granularity	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics. The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.
statid	Identifier (optional) to associate with these statistics within stattab.
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views LIST EMPTY: Returns a list of objects which currently have no statistics
statown	Schema containing stattab, if different from current schema.

Table 192-103 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
gather_sys	Gathers statistics on the objects owned by the SYS user.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
gather_temp	Gathers statistics on global temporary tables when TRUE. The default is FALSE. The temporary table must be created with the ON COMMIT PRESERVE ROWS clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.
gather_fixed	Gather statistics on fixed tables when TRUE. The default is FALSE. Only user SYS can collect statistics for fixed tables. The ownname must be SYS or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments: • estimate_percent • block_sample • stattab • statid • statown The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.
stattype	The type of statistics: • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
obj_filter_list	A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values. When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.

Table 192-103 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
detail_level	The level of detail for the content of the report. Valid values are as follows: • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
format	The format of the report. Valid values are: • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

192.7.95 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in REPORT_GATHER_DICTIONARY_STATS Functions. For all other input parameters, see GATHER_DICTIONARY_STATS Procedure.

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
   comp_id               IN    VARCHAR2   DEFAULT NULL,
   estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE

(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample          IN    BOOLEAN    DEFAULT FALSE,
   method_opt            IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
   degree                IN    NUMBER     DEFAULT TO_DEGREE_TYPE
                                              (GET_PARAM('DEGREE')),
   granularity           IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
   cascade               IN    BOOLEAN    DEFAULT TO_CASCADE_TYPE
                                              (GET_PARAM('CASCADE')),
   stattab               IN    VARCHAR2   DEFAULT NULL,
   options               IN    VARCHAR2   DEFAULT 'GATHER AUTO',
   no_invalidate         IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
                                              (GET_PARAM('NO_INVALIDATE')),
   stattype              IN    VARCHAR2   DEFAULT 'DATA',
   obj_filter_list       IN    ObjectTab  DEFAULT NULL,
   detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
   format                IN    VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 192-104 REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
comp_id	Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	The method options. This parameter accepts the following values: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,2048]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 192-104 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
granularity	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics.
options	Further specification of objects for which to gather statistics: • 'GATHER' - Gathers statistics on all objects in the schema • 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. • 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. • 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. • 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' • 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views • 'LIST EMPTY' - Returns list of objects which currently have no statistics

Table 192-104 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	The type of statistics: • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.
detail_level	See the description in REPORT_GATHER_DICTIONARY_STATS Functions.
format	See the description in REPORT_GATHER_DICTIONARY_STATS Functions.

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

192.7.96 REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
   stattab          IN  VARCHAR2 DEFAULT NULL,
   statid           IN  VARCHAR2 DEFAULT NULL,
   statown          IN  VARCHAR2 DEFAULT NULL,
   no_invalidate    IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                    GET_PARAM('NO_INVALIDATE')),
   detail_level     IN  VARCHAR2   DEFAULT 'TYPICAL',
   format           IN  VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 192-105 REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to save the current statistics
`statid`	Identifier to associate with these statistics within `stattab` (optional)
`statown`	Schema containing `stattab` (if different from current schema)
`no_invalidate`	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • `TRUE`: Dependent cursors are not invalidated. • `FALSE`: Dependent cursors are marked for immediate invalidation. • `AUTO`: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 192-105 (Cont.) REPORT_GATHER_FIXED_OBJ_STATS Procedure Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report • `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (`CONCURRENT` preference is turned on).
`format`	Report format: • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

Related Topics

- GATHER_FIXED_OBJECTS_STATS Procedure
  This procedure gathers statistics for all fixed objects (dynamic performance tables).

192.7.97 REPORT_GATHER_SCHEMA_STATS Functions

This function runs the GATHER_SCHEMA_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER_SCHEMA_STATS. The input set of parameters is exactly the same as in GATHER_SCHEMA_STATS, with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
   ownname           IN   VARCHAR2,
   estimate_percent  IN   NUMBER      DEFAULT TO_ESTIMATE_PERCENT_TYPE (
                                        GET_PARAM ('ESTIMATE_PERCENT')),
   block_sample      IN   BOOLEAN     DEFAULT FALSE,
   method_opt        IN   VARCHAR2    DEFAULT GET_PARAM ('METHOD_OPT'),
   degree            IN   NUMBER      DEFAULT TO_DEGREE_TYPE (
                                        GET_PARAM('DEGREE')),
   granularity       IN   VARCHAR2    DEFAULT GET_PARAM('GRANULARITY'),
   cascade           IN   BOOLEAN     DEFAULT TO_CASCADE_TYPE (
                                        GET_PARAM ('CASCADE')),
   stattab           IN   VARCHAR2    DEFAULT NULL,
   statid            IN   VARCHAR2    DEFAULT NULL,
   options           IN   VARCHAR2    DEFAULT 'GATHER',
   statown           IN   VARCHAR2    DEFAULT NULL,
   no_invalidate     IN   BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE (
                                        GET_PARAM ('NO_INVALIDATE')),
   force             IN   BOOLEAN     DEFAULT FALSE,
   obj_filter_list   IN   ObjectTab   DEFAULT NULL,
   detail_level      IN   VARCHAR2    DEFAULT 'TYPICAL',
   format            IN   VARCHAR2    DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 192-106 REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,2048]. – REPEAT : Collects histograms only on the columns that already have histograms – AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.

Table 192-106 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different than ownname)

Table 192-106 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Table 192-106 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report • `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (`CONCURRENT` preference is turned on).
`format`	Report format: • XML • HTML • TEXT (Default)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

`ORA-20000`: Schema does not exist or insufficient privileges

`ORA-20001`: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "`T`" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'GATHER STALE');
END;
```

192.7.98 REPORT_GATHER_TABLE_STATS Function

This procedure runs the GATHER_TABLE_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                 get_param('NO_INVALIDATE')),
   stattype         VARCHAR2 DEFAULT 'DATA',
   force            BOOLEAN  DEFAULT FALSE)
   detail_level     VARCHAR2 DEFAULT 'TYPICAL',   format          VARCHAR2 DEFAULT
'TEXT')
 RETURN CLOB;
```

Parameters

Table 192-107 REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts either of the following options, or both in combination: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column_clause is defined as column_clause := column_name | extension name | extension – integer : Number of histogram buckets. Must be in the range [1,2048]. – REPEAT : Collects histograms only on the columns that already have histograms – AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 192-107 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Table 192-107 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked

Table 192-107 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
`detail_level`	Detail level for the content of the report • `BASIC`: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • `TYPICAL`: In addition to the information provided at level `BASIC`, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • `ALL`: In addition to the information provided at level `TYPICAL`, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (`CONCURRENT` preference is turned on).
`format`	Report format: • XML • HTML • TEXT (Default)

Return Values

A `CLOB` object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Related Topics

- GATHER_TABLE_STATS Procedure
  This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

192.7.99 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
   opid              NUMBER,
   detail_level      VARCHAR2  DEFAULT 'TYPICAL',
   format            VARCHAR2  DEFAULT 'TEXT'
   container_id      NUMBER    DEFAULT NULL)
 RETURN CLOB;
```

Parameters

Table 192-108 REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
opid	Operation ID

Table 192-108 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) With regard to target objects: - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name - session ID - parameter values - error message if the operation failed With regard to target objects: - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks) - additional error details if the task has failed. Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).

Table 192-108 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
format	Report format: • XML • HTML • TEXT (Default)
container_id	ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

192.7.100 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
   detail_level       VARCHAR2 DEFAULT 'TYPICAL',
   format             VARCHAR2 DEFAULT 'TEXT',
   latestN            NUMBER DEFAULT NULL,
   since              TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   until              TIMESTAMP WITH TIME ZONE DEFAULT NULl,
   auto_only          BOOLEAN DEFAULT FALSE,
   container_ids      DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
 RETURN CLOB;
```

Parameters

Table 192-109 REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
detail_level	Detail level for the content of the report • BASIC: The report includes - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed -out objects (applies to only auto statistics gathering) • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: - job name (if the operation was run in a job) - session ID - parameter values - additional error details if the operation has failed
format	Report format: • XML • HTML • TEXT (Default)
latestN	Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported.
since	The report will include only statistics operations that started after this timestamp.
until	The report will include only statistics operations that before after this timestamp.
auto_only	When TRUE, the report will contain only auto statistics gathering job runs.
container_ids	A multitenant environment contains one or more pluggable databases (PDBs). container_ids represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `harvals` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab  DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

192.7.101 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 192-110 RESET_ADVISOR_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

192.7.102 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
   ownname     IN    VARCHAR2,
   tabname     IN    VARCHAR2);
```

Parameters

Table 192-111 RESET_COL_USAGE Procedure Parameters

Parameter	Description
ownname	Owner name. If NULL it deletes column usage information for tables in all schemas in the database.
tabname	Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tabname is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

192.7.103 RESET_GLOBAL_PLSQL_PREFS_DEF Procedure

Reset all global PL/SQL preferences to their default value.

Syntax

```
EXEC DBMS_STATS.RESET_GLOBAL_PLSQL_PREF_DEFAULTS
```

Parameters

None.

192.7.104 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

> **Note:**
>
> This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility.
>
> See also . DBMS_STATS Deprecated Subprograms

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

192.7.105 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DATABSE_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 192-112 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics
`force`	Restores statistics even if their statistics are locked
`no_invalidate`	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • `TRUE`: Dependent cursors are not invalidated. • `FALSE`: Dependent cursors are marked for immediate invalidation. • `AUTO`: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

192.7.106 RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 192-113 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	Timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

192.7.107 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                            (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 192-114 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics
`force`	Restores statistics even if their statistics are locked
`no_invalidate`	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • `TRUE`: Dependent cursors are not invalidated. • `FALSE`: Dependent cursors are marked for immediate invalidation. • `AUTO`: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or inconsistent values

`ORA-20006`: Unable to restore statistics, statistics history not available

192.7.108 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
```

```
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                                 (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 192-115 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

192.7.109 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 192-116 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

192.7.110 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
   ownname                  VARCHAR2,
   tabname                  VARCHAR2,
   as_of_timestamp          TIMESTAMP WITH TIME ZONE,
   restore_cluster_index    BOOLEAN DEFAULT FALSE,
   force                    BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 192-117 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tabname	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

192.7.111 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
  task_name IN VARCHAR2);
```

Parameters

Table 192-118 RESUME_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 192-14 Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
  v_ename   VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an `ORA-13632` to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

192.7.112 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2    := NULL,
  dir_name           IN   VARCHAR2    := NULL,
  level              IN   VARCHAR2    := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 192-119 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
dir_name	Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory.
level	The level of the script to generate. Possible values are • ALL: Ignores the filter and generates a script for all findings • TYPICAL: Generates a script according to the filters in place

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level

  Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.

- Operation level

  The results depend on the following privileges:

  – Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.

  – Users with the ANALYZE ANY privilege but *not* the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.

  – Users with the ANALYZE ANY DICTIONARY privilege but *not* the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.

  – Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

  Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns a CLOB that contains the script.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 192-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named myrep, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_ftype  VARCHAR2(400) := p_ftype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
   IF which = 'REPORT'
   THEN
      -- generate a report
      v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
                    task_name => v_tname,
                    type      => v_ftype,
                    section   => 'ALL',
                    level     => 'ALL');
      v_len := DBMS_LOB.getlength(v_report);
      WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
   ELSE
      -- generate a script
      v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
      v_len := DBMS_LOB.getlength(v_script);
      WHILE (v_pn < v_len)
      LOOP
```

```
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
   END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF
```

192.7.113 SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```
DBMS_STATS.SEED_COL_USAGE (
   sqlset_name     IN    VARCHAR2,
   owner_name      IN    VARCHAR2,
   time_limit      IN    POSITIVE DEFAULT NULL);
```

Parameters

Table 192-120 SEED_COL_USAGE Procedure Parameters

Parameter	Description
`sqlset_name`	Name of the SQL tuning set that contains the statements to be monitored. If this parameter and `owner_name` are both null, then the procedure monitors all statements in the database for the specified time limit.
`owner_name`	Owner of the SQL tuning set that contains the statements to be monitored. If this parameter and `sqlset_name` are both null, then the procedure monitors all statements in the database for the specified time limit.
`time_limit`	Time limit (in seconds).

Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the CREATE_EXTENDED_STATS Function procedure. If sqlset_name and owner_name are NULL, then the procedure records the column (group) usage information for the statements executed in the system in next time_limit seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in SYS.COL_USAGE$. The procedure stores information in SYS.COL_GROUP_USAGE$.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
   DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

192.7.114 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name     IN   VARCHAR2,
  parameter     IN   VARCHAR2,
  value         IN   VARCHAR2);
```

Parameters

Table 192-121 SET_ADVISOR_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
parameter	The name of the parameter to set. The function returns an error if the specified parameter does not exist.
value	The new value of the parameter.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges

- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to manage Optimizer Statistics Advisor

192.7.115 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   distcnt       NUMBER DEFAULT NULL,
   density       NUMBER DEFAULT NULL,
   nullcnt       NUMBER DEFAULT NULL,
   srec          StatRec DEFAULT NULL,
   avgclen       NUMBER DEFAULT NULL,
   flags         NUMBER DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                 get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 192-122 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

192.7.116 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can by included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname           IN   VARCHAR2,
    pvalue          IN   VARCHAR2,
    add_sys         IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 192-123 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
`pname`	Preference name. The existing value for following preferences can be set and default preference values will be used: • `APPROXIMATE_NDV_ALGORITHM` • `AUTO_STAT_EXTENSIONS` • `CASCADE` • `DEGREE` • `ESTIMATE_PERCENT` • `GLOBAL_TEMP_TABLE_STATS` • `GRANULARITY` • `INCREMENTAL` • `INCREMENTAL_STALENESS` • `INCREMENTAL_LEVEL` • `METHOD_OPT` • `NO_INVALIDATE` • `OPTIONS` • `PREFERENCE_OVERRIDES_PARAMETER` • `PUBLISH` • `STALE_PERCENT` • `STAT_CATEGORY` • `TABLE_CACHED_BLOCKS`
`pvalue`	Preference value. If `NULL` is specified, it will set the Oracle default values
`add_sys`	Value `TRUE` will include the Oracle-owned tables

Table 192-124 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.

Table 192-124 (Cont.) Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table: • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.

Table 192-124 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values: • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 192-124 (Cont.) Statistics Preferences

Preference	Description

INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.
	The parameter accepts the following values:
	• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.
	For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.
	Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.
	• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.
	For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.
	• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.
	• NULL—A partition or subpartition is considered stale when it has any DML changes.
	For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.
	Note that the following two executions are different:
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.

Table 192-124 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] The size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} integer — Specifies the number of histogram buckets. The number must be between 1 and 2048. REPEAT — Collects histograms only on the columns that already have histograms. AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns. SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.
OPTIONS	Specifies which objects require statistics to be gathered. Valid values are as follows: • GATHER — Gathers statistics on all objects in the database. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.

Table 192-124 (Cont.) Statistics Preferences

Preference	Description
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default) • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');
```

>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

192.7.117 SET_GLOBAL_PREFS Procedure

This procedure sets statistics preferences at the global level.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 192-125 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for the following preferences can be set: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • AUTOSTATS_TARGET • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS
pvalue	Preference value. If NULL is specified, it will set the Oracle default values

Table 192-126 Global Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
AUTO_TASK_STATUS	Enables or disables the high-frequency automatic optimizer statistics collection. Values are: • ON — Enables high-frequency automatic optimizer statistics collection. • OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
AUTO_TASK_MAX_RUN_TIME	Configures the maximum runtime in seconds of an execution of the the high-frequency automatic statistics collection. The default is 3600 but varies among Oracle Database platforms.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).
AUTOSTATS_TARGET	Controls the objects considered for statistics collection. It takes the following values: • 'ALL' - Statistics collected for all objects in system • 'ORACLE' - Statistics collected for all Oracle owned objects • 'AUTO' - Oracle decides on which objects to collect statistics This preference is applicable only for automatic statistics collection.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.
CONCURRENT	Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: • MANUAL — Concurrency is enabled only for manual statistics gathering. • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. • ALL — Concurrency is enabled for both manual and automatic statistics gathering. • OFF — Concurrency is disabled for both manual and automatic statistics. Note the following guidelines: The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER_*_STATS procedures. DBMS_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers. To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB_QUEUE_PROCESSES initialization parameter must be at least 4.
DEGREE	Determines the degree of parallelism used for gathering statistics.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL	Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table: • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values: • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description

	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value `NULL`, whereas the second sets the preference to the default, which is `ALLOW_MIXED_FORMAT`.

`METHOD_OPT`	Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • `FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]` `size_clause` is defined as `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}` – `integer`: Number of histogram buckets. Must be in the range [1,2048]. – `REPEAT` : Collects histograms only on the columns that already have histograms – `AUTO` : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns – `SKEWONLY` : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - `column_name` : name of a column - `extension` : can be either a column group in the format of `(column_name, colume_name [, ...])` or an expression The default is `FOR ALL COLUMNS SIZE AUTO`.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics. For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.

Table 192-126 (Cont.) Global Statistics Preferences

Preference	Description
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: • OBJECT_STATS — table statistics, column statistics and index statistics (default) • SYNOPSES — information to support incremental statistics • REALTIME_STATS — specifies only real-time statistics. The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.
WAIT_TIME_TO_UPDATE_STATS	Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.

Security Model

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 192-16 Overriding Statistics Preferences at the Global Level

You use the `SET_GLOBAL_PREFS` procedure to set the `ESTIMATE_PERCENT` preference to `5` for every table in the database that does not have a table preference set. Because `sh.costs` does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');

PL/SQL procedure successfully completed.
```

You use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to true for the `sh.sales` table only.

```
SQL> EXEC
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRUE
');

PL/SQL procedure successfully completed.
```

A script attempts to set `ESTIMATE_PERCENT` to `10` when gathering statistics for `sh.sales`. However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of `5` rather than the specified setting of `10`:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs', ESTIMATE_PERCENT=>10);

PL/SQL procedure successfully completed.
```

Example 192-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

192.7.118 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   numrows       NUMBER    DEFAULT NULL,
   numlblks      NUMBER    DEFAULT NULL,
   numdist       NUMBER    DEFAULT NULL,
   avglblk       NUMBER    DEFAULT NULL,
   avgdblk       NUMBER    DEFAULT NULL,
   clstfct       NUMBER    DEFAULT NULL,
   indlevel      NUMBER    DEFAULT NULL,
   flags         NUMBER    DEFAULT NULL,
   statown       VARCHAR2  DEFAULT NULL,
   no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   guessq        NUMBER    DEFAULT NULL,
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Use the following syntax for user-defined domain index statistics:

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 192-127 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	Internal use only. Do not set.
cachehit	Internal use only. Do not set.
force	Sets the values even if statistics of the index are locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid input value

`ORA-20005`: Object statistics are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

>
> *Oracle Database SQL Tuning Guide* to learn how to set artificial statistics

192.7.119 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of `DBMS_STATS` procedures.

> **Note:**
>
> This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.
>
> See also DBMS_STATS Deprecated Subprograms.

You can use the `GET_PARAM Function` to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
   pname       IN    VARCHAR2,
   pval        IN    VARCHAR2);
```

Parameters

Table 192-128 SET_PARAM Procedure Parameters

Parameter	Description
`pname`	The parameter name The default value for following parameters can be set. • `CASCADE` - The default value for `CASCADE` set by `SET_PARAM` is not used by export/import procedures.It is used only by gather procedures. • `DEGREE` • `ESTIMATE_PERCENT` • `METHOD_OPT` • `NO_INVALIDATE` • `GRANULARITY` • `AUTOSTATS_TARGET` - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see `pval`)
`pval`	The parameter value. If `NULL` is specified, it will set the default value determined by Oracle. When `pname` is `AUTOSTATS_TARGET`, the following are valid values: • `'ALL'` - Statistics are collected for all objects in the system • `'ORACLE'` - Statistics are collected for all Oracle owned objects • `'AUTO'` - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the `SYSDBA` or both the `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

- Note that both arguments are of type `VARCHAR2` and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between `NULL` and `'NULL'`:
  - When `NULL` is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted `'NULL'`, this sets the value of the parameter to `NULL`.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

192.7.120 SET_PLSQL_PREFS Procedure

Sets the PL/SQL function preference either for a specific PL/SQL function or for all functions in the same package.

Dynamic sampling is a performance feature that instructs the optimizer to read a sample of data during query compilation to formulate dynamic statistics. Dynamic statistics supplement optimizer statistics such as table and index block counts, table and join cardinalities (estimated number of rows), join column statistics, and GROUP BY statistics. This information helps the optimizer improve plans by making better estimates for predicate cardinality.

The preference value controls whether functions can be executed during dynamic sampling to improve cardinality estimates. High-performance PL/SQL is generally suitable for use in dynamic sampling, but you should exclude long-running PL/SQL functions since they will increase SQL compilation times.

Function-specific preferences set with SET_PLSQL_PREFS are persistent across sessions.

Syntax

```
DBMS_STATS.SET_PLSQL_PREFS(
    user           IN VARCHAR2,
    package_name   IN VARCHAR2,
    function_name  IN VARCHAR2,
    pname          IN VARCHAR2,
    pvalue         IN VARCHAR2
);
```

Parameters

Table 192-129 SET_PLSQL_PREFS Procedure Parameters

Parameter	Description
`user`	Owner of the function. If NULL, the current user is used.

Table 192-129 (Cont.) SET_PLSQL_PREFS Procedure Parameters

Parameter	Description
package_name	The PL/SQL package name. If NULL, this specifies a stand-alone, top-level function.
function_name	Name of the PL/SQL function. To apply the preference to all functions within the package, specify NULL.
pname	The preference that you want to set. Currently only 'dynamic_stats' is accepted.
pvalue	The value of the preference. These are the options for the 'dynamic_stats' preference: • ON - Allow dynamic sampling for this PL/SQL function • OFF - Disallow dynamic sampling for this PL/SQL function • CHOOSE - Leave enabling or disabling dynamic statistics to the discretion of the optimizer. • If pvalue is NULL, the dynamic statistics preference set for this function is deleted and the global preference is used.

Note:

Preference settings have the following order of precedence from higher to lowest:

1. The plsql_function_dynamic_stats hint
2. The session level parameter plsql_function_dynamic_stats
3. The specific PL/SQL function preference that is set using SET_PLSQL_PREFS
4. The global preference that is set using SET_GLOBAL_PLSQL_PREFS

Examples

In this example the owner is the current schema and so the USER parameter is set to NULL. Dynamic statistics for the named function are turned off.

```
EXEC SET_PLSQL_PREFS(NULL, '<PACKAGE_NAME>', '<FUNCTION_NAME>',
'dynamic_stats', 'OFF')
```

In this example, the function_name parameter is set to NULL. Therefore the dynamic statistics preference is set on all functions within the named PL/SQL package.

```
EXEC SET_PLSQL_PREFS('<USER>', '<PACKAGE_NAME>', NULL, 'dynamic_stats', 'ON')
```

In the example below, `pvalue` is set to NULL. The preference set for this function is deleted and the global preference is used. Setting `pvalue` to NULL in this procedure has the same effect as executing `DELETE_PLSQL_PREFS` on the function.

```
EXEC SET_PLSQL_PREFS('<USER>', '<PACKAGE_NAME>',
'<FUNCTION_NAME>','dynamic_stats', NULL)
```

Usage Notes

> **See Also:**
>
> The following privileges enable use of dynamic sampling for PL/SQL functions:
>
> - The owner of the PL/SQL function (or package) can set preferences on those functions.
> - If the session user has SYSDBA privileges, they can set preferences any PL/SQL function (or all functions within a package).
> - If the session user has the ANALYZE ANY DICTIONARY privilege, they can set preferences on any function or package.
> - If the user in the session has the ANALYZE ANY privilege, they can set preferences on any PL/SQL function or package except those owned by SYS.
>
> For additional controls over PL/SQL preferences see Controls for Dynamic Sampling With PL/SQL Functions in the *Database SQL Tuning Guide*. Oracle provides a hint to control PL/SQL dynamic sampling behavior for an individual SQL statement, as well as a session-level parameter.
>
> The *SQL Tuning Guide* also provides details on dynamic statistics at Configuring Options for Dynamic Statistics

192.7.121 SET_GLOBAL_PLSQL_PREFS Procedure

Sets the global preference for PL/SQL functions.

By default, the global preference is set to `CHOOSE`, which lets the optimizer choose the dynamic statistics behavior.

Global preferences set with SET_GLOBAL_PLSQL_PREFS are persistent across sessions.

Syntax

```
DBMS_STATS.SET_GLOBAL_PLSQL_PREFS(
    pname           IN VARCHAR2,
    pvalue          IN VARCHAR2
);
```

Parameters

Table 192-130 SET_GLOBAL_PLSQL_PREFS Procedure Parameters

Parameter	Description
pname	The preference that you want to set. Currently only 'dynamic_stats' is accepted.
pvalue	The value of the preference can either be NULL or one of these three options: • ON - Allow dynamic statistics for PL/SQL functions. • OFF - Disallow dynamic sampling for PL/SQL functions. • CHOOSE - Leave enabling or disabling dynamic statistics to the discretion of the Optimizer. If pvalue is NULL, the global preference is set to the default – CHOOSE.

Examples

Enable dynamic statistics for PL/SQL functions:

```
EXEC DBMS_STATS.SET_PLSQL_GLOBAL_PREFS('dynamic_stats', 'ON')
```

Disable dynamic statistics for PL/SQL functions:

```
EXEC DBMS_STATS.SET_PLSQL_GLOBAL_PREFS('dynamic_stats', 'OFF')
```

Let the optimizer choose whether or not enable the use of dynamic statistics for PL/SQL functions:

```
EXEC DBMS_STATS.SET_PLSQL_GLOBAL_PREFS('dynamic_stats', 'CHOOSE')
EXEC DBMS_STATS.SET_PLSQL_GLOBAL_PREFS('dynamic_stats', NULL)
```

192.7.122 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
   opname      IN    VARCHAR2,
   procrate    IN    NUMBER);
```

Parameters

Table 192-131 SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
opname	Name of the operation. Valid values are as follows: • AGGR • ALL • CPU • CPU_ACCESS • CPU_AGGR • CPU_BYTES_PER_SEC • CPU_FILTER • CPU_GBY • CPU_HASH_JOIN • CPU_JOIN • CPU_NL_JOIN • CPU_RANDOM_ACCESS • CPU_SEQUENTIAL_ACCESS • CPU_SM_JOIN • CPU_SORT • HASH • IO • IO_ACCESS • IO_BYTES_PER_SEC • IO_RANDOM_ACCESS • IO_SEQUENTIAL_ACCESS • MEMCMP • MEMCPY
procrate	Processing rate.

Security Model

You must have the OPTIMIZER_PROCESSING_RATE role to run this procedure.

Usage Notes

AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

192.7.123 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

Parameters

Table 192-132 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. You can set the default value for the following preferences: • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it sets the database default value.

Table 192-133 Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values. You can set the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	This preference takes the following values: • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 192-133 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are: 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
INCREMENTAL	Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: • INCREMENTAL value for the partitioned table is set to TRUE • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.

Table 192-133 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: • TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. • PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

Table 192-133 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. Note that the following two executions are different: `EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS`

Table 192-133 (Cont.) Statistics Preferences

Preference	Description
	('sh', 'sales', 'INCREMENTAL_STALENESS', null); The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.
METHOD_OPT	Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer: Number of histogram buckets. Must be in the range [1,2048]. – REPEAT : Collects histograms only on the columns that already have histograms – AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns – SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 192-133 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics. For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11*g* Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.

