column_name          => 'cust_id',
                target_column_name           => 'affinity_card',
                confusion_matrix_table_name  => 'nb_confusion_matrix',
                score_column_name            => 'PREDICTION',
                score_criterion_column_name  => 'PROBABILITY',
                score_partition_column_name  => 'PARTITION_NAME'
                cost_matrix_table_name       => 'nb_cost_matrix',
                apply_result_schema_name     => null,
                target_schema_name           => null,
                cost_matrix_schema_name      => null,
                score_criterion_type         => 'COST');
       DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
    END;
    /
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798

 SELECT * FROM NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

Compute a Confusion Matrix Based on Embedded Costs

You can use the `ADD_COST_MATRIX` procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
         SELECT cust_id,
              PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
              PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
          FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
   v_accuracy         NUMBER;
   BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
            accuracy                      => v_accuracy,
            apply_result_table_name       => 'nb_apply_results',
            target_table_name             => 'mining_data_test_v',
            case_id_column_name           => 'cust_id',
            target_column_name            => 'affinity_card',
            confusion_matrix_table_name   => 'nb_confusion_matrix',
            score_column_name             => 'PREDICTION',
            score_criterion_column_name   => 'COST',
            score_partition_column_name   => 'PARTITION_NAME'
            cost_matrix_table_name        => null,
            apply_result_schema_name      => null,
            target_schema_name            => null,
            cost_matrix_schema_name       => null,
            score_criterion_type          => 'COST');
   END;
   /
```

The results are:

```
**** MODEL ACCURACY ****: .798

 SELECT * FROM NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

57.8.7 COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:

  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT (
      apply_result_table_name      IN VARCHAR2,
      target_table_name            IN VARCHAR2,
      case_id_column_name          IN VARCHAR2,
      target_column_name           IN VARCHAR2,
      lift_table_name              IN VARCHAR2,
      positive_target_value        IN VARCHAR2,
      score_column_name            IN VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN VARCHAR2 DEFAULT 'PROBABILITY',
      num_quantiles                IN NUMBER DEFAULT 10,
      cost_matrix_table_name       IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN VARCHAR2 DEFAULT NULL,
      target_schema_name           IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN VARCHAR2 DEFAULT NULL
      score_criterion_type         IN VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 57-60 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.

Table 57-60 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
lift_table_name	Table containing the lift statistics. The table will be created by the procedure in the user's schema. The columns in the lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate lift. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure").
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure"). See the Usage Notes for additional information.
num_quantiles	Number of quantiles to be used in calculating lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COST', the costs will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.

Table 57-60 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name    VARCHAR2);
```

- A cost matrix must have the columns described in Table 57-61.

Table 57-61 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	Type of the target column in the build data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
cost	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for more information about cost matrixes

- The table created by COMPUTE_LIFT has the columns described in Table 57-62

Table 57-62 Columns in a Lift Table

Column Name	Data Type
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for details about the information in the lift table

- When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```
BEGIN
       DBMS_DATA_MINING.COMPUTE_LIFT (
            apply_result_table_name           => 'nb_apply_results',
            target_table_name                 => 'mining_data_test_v',
            case_id_column_name               => 'cust_id',
            target_column_name                => 'affinity_card',
            lift_table_name                       => 'nb_lift',
            positive_target_value             =>  to_char(1),
            score_column_name                 => 'PREDICTION',
            score_criterion_column_name    => 'PROBABILITY',
            num_quantiles                         =>  10,
            cost_matrix_table_name            =>  null,
```

```
            apply_result_schema_name           =>  null,
            target_schema_name                 =>  null,
            cost_matrix_schema_name            =>  null,
            score_criterion_type               =>  'PROBABILITY');
      END;
      /
```

This query displays some of the statistics from the resulting lift table.

```
SQL>SELECT quantile_number, probability_threshold, gain_cumulative,
           quantile_total_count
           FROM nb_lift;

QUANTILE_NUMBER PROBABILITY_THRESHOLD GAIN_CUMULATIVE QUANTILE_TOTAL_COUNT
--------------- --------------------- --------------- --------------------
              1            .989335775       .15034965                   55
              2            .980534911       .26048951                   55
              3            .968506098      .374125874                   55
              4            .958975196      .493006993                   55
              5            .946705997      .587412587                   55
              6            .927454174       .66958042                   55
              7            .904403627      .748251748                   55
              8            .836482525      .839160839                   55
             10            .500184953               1                   54
```

57.8.8 COMPUTE_LIFT_PART Procedure

The `COMPUTE_LIFT_PART` procedure computes lift and stores the results in a table in the user's schema. This procedure provides support to the computation of evaluation metrics per-partition for partitioned models.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT_PART` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT_PART` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT_PART` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

>
> "COMPUTE_ROC_PART Procedure"

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT_PART (
      apply_result_table_name     IN VARCHAR2,
      target_table_name           IN VARCHAR2,
      case_id_column_name         IN VARCHAR2,
      target_column_name          IN VARCHAR2,
      lift_table_name             IN VARCHAR2,
      positive_target_value       IN VARCHAR2,
      score_column_name           IN VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
      score_partition_column_name IN VARCHAR2 DEFAULT 'PARTITION_NAME',
      num_quantiles               IN NUMBER   DEFAULT 10,
      cost_matrix_table_name      IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
      target_schema_name          IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL,
      score_criterion_type        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-63 COMPUTE_LIFT_PART Procedure Parameters

Parameter	Description
apply_result_table_name	Table containing the predictions
target_table_name	Table containing the known target values from the test data
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
lift_table_name	Table containing the Lift statistics. The table will be created by the procedure in the user's schema. The columns in the Lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate Lift. If the target column is a NUMBER, then you can use the TO_CHAR() operator to provide the value as a string.

Table 57-63 (Cont.) COMPUTE_LIFT_PART Procedure Parameters

Parameter	Description
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure").
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, then the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is PROBABILITY, which is the default name created by the APPLY procedure (See "APPLY Procedure"). See the Usage Notes for additional information.
score_partition_column_name	Optional parameter indicating the column containing the name of the partition. This column slices the input test results such that each partition has independent evaluation matrices computed.
num_quantiles	Number of quantiles to be used in calculating Lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to COST, then the costs will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table If null, then the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets If null, then the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided If null, then the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is PROBABILITY. To use costs as the scoring criterion, specify COST. If score_criterion_type is set to COST but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to `COMPUTE_LIFT_PART` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the Lift.
- Instead of passing a cost matrix to `COMPUTE_LIFT_PART`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.
- The predictions that you pass to `COMPUTE_LIFT_PART` are in a table or view specified in `apply_results_table_name`.

```
CREATE TABLE apply_result_table_name AS (
           case_id_column_name           VARCHAR2,
           score_column_name            VARCHAR2,
           score_criterion_column_name    VARCHAR2);
```

- A cost matrix must have the columns described in Table 57-61.

Table 57-64 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	Type of the target column in the test data
predicted_target_value	Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.
cost	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for more information about cost matrixes

- The table created by `COMPUTE_LIFT_PART` has the columns described in Table 57-62

Table 57-65 Columns in a COMPUTE_LIFT_PART Table

Column Name	Data Type
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER

Table 57-65 (Cont.) Columns in a COMPUTE_LIFT_PART Table

Column Name	Data Type
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for details about the information in the Lift table

- When a cost matrix is passed to `COMPUTE_LIFT_PART`, the cost threshold is returned in the `probability_threshold` column of the Lift table.

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`.

The example illustrates Lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

For a partitioned model example, see "COMPUTE_CONFUSION_MATRIX_PART Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute Lift as follows.

```
BEGIN
      DBMS_DATA_MINING.COMPUTE_LIFT_PART (
             apply_result_table_name     => 'nb_apply_results',
             target_table_name           => 'mining_data_test_v',
             case_id_column_name         => 'cust_id',
             target_column_name          => 'affinity_card',
             lift_table_name             => 'nb_lift',

```

57.8.9 COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. `COMPUTE_ROC` compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

`COMPUTE_ROC` accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

> "COMPUTE_LIFT Procedure"

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
      roc_area_under_curve         OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      roc_table_name               IN  VARCHAR2,
      positive_target_value        IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-66 COMPUTE_ROC Procedure Parameters

Parameter	Description
roc_area_under_the_curve	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive. The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
roc_table_name	Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.

Table 57-66 (Cont.) COMPUTE_ROC Procedure Parameters

Parameter	Description
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure").
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure").
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name    VARCHAR2);
```

- The table created by COMPUTE_ROC has the columns shown in Table 57-67.

Table 57-67 COMPUTE_ROC Output

Column	Datatype
probability	BINARY_DOUBLE
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for details about the output of `COMPUTE_ROC`

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

  Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

  If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

  If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
         ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
     v_area_under_curve NUMBER;
BEGIN
     DBMS_DATA_MINING.COMPUTE_ROC (
         roc_area_under_curve        => v_area_under_curve,
         apply_result_table_name     => 'nb_apply_results',
         target_table_name           => 'mining_data_test_v',
         case_id_column_name         => 'cust_id',
         target_column_name          => 'mining_data_test_v',
         roc_table_name              => 'nb_roc',
         positive_target_value       => '1',
         score_column_name           => 'PREDICTION',
         score_criterion_column_name => 'PROBABILITY');
     DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
     ROUND(v_area_under_curve,4));
END;
/
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212

 SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
            FROM NB_ROC;

PROBABILITY  TRUE_POSITIVE_FRACTION  FALSE_POSITIVE_FRACTION
-----------  ----------------------  -----------------------
     .00000                       1                        1
     .50018             .826589595              .227902946
     .53851             .823699422              .221837088
     .54991             .820809249              .217504333
     .55628             .815028902              .215771231
     .55628             .817919075              .215771231
     .57563             .800578035              .214904679
     .57563             .812138728              .214904679
      .                        .                       .
      .                        .                       .
      .                        .                       .
```

57.8.10 COMPUTE_ROC_PART Procedure

The `COMPUTE_ROC_PART` procedure computes Receiver Operating Characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy. This procedure provides support to computation of evaluation metrics per-partition for partitioned models.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. `COMPUTE_ROC_PART` compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is `0.5`. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an x-y axis. The false positive rate is placed on the x-axis. The true positive rate is placed on the y-axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

`COMPUTE_ROC_PART` accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

>
> "COMPUTE_ROC Procedure"
>
> "COMPUTE_CONFUSION_MATRIX Procedure"
>
> "COMPUTE_LIFT_PART Procedure"
>
> "COMPUTE_LIFT Procedure"

Syntax

```
DBMS_DATA_MINING.compute_roc_part(
      roc_area_under_curve        OUT DM_NESTED_NUMERICALS,
      apply_result_table_name     IN  VARCHAR2,
      target_table_name           IN  VARCHAR2,
      case_id_column_name         IN  VARCHAR2,
      target_column_name          IN  VARCHAR2,
      roc_table_name              IN  VARCHAR2,
      positive_target_value       IN  VARCHAR2,
      score_column_name           IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name IN  VARCHAR2 DEFAULT 'PROBABILITY',
      score_partition_column_name IN  VARCHAR2 DEFAULT 'PARTITION_NAME',
      apply_result_schema_name    IN  VARCHAR2 DEFAULT NULL,
      target_schema_name          IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-68 COMPUTE_ROC_PART Procedure Parameters

Parameter	Description
roc_area_under_the_curve	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive. The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another. The output argument is changed from NUMBER to DM_NESTED_NUMERICALS.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
roc_table_name	Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, then you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure").
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is PROBABILITY, which is the default name created by the APPLY procedure (See "APPLY Procedure").
score_partition_column_name	Optional parameter indicating the column which contains the name of the partition. This column slices the input test results such that each partition has independent evaluation matrices computed.
apply_result_schema_name	Schema of the apply results table. If null, then the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, then the user's schema is assumed.

Usage Notes

- The predictive information you pass to `COMPUTE_ROC_PART` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to `COMPUTE_ROC_PART` are in a table or view specified in `apply_results_table_name`.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name            VARCHAR2,
            score_criterion_column_name    VARCHAR2);
```

- The `COMPUTE_ROC_PART` table has the following columns:

Table 57-69 COMPUTE_ROC_PART Output

Column	Data Type
probability	BINARY_DOUBLE
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

> **See Also:**
>
> *Oracle Machine Learning for SQL Concepts* for details about the output of `COMPUTE_ROC_PART`

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

  Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identify the most desirable probability threshold. The approach you use depends on whether you know the relative cost of positive versus negative class prediction errors.

If the costs are known, then you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query as follows:

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, then you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
         ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
     v_area_under_curve NUMBER;
BEGIN
     DBMS_DATA_MINING.COMPUTE_ROC_PART (
         roc_area_under_curve        => v_area_under_curve,
         apply_result_table_name     => 'nb_apply_results',
         target_table_name           => 'mining_data_test_v',
         case_id_column_name         => 'cust_id',
         target_column_name          => 'affinity_card',
         roc_table_name              => 'nb_roc',
         positive_target_value       => '1',
         score_column_name           => 'PREDICTION',
         score_criterion_column_name => 'PROBABILITY');
         score_partition_column_name => 'PARTITION_NAME'
     DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
     ROUND(v_area_under_curve,4));
END;
/
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212

 SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
           FROM NB_ROC;

PROBABILITY  TRUE_POSITIVE_FRACTION  FALSE_POSITIVE_FRACTION
-----------  ----------------------  -----------------------
     .00000                       1                        1
     .50018               .826589595               .227902946
     .53851               .823699422               .221837088
     .54991               .820809249               .217504333
     .55628               .815028902               .215771231
     .55628               .817919075               .215771231
     .57563               .800578035               .214904679
     .57563               .812138728               .214904679
      .                    .                        .
      .                    .                        .
      .                    .                        .
```

57.8.11 CREATE_MODEL Procedure

This procedure creates an Oracle Machine Learning for SQL model with a given machine learning function.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
      model_name            IN VARCHAR2,
      mining_function       IN VARCHAR2,
      data_table_name       IN VARCHAR2,
      case_id_column_name   IN VARCHAR2,
      target_column_name    IN VARCHAR2 DEFAULT NULL,
      settings_table_name   IN VARCHAR2 DEFAULT NULL,
      data_schema_name      IN VARCHAR2 DEFAULT NULL,
      settings_schema_name  IN VARCHAR2 DEFAULT NULL,
      xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 57-70 CREATE_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used. See the Usage Notes for model naming restrictions.
`mining_function`	The machine learning function. Values are listed in Table 57-3.
`data_table_name`	Table or view containing the build data
`case_id_column_name`	Case identifier column in the build data.
`target_column_name`	For supervised models, the target column in the build data. `NULL` for unsupervised models.
`settings_table_name`	Table containing build settings for the model. `NULL` if there is no settings table (only default settings are used).
`data_schema_name`	Schema hosting the build data. If `NULL`, then the user's schema is assumed.

Table 57-70 (Cont.) CREATE_MODEL Procedure Parameters

Parameter	Description
settings_schema_name	Schema hosting the settings table. If NULLthen the user's schema is assumed.

xform_list	A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation".)
	The datatype of xform_list is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC. Each TRANSFORM_REC specifies the transformation information for a single attribute.
	`TYPE`
	`  TRANFORM_REC     IS RECORD (`
	`    attribute_name       VARCHAR2(4000),`
	`    attribute_subname    VARCHAR2(4000),`
	`    expression           EXPRESSION_REC,`
	`    reverse_expression   EXPRESSION_REC,`
	`    attribute_spec       VARCHAR2(4000));`
	The expression field stores a SQL expression for transforming the attribute. The reverse_expression field stores a SQL expression for reversing the transformation in model details and, if the attribute is a target, in the results of scoring. The SQL expressions are manipulated by routines in the DBMS_DATA_MINING_TRANSFORM package:
	• SET_EXPRESSION Procedure
	• GET_EXPRESSION Function
	• SET_TRANSFORM Procedure
	The attribute_spec field identifies individualized treatment for the attribute. See the Usage Notes for details.
	See Table 58-1for details about the TRANSFORM_REC type.

Usage Notes

1. You can use the attribute_spec field of the xform_list argument to identify an attribute as unstructured text or to disable Automatic Data Preparation for the attribute. The attribute_spec can have the following values:

   - TEXT: Indicates that the attribute contains unstructured text. The TEXT value may optionally be followed by POLICY_NAME, TOKEN_TYPE, MAX_FEATURES, and MIN_DOCUMENTS parameters.

     TOKEN_TYPE has the following possible values: NORMAL, STEM, THEME, SYNONYM, BIGRAM, STEM_BIGRAM. SYNONYM may be optionally followed by a thesaurus name in square brackets.

     MAX_FEATURES specifies the maximum number of tokens extracted from the text.

     MIN_DOCUMENTS specifies the minimal number of documents in which every selected token shall occur. (For information about creating a text policy, see CTX_DDL.CREATE_POLICY in *Oracle Text Reference*).

     Oracle Machine Learning for SQL can process columns of VARCHAR2/CHAR, CLOB, BLOB, and BFILE as text. If the column is VARCHAR2 or CHAR and you do not specify TEXT, then OML4SQL processes the column as categorical data. If the column is CLOB, then OML4SQL processes it as text by default (You do not need to specify it as TEXT. However, you do need to provide an Oracle Text Policy in the settings). If the column is

BLOB or BFILE, then you must specify it as TEXT, otherwise CREATE_MODEL returns an error.

If you specify TEXT for a nested column or for an attribute in a nested column, then CREATE_MODEL returns an error.

- NOPREP: Disables ADP for the attribute. When ADP is OFF, the NOPREP value is ignored.

  You can specify NOPREP for a nested column, but not for an attribute in a nested column. If you specify NOPREP for an attribute in a nested column when ADP is on, then CREATE_MODEL will return an error.

2. You can obtain information about a model by querying the Data Dictionary views.