Security Model

To run this procedure, you must be the schema owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or illegal input value

Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

> **See Also:**

> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

192.7.124 SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
   pname          VARCHAR2,
   pvalue         NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 192-134 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: • iotfrspeed—I/O transfer speed in bytes for each millisecond • ioseektim - Seek time + latency time + operating system overhead time, in milliseconds • sreadtim - Average time to read single block (random read), in milliseconds • mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds • cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) • cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. • mbrc - Average multiblock read count for sequential read, in blocks • maxthr - Maximum I/O system throughput, in bytes/second • slavethr - Average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

192.7.125 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
```

```
   pname      IN  VARCHAR2,
   pvalue     IN  VARCHAR2);
```

Parameters

Table 192-135 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. You can set the default value for following preferences: • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Table 192-136 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences: • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether to collect index statistics as part of gathering table statistics.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description
CONCURRENT	This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time: • 'MANUAL' - Concurrency will be turned on only for manual statistics gathering. • 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering. • 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering. • 'OFF': Concurrency will be turned off for both manual and automatic statistics
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values: • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.
GRANULARITY	Determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO'- Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL	Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: • INCREMENTAL value for the partitioned table is set to TRUE; • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE It takes two values: • TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures. • PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'. The parameter accepts the following values: • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCEMENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description

	Note that the following two executions are different:
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');`
	
	`EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);`
	
	The first execution uses single quotes to set the preference to the value `NULL`, whereas the second sets the preference to the default, which is `ALLOW_MIXED_FORMAT`.

`METHOD_OPT`	The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: • `FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]` `size_clause` is defined as `size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}` – `integer`: Number of histogram buckets. Must be in the range [1,2048]. – `REPEAT` : Collects histograms only on the columns that already have histograms – `AUTO` : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns – `SKEWONLY` : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - `column_name` : name of a column - `extension` : can be either a column group in the format of `(column_name, colume_name [, ...])` or an expression The default is `FOR ALL COLUMNS SIZE AUTO`.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
OPTIONS	Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics. For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.

Table 192-136 (Cont.) Statistics Preferences

Preference	Description
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you must connect as owner of the table or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

Example 192-18 Overriding Statistics Preferences

In this example, legacy scripts set ESTIMATE_PERCENT explicitly rather than using the recommended AUTO_SAMPLE_SIZE. Your goal is to prevent users from using these scripts to set preferences on the sh.costs table.

No preference for ESTIMATE_PERCENT is set for sh.costs or at the global level, so the preference defaults to AUTO_SAMPLE_SIZE:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;

STAT_PREFS
----------
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use SET_TABLE_PREFS to set the PREFERENCE_OVERRIDES_PARAMETER preference to TRUE for the costs table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to `100` when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs', ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of `100`.

> **See Also:**
>
> *Oracle Database SQL Tuning Guide* to learn how to set optimizer statistics preferences

192.7.126 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2 DEFAULT NULL,
   statid          VARCHAR2 DEFAULT NULL,
   numrows         NUMBER   DEFAULT NULL,
   numblks         NUMBER   DEFAULT NULL,
   avgrlen         NUMBER   DEFAULT NULL,
   flags           NUMBER   DEFAULT NULL,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                  get_param('NO_INVALIDATE')),
   cachedblk       NUMBER   DEFAULT NULL,
   cachehit        NUMBER   DEFAULT NULL,
   force           BOOLEAN  DEFAULT FALSE,
   im_imcu_count   NUMBER   DEFAULT NULL,
   im_block_count  NUMBER   DEFAULT NULL,
   scanrate        NUMBER   DEFAULT NULL);
```

Parameters

Table 192-137 SET_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema.
`tabname`	Name of the table.

Table 192-137 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	Table in which to store the statistics. If stattab is NULL, then the database stores the statistics in the data dictionary.
statid	Identifier (optional) to associate with these statistics within stattab. This identifier is only relevant if stattab is not NULL.
numrows	Number of rows in the table or partition.
numblks	Number of blocks that the table or partition occupies.
avgrlen	Average row length for the table or partition.
flags	For internal use only. Do not set.
statown	Schema containing stattab (if different than ownname).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
cachedblk	For internal use only. Do not set.
cachehit	For internal use only. Do not set.
force	A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.
im_imcu_count	The number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	The number of In-Memory blocks in the table or partition.
scanrate	The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.

Security Model

To invoke this procedure you must be owner of the table, or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or have the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

`ORA-20005`: Object statistics are locked

Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

> **Note:**
>
> The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the database does not have one major workload, resulting in averages that do not correspond to real values

192.7.127 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 192-138 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

192.7.128 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by dblink to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
   ownname     IN     VARCHAR2,
   tabname     IN     VARCHAR2,
   dblink      IN     VARCHAR2,   options     IN     NUMBER DEFAULT NULL);
```

Parameters

Table 192-139 TRANSFER_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.
tabname	Name of the table. If NULL, all tables in OWNNAME.
dblink	Database link name
options	By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

192.7.129 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname     VARCHAR2,
    tabname     VARCHAR2,
    partname    VARCHAR2);
```

Parameters

Table 192-140 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

192.7.130 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 192-141 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*, DELETE_*, IMPORT_*, GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

192.7.131 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
   ownname     VARCHAR2,
   tabname     VARCHAR2);
```

Parameters

Table 192-142 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke theLOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

192.7.132 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
   ownname    VARCHAR2,
   stattab    VARCHAR2);
```

Parameters

Table 192-143 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

193
DBMS_STORAGE_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of DBMS_STORAGE_MAP Subprograms

193.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

> **See Also:**
>
> - *Oracle Database Administrator's Guide*for more information
> - *Oracle Database Reference*for `V$MAP` views, including `V$MAP_FILE`, `V$MAP_ELEMENT`, `V$MAP_SUBELEMENT`, `V$MAP_FILE_EXTENT`

193.2 DBMS_STORAGE_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

> **See Also:**
>
> *Oracle Database Administrator's Guide*for a discussion of the configuration ID, an attribute of the element or file that is changed.

193.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

Table 193-1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function	Drops the mapping information for the element defined by `elemname`
DROP_FILE Function	Drops the file mapping information defined by `filename`
LOCK_MAP Procedure	Locks the mapping information in the shared memory of the instance
MAP_ALL Function	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function	Builds mapping information for the element identified by `elemname`
MAP_FILE Function	Builds mapping information for the file identified by `filename`
MAP_OBJECT Function	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure	Unlocks the mapping information in the shared memory of the instance.

193.3.1 DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
      dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-2 DROP_ALL Function Parameters

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

193.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by elemname.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-3 DROP_ELEMENT Function Parameters

Parameter	Description
elemname	The element for which mapping information is dropped.
cascade	If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

193.3.3 DROP_FILE Function

This function drops the file mapping information defined by filename.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
   filename          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-4 DROP_FILE Function Parameters

Parameter	Description
filename	The file for which file mapping information is dropped.
cascade	If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.

Table 193-4 (Cont.) DROP_FILE Function Parameters

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

193.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

193.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
   max_num_fileext   IN NUMBER DEFAULT 100,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-5 MAP_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.

193.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by elemname. It may not obtain the latest mapping information if the element being mapped, or any one of the elements

within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-6 MAP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is built.
`cascade`	If `TRUE`, all elements within the elemname I/O stack DAG are mapped.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

193.3.7 MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
   filename           IN VARCHAR2,
   filetype           IN VARCHAR2,
   cascade            IN BOOLEAN,
   max_num_fileextent IN NUMBER DEFAULT 100,
   dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 193-7 MAP_FILE Function Parameters

Parameter	Description
`filename`	The file for which mapping information is built.
`filetype`	Defines the type of the file to be mapped. It can be `"DATAFILE"`, `"SPFILE"`, `"TEMPFILE"`, `"CONTROLFILE"`, `"LOGFILE"`, or `"ARCHIVEFILE"`.
`cascade`	Should be `TRUE` only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an `ALTER SYSTEM` command or DML operations on extended files), `cascade` can be set to `FALSE` because the mapping changes are limited to the file extents only. If `TRUE`, mapping DAGs are also built for the elements where the file resides.

Table 193-7 (Cont.) MAP_FILE Function Parameters

Parameter	Description
max_num_fileextent	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

193.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
   objname  IN  VARCHAR2,
   owner    IN  VARCHAR2,
   objtype  IN  VARCHAR2);
```

Parameters

Table 193-8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

193.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

193.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

193.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

194
DBMS_SYNC_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

> **See Also:**
>
> *Oracle Database Data Warehousing Guide* for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_SYNC_REFRESH Subprograms

194.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12*c*, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

> **See Also:**
>
> *Oracle Database Data Warehousing Guide* for more information about using synchronous refresh

194.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that it, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

  These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function

  This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

194.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

Table 194-1 DBMS_SYNC_REFRESH Package Subprograms

Subprogram	Description
ABORT_REFRESH Procedure	Aborts a refresh.
ALTER_REFRESH_STATS_RETENTION Procedure	Alters the refresh history retention value, specified in days.
CAN_SYNCREF_TABLE Procedure	Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.
EXECUTE_REFRESH Procedure	Executes synchronous refresh on the synchronous refresh groups.
GET_ALL_GROUP_IDS Function	Returns the group IDs of all the synchronous refresh groups in the database.
GET_GROUP_ID Function	Returns the group ID of a table or materialized view.
GET_GROUP_ID_LIST Function	Returns the group IDs of the tables in a given list of objects (tables or materialized views).
PREPARE_REFRESH Procedure	Prepares the sync refresh groups for refresh.
PREPARE_STAGING_LOG Procedure	Validates and collects statistics on the data in the staging log.
PURGE_REFRESH_STATS Procedure	Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter.
REGISTER_MVIEWS	Registers materialized views for synchronous refresh.
REGISTER_PARTITION_OPERATION Procedure	Registers a partition maintenance operation on a partition of a base table.
UNREGISTER_MVIEWS	Unregisters materialized views from synchronous refresh.
UNREGISTER_PARTITION_OPERATION Procedure	Unregisters a partition maintenance operation on a partition of a base table.

194.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
   group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 194-2 ABORT_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be aborted for sync refresh.

Usage Notes

If called after PREPARE_REFRESH, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after EXECUTE_REFRESH fails, this procedure restores the state of tables to before EXECUTE_REFRESH by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks.

ABORT_REFRESH will work only if a PREPARE_REFRESH or EXECUTE_REFRESH statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

194.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with PURGE_REFRESH_HISTORY. It also requires the SYSDBA privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
   retention    IN NUMBER);
```

Parameters

Table 194-3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

Parameter	Description
retention	The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000. You can use the following values for special purposes: • -1 - Refresh history is never purged by PREPARE_REFRESH. • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. • NULL - Change refresh history retention to default value.

194.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide.*

You can invoke `CAN_SYNCREF_TABLE` in two ways. The first is to use a table, while the second is to create a `VARRAY`.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name     IN VARCHAR2,
    table_name      IN VARCHAR2,
    statement_id    IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name     IN VARCHAR2,
    table_name      IN VARCHAR2,
    output_array    IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of `statement_id` or `output_array` need be provided to `CAN_SYNCREF_TABLE`.

Parameters

Table 194-4 CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema of the base table.
`table_name`	The name of the base table.
`statement_id`	A string (`VARCHAR2(30)`) to identify the rows pertaining to an invocation of `CAN_SYNCREF_TABLE` when the output is directed to a table named `SYNCREF_TABLE` in the user's schema.
`output_array`	The output array into which `CAN_SYNCREF_TABLE` records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.

Using SYNCREF_TABLE

The output of `CAN_SYNCREF_TABLE` can be directed to a table named `SYNCREF_TABLE`. The user is responsible for creating the `SYNCREF_TABLE`; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
   statement_id    VARCHAR2(30),
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
```

```
   mv_name         VARCHAR2(30),
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

Using a VARRAY

You can save the output of `CAN_SYNCREF_TABLE` in a PL/SQL `VARRAY`. The elements of this array are of type `CanSyncRefMessage`, which is predefined in the `SYS` schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
   schema_name     VARCHAR2(30),
   table_name      VARCHAR2(30),
   mv_schema_name  VARCHAR2(30),
   mv_name         VARCHAR2(30),
   eligible        VARCHAR2(1),
   seq_num         NUMBER,
   msg_number      NUMBER,
   message         VARCHAR2(4000));
```

The array type `CanSyncRefArrayType`, which is a varray of `CanSyncRefMessage` objects, is predefined in the `SYS` schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each `CanSyncRefMessage` record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the `SYNCREF_TABLE`. However, the `SYNCREF_TABLE` has a `statement_id` field which is absent in `CanSyncRefMessage` because no `statement_id` is supplied (because it is not required) when `CAN_SYNCREF_TABLE` is called with a `VARRAY` parameter.

194.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id    IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
   group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 194-5 EXECUTE_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be executed for sync refresh.

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the PREPARE_REFRESH procedure. See "PREPARE_REFRESH Procedure" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after DBMS_SYNC_REFRESH.EXECUTE_REFRESH.

194.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
           RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 194-6 GET_ALL_GROUP_IDS Function Parameter

Parameter	Description
get_all_group_ids	Returns the group IDs of all the sync refresh groups in the database.

194.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
   object_name_list   IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 194-7 GET_GROUP_ID Function Parameter

Parameter	Description
object_name_list	The name of the materialized view. The name can be schema-qualified.

194.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
   object_name_list    IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 194-8 GET_GROUP_ID_LIST Function Parameter

Parameter	Description
object_name_list	A comma-separated list of object names (materialized views). Each name can be schema-qualified.

194.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, PREPARE_REFRESH and EXECUTE_REFRESH and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide.*

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
   group_id    IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 194-9 PREPARE_REFRESH Procedure Parameters

Parameter	Description
group_id	The group ID of the sync refresh group to be prepared for sync refresh.

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the EXECUTE_REFRESH.

Before running this procedure, the user must run PREPARE_STAGING_LOG on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the REGISTER_PARTITION_OPERATION.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an EXECUTE_REFRESH statement. Alternatively, you can issue an ABORT_REFRESH operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an ALTER SESSION statement.

The group ID of a table can be found using GET_GROUP_ID(table_name). The group IDs of a list of tables can be found with GET_GROUP_ID_LIST(table_name_list). The group IDs of all the lists of tables can be retrieved with GET_ALL_GROUP_IDS.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing PREPARE_REFRESH. This will cause the partition exchange DDL statements generated by PREPARE_REFRESH to have the UPDATE INDEXES clause appended to them, and when they are executed by EXECUTE_REFRESH, the global indexes will be maintained.

194.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running PREPARE_REFRESH.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view USER_SR_STLOG_EXCEPTIONS to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide.*

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (DMLTYPE$$ is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (DMLTYPE$$ is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (DMLTYPE$$ is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (DMLTYPE$$ is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.

- In the new values row (DMLTYPE$$ is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to NULL.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE$$ is 'I') by choosing the psl_mode of DBMS_SYNC_REFRESH.INSERT_TRUSTED
- trust all the delete rows (DMLTYPE$$ is 'D') by choosing the psl_mode of DBMS_SYNC_REFRESH.DELETE_TRUSTED
- trust all the update rows (DMLTYPE$$ is 'UO' or 'UN') by choosing the psl_mode of DBMS_SYNC_REFRESH.UPDATE_TRUSTED
- trust all three types of DMLs by choosing the psl_mode of DBMS_SYNC_REFRESH.TRUSTED.

In addition, you can specify the psl_mode as a bitmask of the flags described above. For example, DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH_DELETE_TRUSTED will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   psl_mode         IN NUMBER DEFAULT
   DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 194-10 PREPARE_STAGING_LOG Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
psl_mode	The mode in which staging log preparation should be done. The possible values are: • DBMS_SYNC_REFRESH.ENFORCED (the default) • DBMS_SYNC_REFRESH.INSERT_TRUSTED • DBMS_SYNC_REFRESH.DELETE_TRUSTED • DBMS_SYNC_REFRESH.UPDATE_TRUSTED • DBMS_SYNC_REFRESH.TRUSTED

194.3.10 PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
   before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 194-11 PURGE_REFRESH_STATS Procedure Parameter

Parameter	Description
`before_timestamp`	Records of sync refreshes saved before this timestamp are purged. If `NULL`, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using `ALTER_REFRESH_STATS_RETENTION`. The default is 31 days.

194.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide.* The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
   mv_list   IN VARCHAR2);
```

Parameter

Table 194-12 REGISTER_MVIEWS Procedure Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to register. These names are optionally schema-qualified.

194.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
   partition_op                IN VARCHAR2,
   schema_name                 IN VARCHAR2,
   base_table_name             IN VARCHAR2,
   partition_name              IN VARCHAR2,
   outside_partn_table_schema  IN VARCHAR2,
   outside_partn_table_name    IN VARCHAR2);
```

Parameters

Table 194-13 REGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.
outside_partn_table_schema	The name of the schema of the outside partition table (required for EXCHANGE only).
outside_partn_table_name	The name of the outside partition table (required for EXCHANGE only).

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

194.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
   mv_list   IN VARCHAR20;
```

Parameter

Table 194-14 UNREGISTER_MVIEWS Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.

194.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
   partition_op     IN VARCHAR2,
   schema_name      IN VARCHAR2,
   base_table_name  IN VARCHAR2,
   partition_name   IN VARCHAR2);
```

Parameters

Table 194-15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.

195
DBMS_TABLE_DATA

The `DBMS_TABLE_DATA` package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- DBMS_TABLE_DATA Overview
- DBMS_TABLE_DATA Security Model
- Summary of DBMS_TABLE_DATA Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Concepts*
> - *Oracle Database SQL Language Reference*
> - *Oracle Database Reference*

195.1 DBMS_TABLE_DATA Overview

The `DBMS_TABLE_DATA` package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

195.2 DBMS_TABLE_DATA Security Model

The `DBMS_TABLE_DATA` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs `SELECT` privileges on the table to extract column data.

195.3 Summary of DBMS_TABLE_DATA Subprograms

The DBMS_TABLE_DATA package uses GET_BYTES_FOR_COLUMN, GET_BYTES_FOR_COLUMNS, and GET_BYTES_FOR_ROW subprograms to perform various functions.

Table 195-1 DBMS_TABLE_DATA Package Subprograms

Subprogram	Description
GET_BYTES_FOR_COLUMN Procedure	Returns the column_data in bytes for the particular column with name column_name for row_id row in the particular table identified by schema_name.table_name.
GET_BYTES_FOR_COLUMNS Procedure	Returns a concatenated array of column byte values in column_data in the order of columns specified in the column_names array.
GET_BYTES_FOR_ROW Procedure	Returns a concatenated array of column byte values in column_data in the order of column positions for the particular row identified by row_id.

195.3.1 GET_BYTES_FOR_COLUMN Procedure

This procedure returns the column_data in bytes for the particular column with name column_name for row_id row in the particular table identified by schema_name.table_name.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_name             IN VARCHAR2,
   column_data             IN OUT BLOB);
```

Parameters

Table 195-2 GET_BYTES_FOR_COLUMN Procedure Parameters

Parameter	Description
schema_name	The name of the schema.
table_name	The name of the table.
row_id	The row id.
column_name	The column name.
column_data	The data in the column.

Usage Notes

All arguments are required.

195.3.2 GET_BYTES_FOR_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_names            IN VARCHAR2,
   column_data             IN OUT BLOB);
```

Parameters

Table 195-3 GET_BYTES_FOR_COLUMNS Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table.
`row_id`	The row id.
`column_names`	The names of the columns.
`column_data`	The data in the columns.

Usage Notes

All arguments are required.

195.3.3 GET_BYTES_FOR_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW(
   schema_name          IN VARCHAR2,
   table_name              IN VARCHAR2,
   row_id                  IN ROWID,
   column_data             IN OUT BLOB);
```

Parameters

Table 195-4 GET_BYTES_FOR_ROW Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table.
`row_id`	The row id.
`column_data`	The data in the row.

Usage Notes

All arguments are required.

196
DBMS_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the RMAN `CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

> **See Also:**
>
> *Oracle Database Backup and Recovery User's Guide* regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- Overview
- DBMS_TDB Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_TDB Subprograms

196.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

196.2 DBMS_TDB Security Model

Use of this package requires the DBA privilege.

196.3 DBMS_TDB Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 196-1.

Table 196-1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in read-only tablespaces when checking whether a database is ready for transport.

196.4 DBMS_TDB Views

The DBMS_TDB package uses the V$DB_TRANSPORTABLE_PLATFORM view.

This view is described in *Oracle Database Reference*.

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

196.5 DBMS_TDB Operational Notes

The following notes apply to DBMS_TDB.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple TRUE or FALSE results to indicate whether database transport is possible. Use the subprograms with SERVEROUTPUT ON for informative messages about why transport is not possible.

196.6 Summary of DBMS_TDB Subprograms

This table lists the DBMS_TDB subprograms and briefly describes them.

Table 196-2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function	Checks whether a database has external tables, directory or BFILEs

196.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2,
     skip_option            IN  NUMBER)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
   RETURN BOOLEAN;
```

Parameters

Table 196-3 CHECK_DB Function Parameters

Parameter	Description
`target_platform_name`	The name of the destination platform, as it appears in `V$DB_TRANSPORTABLE_PLATFORM`.
`skip_option`	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 196-1.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 196-4.

Table 196-4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check `V$DB_TRANSPORTABLE_PLATFORM` for recognized platform names.
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
     BEGIN
       db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
     END;
     /

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```

196.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
   RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If SERVEROUTPUT is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of CHECK_EXTERNAL with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
        external BOOLEAN;
     BEGIN
       external := DBMS_TDB.CHECK_EXTERNAL;
     END;
     /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

197
DBMS_TF

The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

> **See Also:**
>
> - *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
> - *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- DBMS_TF Overview
- DBMS_TF Security Model
- DBMS_TF Constants
- DBMS_TF Operational Notes
- DBMS_TF Execution Flow
- DBMS_TF Restrictions
- DBMS_TF Examples
- DBMS_TF Data Structures
- Summary of DBMS_TF Subprograms

197.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.

197.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker's rights privileges.

197.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The `DBMS_TF` package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, `DBMS_TF.TYPE_DATE`.

Table 197-1 DBMS_TF Supported Types

Name	Description
`TYPE_BINARY_DOUBLE`	Type code for `BINARY_DOUBLE`
`TYPE_BINARY_FLOAT`	Type code for `BINARY_FLOAT`
`TYPE_BLOB`	Type code for `BLOB`
`TYPE_BOOLEAN`	Type code for `BOOLEAN`
`TYPE_CHAR`	Type code for `CHAR`
`TYPE_CLOB`	Type code for `CLOB`
`TYPE_DATE`	Type code for `DATE`
`TYPE_INTERVAL_DS`	Type code for `INTERVAL_DS`
`TYPE_INTERVAL_YM`	Type code for `INTERVAL_YM`
`TYPE_NUMBER`	Type code for `NUMBER`
`TYPE_ROWID`	Type code for `ROWID`
`TYPE_RAW`	Type code for `RAW`
`TYPE_TIMESTAMP`	Type code for `TIMESTAMP`
`TYPE_TIMESTAMP_TZ`	Type code for `TIMESTAMP_TZ`
`TYPE_VARCHAR2`	Type code for `VARCHAR2`

Additional constants are defined for use with specific subprograms.

See Also:

- Table 197-3 for more information about CSTORE related constants
- Table 197-4 for more information about predefined PTF method names
- Table 197-6 for more information about XSTORE related constants
- Supported Types Collections for more information about predefined collections of supported types

197.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

197.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as NULL values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

FETCH_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 197-1 Noop Polymorphic Table Function Example

This example creates a PTF called noop. This PTF returns the input rows as the output rows without any modification or filtering. Noop is one of the smallest PTF you can write.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Noop Polymorphic Table Function

To implement the noop PTF, you first create the implementation package noop_package.

```
CREATE PACKAGE noop_package AS
   FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
     RETURN DBMS_TF.DESCRIBE_T;

   PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
   FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
     RETURN DBMS_TF.DESCRIBE_T AS
     BEGIN
       RETURN NULL;
     END;

   PROCEDURE fetch_rows AS
   BEGIN
     RETURN;
   END;
END noop_package;
```

The noop PTF is defined to execute the noop_package when it is invoked.

```
CREATE FUNCTION noop (t TABLE)
  RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;
```

The PTF can be invoked in queries. For example:

```
SELECT *
FROM   NOOP(emp)
WHERE deptno = 10;

      7782 CLARK      MANAGER         7839 09-JUN-81       2450        10
      7839 KING       PRESIDENT            17-NOV-81       5000        10
      7934 MILLER     CLERK           7782 23-JAN-82       1300        10

WITH e
     AS (SELECT *
         FROM   emp
                NATURAL JOIN dept
         WHERE dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

  30       7499 ALLEN      SALESMAN        7698 20-FEB-81       1600       300
SALES          CHICAGO
  30       7521 WARD       SALESMAN        7698 22-FEB-81       1250       500
SALES          CHICAGO
  30       7654 MARTIN     SALESMAN        7698 28-SEP-81       1250      1400
SALES          CHICAGO
  30       7698 BLAKE      MANAGER         7839 01-MAY-81       2850
SALES          CHICAGO
  30       7844 TURNER     SALESMAN        7698 08-SEP-81       1500         0
SALES          CHICAGO
  30       7900 JAMES      CLERK           7698 03-DEC-81        950
SALES          CHICAGO
```

197.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

197.4.2 PTF Server Side Interface

The `DBMS_TF` package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

Table 197-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

NAME	DESCRIPTION
COLUMN_METADATA_T	Column metadata record
COLUMN_T	Column descriptor record
TABLE_T	Table descriptor record

Table 197-2 (Cont.) Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

NAME	DESCRIPTION
COLUMNS_T	Collection containing column names
COLUMNS_NEW_T	Collection for new columns
TAB_<typ>_T	Collection for each supported types, where <typ> is described in "Supported Types Collections "
ROW_SET_T	Data for a rowset record
GET_COL Procedure	Fetches data for a specified (input) column
PUT_COL Procedure	Returns data for a specified (new) column
GET_ROW_SET Procedure	Fetches the input rowset of column values
PUT_ROW_SET Procedure	Returns data for ALL (new) columns
SUPPORTED_TYPE Function	Verifies if a type is supported by DBMS_TF subprograms
GET_XID Function	Returns a unique execution ID to index PTF state in a session

See Also:

- DBMS_TF Data Structures for the complete list of types
- Summary of DBMS_TF Subprograms for the complete list of subprograms

197.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the FETCH_ROWS procedure.

The PTF indicates the read columns inside DESCRIBE by annotating them in the input table descriptor, TABLE_T. Only the indicated read columns will be fetched and thus available for processing during FETCH_ROWS.

The PTF invocation in a query will typically use the COLUMNS operator to indicate which columns the query wants the PTF to read, and this information is passed to the DESCRIBE function which then in turn sets the COLUMN_T.FOR_READ boolean flag.

Only scalar SQL data types are allowed for the read columns.

The Echo Polymorphic Table Function Example takes a table and a list of columns and produces new columns with the same values.

197.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The DESCRIBE function indicates the pass-through columns by setting the COLUMN_T.PASS_THROUGH boolean flag on the input table descriptor, DBMS_TF.TABLE_T.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to false. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the DESCRIBE function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

197.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. Compilation State : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. Execution State: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

197.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

Name	Description

CSTORE_GET procedure	Fetches item of specified type. If not found, the OUT value remains unchanged.
CSTORE_EXISTS function	If an item with the given key exists in the CSTORE, this function returns TRUE.

CSTORE Supported Types

The DBMS_TF.DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Table 197-3 DBMS_TF CSTORE Scalar Supported Types

Name	Description
CSTORE_TYPE_VARCHAR2	CSTORE VARCHAR2 type code
CSTORE_TYPE_NUMBER	CSTORE NUMBER type code
CSTORE_TYPE_DATE	CSTORE DATE type code
CSTORE_TYPE_BOOLEAN	CSTORE BOOLEAN type code

Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767)  INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER           INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN          INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE             INDEX BY VARCHAR2(32767);
```

DBMS_TF Method Names

The method names are also stored in the DBMS_TF.DESCRIBE_T record. These predefined values for the method names can be customized by the PTF author.

See Method Name Overrides for more information about changing the default method names

Table 197-4 DBMS_TF Method Names Constants

Name	Type	Value	Description
CLOSE	DBMS_QUOTED_ID	'CLOSE'	Predefined index value for the method named CLOSE
FETCH_ROWS	DBMS_QUOTED_ID	'FETCH_ROWS'	Predefined index value for the method named FETCH_ROWS
OPEN	DBMS_QUOTED_ID	'OPEN'	Predefined index value for the method named OPEN

197.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The `XSTORE` key-value interface simplifies the implementation of `Table Semantics` PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 197-5 DBMS_TF XSTORE Subprograms

Name	Description
`XSTORE_CLEAR` procedure	Removes all key-value pairs from the XSTORE execution state
`XSTORE_EXISTS` function	Returns TRUE if an item with a given key exists in the XSTORE
`XSTORE_GET` procedure	Gets the associated value for a given key stored in the XSTORE
`XSTORE_REMOVE` procedure	Removes an item associated with the given key and key_type
`XSTORE_SET` procedure	Sets the value for the given key for PTF Execution State Management

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, and `BOOLEAN`.