```
ALL/USER/DBA_MINING_MODELS
ALL/USER/DBA_MINING_MODEL_ATTRIBUTES
ALL/USER/DBA_MINING_MODEL_SETTINGS
ALL/USER/DBA_MINING_MODEL_VIEWS
ALL/USER/DBA_MINING_MODEL_PARTITIONS
ALL/USER/DBA_MINING_MODEL_XFORMS
```

   You can obtain information about model attributes by querying the model details through model views. Refer to *Oracle Machine Learning for SQL User's Guide*.

3. The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

   - It must be 123 or fewer characters long.
   - It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

   Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

4. To build a partitioned model, you must provide additional settings.

   The setting for partitioning columns are as follows:

```
INSERT INTO settings_table VALUES ('ODMS_PARTITION_COLUMNS', 'GENDER,
AGE');
```

   To set user-defined partition number for a model, the setting is as follows:

```
INSERT INTO settings_table VALUES ('ODMS_MAX_PARTITIONS', '10');
```

   The default value for maximum number of partitions is 1000.

5. By passing an xform_list to CREATE_MODEL, you can specify a list of transformations to be performed on the input data. If the PREP_AUTO setting is ON, the transformations are used in addition to the automatic transformations. If the PREP_AUTO setting is OFF, the specified transformations are the only ones implemented by the model. In both cases, transformation definitions are embedded in the model and run automatically whenever the model is applied. See "Automatic Data Preparation". Other transforms that can be specified with xform_list include FORCE_IN. Refer to *Oracle Machine Learning for SQL User's Guide*.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.prep_auto,dbms_data_mining.prep_auto_on);
  COMMIT;
END;
/
-- Create the model using the specified settings
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svm_model_settings');
END;
/
```

You can display the model settings with the following query:

```
SELECT * FROM user_mining_model_settings
       WHERE model_name IN 'SVM_MODEL';

MODEL_NAME     SETTING_NAME            SETTING_VALUE                 SETTING
-------------  ----------------------  ----------------------------  -------
SVM_MODEL      ALGO_NAME               ALGO_SUPPORT_VECTOR_MACHINES  INPUT

SVM_MODEL      SVMS_STD_DEV            3.004524                      DEFAULT
SVM_MODEL      PREP_AUTO               ON                            INPUT
SVM_MODEL      SVMS_COMPLEXITY_FACTOR  1.887389                      DEFAULT
SVM_MODEL      SVMS_KERNEL_FUNCTION    SVMS_LINEAR                      DEFAULT
SVM_MODEL      SVMS_CONV_TOLERANCE     .001                          DEFAULT
```

The following is an example of querying a model view instead of the older `GEL_MODEL_DETAILS_SVM` routine.

```
SELECT target_value, attribute_name, attribute_value, coefficient   FROM
DM$VLSVM_MODEL;
```

The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'anomaly_detect_model',
```

```
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => null,
    settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;

MODEL_NAME              MINING_FUNCTION      ALGORITHM
----------------------  -------------------- ------------------------------
SVM_MODEL               CLASSIFICATION       SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL    CLASSIFICATION       SUPPORT_VECTOR_MACHINES
```

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
       FROM user_mining_model_attributes
       WHERE target = 'YES';

MODEL_NAME          ATTRIBUTE_NAME   ATTRIBUTE_TYPE     TARGET
------------------  ---------------  -----------------  ------
SVM_MODEL           AFFINITY_CARD    CATEGORICAL         YES
```

57.8.12 CREATE_MODEL2 Procedure

The `CREATE_MODEL2` procedure is an alternate procedure to the `CREATE_MODEL` procedure, which enables creating a model without extra persistence stages. In the `CREATE_MODEL` procedure, the input is a table or a view and if such an object is not already present, the user must create it. By using the `CREATE_MODEL2` procedure, the user does not need to create such transient database objects.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL2 (
     model_name            IN VARCHAR2,
     mining_function       IN VARCHAR2,
     data_query            IN CLOB,
     set_list              IN SETTING_LIST,
     case_id_column_name   IN VARCHAR2 DEFAULT NULL,
     target_column_name    IN VARCHAR2 DEFAULT NULL,
     xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 57-71 CREATE_MODEL2 Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [`schema_name`.]`model_name`. If you do not specify a schema, then the current schema is used. See the Usage Notes, CREATE_MODEL Procedure for model naming restrictions.
`mining_function`	The machine learning function. Values are listed in DBMS_DATA_MINING — Machine Learning Function Settings.

Table 57-71 (Cont.) CREATE_MODEL2 Procedure Parameters

Parameter	Description
data_query	A query which provides training data for building the model.
set_list	Specifies the SETTING_LIST SETTING_LIST is a table of CLOB index by VARCHAR2(30); Where the index is the setting name and the CLOB is the setting value for that name.
case_id_column_name	Case identifier column in the build data.
target_column_name	For supervised models, the target column in the build data. NULL for unsupervised models.
xform_list	Refer to CREATE_MODEL Procedure.

Usage Notes

Refer to CREATE_MODEL Procedure for Usage Notes.

Examples

The following example uses the Support Vector Machine algorithm.

```
declare
 v_setlst DBMS_DATA_MINING.SETTING_LIST;

BEGIN
  v_setlst(dbms_data_mining.algo_name) :=
dbms_data_mining.algo_support_vector_machines;
  v_setlst(dbms_data_mining.prep_auto) := dbms_data_mining.prep_auto_on;

DBMS_DATA_MINING.CREATE_MODEL2(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_query          => 'select * from mining_data_build_v',
    data_table_name     => 'mining_data_build_v',
    case_id_column_name=> 'cust_id',
    target_column_name => 'affinity_card',
    set_list            => v_setlst,
    case_id_column_name=> 'cust_id',
    target_column_name => 'affinity_card');
END;
/
```

57.8.13 Create Model Using Registration Information

Create model function fetches the setting information from JSON object.

Usage Notes

If an algorithm is registered, user can create model using the registered algorithm name. Since all R scripts and default setting values are already registered, providing the value through the setting table is not necessary. This makes the use of this algorithm easier.