Table 197-6 DBMS_TF XSTORE Scalar Supported Types

Name	Description
`XSTORE_TYPE_VARCHAR2`	XSTORE `VARCHAR2` type code
`XSTORE_TYPE_NUMBER`	XSTORE `NUMBER` type code
`XSTORE_TYPE_DATE`	XSTORE `DATE` type code
`XSTORE_TYPE_BOOLEAN`	XSTORE `BOOLEAN` type code

197.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF METHOD_NAMES` collection (see DESCRIBE_T Record Type).

> **See Also:**
>
> Table 197-4

Example 197-2 DBMS_TF Method Name Overrides

This example shows how to change the default method name of the noop_p PTF fetch_rows method to noop_fetch.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at DBMS_TF Method Name Overrides

Create the PTF implementation package noop_p.

```
CREATE PACKAGE noop_p AS
   FUNCTION describe(tab IN OUT DBMS_TF.table_t)
               RETURN DBMS_TF.describe_t;
   PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using DBMS_TF.Method_Names collection. The FETCH_ROWS method name is changed to 'Noop_Fetch'. The procedure noop_fetch to implement this method is defined in the package.

```
 CREATE OR replace PACKAGE BODY noop_p
AS
   FUNCTION describe(tab IN OUT DBMS_TF.table_t)
               RETURN DBMS_TF.describe_t AS
      methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
     BEGIN
          RETURN DBMS_TF.describe_t(method_names => methods);
   END;
   PROCEDURE noop_fetch AS
     BEGIN
         RETURN;
   END;
END noop_p;
```

The noop PTF is defined to execute the noop_p when it is invoked.

```
CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;
```

The PTF is invoked in the FROM clause of a query block.

```
SELECT *
FROM noop(scott.emp)
WHERE deptno =10;
```

197.4.7 Using the COLUMNS Pseudo-Operator

The `COLUMNS` pseudo-operator is an addition to the SQL expression language.

Use the `COLUMNS` pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the `FROM` clause. The `COLUMNS` pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

> **See Also:**
>
> *Oracle Database PL/SQL Language Reference* for more information about the COLUMNS pseudo-operator syntax and semantics

197.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a `Row Semantics` PTF, and the `PARTITION BY` key columns of a `Table Semantics` PTF can be used for projection and predicate pushdown.

Example 197-3 Query Transformations

This example illustrates the predicate and projection pushdown for a `Row Semantics` PTF.

This query calls the echo PTF created in Echo Polymorphic Table Function Example.

```
SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))
WHERE deptno = 30
  AND echo_sal > 1000;

     EMPNO ENAME             SAL       COMM   ECHO_SAL
---------- ---------- ---------- ---------- ----------
      7499 ALLEN            1600        300       1600
      7521 WARD             1250        500       1250
      7654 MARTIN           1250       1400       1250
      7698 BLAKE            2850                  2850
      7844 TURNER           1500          0       1500
```

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

197.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table emp has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
-------------------------------------------------
| Id | Operation                     | Name     |
-------------------------------------------------
| 0 | SELECT STATEMENT                |          |
| 1 | PX COORDINATOR                  |          |
| 2 | PX SEND QC (RANDOM)             | :TQ10000 |
| 3 | POLYMORPHIC TABLE FUNCTION      | ECHO     |
| 6 | PX BLOCK ITERATOR               |          |
|* 7 | TABLE ACCESS FULL              | EMP      |
-------------------------------------------------
Predicate Information (identified by operation id):
-------------------------------------------------
5 - filter("EMP"."DEPTNO"<>20)
```

Table Semantics PTF

`Table Semantics` PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

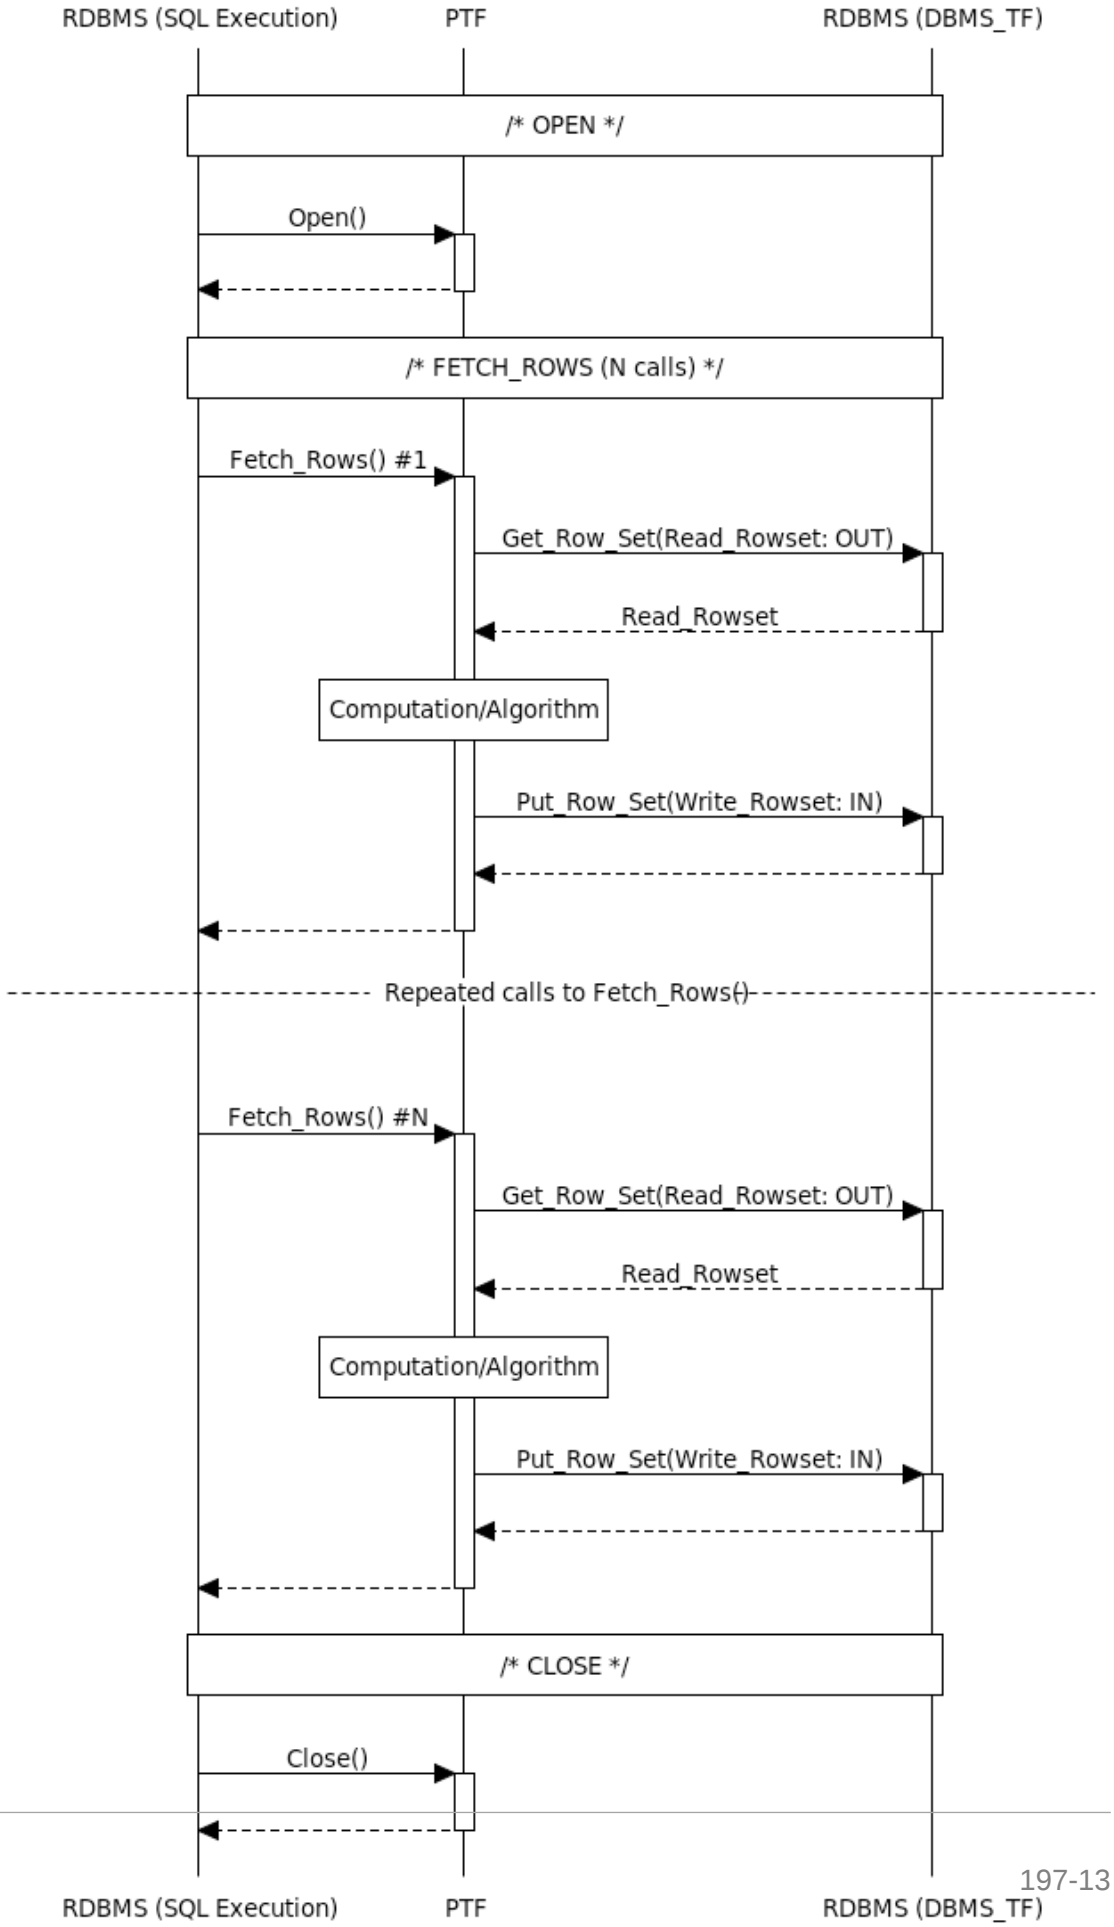
197.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)



RDBMS (SQL Execution)
PTF
RDBMS (DBMS_TF)
/* OPEN */
Open()
/* FETCH_ROWS (N calls) */
Fetch_Rows() #1
Get_Row_Set(Read_Rowset: OUT)
Read_Rowset
Computation/Algorithm
Put_Row_Set(Write_Rowset: IN)
Repeated calls to Fetch_Rows()
Fetch_Rows() #N
Get_Row_Set(Read_Rowset: OUT)
Read_Rowset
Computation/Algorithm
Put_Row_Set(Write_Rowset: IN)
/* CLOSE */
Close()
RDBMS (SQL Execution)
PTF
RDBMS (DBMS_TF)

The FETCH_ROWS procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to FETCH_ROWS is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The GET_ROW_SET or GET_COL is used to read the input rowset.

The PUT_ROW_SET or PUT_COL is used to produce an output rowset, that is written back to the database.

PUT_ROW_SET is used to set all the new columns in a single call.

The ROWSET_T record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use PUT_COL to produce a single column. A given column can only be produced once within a call to FETCH_ROWS.

For a Row Semantics PTF, the FETCH_ROWS procedure will return the new rows using the PTF Server interface before returning back to the database.

197.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the DBMS_TF package.

Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the PUT_ROW_SET, PUT_COL, GET_ROW_SET and GET_COL procedures. All SQL types can be used with pass-through columns. The DESCRIBE function can determine the supported types using the DBMS_TF.SUPPORTED_TYPE function.

PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the FROM clause of a query. Nesting PTF is only allowed using WITH clause.

Nesting table function with polymorphic table function is only allowed using CURSOR expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The PARTITION BY and the ORDER BY clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods OPEN, FETCH_ROWS, and CLOSE must be invoked in the polymorphic table function execution context only.

You cannot invoke the DESCRIBE method directly.

This example shows ten PTF nested invocation.

```
WITH t0
     AS (SELECT /*+ parallel */ *
         FROM   noop(dept)),
     t1
```

```
      AS (SELECT *
          FROM   noop(t0)),
      t2
      AS (SELECT *
          FROM   noop(t1)),
      t3
      AS (SELECT *
          FROM   noop(t2)),
      t4
      AS (SELECT *
          FROM   noop(t3)),
      t5
      AS (SELECT *
          FROM   noop(t4)),
      t6
      AS (SELECT *
          FROM   noop(t5)),
      t7
      AS (SELECT *
          FROM   noop(t6)),
      t8
      AS (SELECT *
          FROM   noop(t7)),
      t9
      AS (SELECT *
          FROM   noop(t8))
SELECT *
FROM   noop(t9)
WHERE  deptno = 10;

        10 ACCOUNTING     NEW YORK
```

197.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

- Example 197-1, "Noop Polymorphic Table Function"
- Echo Polymorphic Table Function Example
- Example 197-2, "DBMS_TF Method Name Overrides"
- Example 197-3, "Query Transformations"
- Example 197-5 , "DBMS_TF.COLUMN_TYPE_NAME Example"
- Example 197-6 , "DBMS_TF.COL_TO_CHAR Example"
- Example 197-7, "DBMS_TF.CSTORE_EXISTS Example"
- Example 197-8, "DBMS_TF.GET_COL Example"
- Example 197-9, "DBMS_TF.GET_ENV Example"
- Example 197-10, "DBMS_TF.GET_ROW_SET Example"
- Example 197-12, "DBMS_TF.GET_XID Example"

- Rand_col Polymorphic Table Function Example, (DBMS_TF.PUT_COL Example)
- Stack Polymorphic Table Function Example
- Split Polymorphic Table Function Example, (DBMS_TF.GET_ROW_SET and PUT_ROW_SET Example)
- Example 197-14, "DBMS_TF.PUT_ROW_SET Example"
- Example 197-16, "Replicate : DBMS_TF.ROW_REPLICATION Example"
- Example 197-17, "DBMS_TF.ROW_TO_CHAR Example"
- Example 197-18, "DBMS_TF.TRACE Example"
- Row_num Polymorphic Table Function Example, (DBMS_TF.XSTORE_GET and XSTORE_SET Example)

  Oracle PL/SQL Language Reference, "To_doc Polymorphic Table Function Example"

197.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table tab, and adds to it the columns listed in cols but with the column names prefixed with "ECHO_".

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Echo Polymorphic Table Function

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));

   DEPTNO DNAME          LOC           ECHO_DNAME     ECHO_LOC
--------- -------------- ------------- -------------- -------------
        10 ACCOUNTING     NEW YORK      ACCOUNTING     NEW YORK
        20 RESEARCH       DALLAS        RESEARCH       DALLAS
        30 SALES          CHICAGO       SALES          CHICAGO
        40 OPERATIONS     BOSTON        OPERATIONS     BOSTON
```

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.
- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab  IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
  PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab  IN OUT DBMS_TF.TABLE_T,
                    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id   PLS_INTEGER := 1;
  BEGIN
      FOR I IN 1 .. tab.COLUMN.COUNT LOOP
          FOR J IN 1 .. cols.COUNT LOOP
              IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
                IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
                THEN
                  RAISE_APPLICATION_ERROR(-20102, 'Unsupported column type ['
||
                  TAB.COLUMN(i).description.TYPE||']');
                END IF;

                TAB.COLUMN(i).for_read := TRUE;
                NEW_COLS(col_id) := TAB.COLUMN(i).description;
                NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
                col_id := col_id + 1;

                EXIT;
              END IF;
          END LOOP;
      END LOOP;

      /* Verify all columns were found */
      IF ( col_id - 1 != cols.COUNT ) THEN
        RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id - 1||'],
['||cols.COUNT||']');
      END IF;

      RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
  END;
  PROCEDURE FETCH_ROWS
```

```
  AS
    ROWSET DBMS_TF.ROW_SET_T;
  BEGIN
      DBMS_TF.GET_ROW_SET(rowset);
      DBMS_TF.PUT_ROW_SET(rowset);
  END;
END echo_package;
```

The PTF echo references the implementation package echo_package.

```
CREATE FUNCTION echo(tab TABLE,
                     cols COLUMNS)
  RETURN TABLE
  PIPELINED ROW POLYMORPHIC USING echo_package;
```

Example 197-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns `ECHO_ENAME`, `ECHO_HIREDATE`, and `ECHO_SAL`.

```
SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;
```

```
EMPNO ENAME JOB      MGR  HIREDATE  SAL  COMM DEPTNO ECHO_ENAME ECHO_HIRE ECHO_SAL
----- ----- -------- ---- --------- ---- ---- ------ ---------- --------- --------
7369  SMITH CLERK    7902 17-DEC-80  800          20 SMITH      17-DEC-80      800
7566  JONES MANAGER  7839 02-APR-81 2975          20 JONES      02-APR-81     2975
7788  SCOTT ANALYST  7566 19-APR-87 3000          20 SCOTT      19-APR-87     3000
7876  ADAMS CLERK    7788 23-MAY-87 1100          20 ADAMS      23-MAY-87     1100
7902  FORD  ANALYST  7566 03-DEC-81 3000          20 FORD       03-DEC-81     3000
```

Using subquery `W`, display `ENAME`, `ECHO_LOC` and `DNAME` columns for all employees in department 30 with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
                dname,
                loc
         FROM   scott.emp e,
                scott.dept d
         WHERE  e.deptno = d.deptno)
SELECT ename,
       echo_loc,
       dname
FROM   echo(w, COLUMNS(sal, dname, loc, hiredate))
WHERE  deptno = 30
       AND echo_sal > 1000;
```

```
ENAME      ECHO_LOC       DNAME
---------- -------------- --------
ALLEN      CHICAGO        SALES
WARD       CHICAGO        SALES
MARTIN     CHICAGO        SALES
```

```
BLAKE      CHICAGO         SALES
TURNER     CHICAGO         SALES
```

Using subquery `W`, display `ENAME` and `DNAME` columns for all employees with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
                dname,
                loc
         FROM   scott.emp e,
                scott.dept d
         WHERE  e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                 FROM   echo(scott.emp, COLUMNS(sal, deptno, ename, hiredate))
                 WHERE  deptno = e.echo_deptno
                        AND sal > 1000);

```

197.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

RECORD Types

- COLUMN_DATA_T Record Type
- COLUMN_METADATA_T Record Type
- COLUMN_T Record Type
- DESCRIBE_T Record Type
- ENV_T Record Type
- PARALLEL_ENV_T Record Type
- TABLE_T Record Type

TABLE Types

- Supported Types Collections (TAB_<typ>_T)

- COLUMNS_NEW_T Table Type
- COLUMNS_T Table Type
- COLUMNS_WITH_TYPE_T Table Type
- TABLE_COLUMNS_T Table Type
- ROW_SET_T Table Type

Types

- XID_T Subtype

CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See Collections For Compilation Storage for more information.

197.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```
TYPE TAB_BOOLEAN_T       IS TABLE OF BOOLEAN       INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_FLOAT_T  IS TABLE OF BINARY_FLOAT  INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_DOUBLE_T IS TABLE OF BINARY_DOUBLE INDEX BY PLS_INTEGER;

TYPE TAB_BLOB_T          IS TABLE OF BLOB          INDEX BY PLS_INTEGER;

TYPE TAB_CHAR_T          IS TABLE OF CHAR(32767)   INDEX BY PLS_INTEGER;

TYPE TAB_CLOB_T          IS TABLE OF CLOB          INDEX BY PLS_INTEGER;

TYPE TAB_DATE_T          IS TABLE OF DATE          INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_YM_T   IS TABLE OF YMINTERVAL_UNCONSTRAINED   INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_DS_T   IS TABLE OF DSINTERVAL_UNCONSTRAINED   INDEX BY PLS_INTEGER;

TYPE TAB_NATURALN_T      IS TABLE OF NATURALN      INDEX BY PLS_INTEGER;

TYPE TAB_NUMBER_T        IS TABLE OF NUMBER        INDEX BY PLS_INTEGER;

TYPE TAB_RAW_T           IS TABLE OF RAW(32767)    INDEX BY PLS_INTEGER;

TYPE TAB_ROWID_T         IS TABLE OF ROWID         INDEX BY PLS_INTEGER;

TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T     IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T  IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY PLS_INTEGER;
```

> **See Also:**
>
> Table 197-1 for more information about the DBMS_TF supported types

197.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See Table 197-1 for the list of supported types.

Syntax

```
TYPE COLUMN_DATA_T IS RECORD
 ( description            COLUMN_METADATA_T,
   tab_varchar2           TAB_VARCHAR2_T,
   tab_number             TAB_NUMBER_T,
   tab_date               TAB_DATE_T,
   tab_binary_float       TAB_BINARY_FLOAT_T,
   tab_binary_double      TAB_BINARY_DOUBLE_T,
   tab_raw                TAB_RAW_T,
   tab_char               TAB_CHAR_T,
   tab_clob               TAB_CLOB_T,
   tab_blob               TAB_BLOB_T,
   tab_timestamp          TAB_TIMESTAMP_T,
   tab_timestamp_tz       TAB_TIMESTAMP_TZ_T,
   tab_interval_ym        TAB_INTERVAL_YM_T,
   tab_interval_ds        TAB_INTERVAL_DS_T,
   tab_timestamp_ltz      TAB_TIMESTAMP_LTZ_T,
   tab_rowid              TAB_ROWID_T,
   tab_boolean            TAB_BOOLEAN_T);
```

Fields

Table 197-7 COLUMN_DATA_T Fields

Field	Description
description	The tag defines the metadata for the column indicating which variant field is active.
tab_varchar2	Variant field
tab_number	Variant field
tab_date	Variant field
tab_binary_float	Variant field
tab_binary_double	Variant field
tab_raw	Variant field
tab_char	Variant field
tab_clob	Variant field
tab_blob	Variant field
tab_timestamp	Variant field

Table 197-7 (Cont.) COLUMN_DATA_T Fields

Field	Description
tab_timestamp_tz	Variant field
tab_interval_ym	Variant field
tab_interval_ds	Variant field
tab_timestamp_ltz	Variant field
tab_rowid	Variant field
tab_boolean_t	Variant field

197.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
  ( type               PLS_INTEGER,
    max_len            PLS_integer DEFAULT -1,
    name               VARCHAR2(32767),
    name_len           PLS_INTEGER,
    precision          PLS_INTEGER,
    scale              PLS_INTEGER,
    charsetid          PLS_INTEGER,
    charsetform        PLS_INTEGER,
    collation          PLS_INTEGER );
```

Fields

Table 197-8 COLUMN_METADATA_T Fields

Field	Description
type	Internal Oracle typecode for the column's type
max_len	Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored.
name	Name of the column
name_len	Length of the name
precision	The precision, or the maximum number of significant decimal digits (for numeric data types)
scale	Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)
charsetid	Character set id (internal Oracle code, applies to string types)
charsetform	Character set form (internal Oracle code, applies to string types)
collation	Collation id (internal Oracle code, applies to string types)

197.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

```
TYPE column_t IS RECORD (
    description            COLUMN_METADATA_T,
    pass_through           BOOLEAN,
    for_read               BOOLEAN);
```

Fields

Table 197-9 COLUMN_T Fields

Field	Description
description	Column metadata
pass_through	Is this a pass through column
for_read	Is this column read by the PTF

197.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

Syntax

```
TYPE DESCRIBE_T          IS RECORD
  ( NEW_COLUMNS        COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
    CSTORE_CHR         CSTORE_CHR_T  DEFAULT CSTORE_CHR_T(),
    CSTORE_NUM         CSTORE_NUM_T  DEFAULT CSTORE_NUM_T(),
    CSTORE_BOL         CSTORE_BOL_T  DEFAULT CSTORE_BOL_T(),
    CSTORE_DAT         CSTORE_DAT_T  DEFAULT CSTORE_DAT_T(),
    METHOD_NAMES       METHODS_T     DEFAULT METHODS_T());
```

Fields

Table 197-10 DESCRIBE_T Fields

Field	Description
NEW_COLUMNS	New columns description that will be produced by the PTF
CSTORE_CHR	CStore array key type : VARCHAR2 (optional)
CSTORE_NUM	CStore array key type : NUMBER (optional)
CSTORE_BOL	CStore array key type : BOOLEAN (optional)
CSTORE_DAT	CStore array key type : DATE (optional)
METHOD_NAMES	Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods

197.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

Syntax

```
TYPE ENV_T IS RECORD (
  get_columns      TABLE_METADATA_T,
  put_columns      TABLE_METADATA_T,
  ref_put_col      REFERENCED_COLS_T,
  parallel_env     PARALLEL_ENV_T,
  query_optim      BOOLEAN,
  row_count        PLS_INTEGER,
  row_replication  BOOLEAN,
  row_insertion    BOOLEAN);
```

Fields

Table 197-11 ENV_T Fields

Field	Description
get_columns	Metadata about the columns read by PTF GET_COL procedure
put_columns	Metadata about columns sent back to database by PUT_COL procedure
ref_put_col	TRUE if the put column was referenced in the query
parallel_env	Parallel execution information (when a query runs in parallel)
query_optim	Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer
row_count	Number of rows in current row set
row_replication	Is Row Replication Enabled?
row_insertion	Is Row Insertion Enabled?

197.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

Syntax

```
TYPE PARALLEL_ENV_T         IS RECORD
  ( instance_id       PLS_INTEGER,
    session_id        PLS_INTEGER,
    server_grp        PLS_INTEGER,
    server_set_no     PLS_INTEGER,
    no_slocal_servers PLS_INTEGER,
    global_server_no  PLS_INTEGER,
    no_local_servers  PLS_INTEGER,
    local_server_no   PLS_INTEGER );
```

Fields

Table 197-12 PARALLEL_ENV_T Fields

Field	Description
instance_id	QC instance ID
session_id	QC session ID
server_grp	Server group

Table 197-12 (Cont.) PARALLEL_ENV_T Fields

Field	Description
server_set_no	Server set number
no_slocal_servers	Number of sibling servers (including self)
global_server_no	Global server number (base 0)
no_local_servers	Number of sibling servers running on instance
local_server_no	Local server number (base 0)

197.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```
TYPE TABLE_T IS RECORD(
  column                TABLE_COLUMNS_T,
  schema_name           DBMS_id,
  package_name          DBMS_id,
  ptf_name              DBMS_id);
```

Fields

Table 197-13 TABLE_T Fields

Field	Description
column	Column information
schema_name	The PTF schema name
package_name	The PTF implementation package name
ptf_name	The PTF name invoked

197.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

197.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

197.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

197.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)

Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

197.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

197.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

197.9 Summary of DBMS_TF Subprograms

This summary briefly describes the `DBMS_TF` package subprograms.

Table 197-14 DBMS_TF Subprograms

Subprogram	Description
`COLUMN_TYPE_NAME` Function	Returns the type name of the specified column type
`COL_TO_CHAR` Function	Returns the string representation of the specified column
`CSTORE_EXISTS` Function	Returns TRUE if an item with a given key exists in the PTF Compilation State management Store
`CSTORE_GET` Procedure	Gets item(s) of specified type from the PTF Compilation State management Store
`GET_COL` Procedure	Gets read column values
`GET_ENV` Function	Returns information about the PTF runtime environment
`GET_ROW_SET` Procedure	Gets read set of column values in the collection
`GET_XID` Function	Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state
`PUT_COL` Procedure	Puts column values in the database

Table 197-14 (Cont.) DBMS_TF Subprograms

Subprogram	Description
`PUT_ROW_SET` Procedure	Puts the collection read set of column values in the database
`ROW_REPLICATION` Procedure	Sets the row replication factor
`ROW_TO_CHAR` Function	Returns the string representation of a row in a rowset
`SUPPORTED_TYPE` Function	Returns TRUE if a specified type is supported by PTF infrastructure
`TRACE` Procedure	Prints data structures to help development and problem diagnosis
`XSTORE_CLEAR` Procedure	Removes all key-value pairs from XStore
`XSTORE_EXISTS` Procedure	Returns TRUE if the key has an associated value
`XSTORE_GET` Procedure	Gets a key-value store for PTF Execution State Management
`XSTORE_REMOVE` Procedure	Removes any value associated with the given key
`XSTORE_SET` Procedure	Sets the value for the given key store for PTF Execution State Management

197.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

```
FUNCTION COLUMN_TYPE_NAME(
   col COLUMN_METADATA_T)
   RETURN VARCHAR2;
```

Parameters

Table 197-15 DBMS_TF.COLUMN_TYPE_NAME Function Parameters

Parameter	Description
`col`	The column metadata. See COLUMN_METADATA_T Record Type

Return Values

Returns the column type converted as text.

Example 197-5 DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
   tab   IN OUT DBMS_TF.table_t,
   cols  IN     DBMS_TF.columns_t)
   RETURN DBMS_TF.describe_t
AS
```

```
  new_cols DBMS_TF.columns_new_t;
  col_id    PLS_INTEGER := 1;
BEGIN
    FOR i IN 1 .. tab.count LOOP
       FOR j IN 1 .. cols.count LOOP
          IF (tab(i).description.name = cols(j)) THEN
               IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2') THEN
                  raise_application_error(-20102,
                   'Unsupported column type ['||tab(i).description.type||']');
               END IF;
             tab(i).for_read       := true;
             new_cols(col_id)      := tab(i).description;
             new_cols(col_id).name := 'ECHO_'|| tab(i).description.name;
             col_id                := col_id + 1;
              EXIT;
         END IF;
       END LOOP;
    END LOOP;

    --  Verify all columns were found
    IF (col_id - 1 != cols.count) THEN
       raise_application_error(-20101,
         'Column mismatch ['||col_id-1||'], ['||cols.count||']');
    END IF;

    RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;
```

197.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

```
FUNCTION COL_TO_CHAR(
   col   COLUMN_DATA_T,
   rid   PLS_INTEGER,
   quote VARCHAR2 DEFAULT '"')
  RETURN VARCHAR2;
```

Parameters

Table 197-16 DBMS_TF.COL_TO_CHAR Function Parameters

Parameter	Description
col	The column whose value is to be converted
rid	Row number
quote	Quotation mark to use for non-numeric values

Return Values

The string representation of a column data value.

Example 197-6 DBMS_TF.COL_TO_CHAR Example

```
PROCEDURE Fetch_Rows AS
    rowset DBMS_TF.rROW_SET_T;
    str    VARCHAR2(32000);
```

```
BEGIN
     DBMS_TF.GET_ROW_SET(rowset);
     str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
END;
```

197.9.3 CSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

Syntax

```
FUNCTION CSTORE_EXISTS
  (key      IN VARCHAR2,
   key_type IN PLS_INTEGER default NULL)
   return BOOLEAN;
```

Parameters

Table 197-17 CSTORE_EXISTS Function Parameters

Parameter	Description
`key`	A unique character key
`key_type`	The type of key (optional) Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

Example 197-7 DBMS_TF.CSTORE_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

197.9.4 CSTORE_GET Procedure

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE` function.

You can get the PTF compilation state during runtime procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

This procedure is overloaded. The `DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

See Table 197-3 for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT VARCHAR2);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT NUMBER);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT DATE);

PROCEDURE CSTORE_GET(
   key   IN     VARCHAR2,
   value IN OUT BOOLEAN);
```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);
```

Parameters

Table 197-18 DBMS_TF.CSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types
key_value	Key value

197.9.5 GET_COL Procedure

Get Read Column Values

Syntax

```
PROCEDURE GET_COL(
   columnId NUMBER,
   collection IN OUT NOCOPY <datatype>);
```

Where <*datatype*> can be any one of the supported types.

See Table 197-1 for the list of supported types.

Parameters

Table 197-19 GET_COL Procedure Parameters

Parameter	Description
`columnid`	The id for the column
`collection`	The data for the column

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in `DESCRIBE` method of PTF.

For the same ColumnId, `GET_COL` and `PUT_COL` may correspond to different column.

Example 197-8 DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
  col1 DBMS_TF.TAB_CLOB_T;
  col2 DBMS_TF.TAB_CLOB_T;
  out1 DBMS_TF.TAB_CLOB_T;
  out2 DBMS_TF.TAB_CLOB_T;
BEGIN
    DBMS_TF.GET_COL(1, col1);
    DBMS_TF.GET_COL(2, col2);

    FOR I IN 1 .. col1.COUNT LOOP
        out1(i) := 'ECHO-' || col1(i);
    END LOOP;

    FOR I IN 1 .. col2.COUNT LOOP
        out2(i) := 'ECHO-' || col2(i);
    END LOOP;

    DBMS_TF.PUT_COL(1, out1);
    DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows

ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

197.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

```
FUNCTION GET_ENV
         RETURN ENV_T;
```

Return Values

Returns information about the PTF runtime environment.

Example 197-9 DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable env of type ENV_T with the PTF execution information in a `FETCH_ROWS` implementation procedure.

```
env          DBMS_TF.ENV_T  := DBMS_TF.GET_ENV();
```

197.9.7 GET_ROW_SET Procedure

Get Read Column Values

The `FETCH_ROW` procedure can call the `GET_ROW_SET` procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

Syntax

```
PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER);

PROCEDURE GET_ROW_SET(
  rowset    OUT NOCOPY ROW_SET_T,
  row_count OUT        PLS_INTEGER,
  col_count OUT        PLS_INTEGER);
```

Parameters

Table 197-20 GET_ROW_SET Procedure Parameters

Parameter	Description
`rowset`	The collection of data and metadata
`row_count`	The number of rows in the columns
`col_count`	The number of columns

Example 197-10 DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
  rowset      DBMS_TF.ROW_SET_T;
  accumulator DBMS_TF.TAB_VARCHAR2_T;
  row_count   PLS_INTEGER;

  FUNCTION get_value(col  PLS_INTEGER,
                     ROW  PLS_INTEGER)
  RETURN VARCHAR2
  AS
    col_type  PLS_INTEGER := rowset(col).description.TYPE;
  BEGIN
      CASE col_type
        WHEN DBMS_TF.TYPE_VARCHAR2 THEN
          RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
        ELSE
          RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
      END CASE;
  END;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset, row_count);

    IF ( rowset.count = 0 ) THEN
      RETURN;
    END IF;

    FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
    END LOOP;

    FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
            accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
        END LOOP;
    END LOOP;
    -- Pushout the accumulator
    DBMS_TF.PUT_COL(1, accumulator);
END;
```

197.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 197-11 Stack Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Stack Polymorphic Table Function

Create the PTF implementation package stack_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

  FUNCTION  describe(tab  IN OUT dbms_tf.table_t,
                     col         dbms_tf.columns_t)
            RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body stack_p.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

  FUNCTION  describe(tab  IN OUT dbms_tf.table_t,
                     col         dbms_tf.columns_t)
            RETURN dbms_tf.describe_t  AS
  BEGIN
    FOR i IN 1 .. tab.column.count LOOP
      FOR j IN 1 .. col.count LOOP
        IF (tab.column(i).description.name = col(j) AND
            tab.column(i).description.TYPE = dbms_tf.type_number) THEN
          tab.column(i).pass_through := false;
          tab.column(i).for_read     := true;
        END IF;
      END LOOP;
    END LOOP;

    RETURN dbms_tf.describe_t(
             new_columns => dbms_tf.columns_new_t(
               1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                              TYPE => dbms_tf.type_varchar2),
               2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                              TYPE => dbms_tf.type_number)),
             row_replication => true);
```

```
  END;

  PROCEDURE fetch_rows  AS
    env    dbms_tf.env_t := dbms_tf.get_env();
    rowset dbms_tf.row_set_t;
    colcnt PLS_INTEGER;
    rowcnt PLS_INTEGER;
    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
      repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
      FOR c IN 1 .. colcnt LOOP
        IF rowset(c).tab_number(r) IS NOT NULL THEN
          repfac(r)                    := repfac(r) + 1;
          namcol(nvl(namcol.last+1,1)) :=
            INITCAP(regexp_replace(env.get_columns(c).name, '^"|"$'));
          valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
        END IF;
      END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

  END;

END stack_p;
```

Create the standalone PTF named stack. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is stack_p.

```
CREATE FUNCTION stack(tab TABLE,
                      col columns)
                   RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;
```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```
SELECT   deptno, ename, column_name, column_value
FROM     stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE    deptno IN (10, 30)
ORDER BY deptno, ename;
```

```
    DEPTNO ENAME      COLUMN_NAME     COLUMN_VALUE
---------- ---------- --------------- ------------
        10 CLARK      Mgr                     7839

        30 WARD       Sal                     1250
```

197.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```
FUNCTION GET_XID
      RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 197-12 DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
  xst(DBMS_TF.GET_XID()) := 0;
END;
```

197.9.9 PUT_COL Procedure

Put Column Values

Syntax

```
PROCEDURE PUT_COL(
   columnid NUMBER,
   collection IN <datatype>);
```

Where <*datatype*> can be any one of the supported types.

See Table 197-1 for the list of supported types.

Parameters

Table 197-21 PUT_COL Procedure Parameters

Parameter	Description
`columnid`	The id for the column
`collection`	The data for the column

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in `DESCRIBE` method of PTF.

For the same columnid, `GET_COL` and `PUT_COL` may correspond to different column.

197.9.9.1 Rand_col Polymorphic Table Function Example

The rand_col PTF appends specified number of random-valued columns to the output.

Example 197-13 Rand_col Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Rand_col Polymorphic Table Function

This rand_col PTF example appends col_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND_<*n*>"

Create the PTF implementation package rand_col_p.

The parameters are :

- tab : Input table
- col_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

  FUNCTION describe(tab       IN OUT DBMS_TF.table_t,
                    col_count        NATURALN DEFAULT 1,
                    low              NUMBER   DEFAULT NULL,
                    high             NUMBER   DEFAULT NULL)
```

```
          RETURN DBMS_TF.describe_t;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                       low       NUMBER   DEFAULT NULL,
                       high      NUMBER   DEFAULT NULL);

END rand_col_p;
```

Create the PTF implementation package body rand_col_p.

The parameter col_count is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of col_count to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```
CREATE PACKAGE BODY rand_col_p AS
  col_name_prefix CONSTANT dbms_id := 'RAND_';

  FUNCTION describe(tab       IN OUT DBMS_TF.table_t,
                    col_count        NATURALN DEFAULT 1,
                    low              NUMBER   DEFAULT NULL,
                    high             NUMBER   DEFAULT NULL)
           RETURN DBMS_TF.describe_t
  AS
    cols DBMS_TF.columns_new_t;
  BEGIN
    FOR i IN 1 .. col_count LOOP
     cols(i):= DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
TYPE=>DBMS_TF.type_number);
    END LOOP;

    RETURN DBMS_TF.describe_t(new_columns => cols);
  END;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                       low       NUMBER   DEFAULT NULL,
                       high      NUMBER   DEFAULT NULL)
  AS
    row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
    col       DBMS_TF.tab_number_t;
  BEGIN
    FOR c IN 1 .. col_count LOOP
      FOR i IN 1 .. row_count LOOP
        col(i) :=  CASE WHEN (low IS NULL OR high IS NULL)
                        THEN dbms_random.VALUE
                         ELSE dbms_random.VALUE(low,
high)
                    END;
      END LOOP;
      DBMS_TF.put_col(c, col);
    END LOOP;
  END;

END rand_col_p;
```

Create the standalone rand_col PTF. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is rand_col_p.

```
CREATE FUNCTION rand_col(tab TABLE,
                         col_count NATURALN DEFAULT 1,
                         low       NUMBER   DEFAULT NULL,
                         high      NUMBER   DEFAULT NULL)
                  RETURN TABLE
                  PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the rand_col PTF to display all columns of table SCOTT.DEPT with one produced RAND_1 column.

```
  SELECT *
    FROM rand_col(scott.dept);
```

```
    DEPTNO DNAME          LOC              RAND_1
---------- -------------- ------------- ----------
        10 ACCOUNTING     NEW YORK      .738666262
        20 RESEARCH       DALLAS        .093256312
        30 SALES          CHICAGO       .992944835
        40 OPERATIONS     BOSTON        .397948124
```

Invoke the rand_col PTF to display all columns of table SCOTT.DEPT with two produced RAND_1 and RAND_2 columns.

```
  SELECT *
    FROM rand_col(scott.dept, col_count => 2);
```

```
    DEPTNO DNAME          LOC              RAND_1     RAND_2

197.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
   rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
  PROCEDURE PUT_ROW_SET(
   rowset             IN   ROW_SET_T,
   replication_factor IN   NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
   rowset             IN   ROW_SET_T,
   replication_factor IN   TAB_NATURALN_T);
```

Parameters

Table 197-22 PUT_ROW_SET Procedure Parameters

Parameter	Description
`rowset`	The collection of data and metadata
`replication_factor`	The replication factor per row

Example 197-14 DBMS_TF.PUT_ROW_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
  rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

197.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 197-15 Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Split Polymorphic Table Function

Create the PTF implementation package split_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

  FUNCTION  describe(tab  IN OUT DBMS_TF.table_t,
                     col         DBMS_TF.columns_t,
                     cnt         NATURALN)
            RETURN DBMS_TF.describe_t;

  PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

  FUNCTION  describe(tab  IN OUT DBMS_TF.Table_t,
                     col         DBMS_TF.Columns_t,
                     cnt         NATURALN)
            RETURN DBMS_TF.describe_t
  AS
    new_cols DBMS_TF.columns_new_t;
    col_id   PLS_INTEGER := 1;
  BEGIN
    FOR i IN 1 .. tab.column.count LOOP
      FOR j IN 1 .. col.count LOOP
        IF (tab.column(i).description.name = col(j) AND
            tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
          tab.column(i).pass_through := FALSE;
          tab.column(i).for_read     := TRUE;
          new_cols(col_id) := tab.column(i).description;
          col_id := col_id + 1;
        END IF;
      END LOOP;
    END LOOP;
```

```
    RETURN DBMS_TF.describe_t(new_columns=>new_cols, row_replication=>true);
  END;
  PROCEDURE fetch_rows(cnt NATURALN)
  AS
    inp_rs DBMS_TF.row_set_t;
    out_rs DBMS_TF.row_set_t;
    rows   PLS_INTEGER;
  BEGIN
    DBMS_TF.get_row_set(inp_rs, rows);

    FOR c IN 1 .. inp_rs.count() LOOP
      FOR r IN 1 .. rows LOOP
        FOR i IN 1 .. cnt LOOP
          out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/cnt;
        END LOOP;
      END LOOP;
    END LOOP;

    DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
  END;

END split_p;
```

Create the standalone PTF named split. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is split_p.

```
CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
                  RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;
```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the split PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```
SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;
```

```
ENAME             SAL                COMM
---------- ---------- --------------------
ALLEN             800                 150
ALLEN             800                 150
WARD              625                 250

JAMES             475
```

197.9.11 ROW_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
  replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
  replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 197-23 ROW_REPLICATION Procedure Parameters

Parameter	Description
`replication_factor`	The replication factor per row

Example 197-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the replication_factor that is given as a parameter.

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Replicate Polymorphic Table Function

Create the PTF implementation package replicate_p.

```
CREATE PACKAGE replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
                      replication_factor NATURAL)
        RETURN DBMS_TF.describe_t;

    PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;
```

Create the PTF implementation package body replicate_p. The PTF replicates each input row by the replication_factor that is given as a parameter.

```
CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                    , replication_factor NATURAL)
        RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;
```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate_p.

```
CREATE FUNCTION replicate(tab TABLE,
                          replication_factor NATURAL)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;
```

This example sets the replication_factor to 2 which results in doubling the number of rows.

```
 SELECT *
 FROM replicate(dept, replication_factor => 2);

   DEPTNO DNAME          LOC
--------- -------------- -------------
        10 ACCOUNTING     NEW YORK
        10 ACCOUNTING     NEW YORK
        20 RESEARCH       DALLAS
        20 RESEARCH       DALLAS
        30 SALES          CHICAGO
        30 SALES          CHICAGO
        40 OPERATIONS     BOSTON
        40 OPERATIONS     BOSTON
```

This example sets the replication_factor to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);

no rows selected
```

Count the number of employees in each department. Invoke the replicate PTF to report from the SCOTT.EMP table to set the replication_factor to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;

    DEPTNO   COUNT(*)
---------- ----------
        30    6000000
        10    3000000
        20    5000000
```

This sets the replication_factor to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);

  COUNT(*)
----------
1000000000
```

197.9.12 ROW_TO_CHAR Function

The ROW_TO_CHAR function converts a row data value to a string representation.

Syntax

```
FUNCTION ROW_TO_CHAR(
   rowset ROW_SET_T,
   rid    PLS_INTEGER,
   format PLS_INTEGER DEFAULT FORMAT_JSON)
   RETURN VARCHAR2;
```

Parameters

Table 197-24 DBMS_TF.ROW_TO_CHAR Function Parameters

Parameter	Description
rowset	The rowset whose value is to be converted
rid	Row number
format	The string format (default is FORMAT_JSON)

Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 197-17 DBMS_TF.ROW_TO_CHAR Example

```
 PROCEDURE Fetch_Rows as
   rowset DBMS_TF.ROW_SET_T;
   str    VARCHAR2(32000);
```

```
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;
```

197.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

```
FUNCTION SUPPORTED_TYPE(
   type_id PLS_INTEGER)
   RETURN BOOLEAN;
```

Parameters

Table 197-25 DBMS_TF.SUPPORTED_TYPE Function Parameters

Parameter	Description
type_id	The type

Return Values

Returns TRUE if the type_id is a scalar supported by `PUT_COL` and `GET_COL`.

> **See Also:**
>
> Echo Polymorphic Table Function Example for an example of DBMS_TF.SUPPORTED_TYPE use.

197.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

```
PROCEDURE TRACE(
   msg          VARCHAR2,
   with_id      BOOLEAN   DEFAULT FALSE,
   separator    VARCHAR2  DEFAULT NULL,
   prefix       VARCHAR2  DEFAULT NULL);

PROCEDURE TRACE(
   rowset       IN ROW_SET_T);

PROCEDURE TRACE(
   env          IN ENV_T);

PROCEDURE TRACE(
   columns_new  IN COLUMNS_NEW_T);

PROCEDURE trace(
   cols         IN COLUMNS_T);
```

```
PROCEDURE trace(
   columns_with_type  IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
   tab          IN TABLE_T);

PROCEDURE trace(
   col          IN COLUMN_METADATA_T);
```

Parameters

Table 197-26 TRACE Procedure Parameters

Parameter	Description
msg	Custom user tracing message
with_id	Include the unique execution ID in the trace?
separator	Specify a string to use to separate values
prefix	Specify a string to prefix the actual values
rowset	Data for a rowset
env	Metadata about the polymorphic table function execution state
columns_new	Collection for new columns
cols	Collection containing column names
columns_with_type	Collection containing columns metadata
tab	Table descriptor
col	Metadata about an existing table column or a new column produced

Example 197-18 DBMS_TF.TRACE Example

This example adds tracing to a fetch_rows procedure.

```
PROCEDURE fetch_rows
AS
   rowset DBMS_TF.ROW_SET_T;
BEGIN
   DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
   DBMS_TF.TRACE(rowset);
   DBMS_TF.GET_ROW_SET(rowset);
   DBMS_TF.TRACE(rowset);
   DBMS_TF.PUT_ROW_SET(rowset);
   DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

197.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

```
PROCEDURE XSTORE_CLEAR;
```

197.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

```
FUNCTION XSTORE_EXISTS(
   key      IN VARCHAR2,
   key_type IN PLS_INTEGER DEFAULT NULL)
  RETURN BOOLEAN;
```

Parameters

Table 197-27 DBMS_TF.XSTORE_EXISTS Function Parameters

Parameter	Description
`key`	A unique character key
`key_type`	The type of key (optional). Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

> **See Also:**
>
> Table 197-6 for more information about supported key types.

197.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

See Table 197-6 for more information about supported key types.

Syntax

```
PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT VARCHAR2);

PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT NUMBER);
```

```
PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT DATE);

PROCEDURE XSTORE_GET(
   key   IN VARCHAR2,
   value IN OUT BOOLEAN);
```

Parameters

Table 197-28 DBMS_TF.XSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If the key is not found, the value is unchanged.

197.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 197-19 Row_num Polymorphic Table Function Example

> **Live SQL:**
>
> You can view and run this example on Oracle Live SQL at Row_num Polymorphic Table Function

Create the PTF implementation package row_num_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)
- inc - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                    ini NUMBER DEFAULT 1,
                    inc NUMBER DEFAULT 1)
           RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column `ROW_ID` to the table. The sequence values start with the specified value (ini) and each time it is incremented by the specified value (inc).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                    ini NUMBER DEFAULT 1,
                    inc NUMBER DEFAULT 1)
           RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
             dbms_tf.columns_new_t(1 =>
               dbms_tf.column_metadata_t(name => 'ROW_ID',
                                         TYPE => dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid     NUMBER               := ini;
    col     dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;

 END;
```

Create a standalone polymorphic table function named row_num. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is row_num_p.

```
CREATE FUNCTION row_num(tab TABLE,
                        ini NUMBER DEFAULT 1,
                        inc NUMBER DEFAULT 1)
                        RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The row_num PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);

DEPTNO DNAME          LOC              ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK              1
    20 RESEARCH       DALLAS                2
    30 SALES          CHICAGO               3
    40 OPERATIONS     BOSTON                4
```

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);

DEPTNO DNAME          LOC              ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK            100
    20 RESEARCH       DALLAS              101
    30 SALES          CHICAGO             102
    40 OPERATIONS     BOSTON              103
```

The row_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW_ID with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);

DEPTNO DNAME          LOC              ROW_ID
------ -------------- ------------- ----------
    10 ACCOUNTING     NEW YORK             0
    20 RESEARCH       DALLAS              -1
    30 SALES          CHICAGO             -2
    40 OPERATIONS     BOSTON              -3
```

The row_num PTF invocation reporting from the SCOTT.EMP table produces a new column ROW_ID with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
  FROM   row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
WHERE  deptno IN (10, 30);

DEPTNO ENAME      JOB              SAL     ROW_ID
------ ---------- --------- ---------- ----------
    10 CLARK      MANAGER         2450          0
    10 KING       PRESIDENT       5000        .25
    10 MILLER     CLERK           1300         .5
    30 ALLEN      SALESMAN        1600          0
    30 BLAKE      MANAGER         2850        .25
    30 JAMES      CLERK            950         .5
    30 MARTIN     SALESMAN        1250        .75
    30 TURNER     SALESMAN        1500          1
    30 WARD       SALESMAN        1250       1.25
```

197.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.

Syntax

```
PROCEDURE XSTORE_REMOVE(
   key      IN VARCHAR2,
   key_type IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 197-29 DBMS_TF.XSTORE_REMOVE Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key to remove (optional)

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

197.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store and item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```
PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN VARCHAR2);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN NUMBER);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN DATE);

PROCEDURE XSTORE_SET (
   key   IN VARCHAR2,
   value IN BOOLEAN);
```

Parameters

Table 197-30 DBMS_TF.XSTORE_SET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If an item for a given key already exists, the value is replaced.

198
DBMS_TNS

The DBMS_TNS package provides the RESOLVE_TNSNAME function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- DBMS_TNS Overview
- DBMS_TNS Security Model
- Summary of DBMS_TNS Subprograms

198.1 DBMS_TNS Overview

The DBMS_TNS package contains one function, RESOLVE_TNSNAME, which returns the resolved connect string from configured sources that have been defined in the names.directory_path parameter in the sqlnet.ora file.

The RESOLVE_TNSNAME function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

> **See Also:**
>
> - *Oracle Database Administrator's Guide* for more information about finding database link information
> - *Oracle Database Reference* for information about the ALL_DB_LINKS data dictionary view

198.2 DBMS_TNS Security Model

You must be granted the EXECUTE privilege on the DBMS_TNS package.

198.3 Summary of DBMS_TNS Subprograms

This table lists the DBMS_TNS subprograms and briefly describes them.

Table 198-1 DBMS_TNS Parameters

Subprogram	Description
RESOLVE_TNSNAME Function	Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the sqlnet.ora names.directory_path parameter)

198.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora names.directory_path` parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
   tns_name VARCHAR2)
  RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

Parameter	Description
`tns_name`	Database address for establishing the connection

Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME function` to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;

DB_LINK
--------------------------------------------------------------------------------
--
DBMS_TNS.RESOLVE_TNSNAME(HOST)
--------------------------------------------------------------------------------
--
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)(HOST=juno)
(USER=psmith))
))
```

199
DBMS_TRACE

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes
- Summary of DBMS_TRACE Subprograms

199.1 DBMS_TRACE Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.

   Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

199.2 DBMS_TRACE Security Model

This package must be created under SYS.

199.3 DBMS_TRACE Constants

DBMS_TRACE defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 199-1 DBMS_TRACE Event Constants

Name	Type	Value	Description
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as • PL/SQL Trace Tool started • Trace flags changed • PL/SQL Virtual Machine started • PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Table 199-2 DBMS_TRACE Version Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	

Oracle recommends using the symbolic form for all these constants.

199.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

199.5 DBMS_TRACE Operational Notes

Certain operational notes apply to `DBMS_TRACE`.

These are described in the following sections:

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated
*/
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY]  <libunit-name> compile debug;
```

> **Note:**
>
> You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

> **Note:**
>
> For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level *n* changes the record limit to 1024 * *n*.

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as `PL/SQL Trace Tool started`, `Trace flags changed`, `PL/SQL Virtual Machine started`, and `PL/SQL Virtual Machine stopped`.

199.6 Summary of DBMS_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

Table 199-3 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function	Gets the trace level
PLSQL_TRACE_VERSION Procedure	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure	Starts tracing in the current session

199.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

199.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS_TRACE constants.

See Table 199-1 for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
  RETURN BINARY_INTEGER;
```

199.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
   major OUT BINARY_INTEGER,
   minor OUT BINARY_INTEGER);
```

Parameters

Table 199-4 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

199.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
   trace_level INTEGER);
```

Parameters

Table 199-5 *SET_PLSQL_TRACE Procedure Parameters*

Parameter	Description
trace_level	You must supply one or more of the constants as listed in Table 199-1. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information.

200

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

> **See Also:**
>
> *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- DBMS_TRANSACTION Security Model
- Summary of DBMS_TRANSACTION Subprograms

200.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

200.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the `DBMS_TRANSACTION` subprograms and briefly describes them.

Table 200-1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`
ADVISE_NOTHING Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`
ADVISE_ROLLBACK Procedure	Equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`
COMMIT Procedure	Equivalent to the SQL statement: `COMMIT`
COMMIT_COMMENT Procedure	Equivalent to the SQL statement: `COMMIT COMMENT <text>`
COMMIT_FORCE Procedure	Equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`
LOCAL_TRANSACTION_ID Function	Returns the local (to instance) unique identifier for the current transaction
GET_TRANSACTION_ID Function	Returns the transaction identifier for the Sessionless transaction or the XA transaction in the session

Table 200-1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
GET_TRANSACTION_TIMEOUT Function	Returns the timeout, in seconds, of the XA transaction branch or the Sessionless transaction within a session
GET_TRANSACTION_TYPE Function	Returns the type of the transaction active in the session
PURGE_LOST_DB_ENTRY Procedure	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure	Equivalent to the SQL statement: `SET TRANSACTION READ ONLY`
READ_WRITE Procedure	equivalent to the SQL statement: `SET TRANSACTION READ WRITE`
ROLLBACK Procedure	Equivalent to the SQL statement: `ROLLBACK`
ROLLBACK_FORCE Procedure	Equivalent to the SQL statement: `ROLLBACK FORCE <text>`
ROLLBACK_SAVEPOINT Procedure	Equivalent to the SQL statement: `ROLLBACK TO SAVEPOINT <savepoint_name>`
SAVEPOINT Procedure	Equivalent to the SQL statement: `SAVEPOINT <savepoint_name>`
START_TRANSACTION Function	Starts a local (vanilla) transaction or a Sessionless transaction
STEP_ID Function	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
SUSPEND_TRANSACTION Procedure	Suspends the Sessionless transaction that is active within a session
USE_ROLLBACK_SEGMENT Procedure	Equivalent to the SQL statement: `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`

200.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

200.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

200.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

200.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: `COMMIT`

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

200.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: `COMMIT COMMENT <text>`

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
   cmnt VARCHAR2);
```

Parameters

Table 200-2 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

200.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
   xid VARCHAR2,
   scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 200-3 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

200.2.7 GET_TRANSACTION_ID Function

This function returns the transaction identifier in the session.

This function returns the hexadecimal representations of the transaction identifier (in varchar2 format) of the active XA transaction or Sessionless transaction in the session. If there are none of these types of transactions active within the session, it returns NULL.

If it's an XA transaction, the function returns a hex representation of format ID and GTRID separated by a dot (<format id>.<GTRID>).

If it is a Sessionless transaction, the function returns a hex representation of GTRID. Call GET_TRANSACTION_TYPE to get whether the transaction is of type XA or Sessionless.

Syntax

```
GET_TRANSACTION_ID
   RETURN VARCHAR2;
```

200.2.8 GET_TRANSACTION_TIMEOUT Function

This function returns the timeout, in seconds, of the XA transaction branch or the Sessionless transaction within a session.

If a local transaction is active within the session, the function returns UB4MAXVAL.

If no transaction is active within the session, the function returns NULL.

Syntax

```
GET_TRANSACTION_TIMEOUT
   RETURN NUMBER;
```

200.2.9 GET_TRANSACTION_TYPE Function

This function returns the type of the transaction active in the session.

The type of the transaction returned can be one of the following: TRANSACTION_TYPE_LOCAL, TRANSACTION_TYPE_SESSIONLESS, TRANSACTION_TYPE_XA, or NULL (if no transaction is active within the session).

Syntax

```
GET_TRANSACTION_TYPE
   RETURN PLS_INTEGER;
```

200.2.10 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
   create_transaction BOOLEAN := FALSE)
  RETURN VARCHAR2;
```

Parameters

Table 200-4 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
`create_transaction`	If true, then start a transaction if one is not currently active.