Examples

The first example builds a Classification model using the GLM algorithm.

```
CREATE TABLE GLM_RDEMO_SETTINGS_CL (

   setting_name  VARCHAR2(30),
   setting_value VARCHAR2(4000));
   BEGIN
        INSERT INTO GLM_RDEMO_SETTINGS_CL VALUES
         ('ALGO_EXTENSIBLE_LANG', 'R');
        INSERT INTO GLM_RDEMO_SETTINGS_CL VALUES
         (dbms_data_mining.ralg_registration_algo_name, 't1');
        INSERT INTO GLM_RDEMO_SETTINGS_CL VALUES
        (dbms_data_mining.odms_formula,
        'AGE + EDUCATION + HOUSEHOLD_SIZE + OCCUPATION');
        INSERT INTO GLM_RDEMO_SETTINGS_CL VALUES
         ('RALG_PARAMETER_FAMILY',   'binomial(logit)' );
   END;
   /
     BEGIN
          DBMS_DATA_MINING.CREATE_MODEL(
          model_name                    =>    'GLM_RDEMO_CLASSIFICATION',
          mining_function               =>     dbms_data_mining.classification,
          data_table_name               =>    'mining_data_build_v',
          case_id_column_name           =>    'CUST_ID',
          target_column_name            =>    'AFFINITY_CARD',
          settings_table_name           =>    'GLM_RDEMO_SETTINGS_CL');
      END;
      /
```

57.8.14 DROP_ALGORITHM Procedure

This function is used to drop the registered algorithm information.

Syntax

```
DBMS_DATA_MINING.DROP_ALGORITHM (algorithm_name  IN  VARCHAR2(30),
                                 cascade         IN  BOOLEAN default FALSE)
```

Parameters

Table 57-72 DROP_ALGORITHM Procedure Parameters

Parameter	Description
`algorithm_name`	Name of the algorithm.
`cascade`	If the cascade option is `TRUE`, all the models with this algorithms are forced to drop. There after, the algorithm is dropped. The default value is `FALSE`.

Usage Note

- To drop a machine learning model, you must be the owner or you must have the `RQADMIN` privilege. See *Oracle Machine Learning for SQL User's Guide* for information about privileges for machine learning.
- Make sure a model is not built on the algorithm, then drop the algorithm from the system table.

- If you try to drop an algorithm with a model built on it, then an error is displayed.

57.8.15 DROP_PARTITION Procedure

Syntax

```
DBMS_DATA_MINING.DROP_PARTITION (
      model_name                IN VARCHAR2,
      partition_name            IN VARCHAR2);
```

Parameters

Table 57-73 DROP_PARTITION Procedure Parameters

Parameters	Description
`model_name`	Name of the machine learning model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`partition_name`	Name of the partition that must be dropped.

57.8.16 DROP_MODEL Procedure

This procedure deletes the specified machine learning model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
                             force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 57-74 DROP_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the machine learning model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`force`	Forces the machine learning model to be dropped even if it is invalid. A machine learning model may be invalid if a serious system error interrupted the model build process.

Usage Note

To drop a machine learning model, you must be the owner or you must have the `DROP ANY MINING MODEL` privilege. See *Oracle Data Mining User's Guide* for information about privileges for Oracle Machine Learning for SQL.

Example

You can use the following command to delete a valid machine learning model named `nb_sh_clas_sample` that exists in your schema.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
```

```
END;
/
```

57.8.17 EXPORT_MODEL Procedure

This procedure exports the specified machine learning models to a dump file set.

To import the models from the dump file set, use the IMPORT_MODEL Procedure. `EXPORT_MODEL` and `IMPORT_MODEL` use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the machine learning models in the schema or database are included. However, `EXPORT_MODEL` and `IMPORT_MODEL` are the only utilities that support the export/import of individual models.

> **See Also:**
>
> *Oracle Database Utilities* for information about Oracle Data Pump
>
> *Oracle Machine Learning for SQL User's Guide* for more information about exporting and importing machine learning models

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
      filename          IN VARCHAR2,
      directory         IN VARCHAR2,
      model_filter      IN VARCHAR2 DEFAULT NULL,
      filesize          IN VARCHAR2 DEFAULT NULL,
      operation         IN VARCHAR2 DEFAULT NULL,
      remote_link       IN VARCHAR2 DEFAULT NULL,
      jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-75 EXPORT_MODEL Procedure Parameters

Parameter	Description
`filename`	Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the `filesize` parameter, or you can use the `operation` parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to *`filename01.dmp`*, even if there is only one file in the dump set. If there are additional files, they are named sequentially as *`filename02.dmp`*, *`filename03.dmp`*, and so forth.

Table 57-75 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
directory	Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies. See *Oracle Database SQL Language Reference* for information about directory objects.
model_filter	Optional parameter that specifies which model or models to export. If you do not specify a value for model_filter, all models in the schema are exported. You can also specify NULL (the default) or 'ALL' to export all models. You can export individual models by name and groups of models based on machine learning function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 57-76.
filesize	Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than filesize, one or more additional files are created within the dump set. See the description of the filename parameter for more information.
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the filesize parameter determines the size of the files. You can specify either of the following values for operation: • 'EXPORT' — Export all or the specified models. (Default) • 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can export the models in the remote database. The EXP_FULL_DATABASE role is required for exporting the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form *username*_exp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_exp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named *jobname*.log, is created in the same directory as the dump file set.

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same machine learning function or algorithm. You can query the USER_MINING_MODELS view to list the models in your schema.

```
SQL> describe user_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
```

```
ALGORITHM                                          VARCHAR2(30)
CREATION_DATE                             NOT NULL DATE
BUILD_DURATION                                     NUMBER
MODEL_SIZE                                         NUMBER
COMMENTS                                           VARCHAR2(4000)
```

Examples of model filters are provided in Table 57-76.

Table 57-76 Sample Values for the Model Filter Parameter

Sample Value	Meaning
`'mymodel'`	Export the model named `mymodel`
`'name= ''mymodel'''`	Export the model named `mymodel`
`'name IN (''mymodel2'',''mymodel3'')'`	Export the models named `mymodel2` and `mymodel3`
`'ALGORITHM_NAME = ''NAIVE_BAYES'''`	Export all Naive Bayes models. See Table 57-5 for a list of algorithm names.
`'FUNCTION_NAME =''CLASSIFICATION'''`	Export all classification models. See Table 57-3 for a list of machine learning functions.

Examples

1. The following statement exports all the models in the `oml_user3` schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The `oml_user3` user has read/write access to the directory and to the directory object.

   ```
   SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
   ```

   You can exit SQL*Plus and list the resulting dump file and log file.

   ```
   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >oml_user3_exp_1027.log  models_out01.dmp
   ```

2. The following example uses the same directory object and is run by the same user. This example exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

   ```
   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ( 'models2_out', 'DATA_PUMP_DIR',
              'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >oml_user3_exp_1027.log  models_out01.dmp
    oml_user3_exp_924.log  models2_out01.dmp
   ```

3. The following examples show how to export models with specific algorithm and machine learning function names.

   ```
   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('algo.dmp','DM_DUMP',
           'ALGORITHM_NAME IN (''O_CLUSTER'',''GENERALIZED_LINEAR_MODEL'',
           ''SUPPORT_VECTOR_MACHINES'',''NAIVE_BAYES'')');

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('func.dmp', 'DM_DUMP',
           'FUNCTION_NAME IN (CLASSIFICATION,CLUSTERING,FEATURE_EXTRACTION)');
   ```

57.8.18 EXPORT_SERMODEL Procedure

This procedure exports the model in a serialized format so that they can be moved to another platform for scoring.

When exporting a model in serialized format, the user must pass in an empty `BLOB` locator and specify the model name to be exported. If the model is partitioned, the user can optionally select an individual partition to export, otherwise all partitions are exported. The returned `BLOB` contains the content that can be deployed.

Syntax

```
DBMS_DATA_MINING.EXPORT_SERMODEL (
      model_data     IN OUT NOCOPY BLOB,
      model_name     IN VARCHAR2,
      partition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57-77 EXPORT_SERMODEL Procedure Parameters

Parameter	Description
`model_data`	Provides serialized model data.
`model_name`	Name of the machine learning model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`partition_name`	Name of the partition that must be exported.