200.2.11 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
   xid VARCHAR2);
```

Parameters

Table 200-5 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

Usage Notes

> **WARNING:**
>
> PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in `DBA_2PC_PENDING` as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the `MIXED` column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is `ORA-02062`). In this case, the DBA may use the procedure `PURGE_LOST_DB_ENTRY` to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 200-6 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

> **Note:**
>
> Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

> **Note:**
>
> Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

200.2.12 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
   xid VARCHAR2);
```

Parameters

Table 200-7 PURGE_MIXED Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

200.2.13 READ_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

200.2.14 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

200.2.15 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

200.2.16 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
   xid VARCHAR2);
```

Parameters

Table 200-8 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
`xid`	Local or global transaction ID.

200.2.17 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 200-9 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

200.2.18 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 200-10 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

200.2.19 START_TRANSACTION Function

This function starts a local (vanilla) transaction or a Sessionless transaction depending on the `transaction_type` being `TRANSACTION_TYPE_LOCAL` or `TRANSACTION_TYPE_SESSIONLESS`.

If starting a local transaction, this function returns the `XID <usn>.<slot>.<wrap>` just like `DBMS_TRANSACTION.local_transaction_id()` does. If starting a Sessionless transaction, this function returns the hexadecimal representation of GTRID of the started transaction.

Syntax

```
DBMS_TRANSACTION.START_TRANSACTION(
   xid              in raw default null,
   transaction_type in pls_integer default TRANSACTION_TYPE_LOCAL,
   timeout          in pls_integer default 60,
   flag             in pls_integer default 0
) RETURN VARCHAR2;
```

The following table describes the parameters of the `DBMS_TRANSACTION.START_TRANSACTION` function.

> **Note:**
>
> The `xid`, `timeout`, and `flag` parameters apply only if the `TRANSACTION_TYPE` is `TRANSACTION_TYPE_SESSIONLESS`.

Table 200-11 START_TRANSACTION Function Parameters

Parameter	Description
`xid`	GTRID of the Sessionless transaction to be newly started or resumed. It can be raw byte array of size up to 64 bytes. If `NULL`, the server generates a GTRID.
`timeout`	The duration, in seconds, that this transaction can be resumed after it is suspended. **Note:** As of Oracle Database 23ai, Version 23.6, the `timeout` parameter is only used if the `flag` is `TRANSACTION_NEW`.
`flag`	The flag can be either `TRANSACTION_NEW` for starting a new transaction or `TRANSACTION_RESUME` for resuming a suspended transaction.

200.2.20 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```

200.2.21 SUSPEND_TRANSACTION Procedure

This procedure suspends the Sessionless transaction that is active within a session.

If the active transaction is not a Sessionless transaction, an `ORA-26202` error is raised. If there is no transaction active within the session, the suspend transaction operation is a no-op.

Syntax

```
DBMS_TRANSACTION.SUSPEND_TRANSACTION
```

200.2.22 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

Table 200-12 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
rb_name	Name of rollback segment to use.

201
DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

> **See Also:**
>
> *Oracle Database Advanced Queuing User's Guide*for more on message format transformations.

201.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the DBMS_TRANSFORM subprograms and briefly describes them.

Table 201-1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_TRANSFORMATION Procedure	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_TRANSFORMATION Procedure	Drops the given transformation
MODIFY_TRANSFORMATION Procedure	Modifies an existing transformation

201.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema               VARCHAR2(30),
    name                 VARCHAR2(30),
    from_schema          VARCHAR2(30),
    from_type            VARCHAR2(30),
    to_schema            VARCHAR2(30),
    to_type              VARCHAR2(30),
    transformation       VARCHAR2(4000));
```

Parameters

Table 201-2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

201.1.2 DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
```

schema VARCHAR2(30),

```
    name        VARCHAR2(30));
```

Parameters

Table 201-3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

201.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
   schema             VARCHAR2(30),
   name               VARCHAR2(30),
   attribute_number   INTEGER,
   transformation     VARCHAR2(4000));
```

Parameters

Table 201-4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

202
DBMS_TSDP_MANAGE

The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies.

DBMS_TSDP_MANAGE is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_TSDP_MANAGE Subprograms

Related Topics

- DBMS_TSDP_PROTECT
  The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package.

> **See Also:**
>
> *Oracle Database Security Guide*

202.1 DBMS_TSDP_MANAGE Overview

The DBMS_TSDP_MANAGE package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the DBMS_TSDP_PROTECT package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

202.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker's rights. The DBMS_TSDP_MANAGE package is owned by SYS.

The EXECUTE privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the EXECUTE privilege for this package, while the DBMS_TSDP_PROTECT package would be governed by a security administrator.

202.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the `DBMS_TSDP_MANAGE` subprograms and briefly describes them.

Table 202-1 DBMS_TSDP_MANAGE Package Subprograms

Subprogram	Description
ADD_SENSITIVE_COLUMN Procedure	Adds a column to the sensitive column list
ADD_SENSITIVE_TYPE Procedure	Creates and adds a sensitive column type to the list of sensitive column types in the database
ALTER_SENSITIVE_COLUMN Procedure	Alters the sensitive type and/or the comment of a column in the sensitive column list.
DROP_SENSITIVE_COLUMN Procedure	Removes columns from the sensitive column list
DROP_SENSITIVE_TYPE Procedure	Drops a sensitive column type from the list sensitive column types in the database
DROP_SENSITIVE_TYPE_SOURCE Procedure	Drops sensitive column types corresponding to a source from the list sensitive column types in the database
IMPORT_DISCOVERY_RESULT Procedure	Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance
IMPORT_SENSITIVE_TYPES Procedure	Imports a list of sensitive column types from a source
REMOVE_DISCOVERY_RESULT Procedure	Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

202.3.1 ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCHAR2,
   column_name        IN VARCHAR2,
   sensitive_type     IN VARCHAR2,
   user_comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 202-2 *ADD_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
`schema_name`	Schema to which the column belongs
`table_name`	Table containing the column
`column_name`	Sensitive column name
`sensitive_type`	Identifier of the sensitive column type

Table 202-2 (Cont.) *ADD_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
user_comment	User comment regarding the sensitive column

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL',
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary column');
```

202.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2,
   table_name         IN VARCAHR2,
   column_name        IN VARCAHR2,
   sensitive_type     IN VARCAHR2,
   user_comment       IN VARCAHR2 DEFAULT NULL);
```

Parameters

Table 202-3 *ALTER_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name        => 'SCOTT',
  table_name         => 'EMP',
  column_name        => 'SAL',
  sensitive_type     => 'FINANCE_Type',
  user_comment       => 'Finance Type. Earlier categorized as Salary Type');
```

202.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
   sensitive_type     IN  VARCHAR2,
   user_comment       IN  VARCAHR2 DEFAULT NULL);
```

Parameters

Table 202-4 *ADD_SENSITIVE_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE',
  user_comment       => 'Salary data');
```

202.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
   schema_name        IN VARCHAR2 DEFAULT '%',
   table_name         IN VARCAHR2 DEFAULT '%',
   column_name        IN VARCAHR2 DEFAULT '%');
```

Parameters

Table 202-5 *DROP_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name         => 'SCOTT',
  table_name          => 'EMP',
  column_name         => 'SAL');
```

202.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
   sensitive_type     IN VARCHAR2);
```

Parameters

Table 202-6 *DROP_SENSITIVE_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type to be dropped

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type     => 'SALARY_TYPE');
```

202.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      IN VARCHAR2);
```

Parameters

Table 202-7 *DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters*

Parameter	Description
source	Name of the source

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
   source      =>  'ADM_DEMO');
```

202.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  CLOB,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_result         IN  XMLTYPE,
  discovery_source         IN  VARCHAR2,
  force                    IN  FORCE DEFAULT FALSE);
```

Parameters

Table 202-8 *IMPORT_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
discovery_result	List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).
discovery_source	Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.
force	Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source. • FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. • TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
  discovery_results        =>  xml_adm_result,
  discovery_source         => 'ADM_Demo');
```

202.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN CLOB,
  source                 IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        IN XMLTYPE,
  source                 IN VARCHAR2);
```

Parameters

Table 202-9 *IMPORT_SENSITIVE_TYPES Procedure Parameters*

Parameter	Description
sensitive_types	List of sensitive column types in XML Format (possibly as a CLOB)
source	Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
  sensitive_types        =>  xml_adm_result,
  source                 => 'ADM_Demo');
```

202.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source     IN  VARCHAR2);
```

Parameters

Table 202-10 *REMOVE_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
discovery_source	Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
  discovery_source    => 'ADM_Demo');
```

203
DBMS_TSDP_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of DBMS_TSDP_PROTECT Subprograms

Related Topics

- DBMS_TSDP_MANAGE
  The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the DBMS_TSDP_PROTECT package with regard to transparent sensitive data protection (TSDP) policies.

> **See Also:**
>
> *Oracle Database Security Guide*

203.1 DBMS_TSDP_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the DBMS_TSDP_MANAGE package.

203.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

203.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

Table 203-1 DBMS_TDSP_PROTECT Constants - Compression Types

Constant	Type	Value	Description
TSDP_PARAM_MAX	INTEGER	4000	Maximum length of the parameter value that can be specified in FEATURE_OPTIONS

203.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- FEATURE_OPTIONS Table Type

  POLICY_CONDITIONS Table Type

203.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by VARCHAR2(M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```

203.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2(TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

203.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.

Table 203-2 DBMS_TSDP_PROTECT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure	Creates a TSDP policy
ALTER_POLICY Procedure	Alters a TDSP policy
ASSOCIATE_POLICY Procedure	Associates or disassociates a TSDP policy with a sensitive column type
DISABLE_PROTECTION_COLUMN Procedure	Disables protection for columns
DISABLE_PROTECTION_SOURCE Procedure	Disables protection based on the source of truth for the sensitive columns
DISABLE_PROTECTION_TYPE Procedure	Disables protection for a sensitive column type
DROP_POLICY Procedure	Removes a TDSP policy
ENABLE_PROTECTION_COLUMN Procedure	Enables protection for columns
ENABLE_PROTECTION_SOURCE Procedure	Enables protection based on the source of truth for the sensitive columns
ENABLE_PROTECTION_TYPE Procedure	Enables protection for a sensitive column type

203.5.1 ADD_POLICY Procedure

This procedure creates a TDSP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
   policy_name              IN VARCHAR2,
   security_feature         IN PLS_INTEGER,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 203-3 *ADD_POLICY Procedure Parameters*

Parameter	Description
`policy_name`	Name of the policy being created. The maximum length for this identifier is `M_IDEN`. This follows the Oracle naming convention.
`security_feature`	Oracle security feature with which the policy is associated. Allowed values: • `DBMS_TSDP_PROTECT.REDACT` • `DBMS_TSDP_PROTECT.VPD` • `DBMS_TSDP_PROTECT.UNIFIED_AUDIT` • `DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT` • `DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION`
`policy_enable_options`	Initialized with the parameter-value pairs corresponding to the `security_feature` setting

Table 203-3 (Cont.) *ADD_POLICY Procedure Parameters*

Parameter	Description
policy_apply_condition	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER). Example: example_policy_condition(*Property*)= *property_value*. Permissible values for Property: • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy PARTIAL_MASK_POLICY:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
   'SYS_CONTEXT(''USERENV'',''SESSION_USER'')      ='APPUSER'';
  redact_feature_options ('function_type')        := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')  := 'STR, VVVVVVVVV,VVVVVVVVV, *,  1,
6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)   := 'VARCHAR2';
 DBMS_TSDP_PROTECT.ADD_POLICY
  ('PARTIAL_MASK_POLICY',  DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;
```

203.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```
DBMS_TSDP_PROTECT.ALTER_POLICY (
   policy_name              IN VARCHAR2,
   policy_enable_options    IN FEATURE_OPTIONS,
   policy_apply_condition   IN POLICY_CONDITION default TSDP$default_condition);
```

Parameters

Table 203-4 *ALTER_POLICY Procedure Parameters*

Parameter	Description
policy_name	Name of the policy to alter

Table 203-4 (Cont.) *ALTER_POLICY Procedure Parameters*

Parameter	Description
`policy_enable_options`	Initialized with the parameter-value pairs corresponding to the security feature
`policy_apply_condition`	Initialized with the property-value pairs that must be satisfied in order to apply the corresponding `policy_enable_options`. This is an associative array with Property as the key (`PLS_INTEGER`). Example: `example_policy_condition(`*`Property`*`)=`*`property_value`*. Permissible values for Property: • `DBMS_TSDP_PROPERTY.DATATYPE` • `DBMS_TSDP_PROPERTY.LENGTH` • `DBMS_TSDP_PROPERTY.PARENT_SCHEMA` • `DBMS_TSDP_PROPERTY.PARENT_TABLE`

Usage Notes

- If the `policy_apply_condition` matches an existing condition for the policy, then the corresponding enable options are updated with `policy_enable_options`.
- If the `policy_apply_condition` does not match any existing condition for the policy, the combination of `policy_enable_options` and `policy_apply_condition` is added to the policy.

Examples

Add a new combination of `policy_apply_condition` and `policy_enable_options` to an existing policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   redact_feature_options ('expression') :=
       'SYS_CONTEXT(''USERENV'',''SESSION_USER'')=''APPUSER''';
   redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
   redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV,VVVVVVVVV, *,
        1, 6';
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY',  redact_feature_options,
policy_conditions);
END;
```

203.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
   policy_name        IN  VARCHAR2,
   sensitive_type     IN  VARCHAR2,
   associate          IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-5 *ASSOCIATE_POLICY Procedure Parameters*

Parameter	Description
policy_name	Name of the TDSP policy
sensitive_type	Name of the sensitive column type:
associate	Associate or Disassociate. TRUE implies Associate

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

203.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
   schema_name        IN  VARCHAR2 DEFAULT '%',
   table_name         IN  VARCHAR2 DEFAULT '%',
   column_name        IN  VARCHAR2 DEFAULT '%',
   policy_name        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 203-6 *DISABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is disabled.

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

203.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 203-7 *DISABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Disable protection for all columns corresponding to `ADM_Demo`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

203.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 203-8 *DISABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Disable protection for all columns identified by `SSN_TYPE`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

203.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2,
   policy_apply_condition   IN POLICY_CONDITIONS);
```

```
DBMS_TSDP_PROTECT.DROP_POLICY (
   policy_name              IN VARCHAR2);
```

Parameters

Table 203-9 *DROP_POLICY Procedure Parameters*

Parameter	Description
policy_name	Name of the policy to drop
policy_apply_condition	To be initialized with the relevant condition

Usage Notes

- The combination of policy_conditions and policy_enable_options can be dropped from a TSDP policy by giving the policy_apply_condition parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type DBMS_TSDP_PROTECT.POLICY_CONDITION.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only policy_name.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
   policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
   DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable_options combination can be dropped by passing an empty associative array of type DBMS_TSDP_PROTECT.POLICY_CONDITIONS for the policy_apply_condition parameter:

```
DECLARE
   policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;
```

Dropping a TSDP policy:

```
BEGIN
   DBMS_TSDP_PROTECT.DROP_POLICY(
   policy_name => 'PARTIAL_MASK_POLICY');
END;
```

203.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
   schema_name         IN  VARCHAR2 DEFAULT '%',
   table_name          IN  VARCHAR2 DEFAULT '%',
   column_name         IN  VARCHAR2 DEFAULT '%',
   policy_name         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 203-10 *ENABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is enabled.

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

203.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
   discovery_sourcename      IN  VARCHAR2);
```

Parameters

Table 203-11 *ENABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Enable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

203.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
   sensitive_type         IN VARCHAR2);
```

Parameters

Table 203-12 *ENABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Enable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

204
DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

This chapter contains the following topics:

- Security Model
- Exceptions
- Operational Notes
- Summary of DBMS_TTS Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Upgrade Guide*

204.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

204.2 DBMS_TTS Exceptions

The `DBMS_TTS` package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

204.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.

- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

204.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 204-1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure	Downgrades transportable tablespace-related data
TRANSPORT_SET_CHECK Procedure	Checks if a set of tablespaces (to be transported) is self-contained

204.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data in releases earlier than Oracle Database 10g.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

> **Note:**
>
> This procedure has no effect in Oracle Database 10g and later releases. It is included only for backward compatibility to support references to it in existing scripts.

204.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
   ts_list          IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 204-2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
`ts_list`	List of one or more tablespaces, separated by comma.
`incl_constraints`	`TRUE` if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The `incl_constraints` parameter is a default so that `TRANSPORT_SET_CHECK` will work if it is called with only the `ts_list` argument.)

Table 204-2 (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

205
DBMS_TYPES

The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Constants
- Exceptions

205.1 DBMS_TYPES Constants

The DBMS_TYPES package defines several constants to use when specifying parameter values.

These constants are listed in following table .

Table 205-1 ***DBMS_TYPES Constants***

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type

Table 205-1 (Cont.) *DBMS_TYPES Constants*

Constant	Description
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

205.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

206
DBMS_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- Summary of DBMS_UMF Subprograms

206.1 Summary of DBMS_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

Table 206-1 DBMS_UMF Package Subprograms

Subprogram	Description
CONFIGURE_NODE Procedure	Configures a node in the RMF topology
CREATE_LINK Procedure	Creates a database link between two nodes in the RMF topology
CREATE_TOPOLOGY Procedure	Creates the RMF topology
DROP_LINK Procedure	Removes a database link between two nodes in the RMF topology
DROP_TOPOLOGY Procedure	Deletes the RMF topology
ENABLE_SERVICE Procedure	Enables a service on a node in the RMF topology
GET_NODE_ID_LOCAL Function	Returns the node ID of a node in the RMF topology
GET_NODE_NAME_LOCAL Function	Returns the node name of a node in the RMF topology
GET_TARGET_ID Function	Returns the destination ID in the RMF topology
GET_TOPOLOGY_NAME_LOCAL Function	Returns the RMF topology name of the local node
QUERY_LINK_INFO Procedure	Returns the information about a database link in the RMF topology
QUERY_NODE_INFO Procedures	Returns the information about a node in the RMF topology
REGISTER_NODE Function and Procedure	Registers a node in the RMF topology
SWITCH_DESTINATION Procedure	Designates a source node as a destination node in the RMF topology

Table 206-1 (Cont.) DBMS_UMF Package Subprograms

Subprogram	Description
UNCONFIGURE_NODE Procedure	Resets the configuration of a node in the RMF topology
UNREGISTER_NODE Procedure	Removes the registration of a node in the RMF topology

206.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```
DBMS_UMF.CONFIGURE_NODE(
   node_name          IN VARCHAR2 DEFAULT NULL,
   dblink_to_target   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 206-2 CONFIGURE_NODE Procedure Parameters

Parameter	Description
node_name	Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter DB_UNIQUE_NAME is assigned as the name for the node by default.
dblink_to_target	Database link from this node to the destination node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK(
   topology_name      IN VARCHAR2,
   node_a_name        IN VARCHAR2,
   node_b_name        IN VARCHAR2,
   dblink_a_to_b      IN VARCHAR2,
   dblink_b_to_a      IN VARCHAR2);
```

Parameters

Table 206-3 CREATE_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.
dblink_a_to_b	Database link from the first node to the second node.
dblink_b_to_b	Database link from the second node to the first node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```
DBMS_UMF.CREATE_TOPOLOGY(
   topology_name IN VARCHAR2);
```

Parameters

Table 206-4 CREATE_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_LINK(
   topology_name  IN VARCHAR2,
   node_a_name    IN VARCHAR2,
   node_b_name    IN VARCHAR2);
```

Parameters

Table 206-5 DROP_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_TOPOLOGY(
   topology_name IN VARCHAR2);
```

Parameters

Table 206-6 DROP_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the topology to delete.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.ENABLE_SERVICE(
   topology_name      IN VARCHAR2,
   node_name          IN VARCHAR2,
   service_type       IN NUMBER);
```

Parameters

Table 206-7 ENABLE_SERVICE Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node on which a specific service needs to be enabled.
service_type	Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(
   topology_name  IN  VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 206-8 GET_NODE_ID_LOCAL Function Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

Security Model

Only the database users SYS and SYS$UMF can execute this function.

206.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

206.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(
   topology_name  IN  VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 206-9 GET_TARGET_ID Function Parameters

Parameter	Description
`topology_name`	Name of the RMF topology.

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

206.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

206.1.11 QUERY_LINK_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_LINK_INFO(
   topology_name      IN   VARCHAR2,
   from_node_id       IN   NUMBER,
   to_node_id         IN   NUMBER,
   link_name          OUT  VARCHAR2);
```

Parameters

Table 206-10 QUERY_LINK_INFO Procedure Parameters

Parameter	Description
`topology_name`	Name of the RMF topology.
`from_node_id`	Node ID of the first node.
`to_node_id`	Node ID of the second node.
`link_name`	Name of the database link from the first node to the second node returned by the procedure.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

206.1.12 QUERY_NODE_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_NODE_INFO(
   topology_name      IN    VARCHAR2  DEFAULT NULL,
   node_name          IN    VARCHAR2,
   node_id            OUT   NUMBER);

DBMS_UMF.QUERY_NODE_INFO(
   node_id            IN    NUMBER,
```

```
   topology_name       OUT   VARCHAR2,
   node_name           OUT   VARCHAR2);
```

Parameters

Table 206-11 QUERY_NODE_INFO Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.
node_name	Name of the node.
node_id	Identifier of the node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE(
   topology_name           IN  VARCHAR2,
   node_name               IN  VARCHAR2,
   dblink_to_node          IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node        IN  VARCHAR2 DEFAULT NULL,
   as_source               IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target     IN  VARCHAR2 DEFAULT 'FALSE');

DBMS_UMF.REGISTER_NODE(
   topology_name           IN  VARCHAR2,
   node_name               IN  VARCHAR2,
   dblink_to_node          IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node        IN  VARCHAR2 DEFAULT NULL,
   as_source               IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target     IN  VARCHAR2 DEFAULT 'FALSE');
   node_id                 OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
   topology_name           IN  VARCHAR2,
   node_name               IN  VARCHAR2,
   dblink_to_node          IN  VARCHAR2 DEFAULT NULL,
   dblink_from_node        IN  VARCHAR2 DEFAULT NULL,
   as_source               IN  VARCHAR2 DEFAULT 'TRUE',
   as_candidate_target     IN  VARCHAR2 DEFAULT 'FALSE')
 RETURN NUMBER;
```

Parameters

Table 206-12 REGISTER_NODE Function and Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node to register.
dblink_to_node	Name for the database link from the destination to the node.
dblink_from_node	Name for the database link from the node to the destination.
as_source	Set to TRUE, if the node is a source, else set to FALSE.
as_candidate_target	Set to TRUE, if the node is a candidate destination, else set to FALSE.
node_id	Node ID returned by the procedure.

Return Value

Returns the node ID of the registered node.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

Syntax

```
DBMS_UMF.SWITCH_DESTINATION(
   topology_name      IN VARCHAR2,
   force_switch       IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 206-13 SWITCH_DESTINATION Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Table 206-13 (Cont.) SWITCH_DESTINATION Procedure Parameters

Parameter	Description
force_switch	If set to FALSE, the execution of this procedure fails in the following situations: • Candidate destination is a read-only database, and hence it cannot become the new destination. • Candidate destination does not have database links to one or more sources in the topology. • Candidate destination is unable to get the latest AWR data from the old destination. If set to TRUE, the execution of this procedure fails in the following situation: • Candidate destination is a read-only database, and hence it cannot become the new destination.

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

Security Model

Only the database users SYS and SYS$UMF can execute this procedure.

206.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.UNREGISTER_NODE(
   topology_name    IN VARCHAR2,
   node_name        IN VARCHAR2);
```

Parameters

Table 206-14 UNREGISTER_NODE Procedure Parameters

Parameter	Description
`topology_name`	Name of the RMF topology.
`node_name`	Name of the node which needs to be removed from the topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

207
DBMS_UNDO_ADV

The Undo Advisor assists in correctly sizing the undo tablespace and sets the low threshold value of the Undo Retention Period for any Oracle Flashback requirements. The Undo Advisor can also be used to estimate the undo tablespace required for migration from manual to automatic undo management before actually creating the new undo tablespace.

The `DBMS_UNDO_ADVISOR` package provides subprograms to manage the execution of the Undo Advisor feature.

The Undo Advisor relies for its analysis on data collected in the Automatic Workload Repository (AWR). Thus, it is important that the AWR have adequate workload statistics available so that the Undo Advisor can make accurate recommendations. For newly created databases, adequate statistics may not be available immediately. In such cases, continue to use the default auto-extending undo tablespace until at least one workload cycle completes.

This chapter contains the following topic:

- Summary of DBMS_UNDO_ADV Subprograms

207.1 Summary of DBMS_UNDO_ADV Subprograms

This topic lists the `DBMS_UNDO_ADV` subprograms in alphabetical order and briefly describes them.

Table 207-1 DBMS_UNDO_ADV Package Subprograms

Subprogram	Description
BEST_POSSIBLE_RETENTION Function	Returns the best possible value for the `undo_retention` parameter that the current undo tablespace can satisfy in order to maximize the usage of the current undo tablespace based on the historical information of the given period.
LONGEST QUERY Function	This function returns the duration of the longest query, in seconds, for a given period.
RBU_MIGRATION Function	Estimates the undo tablespace needed for migration from manual to automatic undo management.
REQUIRED_RETENTION Function	Returns the required value for the `undo_retention` parameter to satisfy the longest query based on undo statistics available for a given period.
REQUIRED_UNDO_SIZE Function	Returns the required undo tablespace size in MB to satisfy a certain undo retention value based on undo statistics available for a given period.
UNDO_ADVISOR Function	Uses the advisor framework to check if there is any problem with the current instance. It also provides recommendations.
UNDO_AUTOTUNE Function	Determines whether auto-tuning of undo retention is enabled for the current undo tablespace.

Table 207-1 (Cont.) DBMS_UNDO_ADV Package Subprograms

Subprogram	Description
UNDO_HEALTH Function	Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.
UNDO_INFO Function	Retrieves information about the undo tablespace of the current instance.

207.1.1 BEST_POSSIBLE_RETENTION Function

This function returns the best possible value for the `undo_retention` parameter that the current undo tablespace can satisfy in order to maximize the usage for the current undo tablespace based on the historical information of a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 207-2 BEST_POSSIBLE_RETENTION Function Parameters

Parameter	Description
`start_time`	Start time of the given period.
`end_time`	End time of the given period.
`begin_snap`	Begin snapshot identifier. It is based on historical information in AWR from the `begin_snap` identifier.
`end_snap`	End snapshot identifier. It is based on historical information in AWR until the `end_snap` identifier.

207.1.2 RBU_MIGRATION Function

This function estimates the undo tablespace needed for migration from manual to automatic undo management.

If you are currently using manual undo management (rollback segments) to manage undo space, then Oracle recommends migrating to automatic undo management. You must first create an undo tablespace, before opening a newly upgraded database. The required size of undo tablespace depends on the system workload and Flashback requirements.

> **Note:**
>
> The `RBU_MIGRATION` function should be called only when `undo_management = manual`.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.RBU_MIGRATION()
RETURN NUMBER;
```

Viewing the output using the Start Time and End Time:

```
DBMS_UNDO_ADV.RBU_MIGRATION(
    START_TIME IN DATE,
    END_TIME   IN DATE)
RETURN NUMBER;
```

Parameters

Table 207-3 RBU_MIGRATION Function Parameters

Parameter	Description
`START_TIME`	Start time of the given period.
`END_TIME`	End time of the given period.

207.1.3 LONGEST_QUERY Function

This function returns the duration of the longest query, in seconds, for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.LONGEST_QUERY()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.LONGEST_QUERY(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.LONGEST_QUERY(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 207-4 LONGEST_QUERY Function Parameters

Parameter	Description
`start_time`	Start time for the specified period.
`end_time`	End time for the specified period.
`begin_snap`	Begin snapshot identifier. It is based on historical information in AWR from the `begin_snap` identifier.
`end_snap`	End snapshot identifier. It is based on historical information in AWR until the `end_snap` identifier.

207.1.4 REQUIRED_RETENTION Function

This function returns the required value for the `undo_retention` parameter to satisfy the longest query based on undo statistics available for a given period.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION()
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(
    begin_snap IN NUMBER,
```

```
    end_snap    IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 207-5 REQUIRED_RETENTION Function Parameters

Parameter	Description
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.

207.1.5 REQUIRED_UNDO_SIZE Function

This function returns the required undo tablespace size (in MB) to satisfy certain undo retention value based on undo statistics available for a given period.

> **Note:**
>
> Zero will be returned if the information about the given period is not available.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention IN NUMBER)
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention  IN NUMBER,
    start_time IN DATE,
    end_time   IN DATE)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(
    retention  IN NUMBER,
    begin_snap IN NUMBER,
    end_snap   IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 207-6 REQUIRED_UNDO_SIZE Function Parameters

Parameter	Description
retention	Retention value you want to set for the undo_retention init.ora parameter.
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.

207.1.6 UNDO_ADVISOR Function

This function uses the advisor framework to check if there is any problem with the current instance and provide recommendations.

> **Note:**
>
> This function should be used when undo_management is set to auto.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(
    instance_id IN NUMBER)
RETURN VARCHAR2;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(
    start_time  IN DATE,
    end_time    IN DATE,
    instance_id IN NUMBER)
RETURN VARCHAR2;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(
    begin_snap  IN NUMBER,
    end_snap    IN NUMBER,
    instance_id IN NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 207-7 UNDO_ADVISOR Function Parameters

Parameter	Description
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.
instance_id	Instance ID of the current instance.

207.1.7 UNDO_AUTOTUNE Function

This function finds out whether the auto-tuning of undo retention is enabled for the current undo tablespace.

Syntax

```
DBMS_UNDO_ADV.UNDO_AUTOTUNE(
     chk OUT BOOLEAN)
RETURN BOOLEAN;
```

Parameters

Table 207-8 UNDO_AUTOTUNE Function Parameters

Parameter	Description
chk	TRUE if auto-tuning of undo retention is enabled, FALSE otherwise.

207.1.8 UNDO_HEALTH Function

Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.

If the return value is 0, no problem is found. Otherwise, parameter prob and reco are the problem and recommendation on fixing the problem.

Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_HEALTH(
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
```

```
    retn OUT NUMBER,
    utbs OUT NUMBER);
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_HEALTH(
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtn1 OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER)
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_HEALTH(
    begin_snap IN  NUMBER,
    end_snap   IN  NUMBER,
    prob       OUT VARCHAR2,
    reco       OUT VARCHAR2,
    rtn1       OUT VARCHAR2,
    retn       OUT NUMBER,
    utbs       OUT NUMBER)
RETURN NUMBER;
```

Parameters

Table 207-9 UNDO_HEALTH Function Parameters

Parameter	Description
start_time	Start time of the given period.
end_time	End time of the given period.
begin_snap	Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier.
end_snap	End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.
prob	Problem that is being diagnosed. For example, long running query may fail or undo tablespace cannot satisfy undo_retention.
reco	Recommendation for fixing the problem.
rtn1	Rationale for the recommendation.
retn	The numerical value of retention if the recommendation is to change retention.
utbs	The numerical value of undo tablespace size (in MB) if the recommendation is to change undo tablespace size.

207.1.9 UNDO_INFO Function

This function retrieves information about the undo tablespace of the current instance.

This function returns the undo tablespace name, maximum possible size for the undo tablespace, current undo retention value, and boolean values to verify if it is auto-extensible or if the undo tablespace has guaranteed undo retention.

Syntax

```
DBMS_UNDO_ADV.UNDO_INFO(
    tbs_name       OUT VARCHAR2,
    tbs_size       OUT NUMBER,
    tbs_autoextend OUT BOOLEAN,
    tbs_retention  OUT NUMBER,
    tbs_guarantee  OUT BOOLEAN)
RETURN BOOLEAN;
```

Parameters

Table 207-10 UNDO_INFO Function Parameters

Parameter	Description
tbs_name	Name of the current undo tablespace the instance is using.
tbs_size	The size of the undo tablespace in MB, if the undo tablespace is fixed-sized. If the tablespace is auto_extensible, it is the maximum possible size of the undo tablespace in MB.
tbs_autoextend	TRUE if the undo tablespace is extensible, FALSE otherwise.
tbs_retention	The value of the undo_retentioninit.ora parameter.
tbs_guarantee	TRUE if the undo tablespace has guaranteed retention, FALSE otherwise.

208
DBMS_USER_CERTS

The DBMS_USER_CERTS package allows you add and delete certificates.

This chapter contains the following topics:

- DBMS_USER_CERTS Overview
- DBMS_USER_CERTS Security Model
- Summary of DBMS_USER_CERTS Subprograms

> **See Also:**
>
> - *Oracle Database Administrator's Guide*
> - *Oracle Database Concepts*
> - *Oracle Database SQL Language Reference*
> - *Oracle Database Reference*
> - For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

208.1 DBMS_USER_CERTS Overview

The DBMS_USER_CERTS package allows you add and delete certificates.

The DBMS_USER_CERTS package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

208.2 DBMS_USER_CERTS Security Model

The DBMS_USER_CERTS package is owned by SYS and is installed as part of database installation.

- Both ADD_CERTIFICATE() and DROP_CERTIFICATE() sub-programs can be executed by any database user. The EXECUTE privilege on DBMS_USER_CERTS package is granted to PUBLIC role.
- Using ADD_CERTIFICATE(), a database user can add multiple certificates, each one would be identified uniquely using a GUID.

- Only SYSDBA or the user who owns the certificate, can drop it using DROP_CERTIFICATE().

208.3 Summary of DBMS_USER_CERTS Subprograms

The DBMS_USER_CERTS package uses ADD_CERTIFICATE, ADD_COPY, and DROP_CERTIFICATE subprograms to add, copy, and delete X.509 certificates which are used for signature verification for blockchain tables by the current user.

Table 208-1 DBMS_USER_CERTS Package Subprograms

Subprogram	Description
ADD_CERTIFICATE Procedure	Adds X.509 certificates which are used for signature verification of blockchain tables.
ADD_COPY Procedure	Adds a certificate to the database and assign the certificate a specific global unique identifier (GUID).
DROP_CERTIFICATE Procedure	Drops a certificate that is used for signature verification of blockchain tables.

208.3.1 ADD_CERTIFICATE Procedure

This procedure can be used by the current user to add an X.509 certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE(
   x509_cert                 IN  BLOB,
   cert_id                   OUT RAW);
```

Parameters

Table 208-2 ADD_CERTIFICATE Procedure Parameters

Parameter	Description
x509_cert	The X.509 certificate used for signature verification of blockchain tables.
cert_id	The Global Unique Identifier (GUID) for the certificate.

208.3.2 ADD_COPY Procedure

This procedure enables you add a certificate to the database and assign the certificate a specific global unique identifier (GUID).

This procedure is used when a user needs to make a copy of the certificate that was previously created in one database and add the copy to another database while preserving its GUID. When recording blockchain table signatures in one database and verifying the signatures in another, the certificate GUID must be preserved. One scenario is when you use Oracle Data Pump to copy a blockchain table between databases. Another scenario is when you use Oracle GoldenGate to replicate rows in a blockchain table between databases.

Syntax

```
DBMS_USER_CERTS.ADD_COPY(
   x509_cert IN   BLOB,
```

```
   cert_id   IN   RAW,
   username  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 208-3 ADD_COPY Procedure Parameters

Parameter	Description
x509_cert	The X.509 certificate used for signature verification of blockchain tables.
cert_id	The Global Unique Identifier (GUID) for the certificate.
username	The name of the user who will own the certificate. A NULL value defaults to the current user.

Usage Note

If username is not NULL, either username must refer to the current user, or the current user must be SYSDBA.

208.3.3 DROP_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE(
   cert_id                    IN  RAW);
```

Parameters

Table 208-4 DROP_CERTIFICATE Procedure Parameters

Parameter	Description
cert_id	The Global Unique Identifier (GUID) of the certificate.

209
DBMS_USERDIAG

The DBMS_USERDIAG package allows you to perform a limited set of diagnosis operations on the PDB.

This chapter contains the following topics:

- DBMS_USERDIAG Overview
- Summary of DBMS_USERDIAG Subprograms

Enabling traces on cloud requires additional configuration as documented here: Perform SQL Tracing on Autonomous Database.

209.1 DBMS_USERDIAG Overview

The DBMS_USERDIAG package is for diagnosis and allows you to set up a trace within a PDB.

The DBMS_USERDIAG package utilizes underneath DBMS_SYSTEM functionality but with a narrow set of definitions which restrict arbitrary event settings.

For a given PDB, the DBMS_USERDIAG package allows you:

- to enable the SQL trace at a given level.
- to disable the SQL trace.
- to check the SQL trace.

Most of the regular diagnostic mechanisms have been restricted outside of a given PDB using lockdown profiles, so that arbitrary events cannot be enabled from user sessions in a shared tenancy in CBD deployments in cloud instances. In particular, "alter session set events" statement is blocked in cloud deployments, because it can be misused to set events/actions which may change code-path execution or simulate errors.

209.2 Summary of DBMS_USERDIAG Subprograms

The DBMS_USERDIAG package uses ENABLE_SQL_TRACE_EVENT and CHECK_SQL_TRACE_EVENT subprograms to enable, disable, and monitor sql_trace events.

Table 209-1 DBMS_USERDIAG Package Subprograms

Subprogram	Description
CHECK_SQL_TRACE_EVENT Procedure	Checks the current sql_trace event and retrieves the level.
ENABLE_SQL_TRACE_EVENT Procedure	Enables sql_trace event at a given level in user session, and generates SQL traces into respective process trace files.
GET_CALL_ERROR_MSG Function	Obtains the error message if the last call to DBMS_USERDIAG API returned an error.
GET_CALL_STATUS Function	Obtains the status of the last call to the DBMS_USERDIAG API.

Table 209-1 (Cont.) DBMS_USERDIAG Package Subprograms

Subprogram	Description
SET_EXCEPTION_MODE Procedure	Raises an exception on any error or silently ignores the same (default).
SET_TRACEFILE_IDENTIFIER Procedure	Sets a custom trace file identifier for the active trace file in the current ADR home.
TRACE Procedure	Traces message to the trace file or alert log.

209.2.1 CHECK_SQL_TRACE_EVENT Procedure

This procedure can be used by the current user to check the current `sql_trace` event and retrieves the level.

Syntax

```
DBMS_USERDIAG.CHECK_SQL_TRACE_EVENT(
   sql_id                IN VARCHAR2       DEFAULT NULL
   sys                   IN BINARY_INTEGER DEFAULT NULL
   level                 OUT BINARY_INTEGER);
```

Parameters

Table 209-2 CHECK_SQL_TRACE_EVENT Procedure Parameters

Parameter	Description
`level`	Required. Output of the current level at which `sql_trace` event is enabled.
`sql_id`	`sql_trace` in scope of a given `sql_id` alone. This is currently ignored.
`sys`	Optional. Set event instance-wide or PDB-wide. Default 0. This is currently ignored.

209.2.2 ENABLE_SQL_TRACE_EVENT Procedure

This procedure enables `sql_trace` event (`sql_trace/10046`) at a given `level` in user session, and generates SQL traces into respective process trace files.

Optionally a `sql_id` can also be specified in which case tracing is enabled for that `sql_id` alone. Default is to enable events without sql scope. Default is to set event in current session alone. Event can be disabled by setting `disable` to non-zero value (default zero).

Syntax

```
DBMS_USERDIAG.ENABLE_SQL_TRACE_EVENT(
   level                 IN  BINARY_INTEGER DEFAULT 1,
   sid                   IN  BINARY_INTEGER DEFAULT 0,
   ser                   IN  BINARY_INTEGER DEFAULT 0,
   binds                 IN  BINARY_INTEGER DEFAULT 0,
   waits                 IN  BINARY_INTEGER DEFAULT 0,
   plan_stat             IN  VARCHAR2       DEFAULT NULL,
   sql_id                IN  VARCHAR2       DEFAULT NULL,
```

```
  disable               IN  BINARY_INTEGER DEFAULT 0,
  sys                   IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 209-3 ENABLE_SQL_TRACE_EVENT Procedure Parameters

Parameter	Description
level	Optional. Specifies the level associated with sql_trace event. Other settings augment the level value. For example, binds=>true adds to whatever level value has been provided by the user. This is kept for ease of usage.
sid	Optional. Target session identifier. sid, ser pair must be validated to be within current PDB id.
ser	Optional. Target serial number.
binds	Optional. A non-zero value traces bind values. Maps to level 4.
waits	Optional. A non-zero value traces waits. Maps to level 8.
plan_stat	Optional. Allowed values: FIRST_EXECUTION (default), NEVER, ALL_EXECUTIONS, and ADAPTIVE
sql_id	Enable sql_trace in scope of a given sql_id alone
disable	Optional. Non-zero value disables the already set sql_trace event.
sys	Optional. Set event instance-wide or PDB-wide. Default 0.

209.2.3 GET_CALL_ERROR_MSG Function

This function is used to obtain the error message if the last call to DBMS_USERDIAG API returned an error.

Syntax

```
DBMS_USERDIAG.GET_CALL_ERROR_MSG RETURN VARCHAR2;
```

Return Value

If the previous call to DBMS_USERDIAG was unsuccessful, the VARCHAR2 contains the error message associated with it.

If the previous call to DBMS_USERDIAG was successful, the value returned is NULL.

209.2.4 GET_CALL_STATUS Function

This function is used to obtain the status of the last call to the DBMS_USERDIAG API.

Syntax

```
DBMS_USERDIAG.GET_CALL_STATUS RETURN NUMBER;
```

Return Value

Returns a number for the status of the last call to the DBMS_USERDIAG API.

If the previous call was successful, the value of this call is `NOERROR(0)`.

If the previous call was unsuccessful, the value of this call is the error code number.

209.2.5 SET_EXCEPTION_MODE Procedure

This procedure raises an exception on any error or silently ignores the same (default).

Syntax

```
DBMS_USERDIAG.SET_EXCEPTION_MODE(
   exc_mode IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 209-4 SET_EXCEPTION_MODE Procedure Parameters

Parameter	Description
`exc_mode`	When `TRUE`, an exception is raised on any error. When `FALSE` (default), errors are ignored.

209.2.6 SET_TRACEFILE_IDENTIFIER Procedure

This procedure is used to set a custom trace file identifier for the active trace file in the current ADR home.

Syntax

```
DBMS_USERDIAG.SET_TRACEFILE_IDENTIFIER(
   trc_identifier IN VARCHAR2);
```

Parameters

Table 209-5 SET_TRACEFILE_IDENTIFIER Procedure Parameters

Parameter	Description
`trc_identifier`	Specifies the trace identifier for the active trace file in the current ADR home.

209.2.7 TRACE Procedure

This procedure is used to trace message to the trace file or alert log.

Syntax

```
DBMS_USERDIAG.TRACE(
   message IN VARCHAR2,
   alert   IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 209-6 TRACE Procedure Parameters

Parameter	Description
`message`	Specifies the text or message to be traced.
`alert`	When `TRUE`, the alert logs are included with the trace file for the trace operation. When `FALSE` (default), the alert logs are ignored and only the trace file is used for the trace operation.

210
DBMS_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- DBMS_UTILITY Deprecated Subprograms
- Security Model
- Constants
- Exceptions
- Data Structures
- Summary of DBMS_UTILITY Subprograms

210.1 DBMS_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12*c* release 12.2.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- GET_PARAMETER_VALUE Function

  Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- ANALYZE_PART_OBJECT Procedure

  Use `DBMS_STATS` to gather statistics.
- GET_DEPENDENCY Procedure

  There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

210.2 DBMS_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

Related Topics

- NAME_RESOLVE Procedure
  This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- COMPILE_SCHEMA Procedure
  This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

210.3 DBMS_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

Table 210-1 DBMS_UTILITY Constants

Name	Type	Value	Description
`INV_ERROR_ON_RESTRICTIONS`	`PLS_INTEGER`	`1`	This constant is the only legal value for the `p_option_flags` parameter of the `INVALIDATE` subprogram

210.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

Table 210-2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
`INV_NOT_EXIST_OR_NO_PRIV`	-24237	Raised by the `INVALIDATE` subprogram when the `object_id` argument is `NULL` or invalid, or when the caller does not have `CREATE` privileges on the object being invalidated
`INV_MALFORMED_SETTINGS`	-24238	Raised by the `INVALIDATE` subprogram if a compiler setting is specified more than once in the `p_plsql_object_settings` parameter
`INV_RESTRICTED_OBJECT`	-24239	Raised by the `INVALIDATE` subprogram when different combinations of conditions pertaining to the `p_object_id` parameter are contravened

210.5 DBMS_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

Record Types

- INSTANCE_RECORD Record Type

Table Types

- DBLINK_ARRAY TABLE Type

- INDEX_TABLE_TYPE Table Type
- INSTANCE_TABLE Table Type
- LNAME_ARRAY Table Type
- NAME_ARRAY Table Type
- NUMBER_ARRAY Table Type
- UNCL_ARRAY Table Type

210.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (
     inst_number   NUMBER,
     inst_name     VARCHAR2(60));
```

Fields

Table 210-3 INSTANCE_RECORD Record Type Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

210.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

210.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

210.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` Is 1; `INSTANCE_TABLE` Is Dense.

Related Topics

- DBMS_UTILITY INSTANCE_RECORD Record Type
  This type describes a list of active instance number-name pairs.

210.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

210.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

210.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

210.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of "`user`"."`name`"."`column`"`@link`

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

210.6 Summary of DBMS_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

Table 210-4 *DBMS_UTILITY Package Subprograms*

Subprogram	Description
ACTIVE_INSTANCES Procedure	Returns the active instance
ANALYZE_DATABASE Procedure	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure	Analyzes the given tables and indexes This procedure is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. Use `DBMS_STATS` to gather statistics.
ANALYZE_SCHEMA Procedure	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure	Canonicalizes a given string

Table 210-4 (Cont.) *DBMS_UTILITY Package Subprograms*

Subprogram	Description
COMMA_TO_TABLE Procedures	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure	Creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement
CURRENT_INSTANCE Function	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function	Gets the file number part of a data block address
DB_VERSION Procedure	Returns version information for the database
EXEC_DDL_STATEMENT Procedure	Executes the DDL statement in `parse_string`
EXPAND_SQL_TEXT Procedure	Recursively replaces any view references in the input SQL query with the corresponding view subquery
FORMAT_CALL_STACK Function	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function	Formats the current error stack
GET_CPU_TIME Function	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure	Shows the dependencies on the object passed in. This procedure is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.
GET_ENDIANNESS Function	Gets the endianness of the database platform
GET_HASH_VALUE Function	Computes a hash value for the given string
GET_PARAMETER_VALUE Function	Gets the value of specified init.ora parameter. This function is deprecated from the `DBMS_UTILITY` package with Oracle Database 12c release 12.2 and later. You can query `v$_parameter` directly.
GET_SQL_HASH Function	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function	Returns the current time in 100th's of a second
GET_TZ_TRANSITIONS Procedure	Returns time zeone transitions by `regionid` from the `timezone.dat` file
INVALIDATE Procedure	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function	Checks the bit setting for the given bit in the given `RAW` value
IS_CLUSTER_DATABASE Function	Determines if the database is running in cluster database mode
MAKE_DATA_BLOCK_ADDRESS Function	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure	Resolves the given name
NAME_TOKENIZE Procedure	Calls the parser to parse the given name

Table 210-4 (Cont.) *DBMS_UTILITY Package Subprograms*

Subprogram	Description
OLD_CURRENT_SCHEMA Function	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')`
OLD_CURRENT_USER Function	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_USER')`
PORT_STRING Function	Returns a string that uniquely identifies the version of Oracle and the operating system
SQLID_TO_SQLHASH Function	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure	Makes invalid database objects valid
WAIT_ON_PENDING_DML Function	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

210.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
   instance_table   OUT INSTANCE_TABLE,
   instance_count   OUT NUMBER);
```

Parameters

Table 210-5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
`instance_table`	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
`instance_count`	Number of active instances

210.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this database

210.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]

> **Note:**
>
> This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use DBMS_STATS to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
   schema        IN VARCHAR2 DEFAULT NULL,
   object_name   IN VARCHAR2 DEFAULT NULL,
   object_type   IN CHAR     DEFAULT 'T',
   command_type  IN CHAR     DEFAULT 'E',
   command_opt   IN VARCHAR2 DEFAULT NULL,
   sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 210-7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)

Table 210-7 (Cont.) ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

Usage Notes

For each partition of the object, run in parallel using job queues.

210.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
   schema             IN  VARCHAR2,
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 210-8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

210.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
   name           IN    VARCHAR2,
   canon_name     OUT   VARCHAR2,
   canon_len      IN    BINARY_INTEGER);
```

Parameters

Table 210-9 CANONICALIZE Procedure Parameters

Parameter	Description
`name`	String to be canonicalized
`canon_name`	Canonicalized string
`canon_len`	Length of the string (in bytes) to canonicalize

Return Values

Returns the first `canon_len` bytes in `canon_name`.

Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- `a` becomes `A`
- `"a"` becomes `a`
- `"a".b` becomes `"a"."B"`
- `"a".b,c.f` becomes `"a"."B"` with`",c.f"` ignored.

210.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT lname_array);
```

Parameters

Table 210-10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
`list`	Comma separated list of list of 'names', where a name should have the following format for the first overloading: `a [. b [. c ]][ @ d ]` and the following format for the second overloading: `a [. b]*` where `a`, `b`, `c`, `d` are simple identifiers (quoted or unquoted).
`tablen`	Number of tables in the PL/SQL table
`tab`	PL/SQL table which contains list of names

Return Values

A PL/SQL table is returned, with values `1..n` and `n+1 is null`.

Usage Notes

- The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

210.6.7 COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
   schema          IN VARCHAR2,
   compile_all     IN BOOLEAN DEFAULT TRUE,
   reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 210-11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 210-12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for the RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

210.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
   schema_name      IN     VARCHAR2,
   table_name       IN     VARCHAR2);
```

Parameters

Table 210-13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
schema_name	Name of the schema
table_name	Name of the table created

Exceptions

An error is returned if the table already exists.

210.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
   RETURN NUMBER;
```

210.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 210-14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

210.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 210-15 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

210.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (
   version       OUT VARCHAR2,
   compatibility OUT VARCHAR2);
```

Parameters

Table 210-16 DB_VERSION Procedure Parameters

Parameter	Description
version	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
compatibility	The compatibility setting of the database determined by the "compatible" init.ora parameter. If the parameter is not specified in the init.ora file, then NULL is returned.

210.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
   parse_string IN VARCHAR2);
```

Parameters

Table 210-17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
`parse_string`	DDL statement to be executed

210.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
   input_sql_text     IN           CLOB,
   output_sql_text    OUT NOCOPY   CLOB);
```

Parameters

Table 210-18 EXPAND_SQL_TEXT Procedure Parameters

Parameter	Description
`input_sql_text`	Input SQL query text
`output_sql_text`	View-expanded query text

Exceptions

Table 210-19 EXPAND_SQL_TEXT Procedure Exceptions

Exception	Description
`ORA-00942`	Current user does not have select privileges on all the views and tables recursively referenced in the `input_sql_text`
`ORA-24251`	`input_sql_text` is not a `SELECT` statement
`ORA-00900`	Input is not valid
`ORA-29477`	Input LOB size exceeds maximum size of 4GB -1

Usage Notes

The expanded and merged SQL statement text is copied to output_sql_text on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the userid caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

210.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

210.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A `NULL` string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
```

```
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

BEGIN
  WHILE Output_One_Line() LOOP NULL;
  END LOOP;
END Log_Errors;
/

    or database administrator.
*/
```

210.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
  RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

210.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
  DBMS_UTILITY.GET_CPU_TIME
   RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

210.6.19 GET_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

> **Note:**
>
> This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
 type      IN     VARCHAR2,
 schema    IN     VARCHAR2,
 name      IN     VARCHAR2);
```

Parameters

Table 210-20 GET_DEPENDENCY Procedure Parameters

Parameter	Description
type	Type of the object, for example if the object is a table give the type as 'TABLE'
schema	Schema name of the object
name	Name of the object

Usage Notes

This procedure uses the DBMS_OUTPUT package to display results, and so you must declare SET SERVEROUTPUT ON if you wish to view dependencies. Alternatively, any application that checks the DBMS_OUTPUT output buffers can invoke this subprogram and then retrieve the output by means of DBMS_OUTPUT subprograms such as GET_LINES.

210.6.20 GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
 RETURN NUMBER;
```

Return Values

A NUMBER value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

210.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
   name      VARCHAR2,
   base      NUMBER,
   hash_size NUMBER)
  RETURN NUMBER;
```

Parameters

Table 210-21 GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

210.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified init.ora parameter.

> **Note:**
>
> This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query v$_parameter directly.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
   parnam     IN        VARCHAR2,
   intval     IN OUT    BINARY_INTEGER,
   strval     IN OUT    VARCHAR2,
   listno     IN        BINARY_INTEGER DEFAULT 1)
  RETURN BINARY_INTEGER;
```

Parameters

Table 210-22 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
parnam	Parameter name
intval	Value of an integer parameter or the value length of a string parameter
strval	Value of a string parameter
listno	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an `INTEGER`/`BOOLEAN` parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the `SELECT` privilege on the V$PARAMETER dynamic view.

Examples

```
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                             intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```

210.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
   name          IN   VARCHAR2,
   hash          OUT  RAW,
   pre10ihash    OUT  NUMBER)
  RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(`Get_sql_hash`, `Wnds`, `Rnds`, `Wnps`, `Rnps`);

Parameters

Table 210-23 GET_SQL_HASH Procedure Parameters

Parameter	Description
`name`	String to be hashed
`hash`	Stores all 16 bytes of returned hash value
`pre10ihash`	Stores the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. Use the `hash` parameter to get all 16 bytes and pre10*i* hash parameter to store the pre 10*i* hash value of 4 bytes.

210.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
  RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

210.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
   regionid      IN     NUMBER,
   transitions   OUT    MAXRAW);
```

Parameters

Table 210-24 GET_TZ_TRANSITIONS Procedure Parameters

Parameter	Description
regionid	Number corresponding to the region
transitions	Raw bytes from the timezone.dat file

Exceptions

Table 210-25 GET_TZ_TRANSITIONS Procedure Exceptions

Exception	Description
ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR	For an invalid regionid

210.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
   p_object_id              NUMBER,
   p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
   p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

Table 210-26 INVALIDATE Procedure Parameters

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.

Table 210-26 (Cont.) INVALIDATE Procedure Parameters

Parameter	Description
p_plsql_object_settings	Optional parameter that ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	Optional parameter defaults to zero (no flags). Option flags supported by invalidate. • inv_error_on_restrictions (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 210-27 INVALIDATE Exceptions

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag

inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change it's PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the object_id 40796 refers to the view oc_orders in the OE schema. Then the above call will mark the oc_orders view invalid.

Objects that depend on oe.oc_orders will also get marked invalid.

210.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
   r     IN    RAW,   n     IN    NUMBER)
 RETURN NUMBER;
```

Parameters

Table 210-28 IS_BET_SET Function Parameters

Parameter	Description
r	RAW source

Table 210-28 (Cont.) IS_BET_SET Function Parameters

Parameter	Description
n	Bit in r to check

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

210.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

210.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
   file  NUMBER,
   block NUMBER)
  RETURN NUMBER;
```

Parameters

Table 210-29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
file	File that contains the block
block	Offset of the block within the file in terms of block increments

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

210.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
   name          IN  VARCHAR2,
   context       IN  NUMBER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT NUMBER,
   object_number OUT NUMBER);
```

Parameters

Table 210-30 NAME_RESOLVE Procedure Parameters

Parameter	Description
`name`	Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the `schema`, `part1`, `part2` and `dblink` `OUT` parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).
`context`	Must be an integer between 0 and 9. • 0 - table • 1 - PL/SQL (for 2 part names) • 2 - sequences • 3 - trigger • 4 - Java Source • 5 - Java resource • 6 - Java class • 7 - type • 8 - Java shared data • 9 - index
`schema`	Schema of the object: c. If no schema is specified in `name`, then the `schema` is determined by resolving the name.
`part1`	First part of the name. The type of this name is specified `part1_type` (synonym or package).
`part2`	If this is non-`NULL`, then this is a subprogram name. If part1 is non-`NULL`, then the subprogram is within the package indicated by part1. If part1 is `NULL`, then the subprogram is a top-level subprogram.
`dblink`	If this is non-`NULL`, then a database link was either specified as part of `name` or `name` was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the `DBMS_UTILITY.NAME_RESOLVE` procedure on this remote node.