Examples

The following statement exports all of the models in a serialized format.

```
DECLARE
 v_blob blob;
BEGIN
 dbms_lob.createtemporary(v_blob, FALSE);
 dbms_data_mining.export_sermodel(v_blob, 'MY_MODEL');
-- save v_blob somewhere (e.g., bfile, etc.)
 dbms_lob.freetemporary(v_blob);
END;
/
```

> **See Also:**
>
> *Oracle Machine Learning for SQL User's Guide* for more information about exporting and importing machine learning models

57.8.19 FETCH_JSON_SCHEMA Procedure

User can fetch and read JSON schema from the `ALL_MINING_ALGORITHMS` view. This function returns the pre-registered JSON schema for R extensible algorithms.

Syntax

```
DBMS_DATA_MINING.FETCH_JSON_SCHEMA RETURN CLOB;
```

Parameters

Table 57-78 FETCH_JSON_SCHEMA Procedure Parameters

Parameter	Description
`RETURN`	This function returns the pre-registered JSON schema for R extensibility. The default value is `CLOB`.

Usage Note

If a user wants to register a new algorithm using the algorithm registration function, they must fetch and follow the pre-registered JSON schema using this function, when they create the required JSON object metadata, and then pass it to the registration function.

57.8.20 GET_ASSOCIATION_RULES Function

The `GET_ASSOCIATION_RULES` function returns the rules produced by an association model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

You can specify filtering criteria to `GET_ASSOCIATION_RULES` to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, then the greatest performance improvement will result from specifying the `topn` parameter.

Syntax

```
DBMS_DATA_MINING.get_association_rules(
      model_name       IN VARCHAR2,
      topn             IN NUMBER DEFAULT NULL,
      rule_id          IN INTEGER DEFAULT NULL,
      min_confidence   IN NUMBER DEFAULT NULL,
      min_support      IN NUMBER DEFAULT NULL,
      max_rule_length  IN INTEGER DEFAULT NULL,
      min_rule_length  IN INTEGER DEFAULT NULL,
      sort_order       IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
      antecedent_items IN DM_ITEMS DEFAULT NULL,
      consequent_items IN DM_ITEMS DEFAULT NULL,
      min_lift         IN NUMBER DEFAULT NULL,
      partition_name   IN VARCHAR2 DEFAULT NULL)
  RETURN DM_Rules PIPELINED;
```

Parameters

Table 57-79 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
topn	Returns the *n* top rules ordered by confidence and then support, both descending. If you specify a sort order, then the top *n* rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If topn is specified and a maximum or minimum rule length *is* specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.
rule_id	Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.
min_confidence	Returns the rules with confidence greater than or equal to this number.
min_support	Returns the rules with support greater than or equal to this number.
max_rule_length	Returns the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 57-80). For example, in the rule A=>B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
min_rule_length	Returns the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sorts the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. (See Table 57-80 for the column names.) For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you must specify: `ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC')` If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by Confidence in descending order, then by Support in descending order.
antecedent_items	Returns the rules with these items in the antecedent.
consequent_items	Returns the rules with this item in the consequent.
min_lift	Returns the rules with lift greater than or equal to this number.
partition_name	Specifies a partition in a partitioned model.

Return Values

The object type returned by `GET_ASSOCIATION_RULES` is described in Table 57-80. For descriptions of each field, see the Usage Notes.

Table 57-80 GET_ASSOCIATION RULES Function Return Values

Return Value	Description

`DM_RULES`	A set of rows of type `DM_RULE`. The rows have the following columns:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER )`

`DM_PREDICATES`	The `antecedent` and `consequent` columns each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

1. This table function pipes out rows of type `DM_RULES`. For information on machine learning data types and piped output from table functions, see "Datatypes".
2. The columns returned by `GET_ASSOCIATION_RULES` are described as follows:

Column in DM_RULES	Description
`rule_id`	Unique identifier of the rule

Column in DM_RULES	Description
antecedent	The independent condition in the rule. When this condition exists, the dependent condition in the consequent also exists. The condition is a combination of attribute values called a predicate (DM_PREDICATE). The predicate specifies a condition for each attribute. The condition may specify equality (=), inequality (<>), greater than (>), less than (<), greater than or equal to (>=), or less than or equal to (<=) a given value. Support and Confidence for each attribute condition in the antecedent is returned in the predicate. Support is the number of transactions that satisfy the antecedent. Confidence is the likelihood that a transaction will satisfy the antecedent. **Note:** The occurrence of the attribute as a DM_PREDICATE indicates the presence of the item in the transaction. The actual value for attribute_num_value or attribute_str_value is meaningless. For example, the following predicate indicates that 'Mouse Pad' is present in the transaction *even though* the attribute value is NULL. `DM_PREDICATE('PROD_NAME', 'Mouse Pad', '= ', NULL, NULL, NULL, NULL))`
consequent	The dependent condition in the rule. This condition exists when the antecedent exists. The consequent, like the antecedent, is a predicate (DM_PREDICATE). Support and confidence for each attribute condition in the consequent is returned in the predicate. Support is the number of transactions that satisfy the consequent. Confidence is the likelihood that a transaction will satisfy the consequent.
rule_support	The number of transactions that satisfy the rule.
rule_confidence	The likelihood of a transaction satisfying the rule.
rule_lift	The degree of improvement in the prediction over random chance when the rule is satisfied.
antecedent_support	The ratio of the number of transactions that satisfy the antecedent to the total number of transactions.
consequent_support	The ratio of the number of transactions that satisfy the consequent to the total number of transactions.
number_of_items	The total number of attributes referenced in the antecedent and consequent of the rule.

Examples

The following example demonstrates an association model build followed by several invocations of the GET_ASSOCIATION_RULES table function:

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
```

```
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'market_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following query uses the association model `AR_SH_SAMPLE`.

```
SELECT * FROM TABLE (
   DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
      'AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
         ORA_MINING_VARCHAR2_NT (
         'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
         DM_ITEMS(DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL),
                  DM_ITEM('CUSTPRODS', 'Standard Mouse', 1, NULL)),
         DM_ITEMS(DM_ITEM('CUSTPRODS', 'Extension Cable', 1, NULL))));
```

The query returns three rules, shown as follows:

```
13  DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL),
       DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
    .15532      .84393   2.7075     .18404     .3117   2

11  DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Standard Mouse', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
    .18085      .56291   1.8059     .32128     .3117   1

9   DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '= ', 1, NULL, NULL, NULL))
    DM_PREDICATES(
       DM_PREDICATE('CUSTPRODS', 'Extension Cable', '= ', 1, NULL, NULL, NULL))
      .17766    .55116   1.7682     .32234     .3117   1
```

> **See Also:**
>
> Table 57-80 for the DM_RULE column data types.

57.8.21 GET_FREQUENT_ITEMSETS Function

The GET_FREQUENT_ITEMSETS function returns a set of rows that represent the frequent itemsets from an association model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead..

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

For a detailed description of frequent itemsets, consult *Oracle Machine Learning for SQL Concepts*.

Syntax

```
DBMS_DATA_MINING.get_frequent_itemsets(
      model_name IN VARCHAR2,
      topn IN NUMBER DEFAULT NULL,
      max_itemset_length IN NUMBER DEFAULT NULL,
      partition_name     IN VARCHAR2 DEFAULT NULL)
  RETURN DM_ItemSets PIPELINED;
```

Parameters

Table 57-81 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
topn	When not NULL, return the top *n* rows ordered by support in descending order
max_itemset_length	Maximum length of an item set.
partition_name	Specifies a partition in a partitioned model.

> **Note:**
>
> The partition_name columns applies only when the model is partitioned.

Return Values

Table 57-82 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description
DM_ITEMSETS	A set of rows of type DM_ITEMSET. The rows have the following columns: (partition_name VARCHAR2(128) itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER) **Note:** The partition_name columns applies only when the model is partitioned. The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on machine learning data types and piped output from table functions, see "Data Types".

Examples

The following example demonstrates an association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS

    SELECT *

  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
```

```
  settings_table_name  => 'market_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

57.8.22 GET_MODEL_COST_MATRIX Function

The `GET_*` interfaces are replaced by model views, and Oracle recommends that users leverage the views instead.

The GET_MODEL_COST_MATRIX function is replaced by the `DM$VC` prefixed view, Scoring Cost Matrix. The cost matrix used when building a Decision Tree is made available by the `DM$VM` prefixed view, Decision Tree build cost matrix.

Refer to Model Detail View for Classification Algorithm.

The `GET_MODEL_COST_MATRIX` function returns the rows of a cost matrix associated with the specified model.

By default, this function returns the scoring cost matrix that was added to the model with the `ADD_COST_MATRIX` procedure. If you wish to obtain the cost matrix used to create a model, specify `cost_matrix_type_create` as the `matrix_type`. See Table 57-83.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
      model_name                IN VARCHAR2,
      matrix_type               IN VARCHAR2 DEFAULT cost_matrix_type_score)
      partition_name            IN VARCHAR2 DEFAULT NULL);
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 57-83 GET_MODEL_COST_MATRIX Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`matrix_type`	The type of cost matrix. `COST_MATRIX_TYPE_SCORE` — cost matrix used for scoring. (Default.) `COST_MATRIX_TYPE_CREATE` — cost matrix used to create the model (Decision Tree only).
`partition_name`	Name of the partition in a partitioned model

Return Values

Table 57-84 GET_MODEL_COST_MATRIX Function Return Values

Return Value	Description
DM_COST_MATRIX	A set of rows of type DM_COST_ELEMENT. The rows have the following columns: actual VARCHAR2(4000), predicted VARCHAR2(4000), cost NUMBER)

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 57-7.

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

The GET_MODEL_COST_MATRIX may return either the build or scoring cost matrix defined for a model or model partition.

If you do not specify a partitioned model name, then an error is displayed.

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
    FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
    ORDER BY predicted, actual;

ACTUAL     PREDICTED   COST
---------- ---------- -----
0          0            .00
1          0            .75
0          1            .25
1          1            .00
```

57.8.23 GET_MODEL_DETAILS_AI Function

The GET_MODEL_DETAILS_AI function returns a set of rows that provide the details of an attribute importance model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Syntax

```
DBMS_DATA_MINING.get_model_details_ai(
      model_name IN VARCHAR2,
```

```
    partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN dm_ranked_attributes pipelined;
```

Parameters

Table 57-85 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
partition_name	Specifies a partition in a partitioned model.

Return Values

Table 57-86 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description
DM_RANKED_ATTRIBUTES	A set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(4000, attribute_subname VARCHAR2(4000), importance_value NUMBER, rank NUMBER(38))

Examples

The following example returns model details for the attribute importance model AI_SH_sample, which was created by the sample program dmaidemo.sql.

```
SELECT attribute_name, importance_value, rank
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_AI('AI_SH_sample'))
    ORDER BY RANK;

ATTRIBUTE_NAME                          IMPORTANCE_VALUE       RANK
--------------------------------------- ---------------- ----------
HOUSEHOLD_SIZE                               .151685183          1
CUST_MARITAL_STATUS                          .145294546          2
YRS_RESIDENCE                                 .07838928          3
AGE                                          .075027496          4
Y_BOX_GAMES                                  .063039952          5
EDUCATION                                    .059605314          6
HOME_THEATER_PACKAGE                         .056458722          7
OCCUPATION                                   .054652937          8
CUST_GENDER                                  .035264741          9
BOOKKEEPING_APPLICATION                      .019204751         10
PRINTER_SUPPLIES                                      0         11
OS_DOC_SET_KANJI                            -.00050013         12
FLAT_PANEL_MONITOR                          -.00509564         13
BULK_PACK_DISKETTES                         -.00540822         14
COUNTRY_NAME                                -.01201116         15
CUST_INCOME_LEVEL                           -.03951311         16
```

57.8.24 GET_MODEL_DETAILS_EM Function

The `GET_MODEL_DETAILS_EM` function returns a set of rows that provide statistics about the clusters produced by an expectation maximization model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

By default, the EM algorithm groups components into high-level clusters, and `GET_MODEL_DETAILS_EM` returns only the high-level clusters with their hierarchies. Alternatively, you can configure EM model to disable the grouping of components into high-level clusters. In this case, `GET_MODEL_DETAILS_EM` returns the components themselves as clusters with their hierarchies. See Table 57-12.

Syntax

```
DBMS_DATA_MINING.get_model_details_em(
      model_name VARCHAR2,
      cluster_id NUMBER   DEFAULT NULL,
      attribute  VARCHAR2 DEFAULT NULL,
      centroid   NUMBER   DEFAULT 1,
      histogram  NUMBER   DEFAULT 1,
      rules      NUMBER   DEFAULT 2,
      attribute_subname  VARCHAR2 DEFAULT NULL,
      topn_attributes NUMBER DEFAULT NULL,
      partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN dm_clusters PIPELINED;
```

Parameters

Table 57-87 GET_MODEL_DETAILS_EM Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`cluster_id`	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise, the details for all clusters are returned.
`attribute`	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned
`centroid`	This parameter accepts the following values: • 1: Details about centroids are returned (default) • 0: Details about centroids are not returned
`histogram`	This parameter accepts the following values: • 1: Details about histograms are returned (default) • 0: Details about histograms are not returned
`rules`	This parameter accepts the following values: • 2: Details about rules are returned (default) • 1: Rule summaries are returned • 0: No information about rules is returned

Table 57-87 (Cont.) GET_MODEL_DETAILS_EM Function Parameters

Parameter	Description
attribute_subname	The name of a nested attribute. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the column and *attribute_subname* is the name of the nested attribute in that column. If the attribute is not nested, then attribute_subname is null.
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then, up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.
partition_name	Specifies a partition in a partitioned model.

Usage Notes

1. For information on Oracle Machine Learning for SQL data types and return values for Clustering algorithms piped output from table functions, see "Data Types".
2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.
3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCS_CLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.
4. When the partition_name is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

57.8.25 GET_MODEL_DETAILS_EM_COMP Function

he GET_MODEL_DETAILS_EM_COMP table function returns a set of rows that provide details about the parameters of an expectation maximization model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Syntax

```
DBMS_DATA_MINING.get_model_details_em_comp(
      model_name IN VARCHAR2,
      partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN DM_EM_COMPONENT_SET PIPELINED;
```

Parameters

Table 57-88 GET_MODEL_DETAILS_EM_COMP Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
partition_name	Specifies a partition in a partitioned model to retrieve details for.

Return Values

Table 57-89 GET_MODEL_DETAILS_EM_COMP Function Return Values

Return Value	Description
DM_EM_COMPONENT_SET	A set of rows of type DM_EM_COMPONENT. The rows have the following columns: (info_type VARCHAR2(30), component_id NUMBER, cluster_id NUMBER, attribute_name VARCHAR2(4000), covariate_name VARCHAR2(4000), attribute_value VARCHAR2(4000), value NUMBER)

Usage Notes

1. This table function pipes out rows of type DM_EM_COMPONENT. For information on Oracle Machine Learning for SQL data types and piped output from table functions, see "Data Types".

   The columns in each row returned by GET_MODEL_DETAILS_EM_COMP are described as follows:

Column in DM_EM_COMPONENT	Description
info_type	The type of information in the row. The following information types are supported: • cluster • prior • mean • covariance • frequency
component_id	Unique identifier of a component
cluster_id	Unique identifier of the high-level leaf cluster for each component
attribute_name	Name of an original attribute or a derived feature ID. The derived feature ID is used in models built on data with nested columns. The derived feature definitions can be obtained from the GET_MODEL_DETAILS_EM_PROJ Function.

Column in DM_EM_COMPONENT	Description
covariate_name	Name of an original attribute or a derived feature ID used in variance/covariance definition
attribute_value	Categorical value or bin interval for binned numerical attributes
value	Encodes different information depending on the value of info_type, as follows: • cluster — The value field is NULL • prior — The value field returns the component prior • mean — The value field returns the mean of the attribute specified in attribute_name • covariance — The value field returns the covariance of the attributes specified in attribute_name and covariate_name. Using the same attribute in attribute_name and covariate_name, returns the variance. • frequency— The value field returns the multivalued Bernoulli frequency parameter for the attribute/value combination specified by attribute_name and attribute_value See Usage Note 2 for details.

2. The following table shows which fields are used for each info_type. The blank cells represent NULLs.

info_type	component_id	cluster_id	attribute_name	covariate_name	attribute_value	value
cluster	X	X				
prior	X	X				X
mean	X	X	X			X
covariance	X	X	X	X		X
frequency	X	X	X		X	X

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.
4. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

57.8.26 GET_MODEL_DETAILS_EM_PROJ Function

The GET_MODEL_DETAILS_EM_PROJ function returns a set of rows that provide statistics about the projections produced by an expectation maximization model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Syntax

```
DBMS_DATA_MINING.get_model_details_em_proj(
      model_name IN VARCHAR2,
```

```
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_EM_PROJECTION_SET PIPELINED;
```

Parameters

Table 57-90 GET_MODEL_DETAILS_EM_PROJ Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
partition_name	Specifies a partition in a partitioned model

Return Values

Table 57-91 GET_MODEL_DETAILS_EM_PROJ Function Return Values

Return Value	Description
DM_EM_PROJECTION_SET	A set of rows of type DM_EM_PROJECTION. The rows have the following columns: (feature_name VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER) See Usage Notes for details.

Usage Notes

1. This table function pipes out rows of type DM_EM_PROJECTION. For information on machine learning data types and piped output from table functions, see "Datatypes".

   The columns in each row returned by GET_MODEL_DETAILS_EM_PROJ are described as follows:

Column in DM_EM_PROJECTION	Description
feature_name	Name of a derived feature. The feature maps to the attribute_name returned by the GET_MODEL_DETAILS_EM Function.
attribute_name	Name of a column in the build data
attribute_subname	Subname in a nested column
attribute_value	Categorical value
coefficient	Projection coefficient. The representation is sparse; only the non-zero coefficients are returned.

2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information.

3. When the value is `NULL` for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

57.8.27 GET_MODEL_DETAILS_GLM Function

The `GET_MODEL_DETAILS_GLM` function returns the coefficient statistics for a generalized linear model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the machine learning function are returned as `NULL`. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.get_model_details_glm(
      model_name IN VARCHAR2,
      partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN DM_GLM_Coeff_Set PIPELINED;
```

Parameters

Table 57-92 GET_MODEL_DETAILS_GLM Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`partition_name`	Specifies a partition in a partitioned model

Return Values

Table 57-93 GET_MODEL_DETAILS_GLM Return Values

Return Value	Description
DM_GLM_COEFF_SET	A set of rows of type DM_GLM_COEFF. The rows have the following columns: (class VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), feature_expression VARCHAR2(4000), coefficient NUMBER, std_error NUMBER, test_statistic NUMBER, p_value NUMBER, VIF NUMBER, std_coefficient NUMBER, lower_coeff_limit NUMBER, upper_coeff_limit NUMBER, exp_coefficient BINARY_DOUBLE, exp_lower_coeff_limit BINARY_DOUBLE, exp_upper_coeff_limit BINARY_DOUBLE)

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF data type. The statistics are described in Table 57-94.

Table 57-94 DM_GLM_COEFF Data Type Description

Column	Description
class	The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 57-19. For Linear Regression, class is null.
attribute_name	The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.
attribute_subname	The name of an attribute in a nested table. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, then attribute_subname is null. If the attribute is an intercept, then both the attribute_name and the attribute_subname are null.

Table 57-94 (Cont.) DM_GLM_COEFF Data Type Description

Column	Description
attribute_value	The value of the attribute (categorical attribute only). For numeric attributes, attribute_value is null.
feature_expression	The feature name constructed by the algorithm when feature generation is enabled and higher-order features are found. If feature selection is not enabled, then the feature name is simply the fully-qualified attribute name (*attribute_name.attribute_subname* if the attribute is in a nested column). For categorical attributes, the algorithm constructs a feature name that has the following form: *fully-qualified_attribute_name.attribute_value* For numeric attributes, the algorithm constructs a name for the higher-order feature by taking the product of the resulting values: (*attrib1*)*(*attrib2*))*..... where *attrib1* and *attrib2* are fully-qualified attribute names.
coefficient	The linear coefficient estimate.
std_error	Standard error of the coefficient estimate.
test_statistic	For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.
p-value	Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.
VIF	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, VIF is null. VIF is not computed if the solver is Cholesky.
std_coefficient	Standardized estimate of the coefficient.
lower_coeff_limit	Lower confidence bound of the coefficient.
upper_coeff_limit	Upper confidence bound of the coefficient.
exp_coefficient	Exponentiated coefficient for logistic regression. For linear regression, exp_coefficient is null.
exp_lower_coeff_limit	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.
exp_upper_coeff_limit	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the machine learning function. For example, exp_coefficient does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For information on ridge regression, see Table 57-19.
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

- When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns some of the model details for the GLM regression model GLMR_SH_Regr_sample.

57.8.28 GET_MODEL_DETAILS_GLOBAL Function

The GET_MODEL_DETAILS_GLOBAL function returns statistics about the model as a whole. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Global details are available for Generalized Linear Models, Association Rules, Singular Value Decomposition, and Expectation Maximization. There are new Global model views which show global information for all algorithms. Oracle recommends that users leverage the views instead. Refer to Model Details View Global.

Syntax

```
DBMS_DATA_MINING.get_model_details_global(
      model_name IN VARCHAR2,
      partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN DM_model_global_details PIPELINED;
```

Parameters

Table 57-95 GET_MODEL_DETAILS_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
partition_name	Specifies a partition in a partitioned model.

Return Values

Table 57-96 GET_MODEL_DETAILS_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns: (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

Examples

The following example returns the global model details for the GLM regression model GLMR_SH_Regr_sample.

```
SELECT *
  FROM TABLE(dbms_data_mining.get_model_details_global(
              'GLMR_SH_Regr_sample'))

57.8.29 GET_MODEL_DETAILS_KM Function

The `GET_MODEL_DETAILS_KM` function returns a set of rows that provide the details of a *k*-means clustering model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

You can provide input to `GET_MODEL_DETAILS_KM` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then `GET_MODEL_DETAILS_KM` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.get_model_details_km(
      model_name VARCHAR2,
      cluster_id NUMBER   DEFAULT NULL,
      attribute  VARCHAR2 DEFAULT NULL,
      centroid   NUMBER   DEFAULT 1,
      histogram  NUMBER   DEFAULT 1,
      rules      NUMBER   DEFAULT 2,
      attribute_subname  VARCHAR2 DEFAULT NULL,
      topn_attributes NUMBER DEFAULT NULL,
      partition_name VARCHAR2 DEFAULT NULL)
  RETURN dm_clusters PIPELINED;
```

Parameters

Table 57-97 GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`cluster_id`	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
`attribute`	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned
`centroid`	This parameter accepts the following values: • 1: Details about centroids are returned (default) • 0: Details about centroids are not returned
`histogram`	This parameter accepts the following values: • 1: Details about histograms are returned (default) • 0: Details about histograms are not returned
`rules`	This parameter accepts the following values: • 2: Details about rules are returned (default) • 1: Rule summaries are returned • 0: No information about rules is returned

Table 57-97 (Cont.) GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
attribute_subname	The name of a nested attribute. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the column and *attribute_subname* is the name of the nested attribute in that column. If the attribute is not nested, attribute_subname is null.
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.
partition_name	Specifies a partition in a partitioned model.

Usage Notes

1. The table function pipes out rows of type DM_CLUSTERS. For information on machine learning data types and Return Value for Clustering Algorithms piped output from table functions, see "Data Types".
2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the *k*-means clustering model KM_SH_Clus_sample.

```
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level,
       T.dispersion   dispersion
  FROM (SELECT *
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM(
                     'KM_SH_Clus_sample'))
        ORDER BY id) T
 WHERE ROWNUM < 6;

    CLU_ID    REC_CNT     PARENT TREE_LEVEL DISPERSION
---------- ---------- ---------- ---------- ----------
         1       1500                     1  5.9152211
         2        638          1          2 3.98458982
         3        862          1          2 5.83732097
         4        376          3          3 5.05192137
         5        486          3          3 5.42901522
```

57.8.30 GET_MODEL_DETAILS_NB Function

The `GET_MODEL_DETAILS_NB` function returns a set of rows that provide the details of a naive Bayes model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Syntax

```
DBMS_DATA_MINING.get_model_details_nb(
      model_name IN VARCHAR2,
      partition_name IN VARCHAR2 DEFAULT NULL)
  RETURN DM_NB_Details PIPELINED;
```

Parameters

Table 57-98 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`partition_name`	Specifies a partition in a partitioned model

Return Values

Table 57-99 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description

`DM_NB_DETAILS`	A set of rows of type `DM_NB_DETAIL`. The rows have the following columns:
	`(target_attribute_name VARCHAR2(30),`
	`target_attribute_str_value VARCHAR2(4000),`
	`target_attribute_num_value NUMBER,`
	`prior_probability NUMBER,`
	`conditionals DM_CONDITIONALS)`
	The `conditionals` column of `DM_NB_DETAIL` returns a nested table of type `DM_CONDITIONALS`. The rows, of type `DM_CONDITIONAL`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_num_value NUMBER,`
	`conditional_probability NUMBER)`

Usage Notes

- The table function pipes out rows of type `DM_NB_DETAILS`. For information on machine learning data types and piped output from table functions, see "Data Types".
- When the value is `NULL` for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following query is from the sample program `dmnbdemo.sql`. It returns model details about the model `NB_SH_Clas_sample`. For information about the sample programs, see *Oracle Machine Learning for SQL User's Guide*.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are `(lower_boundary,upper_boundary]`; for categorical bins, the label matches the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

```
WITH
    bin_label_view AS (
    SELECT col, bin, (DECODE(bin,'1','[','(') || lv || ',' || val || ']') label
      FROM (SELECT col,
                   bin,
                   LAST_VALUE(val) OVER (
                   PARTITION BY col ORDER BY val
                   ROWS BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv,
                   val
              FROM nb_sh_sample_num)
   UNION ALL
   SELECT col, bin, val label
     FROM nb_sh_sample_cat
   ),
   model_details AS (
   SELECT T.target_attribute_name                                          tname,
          NVL(TO_CHAR(T.target_attribute_num_value,T.target_attribute_str_value)) tval,
          C.attribute_name                                                 pname,
          NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval,
          T.prior_probability                                             priorp,
          C.conditional_probability                                       condp
     FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('NB_SH_Clas_sample')) T,
          TABLE(T.conditionals) C,
          bin_label_view L
    WHERE C.attribute_name = L.col (+) AND
          (NVL(C.attribute_str_value,C.attribute_num_value) = L.bin(+))
   ORDER BY 1,2,3,4,5,6
   )
   SELECT tname, tval, pname, pval, priorp, condp
     FROM model_details
    WHERE ROWNUM < 11;

TNAME          TVAL PNAME                     PVAL           PRIORP   CONDP

57.8.31 GET_MODEL_DETAILS_NMF Function

The `GET_MODEL_DETAILS_NMF` function returns a set of rows that provide the details of a non-negative matrix factorization model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

Syntax

```
DBMS_DATA_MINING.get_model_details_nmf(
      model_name IN VARCHAR2,
      partition_name VARCHAR2 DEFAULT NULL)
   RETURN DM_NMF_Feature_Set PIPELINED;
```

Parameters

Table 57-100 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`partition_name`	Specifies a partition in a partitioned model

Return Values

Table 57-101 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description

`DM_NMF_FEATURE_SET`	A set of rows of `DM_NMF_FEATURE`. The rows have the following columns:
	`(feature_id NUMBER,`
	`mapped_feature_id VARCHAR2(4000),`
	`attribute_set DM_NMF_ATTRIBUTE_SET)`
	The `attribute_set` column of `DM_NMF_FEATURE` returns a nested table of type `DM_NMF_ATTRIBUTE_SET`. The rows, of type `DM_NMF_ATTRIBUTE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_value VARCHAR2(4000),`
	`coefficient NUMBER)`

Usage Notes

- The table function pipes out rows of type `DM_NMF_FEATURE_SET`. For information on machine learning data types and piped output from table functions, see "Data Types".
- When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the feature extraction model `NMF_SH_Sample`.

```
SELECT * FROM (
SELECT F.feature_id,
       A.attribute_name,
       A.attribute_value,
       A.coefficient
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
       TABLE(F.attribute_set) A
ORDER BY feature_id,attribute_name,attribute_value
) WHERE ROWNUM < 11;

FEATURE_ID ATTRIBUTE_NAME          ATTRIBUTE_VALUE          COEFFICIENT

57.8.32 GET_MODEL_DETAILS_OC Function

The `GET_MODEL_DETAILS_OC` function returns a set of rows that provide the details of an O-cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. Use model detail views instead.

See Model Detail Views in *Oracle Machine Learning for SQL User's Guide*.

You can provide input to `GET_MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then `GET_MODEL_DETAILS_OC` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.get_model_details_oc(
      model_name VARCHAR2,
      cluster_id NUMBER   DEFAULT NULL,
      attribute  VARCHAR2 DEFAULT NULL,
      centroid   NUMBER   DEFAULT 1,
      histogram  NUMBER   DEFAULT 1,
      rules      NUMBER   DEFAULT 2,
      topn_attributes NUMBER DEFAULT NULL,
      partition_name VARCHAR2 DEFAULT NULL)
  RETURN dm_clusters PIPELINED;
```

Parameters

Table 57-102 GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned
centroid	This parameter accepts the following values: • 1: Details about centroids are returned (default) • 0: Details about centroids are not returned
histogram	This parameter accepts the following values: • 1: Details about histograms are returned (default) • 0: Details about histograms are not returned
rules	This parameter accepts the following values: • 2: Details about rules are returned (default) • 1: Rule summaries are returned • 0: No information about rules is returned
topn_attributes	Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the *n* attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than *topn*, then up to *n* additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.
partition_name	Specifies a partition in a partitioned model.

Usage Notes

1. For information about machine learning data types and return values for clustering algorithms piped output from table functions, see "Data Types".
2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the clustering model OC_SH_Clus_sample.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
     FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
                  sp.attribute_str_value s_value
             FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                    'OC_SH_Clus_sample')) a,
```

```
                TABLE(a.split_predicate) sp
          ORDER BY a.id, op, s_value)
    WHERE ROWNUM < 11;

57.8.33 GET_MODEL_SETTINGS Function

The `GET_MODEL_SETTINGS` function returns the settings used to build the given model. Starting from Oracle Database 12*c* Release 2, this function is deprecated. See "Static Data Dictionary Views: `ALL_ALL_TABLES` to `ALL_OUTLINES`" in *Oracle Database Reference*.

Syntax

```
FUNCTION get_model_settings(model_name IN VARCHAR2)
  RETURN DM_Model_Settings PIPELINED;
```

Parameters

Table 57-103 GET_MODEL_SETTINGS Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.

Return Values

Table 57-104 GET_MODEL_SETTINGS Function Return Values

Return Value	Description

`DM_MODEL_SETTINGS`	A set of rows of type `DM_MODEL_SETTINGS`. The rows have the following columns:
	`DM_MODEL_SETTINGS TABLE OF SYS.DM_MODEL_SETTING`
	`Name Type`
	`SETTING_NAME VARCHAR2(30)`
	`SETTING_VALUE VARCHAR2(4000)`

Usage Notes

1. This table function pipes out rows of type `DM_MODEL_SETTINGS`. For information on machine learning data types and piped output from table functions, see "DBMS_DATA_MINING Datatypes".
2. The setting names/values include both those specified by the user and any defaults assigned by the build process.

Examples

The following example returns model model settings for an example naive Bayes model.

```
SETTING_NAME                   SETTING_VALUE
------------------------------ ------------------------------
ALGO_NAME                       ALGO_NAIVE_BAYES
PREP_AUTO                       ON
ODMS_MAX_PARTITIONS             1000
NABS_SINGLETON_THRESHOLD       0
CLAS_WEIGHTS_BALANCED          OFF