Table 210-30 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
part1_type	Type of part1 is: • 5 - synonym • 7 - procedure (top level) • 8 - function (top level) • 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

210.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as `a [. b [. c ]][@ dblink ]`.

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as `NULL`.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
   name     IN  VARCHAR2,
   a        OUT VARCHAR2,
   b        OUT VARCHAR2,
   c        OUT VARCHAR2,
   dblink   OUT VARCHAR2,
   nextpos OUT BINARY_INTEGER);
```

Parameters

Table 210-31 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
a	Output for the first token of the name
b	Output for the second token of the name (if applicable)
c	Output for the third token of the name (if applicable)
dblink	Output for the dblink of the name
nextpos	Next position after parsing the input name

210.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context` ('`userenv`', '`current_schema`').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
 RETURN VARCHAR2;
```

210.6.33 OLD_CURRENT_USER Function

This function returns the session value from `sys_context` ('`userenv`', '`current_user`').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
 RETURN VARCHAR2;
```

210.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the `TWO TASK PROTOCOL` version of the database. For example, "`VAX/VMX-7.1.0.0`"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
   RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

210.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
   sql_id    IN   VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 210-32 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
`sql_id`	SQL ID of a SQL statement. Must be `VARCHAR2(13)`.

210.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, `1..n`, terminated with `n+1 null`. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  UNCL_ARRAY,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);

DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  lname_array,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);
```

Parameters

Table 210-33 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
`tab`	PL/SQL table which contains list of table names
`tablen`	Number of tables in the PL/SQL table
`list`	Comma separated list of tables

Return Values

A comma-delimited list and the number of elements found in the table.

210.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
   owner          VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER,   edition_name   := SYS_CONTEXT ('USERENV',
'CURRENT_EDITION'));
```

Parameters

Table 210-34 VALIDATE Procedure Parameters

Parameter	Description
`owner`	Name of the user who owns the object. Same as the `OWNER` field in `ALL_OBJECTS`.

Table 210-34 (Cont.) VALIDATE Procedure Parameters

Parameter	Description
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows: • 1 — TABLE/PROCEDURE/TYPE • 2 — BODY • 3 — TRIGGER • 4 — INDEX • 5 — CLUSTER • 8 — LOB • 9 — DIRECTORY • 10 — QUEUE • 11 — REPLICATION OBJECT GROUP • 12 — REPLICATION PROPAGATOR • 13 — JAVA SOURCE • 14 — JAVA RESOURCE • 58 — (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its object_id. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.

210.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables     IN       VARCHAR2,
    timeout    IN       BINARY_INTEGER,
    scn        IN OUT   NUMBER)
  RETURN BOOLEAN;
```

Parameters

Table 210-35 WAIT_ON_PENDING_DML Function Parameters

Parameter	Description
tables	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
timeout	Maximum number of seconds to wait, totalled across all tables/ transactions. A NULL or negative value will cause a very long wait.
scn	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

211
DBMS_VECTOR

The `DBMS_VECTOR` package provides APIs to support common operations with Oracle AI Vector Search, such as extracting chunks or embeddings from user data, generating text for a given prompt, creating a vector index, or reporting on index accuracy.

These functions accept their respective input parameters in JSON format.

Related Topics

- *Oracle Database AI Vector Search User's Guide*

211.1 Summary of DBMS_VECTOR Subprograms

This table lists the `DBMS_VECTOR` subprograms and briefly describes them.

Table 211-1 ***DBMS_VECTOR Package Subprograms***

Subprogram	Description
ONNX Model Related Procedures:	
These procedures enable you to load an ONNX model into Oracle Database and drop the ONNX model.	
LOAD_ONNX_MODEL	Loads an ONNX model into the database
LOAD_ONNX_MODEL_CLOUD	Loads an ONNX model from object storage into the database
DROP_ONNX_MODEL Procedure	Drops the ONNX model
Chainable Utility (UTL) Functions:	
These functions are a set of modular and flexible functions within vector utility PL/SQL packages. You can chain these together to automate end-to-end data transformation and similarity search operations.	
UTL_TO_CHUNKS	Splits data into smaller pieces or chunks
UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS	Converts data to one or more vector embeddings
UTL_TO_GENERATE_TEXT	Generates text for a prompt (input string) or an image
Credential Helper Procedures:	
These procedures enable you to securely manage authentication credentials in the database. You require these credentials to enable access to third-party service providers for making REST calls.	
CREATE_CREDENTIAL	Creates a credential name
DROP_CREDENTIAL	Drops an existing credential name
Data Access Functions:	
These functions enable you to retrieve data, create index, and perform simple similarity search operations.	
CREATE_INDEX	Creates a vector index
REBUILD_INDEX	Rebuilds a vector index
GET_INDEX_STATUS	Describes the status of a vector index creation
ENABLE_CHECKPOINT	Enables the Checkpoint feature for a vector index user and index name

Table 211-1 (Cont.) *DBMS_VECTOR Package Subprograms*

Subprogram	Description
DISABLE_CHECKPOINT	Disables the Checkpoint feature for a vector index user and index name
INDEX_VECTOR_MEMORY_ADVISOR	Determines the vector memory size that is needed for a vector index
QUERY	Performs a similarity search query
RERANK	Reorders search results for more relevant output
Accuracy Reporting Function:	
These functions enable you to determine the accuracy of existing search indexes and to capture accuracy values achieved by approximate searches performed by past workloads.	
INDEX_ACCURACY_QUERY	Verifies the accuracy of a vector index
INDEX_ACCURACY_REPORT	Captures accuracy values achieved by approximate searches

> **Note:**
>
> `DBMS_VECTOR` is a lightweight package that does not support text processing or summarization operations. Therefore, the `UTL_TO_TEXT` and `UTL_TO_SUMMARY` chainable utility functions and all the chunker helper procedures are available only in the advanced `DBMS_VECTOR_CHAIN` package.

211.1.1 CREATE_CREDENTIAL

Use the `DBMS_VECTOR.CREATE_CREDENTIAL` credential helper procedure to create a credential name for storing user authentication details in Oracle Database.

Purpose

To securely manage authentication credentials in the database. You require these credentials to enable access during REST API calls to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A credential name holds authentication parameters, such as user name, password, access token, private key, or fingerprint.

Note that if you are using Oracle Database as the service provider, then you do not need to create a credential.

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

```
DBMS_VECTOR.CREATE_CREDENTIAL (
    CREDENTIAL_NAME     IN VARCHAR2,
    PARAMS              IN JSON DEFAULT NULL
);
```

CREDENTIAL_NAME

Specify a name of the credential that you want to create for holding authentication parameters.

PARAMS

Specify authentication parameters in JSON format, based on your chosen service provider.

Generative AI requires the following authentication parameters:

```
{
"user_ocid"       : "<user ocid>",
"tenancy_ocid"    : "<tenancy ocid>",
"compartment_ocid": "<compartment ocid>",
"private_key"     : "<private key>",
"fingerprint"     : "<fingerprint>"
}
```

Cohere, Google AI, Hugging Face, OpenAI, and Vertex AI require the following authentication parameter:

```
{ "access_token": "<access token>" }
```

Table 211-2 Parameter Details

Parameter	Description
`user_ocid`	Oracle Cloud Identifier (OCID) of the user, as listed on the User Details page in the OCI console.
`tenancy_ocid`	OCID of your tenancy, as listed on the Tenancy Details page in the OCI console.
`compartment_ocid`	OCID of your compartment, as listed on the Compartments information page in the OCI console.

Table 211-2 (Cont.) Parameter Details

Parameter	Description

`private_key`	OCI private key.
	Note: The generated private key may appear as:
	
	`-----BEGIN RSA PRIVATE KEY-----`
	`<private key string>`
	`-----END RSA PRIVATE KEY-----`
	
	You pass the `<private key string>` value (excluding the `BEGIN` and `END` lines), either as a single line or as multiple lines.

`fingerprint`	Fingerprint of the OCI profile key, as listed on the User Details page under API Keys in the OCI console.
`access_token`	Access token obtained from your third-party service provider.

Required Privilege

You need the `CREATE CREDENTIAL` privilege to call this API.

Examples

- For Generative AI:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();

jo.put('user_ocid','ocid1.user.oc1..aabbalbbaa1112233aabbaabb1111222aa1111b
b');

jo.put('tenancy_ocid','ocid1.tenancy.oc1..aaaaalbbbb1112233aaaabbaa1111222a
aa111a');

jo.put('compartment_ocid','ocid1.compartment.oc1..ababalabab1112233abababab
1111222aba11ab');
  jo.put('private_key','AAAaaaBBB11112222333...AAA111AAABBB222aaa1a/+');
  jo.put('fingerprint','01:1a:a1:aa:12:a1:12:1a:ab:12:01:ab:a1:12:ab:1a');
  dbms_vector.create_credential(
    credential_name   => 'OCI_CRED',
    params            => json(jo.to_string));
end;
/
```

- For Cohere:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();
  jo.put('access_token', 'A1Aa0abA1AB1a1Abc123ab1A123ab123AbcA12a');
  dbms_vector.create_credential(
```

```
        credential_name   => 'COHERE_CRED',
        params            => json(jo.to_string));
    end;
    /
```

End-to-end examples:

To run end-to-end example scenarios using this procedure, see Use LLM-Powered APIs to Generate Summary and Text.

211.1.2 CREATE_INDEX

Use the `DBMS_VECTOR.CREATE_INDEX` procedure to create an index.

Syntax

```
DBMS_VECTOR.CREATE_INDEX (
    IDX_NAME                    IN VARCHAR2,
    TABLE_NAME                  IN VARCHAR2,
    IDX_VECTOR_COL              IN VARCHAR2,
    IDX_INCLUDE_COLS            IN VARCHAR2 DEFAULT NULL,
    IDX_PARTITIONING_SCHEME     IN VARCHAR2 default 'LOCAL',
    IDX_ORGANIZATION            IN VARCHAR2,
    IDX_DISTANCE_METRIC         IN VARCHAR2 DEFAULT COSINE,
    IDX_ACCURACY                IN NUMBER DEFAULT 90,
    IDX_PARAMETERS              IN CLOB,
    IDX_PARALLEL_CREATION       IN NUMBER DEFAULT 1
);
```

Parameters

Specify the input parameters in JSON format.

Table 211-3 CREATE_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
`table_name`	Table on which to create the index.
`idx_name`	Name of the index.
`idx_vector_col`	Vector column on which to create the index.
`idx_partitioning_scheme`	Partitioning scheme. `LOCAL` or `GLOBAL`.
`idx_organization`	Index organization. Either `NEIGHBOR PARTITIONS` or `INMEMORY NEIGHBOR GRAPH`.
`idx_distance_metric`	Distance computation metric. Defaults to `COSINE`. Can also be `MANHATTAN`, `HAMMING`, `DOT`, `EUCLIDEAN`, `L2_SQUARED`, `EUCLIDEAN_SQUARED`.
`idx_accuracy`	Target accuracy.
`idx_parameters`	Takes in CLOB with type of index and associated parameters. Type, neighbor partitions for IVF, neighbors/efConstruction for HNSW) .
`idx_parallel_creation`	Number of parallel threads used for index construction.

211.1.3 DISABLE_CHECKPOINT

Use the `DISABLE_CHECKPOINT` procedure to disable the Checkpoint feature for a given Hierarchical Navigable Small World (HNSW) index user and HNSW index name. This operation purges all older checkpoints for the HNSW index. It also disables the creation of future checkpoints as part of the HNSW graph refresh.

Syntax

```
DBMS_VECTOR.DISABLE_CHECKPOINT('INDEX_USER',['INDEX_NAME']);
```

INDEX_USER

Specify the user name of the HNSW vector index owner.

INDEX_NAME

Specify the name of the HNSW vector index for which you want to disable the Checkpoint feature.

The `INDEX_NAME` clause is optional. If you do not specify the index name, then this procedure disables the Checkpoint feature for all HNSW vector indexes under the given user.

Examples

- Using both the index name and index user:

  ```
  DBMS_VECTOR.DISABLE_CHECKPOINT('VECTOR_USER','VIDX1');
  ```

- Using only the index user:

  ```
  DBMS_VECTOR.DISABLE_CHECKPOINT('VECTOR_USER');
  ```

Related Topics

- *Oracle Database AI Vector Search User's Guide*
- ENABLE_CHECKPOINT
  Use the `ENABLE_CHECKPOINT` procedure to enable the Checkpoint feature for a given Hierarchical Navigable Small World (HNSW) index user and HNSW index name.

211.1.4 DROP_CREDENTIAL

Use the `DBMS_VECTOR.DROP_CREDENTIAL` credential helper procedure to drop an existing credential name from the data dictionary.

Syntax

```
DBMS_VECTOR.DROP_CREDENTIAL (
    CREDENTIAL_NAME      IN VARCHAR2
);
```

CREDENTIAL_NAME

Specify the credential name that you want to drop.

Examples

- For Generative AI:

```
exec dbms_vector.drop_credential('OCI_CRED');
```

- For Cohere:

```
exec dbms_vector.drop_credential('COHERE_CRED');
```

211.1.5 ENABLE_CHECKPOINT

Use the `ENABLE_CHECKPOINT` procedure to enable the Checkpoint feature for a given Hierarchical Navigable Small World (HNSW) index user and HNSW index name.

> **Note:**
>
> - This procedure only allows the index to create checkpoints. The checkpoint is created as part of the next HNSW graph refresh.
> - By default, HNSW checkpointing is enabled. If required, you can disable it using the `DBMS_VECTOR.DISABLE_CHECKPOINT` procedure.

Syntax

```
DBMS_VECTOR.ENABLE_CHECKPOINT('INDEX_USER',['INDEX_NAME']);
```

INDEX_USER

Specify the user name of the HNSW vector index owner.

INDEX_NAME

Specify the name of the HNSW vector index for which you want to enable the Checkpoint feature.

The `INDEX_NAME` clause is optional. If you do not specify the index name, then this procedure enables the Checkpoint feature for all HNSW vector indexes under the given user.

Examples

- Using both the index name and index user:

```
DBMS_VECTOR.ENABLE_CHECKPOINT('VECTOR_USER','VIDX1');
```

- Using only the index user:

```
DBMS_VECTOR.ENABLE_CHECKPOINT('VECTOR_USER');
```

Related Topics

- *Oracle Database AI Vector Search User's Guide*

- DISABLE_CHECKPOINT
  Use the `DISABLE_CHECKPOINT` procedure to disable the Checkpoint feature for a given Hierarchical Navigable Small World (HNSW) index user and HNSW index name. This operation purges all older checkpoints for the HNSW index. It also disables the creation of future checkpoints as part of the HNSW graph refresh.

211.1.6 DROP_ONNX_MODEL Procedure

This procedure deletes the specified ONNX model.

Syntax

```
DBMS_VECTOR.DROP_ONNX_MODEL (model_name IN VARCHAR2,
                                force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 211-4 DROP_ONNX_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the machine learning ONNX model in the form [*schema_name*.]*model_name*. If you do not specify a schema, then your own schema is used.
`force`	Forces the machine learning ONNX model to be dropped even if it is invalid. An ONNX model may be invalid if a serious system error interrupted the model build process.

Usage Note

To drop an ONNX model, you must be the owner or you must have the `DB_DEVELOPER_ROLE`.

Example

You can use the following command to delete a valid ONNX model named `doc_model` that exists in your schema.

```
BEGIN
  DBMS_VECTOR.DROP_ONNX_MODEL(model_name => 'doc_model');
END;
/
```

211.1.7 GET_INDEX_STATUS

Use the `GET_INDEX_STATUS` procedure to query the status of a vector index creation.

Syntax

```
DBMS_VECTOR.GET_INDEX_STATUS ('USER_NAME','INDEX_NAME');
```

USER_NAME

Specify the user name of the vector index owner.

INDEX_NAME

Specify the name of the vector index. You can query the index creation status for both Hierarchical Navigable Small World (HNSW) indexes and Inverted File Flat (IVF) indexes.

Usage Notes

- You can use the `GET_INDEX_STATUS` procedure only during a vector index creation.
- The `Percentage` value is shown in the output only for Hierarchical Navigable Small World (HNSW) indexes (and not for Inverted File Flat (IVF) indexes).
- Along with the `DB_DEVELOPER_ROLE` privilege, you must have read access to the `VECSYS.VECTOR$INDEX$BUILD$` table.
- You can use the following query to view all auxiliary tables:

```
select IDX_AUXILIARY_TABLES from vecsys.vector$index;
```

  - For HNSW indexes:

    `rowid_vid_map` stores the mapping between a row ID and vector ID. `shared_journal_change_log` stores the DML changes that are yet to be incorporated into an HNSW graph.
  - For IVF indexes:

    `centroids` stores the location for each centroid. `centroid_partitions` stores the best centroid for each vector.
- The possible values of `Stage` for HNSW vector indexes are:

Value	Description
`HNSW Index Initialization`	Initialization phase for the HNSW vector index creation
`HNSW Index Auxiliary Tables Creation`	Creation of the internal auxiliary tables for the HNSW Neighbor Graph vector index
`HNSW Index Graph Allocation`	Allocation of memory from the vector memory pool for the HNSW graph
`HNSW Index Loading Vectors`	Loading of the base table vectors into the vector pool memory
`HNSW Index Graph Construction`	Creation of the multi-layered HNSW graph with the previously loaded vectors
`HNSW Index Creation Completed`	HNSW vector index creation finished

- The possible values of `Stage` for IVF vector indexes are:

Value	Description
`IVF Index Initialization`	Initialization phase for the IVF vector index creation
`IVF Index Centroids Creation`	The K-means clustering phase that computes the cluster centroids on a sample of base table vectors
`IVF Index Centroid Partitions Creation`	Centroids assignment phase for the base table vectors
`IVF Index Creation Completed`	IVF vector index creation completed

Example

```
exec DBMS_VECTOR.GET_INDEX_STATUS('VECTOR_USER','VIDX_HNSW');

Index objn: 74745
```

```
Stage: HNSW Index Loading Vectors
Percentage: 80%
```

211.1.8 INDEX_ACCURACY_QUERY

Use the `DBMS_VECTOR.INDEX_ACCURACY_QUERY` function to verify the accuracy of a vector index for a given query vector, top-K, and target accuracy.

Syntax

```
DBMS_VECTOR.INDEX_ACCURACY_QUERY (
    OWNER_NAME          IN VARCHAR2,
    INDEX_NAME          IN VARCHAR2,
    QV                  IN VECTOR,
    TOP_K               IN NUMBER,
    TARGET_ACCURACY     IN NUMBER
) return VARCHAR2;

DBMS_VECTOR.INDEX_ACCURACY_QUERY (
    OWNER_NAME          IN VARCHAR2,
    INDEX_NAME          IN VARCHAR2,
    QV                  IN VECTOR,
    TOP_K               IN NUMBER,
    QUERY_PARAM         IN JSON
) return VARCHAR2;
```

Parameters

Table 211-5 INDEX_ACCURACY_QUERY (IN) Parameters of DBMS_VECTOR

Parameter	Description
`owner_name`	The name of the vector index owner.
`index_name`	The name of the vector index.
`qv`	Specifies the query vector.
`top_k`	The `top_k` value for accuracy computation.
`target_accuracy`	The target accuracy value for the vector index.

For information about determining the accuracy of your vector indexes, see Index Accuracy Report in *Oracle Database AI Vector Search User's Guide*.

211.1.9 INDEX_ACCURACY_REPORT

Use the `DBMS_VECTOR.INDEX_ACCURACY_REPORT` function to capture from your past workloads, accuracy values achieved by approximate searches using a particular vector index for a certain period of time.

Syntax

```
DBMS_VECTOR.INDEX_ACCURACY_REPORT (
    OWNER_NAME          IN VARCHAR2,
    INDEX_NAME          IN VARCHAR2,
    START_TIME          IN TIMESTAMP WITH TIME ZONE,
    END_TIME            IN TIMESTAMP WITH TIME ZONE
) return NUMBER;
```

Parameters

Table 211-6 INDEX_ACCURACY_REPORT (IN) Parameters of DBMS_VECTOR

Parameter	Description
`owner_name`	The name of the vector index owner.
`index_name`	The name of the vector index.
`start_time`	Specifies from what time to capture query vectors to consider for the accuracy computation. A `NULL` `start_time` uses query vectors captured in the last 24 hours.
`end_time`	Specifies an end point up until which query vectors are considered for accuracy computation. A `NULL` `end_time` uses query vectors captured from `start_time` until the current time.

For information about determining the accuracy of your vector indexes, see Index Accuracy Report in *Oracle Database AI Vector Search User's Guide*.

211.1.10 INDEX_VECTOR_MEMORY_ADVISOR

Use the `INDEX_VECTOR_MEMORY_ADVISOR` procedure to determine the vector memory size needed for a particular vector index. This helps you evaluate the number of indexes that can fit for each simulated vector memory size.

Syntax

- Using the number and type of vector dimensions that you want to store in your vector index.

```
DBMS_VECTOR.INDEX_VECTOR_MEMORY_ADVISOR(
    INDEX_TYPE,
    NUM_VECTORS,
    DIM_COUNT,
    DIM_TYPE,
    PARAMETER_JSON,
    RESPONSE_JSON);
```

- Using the table and vector column on which you want to create your vector index:

```
DBMS_VECTOR.INDEX_VECTOR_MEMORY_ADVISOR(
    TABLE_OWNER,
    TABLE_NAME,
    COLUMN_NAME,
    INDEX_TYPE,
    PARAMETER_JSON,
    RESPONSE_JSON);
```

Table 211-7 Syntax Details: INDEX_VECTOR_MEMORY_ADVISOR

Parameter	Description
INDEX_TYPE	Type of vector index: • IVF for Inverted File Flat (IVF) vector indexes • HNSW for Hierarchical Navigable Small World (HNSW) vector indexes
NUM_VECTORS	Number of vectors that you plan to create the vector index with.
DIM_COUNT	Number of dimensions of a vector as a NUMBER.
DIM_TYPE	Type of dimensions of a vector. Possible values are: • FLOAT16 • FLOAT32 • FLOAT64 • INT8
TABLE_OWNER	Owner name of the table on which to create the vector index.
TABLE_NAME	Table name on which to create the vector index.
COLUMN_NAME	Name of the vector column on which to create the vector index.
PARAMETER_JSON	Input parameter in JSON format. You can specify only one of the following form: • PARAMTER_JSON=>{"accuracy":value} • INDEX_TYPE=>IVF, parameter_json=>{"neighbor_partitions":value} • INDEX_TYPE=>HNSW, parameter_json=>{"neighbors":value} **Note**: You cannot specify values for accuracy along with neighbor_partitions or neighbors.
RESPONSE_JSON	JSON-formatted response string.

Examples

- Using neighbors in the parameters list:

```
exec DBMS_VECTOR.INDEX_VECTOR_MEMORY_ADVISOR(
    INDEX_TYPE=>'HNSW',
    NUM_VECTORS=>10000,
    DIM_COUNT=>768,
    DIM_TYPE=>'FLOAT32',
    PARAMETER_JSON=>'{"neighbors":128}',
    RESPONSE_JSON=>:response_json);
```

```
Suggested vector memory pool size: 59918628 Bytes
```

- Using accuracy in the parameters list:

```
exec DBMS_VECTOR.INDEX_VECTOR_MEMORY_ADVISOR(
    INDEX_TYPE=>'HNSW',
    NUM_VECTORS=>10000,
    DIM_COUNT=>768,
    DIM_TYPE=>'FLOAT32',
    PARAMETER_JSON=>'{"accuracy":90}',
    RESPONSE_JSON=>:response_json);

Suggested vector memory pool size: 53926765 Bytes
```

- Using the table and vector column on which you want to create the vector index:

```
exec DBMS_VECTOR.INDEX_VECTOR_MEMORY_ADVISOR(
    'VECTOR_USER',
    'VECTAB',
    'DATA_VECTOR',
    'HNSW',
    RESPONSE_JSON=>:response_json);

Using default accuracy: 90%
Suggested vector memory pool size: 76396251 Bytes
```

211.1.11 LOAD_ONNX_MODEL

This procedure enables you to load an ONNX model into the Database.

Syntax

```
DBMS_VECTOR.LOAD_ONNX_MODEL (
     directory  VARCHAR2,
     file_name   VARCHAR2,
     model_name  VARCHAR2,
     metadata   JSON);

DBMS_VECTOR.LOAD_ONNX_MODEL(
model_name  IN  VARCHAR2,
model_data  IN  BLOB,
metadata    IN  JSON);
```

Parameters

Table 211-8 LOAD_ONNX_MODEL Procedure Parameters

Parameter	Description
`directory`	The directory name of the data dump. For example, `DM_DUMP`.

Table 211-8 (Cont.) LOAD_ONNX_MODEL Procedure Parameters

Parameter	Description
file_name	A VARCHAR2 type parameter that specifies the name of the ONNX model.
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.
model_data	It is a BLOB holding the ONNX representation of the model. The BLOB contains the identical byte sequence as the one stored in an ONNX file.
metadata	A JSON description of the metadata describing the model. The metadata at minimum must describe the machine learning function supported by the model. The model's metadata parameters are described in JSON Metadata Parameters for ONNX Models.

Examples

The following examples illustrates a code snippet of using the DBMS_VECTOR.LOAD_ONNX_MODEL procedure. The complete step-by-step example is illustrated in Import ONNX Models and Generate Embeddings.

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL(
    'DM_DUMP',
    'my_embedding_model.onnx',
    'doc_model',
    JSON('{"function" : "embedding", "embeddingOutput" : "embedding", "input": {"input":
["DATA"]}}'));

DBMS_VECTOR.LOAD_ONNX_MODEL('my_embedding_model.onnx',
                                                :blob_bind_variable,
                                                 JSON('{"function" :
"embedding",
                                                        "embeddingOutput" :
"embedding" ,
                                                         "input":{"input":
["DATA"]}}'));
```

For a complete example to illustrate how you can define a BLOB variable and use it in the LOAD_ONNX_MODEL procedure, you can have the following:

```
CREATE OR REPLACE MY_LOAD_EMBEDDING_MODEL(embedding_model_name VARCHAR2,
onnx_blob BLOB) IS
BEGIN
DBMS_VECTOR.LOAD_ONNX_MODEL(embedding_model_name,
                            onnx_blob,
                            JSON('{"function" : "embedding",
                                   "embeddingOutput" : "embedding" ,
                                   "input":{"input": ["DATA"]}}'));
END;
/
```

Usage Notes

The name of the model follows the same restrictions as those used for other machine learning models, namely:

- The schema name, if provided, is limited to 128 characters.
- The model name is limited to 123 characters and must follow the rules of unquoted identifiers: they contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#). The initial character must be alphabetic.
- The model size is limited to 1 gigabyte.
- The model must not depend on external initializers. To know more about initializers and other ONNX concepts, see https://onnx.ai/onnx/intro/concepts.html.
- There are default input and output names for input and output attributes for models that are prepared by the Python utility. You can load those models without the JSON parameters. For example:

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL('DM_DUMP', 'my_embedding_model.onnx',
'doc_model'));
```

211.1.11.1 JSON Metadata Parameters for ONNX Models

When importing models using the `IMPORT_ONNX_MODEL` (`DBMS_DATA_MINING`), `LOAD_ONNX_MODEL` (`DBMS_VECTOR`), or `LOAD_ONNX_MODEL_CLOUD` (`DBMS_VECTOR`) procedures, you supply metadata as JSON parameters.

Parameters

Field	Value Type	Description
`function`	String	Specify regression, classification, clustering, or embedding. This is a mandatory setting. **NOTE**: The only JSON parameter required when importing the model is the machine learning function.
`input`	NA	Describes the model input mapping. See "Input" in Usage Notes.
`regressionOutput`	String	The name of the regression model output that stores the regression results. The output is expected to be a tensor of supported shape of any supported regression output type. See "Output" in Usage Notes.
`classificationProbOutput`	String	The name of the classification model output storing probabilities. The output is expected to be a tensor value of type float (width 32/64) of supported shape. See "Automatic normalization of output probabilities" in Usage Notes.

Field	Value Type	Description
clusteringDistanceOutput	String	The name of the clustering model output storing distances. The output is of type float (width 16/32/64) of supported shape.
clusteringProbOutput	String	The name of the clustering model output storing probabilities. The output is of type float (width 16/32/64) of supported shape.
classificationLabelOutput	String	The name of the model output holding label information. You have the following metadata parameters to specify the labels for classification: • labels: specify the labels directly in the JSON metadata • classificationLabelOutput: specify the model output that provides labels If you do not specify any value for this parameter or the function of the model is not classification, you will receive an error. The user can specify to use labels from the model directly by setting classificationLabelOutput to the model output holding the label information. The tensor output holding the label information must be the same size as the number of classes and must be of integer or string type. If the tensor that holds the labels is of string type, the returned type of the PREDICTION operator is VARCHAR2. If the tensor that holds the labels is of integer type, the returned type of the PREDICTION operator is NUMBER.
normalizeProb	String	Describes automatic normalization of output probabilities. See "Automatic normalization of output probabilities" in Usage Notes.
labels	NA	The labels used for classification. If you want to use custom labels, specify the labels using the labels field in the JSON metadata. The field can be set to an array of length equal to the number of classes. The labels for the class i must be stored at index i of the label array. If an array of strings is used, the returned type of the PREDICTION operator is VARCHAR2. The size of the string labels specified by the user cannot exceed *4000* bytes. If an array of numbers is used, the returned type of the PREDICTION operator is NUMBER. If you do not specify labels or classificationLabelOutput, classes are identified by integers in the range 1 to N where N is the number of classes. In this case, the returned type of the PREDICTION operator is NUMBER.
embeddingOutput	String	The model output that holds the generated embeddings.

Field	Value Type	Description
`suitableDistanceMetrics`	String	An array of names of suitable distance metrics for the model. The names must be the names of the distance metrics used for the Oracle `VECTOR_DISTANCE` operator. To know the supported distance metrics, see Vector Distance Metrics.
`normalization`	Boolean	A boolean value indicates if normalization is applied to the output vector. The value 1 means normalization is applied. Normalization is process of converting an embedding vector so that it's norm or length equals 1. A normalized vector maintains its direction but its length becomes 1. The resulting vector is often called a unit vector.
`maxSequenceLength`	Number	The maximum length of the token (input) sequence that is meaningful for the model. This parameter sets a limit on the number of tokens, words, or elements in each input sequence that the model will process. This ensures uniform input size for the model. For example, the value could be 128, or 512 to 4096 depending on the task for which the parameter is used. A machine translation model might have a `maxSequenceLength` of 512, accommodating sentences or paragraphs up to 512 tokens for translation tasks.
`pooling`	String	Indicates the pooling function performed on the output vector.
`modelDescription`	Object	A JSON object that allows users to add additional descriptions to the models complementing the existing ONNX metadata for model description.
`languages`	String	A comma-separated list of language name or abbreviation, as described in "A.1 Languages" of *Oracle Database Globalization Support Guide*. If you import multi-lingual embedding model, specify the language or the language abbreviation as the metadata.
`tokenizer`	String	Tokenizers help in transforming text into words. There are several tokenizers available, including: bert, gpt2, bpe, wordpiece, sentencepiece, and clip.
`embeddingLayer`	String	An identifier for the embedding layer. An embedding layer, serving as a hidden layer in neural networks, transforms input data from high to lower dimensions, enhancing the network's understanding of input relationships and data processing efficiency. Embedding layer helps in processing and analyzing categorical or discrete data. It achieves this by transforming categories into continuous embeddings, capturing the essential semantic relationships and similarities between them. For example the last hidden state in some transformer, or a layer in a resnet network.

Field	Value Type	Description
defaultOnNull	NA	Specify the replacement of missing values in the JSON using the defaultOnNull field. If defaultOnNull is not specified, the replacement of missing values is not performed. The defaultOnNull sets the missing values to NULL by default. You can override the default value of NULL by providing meaningful default values to substitute for NULL. The field must be a JSON object literal, whose fields are the input attribute names and whose values are the default values for the input. Note that the default value is of type string and must be a valid Oracle PL/SQL NVL value for the given datatype.

Note: The parameters are case-sensitive. A number of default conventions for output parameter names and default values allows to minimize the information that you may have to provide. The parameters such as suitableDistanceMetrics are informational only and you are not expected to provide this information while importing the model. The JSON descriptor may specify only one input attribute. If more are specified, you will receive an error. You will receive an error if the normalizeProb field is specified as the JSON metadata parameter.

Usage Notes

The name of the model follows the same restrictions as those used for other machine learning models, namely:

- **Input**

  When importing a model from an ONNX representation, you must specify the name of the attribute used for scoring and how it maps to actual ONNX inputs. A scoring operator uses these attribute names to identify the columns to be used. (For example, PREDICTION). Follow these conventions to specify the attribute names using the input field:

  not specified: When the field input is not specified, attribute names are mapped directly to model inputs by name. That is, if the attribute name is not specified in the JSON metadata, then the name of the input tensor is used as an attribute name. Each model input must have dimension [batch_size, value]. If you do not specify input in the JSON metatdata, the value must be 1. You don't have to specify extra metadata if the input of the model already conforms to the format. For an embedding model, a single input is provided that may be used in batches. Here, if the input parameter is not specified in the JSON metadata, the valid model will have [batch_size, 1].

  You must ensure that all attribute names, whether implied by the model or explicitly set by you through the input field, are valid Oracle Database identifiers for column names. Each attribute name within a model must be unique, ensuring no duplicates exist.

  You can explicitly specify attribute name for model that use input tensors that have a dimension larger than 1 (for example, (batch_size, 2)). In this case, you must specify a name for each of these values for them to be interpreted as independent attribute name. This can be done for regression, classification, clustering which are models whose scoring operation can take multiple input attributes.

- **Output**

  As models might have multiple outputs, you can specify which output is of interest for a specific machine learning technique. You have the following ways to specify model outputs:

- Specify the output name of interest in the JSON during model import. If the specified name is not a valid model output (see the table with valid outputs for a given machine learning function), you will receive an error.
- If the model produces an output that matches the expected output name for the given machine learning technique (for example, `classificationProbOutput`) and you didn't explicitly specify it, the output is automatically assumed.
- If you do not specify any output name and the model has a single output, the system assumes that the single output corresponds to a default specific to the machine learning technique. For an embedding machine learning function, the default value is `embeddingOutput`.
  The system reports an error if you do not specify model outputs or if you supply outputs that the specified machine learning function does not support. The following table displays supported outputs for a specific machine learning function:

Machine learning function	Output
regression	`regressionOutput`
classification	`classificationProbOutput`
clustering	`clusteringDistanceOutput`
embedding	`embeddingOutput`

  If none of the mentioned model outputs are specified, or if you supply outputs that are not supported by the specified machine learning function, you will receive an error.

- **Automatic Normalization of Output Probabilities**

  Many users widely employ the softmax function to normalize the output of multi-class classification models, as it enables to easily interpret the results of these models. The **softmax function** is a mathematical function that converts a vector of real numbers into a probability distribution. It is also known as the softargmax, or normalized exponential function. This function is available to you to specify at the model import-time that a softmax normalization must be applied to the tensor holding output probabilities such as `classificationProbOutput` and `clusteringProbOutput`. Specify `normalizeProb` to define the normalization that must be applied for softmax normalization. The default setting is `none`, indicating that no normalization is applied. You can choose `softmax` to apply a softmax function to the probability output. Specifying any other value for this field will result in an error during import. Additionally, specifying this field for models other than classification and clustering will also lead to an error.

Example: Specifying JSON Metadata Parameters for Embedding Models

The following example illustrates a simple case of how you can specify JSON metadata parameters while importing an ONNX embedding model into the Database using the `DBMS_VECTOR.IMPORT_ONNX_MODEL` procedure.

```
DBMS_VECTOR.IMPORT_ONNX_MODEL('my_embedding_model.onnx', 'doc_model',
                JSON('{"function" : "embedding",
                       "embeddingOutput" : "embedding" ,
                        "input":{"input": ["DATA"]}}'));
```

Example: Specifying Complete JSON Metadata Parameters for Embedding Models

The following example illustrates how to provide a complete JSON metadata parameters, with an exception of `embeddingLayer`, for importing embedding models.

```
DECLARE
  metadata JSON;
  mdtxt varchar2(4000);
BEGIN
  metadata := JSON(q'#
           {
             "function"                : "embedding",
             "embeddingOutput"         : "embedding",
             "input"                   : { "input" : ["txt"]},
             "maxSequenceLength"       : 512,
             "tokenizer"               : "bert",
             "suitableDistanceMetrics" : [ "DOT", "COSINE", "EUCLIDEAN"],
             "pooling"                 : "Mean Pooling",
             "normalization"           : true,
             "languages"               : ["US"],
             "modelDescription"        : {
                 "description" : "This model was tuned for semantic search:
Given a query/question, if can find relevant passages. It was trained on a
large and diverse set of (question, a
nswer) pairs.",
                 "url" : "https://example.co/sentence-transformers/
my_embedding_model"}
           }
           #');
  -- load the onnx model
    DBMS_VECTOR.IMPORT_ONNX_MODEL('my_embedding_model.onnx', 'doc_model',
metadata);
END;
/
```

211.1.12 LOAD_ONNX_MODEL_CLOUD

This procedure enables you to load an ONNX model from object storage into the Database.

Syntax

```
DBMS_VECTOR.LOAD_ONNX_MODEL_CLOUD (
     model_name  IN  VARCHAR2,
     credential  IN  VARCHAR2,
     uri         IN  VARCHAR2,
     metadata    IN  JSON DEFAULT JSON('{"function" : "embedding", '||
                          '"embeddingOutput" : "embedding", "input": {"input":
["DATA"]}}')
);
```

Parameters

Table 211-9 LOAD_ONNX_MODEL_CLOUD Procedure Parameters

Parameter	Description
`model_name`	The name of the model in the form `[schema_name.]model_name`. If you do not specify a schema, then your own schema is used.
`credential`	The name of the credential to be used to access Object Store.
`uri`	The URI of the ONNX model.
`metadata`	A JSON description of the metadata describing the model. The metadata at minimum must describe the machine learning function supported by the model. The model's metadata parameters are described in JSON Metadata Parameters for ONNX Models.

Examples

The following example includes a code snippet of using the `DBMS_VECTOR.LOAD_ONNX_MODEL_CLOUD` procedure.

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL_CLOUD(
    model_name => 'database',
    credential => 'MYCRED',
    uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/
bucketname/o/all-MiniLM-L6-v2.onnx',
    metadata => JSON('{"function" : "embedding", "embeddingOutput" : "embedding" , "input":
{"input": ["DATA"]}}')
);
```

Usage Notes

The name of the model follows the same restrictions as those used for other machine learning models, namely:

- The schema name, if provided, is limited to 128 characters.
- The model name is limited to 123 characters and must follow the rules of unquoted identifiers: they contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#). The initial character must be alphabetic.
- The model size is limited to 1 gigabyte.

- The model must not depend on external initializers. To know more about initializers and other ONNX concepts, see https://onnx.ai/onnx/intro/concepts.html.
- There are default input and output names for input and output attributes for models that are prepared by the Python utility. You can load those models without the JSON parameters. For example:

```
EXECUTE DBMS_VECTOR.LOAD_ONNX_MODEL_CLOUD(
    'database',
    'MYCRED',
    'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-
string/b/bucketname/o/all-MiniLM-L6-v2.onnx'
);
```

> **See Also:**
>
> *Oracle Machine Learning for SQL User's Guide* for examples of using ONNX models for machine learning tasks

211.1.13 QUERY

Use the `DBMS_VECTOR.QUERY` function to perform a similarity search operation which returns the top-k results as a JSON array.

Syntax

Query is overloaded and supports a version with `query_vector` passed in as a `VECTOR` type in addition to `CLOB`.

```
DBMS_VECTOR.QUERY (
    TAB_NAME             IN VARCHAR2,
    VEC_COL_NAME         IN VARCHAR2,
    QUERY_VECTOR         IN CLOB,
    TOP_K                IN NUMBER,
    VEC_PROJ_COLS        IN JSON_ARRAY_T DEFAULT NULL,
    IDX_NAME             IN VARCHAR2 DEFAULT NULL,
    DISTANCE_METRIC      IN VARCHAR2 DEFAULT 'COSINE',
    USE_INDEX            IN BOOLEAN DEFAULT TRUE,
    ACCURACY             IN NUMBER DEFAULT '90',
    IDX_PARAMETERS       IN CLOB DEFAULT NULL
) return JSON_ARRAY_T;

DBMS_VECTOR.QUERY (
    TAB_NAME             IN VARCHAR2,
    VEC_COL_NAME         IN VARCHAR2,
    QUERY_VECTOR         IN VECTOR,
    TOP_K                IN NUMBER,
    VEC_PROJ_COLS        IN JSON_ARRAY_T DEFAULT NULL,
    IDX_NAME             IN VARCHAR2 DEFAULT NULL,
    DISTANCE_METRIC      IN VARCHAR2 DEFAULT 'COSINE',
    USE_INDEX            IN BOOLEAN DEFAULT TRUE,
    ACCURACY             IN NUMBER DEFAULT '90',
```

```
    IDX_PARAMETERS       IN CLOB DEFAULT NULL
) return JSON_ARRAY_T;
```

Parameters

Specify the input parameters in JSON format.

Table 211-10 DBMS_VECTOR.QUERY Parameters

Parameter	Description
tab_name	Table name to query
vec_col_name	Vector column name
query_vector	Query vector passed in as CLOB or VECTOR.
top_k	Number of results to be returned.
vec_proj_cols	Columns to be projected as part of the result.
idx_name	Name of the index queried.
distance_metric	Distance computation metric. Defaults to COSINE. Can also be MANHATTAN, HAMMING, DOT, EUCLIDEAN, L2_SQUARED, EUCLIDEAN_SQUARED. .
use_index	Specifies whether the search is an approximate search or exact search. Defaults to TRUE (that is, approximate).
accuracy	Specifies the minimum desired query accuracy.
idx_parameters	Specifies values of efsearch and neighbor partition probes passed in, formatted as JSON

DATA

This function accepts the input data type as VARCHAR2, NUMBER, JSON, BOOLEAN or CLOB.

211.1.14 REBUILD_INDEX

Use the DBMS_VECTOR.REBUILD_INDEX function to rebuild an index.

Syntax

This API rebuilds an index. In case only the idx_name is provided, it rebuilds the index using get_ddl. When all params are provided, it performs a drop index followed by a call to dbms_vector.create_index().

```
DBMS_VECTOR.REBUILD_INDEX (
    IDX_NAME                    IN VARCHAR2,
    TABLE_NAME                  IN VARCHAR2 DEFAULT NULL,
    IDX_VECTOR_COL              IN VARCHAR2 DEFAULT NULL,
    IDX_INCLUDE_COLS            IN VARCHAR2 DEFAULT NULL,
    IDX_PARTITIONING_SCHEME     IN VARCHAR2 DEFAULT NULL,
    IDX_ORGANIZATION            IN VARCHAR2 DEFAULT NULL,
    IDX_DISTANCE_METRIC         IN VARCHAR2 DEFAULT 'COSINE',
    IDX_ACCURACY                IN NUMBER DEFAULT 90,
    IDX_PARAMETERS              IN CLOB DEFAULT NULL,
```

```
    IDX_PARALLEL_CREATION      IN NUMBER DEFAULT 1,
);
```

Parameters

Specify the input parameters in JSON format.

Table 211-11 REBUILD_INDEX (IN) Parameters of DBMS_VECTOR

Parameter	Description
table_name	Table on which to create the index.
idx_name	Name of the index.
idx_vector_col	Vector column on which to rebuild the index.
idx_partitioning_scheme	Partitioning scheme. LOCAL or GLOBAL.
idx_organization	Index organization. Either NEIGHBOR PARTITIONS or INMEMORY NEIGHBOR GRAPH.
idx_distance_metric	Distance computation metric. Defaults to COSINE. Can also be MANHATTAN, HAMMING, DOT, EUCLIDEAN, L2_SQUARED, EUCLIDEAN_SQUARED.
idx_accuracy	Target accuracy.
idx_parameters	Takes in CLOB with type of index and associated parameters. Type, neighbor partitions for IVF, neighbors/efConstruction for HNSW) .
idx_parallel_creation	Number of parallel threads used for index construction.

DATA

This function accepts the input data type as VARCHAR2, NUMBER, or CLOB.

If you specify only the idx_name value, then the function rebuilds the index using get_ddl. If you specify all the parameter values, then the function first performs a drop index operation and then calls the DBMS_VECTOR.CREATE_INDEX() function.

211.1.15 RERANK

Use the DBMS_VECTOR.RERANK function to reassess and reorder an initial set of results to retrieve more relevant search output.

Purpose

To improve the relevance and quality of search results in both similarity search and Retrieval Augmented Generation (RAG) scenarios.

Reranking improves the quality of information ingested into an LLM by ensuring that the most relevant documents or chunks are prioritized. This helps to reduce hallucinations and improves the accuracy of generated outputs.

For this operation, Oracle AI Vector Search supports reranking models provided by Cohere and Vertex AI.

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

```
DBMS_VECTOR.RERANK(
                QUERY      IN CLOB,
                DOCUMENTS  IN JSON,
                PARAMS     IN JSON default NULL
) return JSON;
```

This function accepts the input containing a query as `CLOB` and a list of documents in `JSON` format. It then processes this information to generate a `JSON` object containing a reranked list of documents, sorted by score.

For example, a reranked output includes:

```
{
    "index"   : "1",
    "score"   : "0.99",
    "content" : "Jupiter boasts an impressive system of 95 known moons."
}
```

Where,

- `index` specifies the position of the document in the list of input text.
- `score` specifies the relevance score.
- `content` specifies the input text corresponding to the index.

QUERY

Specify the search query (typically from an initial search) as `CLOB`.

DOCUMENTS

Specify a JSON array of strings (list of potentially relevant documents to rerank) in the following format:

```
{
  "documents": [
  "string1",
  "string2",
    ...
```

```
  ]
}
```

PARAMS

Specify the following list of parameters in JSON format. All these parameters are mandatory.

```
{
  "provider"         : "<service provider>",
  "credential_name"  : "<credential name>",
  "url"              : "<REST endpoint URL for reranking>",
  "model"            : "<reranking model name>",
  ...
}
```

Table 211-12 RERANK Parameter Details

Parameter	Description
`provider`	Supported REST provider to access for reranking: • `cohere` • `vertexai`
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the reranking model in the form: *`schema.model_name`* If the model name is not schema-qualified, then the schema of the procedure invoker is used.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters for reranking.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"         : "cohere",
  "credential_name"  : "COHERE_CRED",
  "url"              : "https://api.cohere.example.com/rerank",
  "model"            : "rerank-model",
  "return_documents": false,
  "top_n"            : 3
}
```

Vertex AI example:

```
{
  "provider"          : "vertexai",
  "credential_name"   : "VERTEXAI_CRED",
  "url"               : "https://googleapis.example.com/
default_ranking_config:rank",
  "model"             : "rerank-model",
  "ignoreRecordDetailsInResponse" : true,
  "topN"              : 3
  }
```

Table 211-13 Additional REST Provider Parameter Details

Parameter	Description
`return_documents`	Whether to return search results with original documents or input text (`content`): • `false` (default, also recommended) to not return any input text (return only index and score) • `true` to return input text along with index and score **Note**: With Cohere as the provider, Oracle recommends that you keep this option disabled for better performance. You may choose to enable it for debugging purposes when you need to view the original text.
`ignoreRecordDetailsInResponse`	Whether to return search results with original record details or input text (`content`): • `false` (default) to return input text along with index and score • `true` (recommended) to not return any input text (return only index and score) **Note**: With Vertex AI as the provider, Oracle recommends that you keep this option enabled for better performance. You may choose to disable it for debugging purposes when you need to view the original text.
`top_n` or `topN`	The number of most relevant documents to return.

Examples

- Using Cohere:

```
declare
  params clob;
  reranked_output json;
begin
  params := '
```

```
{
  "provider": "cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.com/v1/rerank",
  "model": "rerank-english-v3.0",
  "return_documents": true,
  "top_n": 3
}';

  reranked_output := dbms_vector.rerank(:query,
json(:initial_retrieval_docs), json(params));
  dbms_output.put_line(json_serialize(reranked_output));
end;
/
```

- Using Vertex AI:

```
declare
  params clob;
  reranked_output json;
begin
  params := '
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://discoveryengine.googleapis.com/v1/projects/1085581009881/
locations/global/rankingConfigs/default_ranking_config:rank",
  "model": "semantic-ranker-512@latest",
  "ignoreRecordDetailsInResponse": false,
  "topN": 3
}';

  reranked_output := dbms_vector.rerank(:query,
json(:initial_retrieval_docs), json(params));
  dbms_output.put_line(json_serialize(reranked_output));
end;
/
```

End-to-end example:

To run an end-to-end example scenario using this function, see Use Reranking for Better RAG Results.

211.1.16 UTL_TO_CHUNKS

Use the `DBMS_VECTOR.UTL_TO_CHUNKS` chainable utility function to split a large plain text document into smaller chunks of text.

Purpose

To perform a text-to-chunks transformation. This chainable utility function internally calls the `VECTOR_CHUNKS` SQL function for the operation.

To embed a large document, you may first need to split it into multiple appropriate-sized segments or chunks through a splitting process known as chunking (as explained in Understand the Stages of Data Transformations). A chunk can be words (to capture specific

words or word pieces), sentences (to capture a specific meaning), or paragraphs (to capture broader themes). A single document may be split into multiple chunks, each transformed into a vector.

Syntax

```
DBMS_VECTOR.UTL_TO_CHUNKS (
    DATA         IN CLOB | VARCHAR2
    PARAMS       IN JSON default NULL
) return VECTOR_ARRAY_T;
```

DATA

This function accepts the input data type as `CLOB` or `VARCHAR2`.

It returns an array of `CLOB`s, where each `CLOB` contains a chunk along with its metadata in JSON format, as follows:

```
{
    "chunk_id"     : NUMBER,
    "chunk_offset" : NUMBER,
    "chunk_length" : NUMBER,
    "chunk_data"   : "VARCHAR2(4000)"
}
```

For example:

```
{"chunk_id":1,"chunk_offset":1,"chunk_length":6,"chunk_data":"sample"}
```

Where,

- `chunk_id` specifies the chunk ID for each chunk.
- `chunk_offset` specifies the original position of each chunk in the source document, relative to the start of document which has a position of `1`.
- `chunk_length` specifies the character length of each chunk.
- `chunk_data` displays text pieces from each chunk.

PARAMS

Specify input parameters in JSON format:

```
{
    "by"           :     mode,
    "max"          :     max,
    "overlap"      :     overlap,
    "split"        :     split_condition,
    "custom_list"  :     [ split_chars1, ... ],
    "vocabulary"   :     vocabulary_name,
    "language"     :     nls_language,
    "normalize"    :     normalize_mode,
    "norm_options" :     [ normalize_option1, ... ],
    "extended"     :     boolean
}
```

For example:

```
JSON('
  { "by"           :    "vocabulary",
    "vocabulary"   :    "myvocab",
    "max"          :    "100",
    "overlap"      :    "0",
    "split"        :    "custom",
    "custom_list"  :    [ "<p>" , "<s>" ],
    "language"     :    "american",
    "normalize"    :    "options",
    "norm_options" :    [ "WHITESPACE" ]
  }')
```

Here is a complete description of these parameters:

Parameter	Description and Acceptable Values
`by`	Specify a mode for splitting your data, that is, to split by counting the number of characters, words, or vocabulary tokens. **Valid values**: • `characters` (or `chars`): Splits by counting the number of characters. • `words`: Splits by counting the number of words. Words are defined as sequences of alphabetic characters, sequences of digits, individual punctuation marks, or symbols. For segmented languages without whitespace word boundaries (such as Chinese, Japanese, or Thai), each native character is considered a word (that is, unigram). • `vocabulary`: Splits by counting the number of vocabulary tokens. Vocabulary tokens are words or word pieces, recognized by the vocabulary of the tokenizer that your embedding model uses. You can load your vocabulary file using the chunker helper API `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY`. **Note**: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. **Default value**: `words`
`max`	Specify a limit on the maximum size of each chunk. This setting splits the input text at a fixed point where the maximum limit occurs in the larger text. The units of `max` correspond to the `by` mode, that is, to split data when it reaches the maximum size limit of a certain number of characters, words, numbers, punctuation marks, or vocabulary tokens. **Valid values**: • `by characters`: `50` to `4000` characters • `by words`: `10` to `1000` words • `by vocabulary`: `10` to `1000` tokens **Default value**: `100`

Parameter	Description and Acceptable Values

split [by]	Specify where to split the input text when it reaches the maximum size limit. This helps to keep related data together by defining appropriate boundaries for chunks.
	Valid values:
	• none:
	Splits at the max limit of characters, words, or vocabulary tokens.
	• newline, blankline, and space:
	These are single-split character conditions that split at the last split character before the max value.
	Use newline to split at the end of a line of text. Use blankline to split at the end of a blank line (sequence of characters, such as two newlines). Use space to split at the end of a blank space.
	• recursively:
	This is a multiple-split character condition that breaks the input text using an ordered list of characters (or sequences).
	recursively is predefined as BLANKLINE, newline, space, none in this order:
	1. If the input text is more than the max value, then split by the first split character.
	2. If that fails, then split by the second split character.
	3. And so on.
	4. If no split characters exist, then split by max wherever it appears in the text.
	• sentence:
	This is an end-of-sentence split condition that breaks the input text at a sentence boundary.
	This condition automatically determines sentence boundaries by using knowledge of the input language's sentence punctuation and contextual rules. This language-specific condition relies mostly on end-of-sentence (EOS) punctuations and common abbreviations.
	Contextual rules are based on word information, so this condition is only valid when splitting the text by words or vocabulary (not by characters).
	Note: This condition obeys the by word and max settings, and thus may not determine accurate sentence boundaries in some cases. For example, when a sentence is larger than the max value, it splits the sentence at max. Similarly, it includes multiple sentences in the text only when they fit within the max limit.
	• custom:
	Splits based on a custom split characters list. You can provide custom sequences up to a limit of 16 split character strings, with a maximum length of 10 each.
	Specify an array of valid text literals using the custom_list parameter.
	`{ "split" : "custom", "custom_list" : [ "split_chars1", ... ] }`
	For example:
	`{ "split" : "custom", "custom_list" : [ "<p>" , "<s>" ] }`
	Note: You can omit sequences only for tab (\t), newline (\n), and linefeed (\r).
	Default value: recursively

Parameter	Description and Acceptable Values
`overlap`	Specify the amount (as a positive integer literal or zero) of the preceding text that the chunk should contain, if any. This helps in logically splitting up related text (such as a sentence) by including some amount of the preceding chunk text. The amount of overlap depends on how the maximum size of the chunk is measured (in characters, words, or vocabulary tokens). The overlap begins at the specified `split` condition (for example, at `newline`). **Valid value**: `5%` to `20%` of `max` **Default value**: `0`
`language`	Specify the language of your input data. This clause is important, especially when your text contains certain characters (for example, punctuations or abbreviations) that may be interpreted differently in another language. **Valid values**: • NLS-supported language name or its abbreviation, as listed in *Oracle Database Globalization Support Guide*. • Custom language name or its abbreviation, as listed in Supported Languages and Data File Locations. You use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper API to load language-specific data (abbreviation tokens) into the database, for your specified language. **Default value**: `NLS_LANGUAGE` from session

Parameter	Description and Acceptable Values

normalize	Automatically pre-processes or post-processes issues (such as multiple consecutive spaces and smart quotes) that may arise when documents are converted into text. Oracle recommends you to use a normalization mode to extract high-quality chunks.
	Valid values:
	• none:
	Applies no normalization.
	• all:
	Normalizes common multi-byte (unicode) punctuation to standard single-byte.
	• options:
	Specify an array of normalization options using the norm_options parameter.
	`{ "normalize" : "options", "norm_options" : [ "normalize_option1", ... ] }`
	– punctuation:
	Includes smart quotes, smart hyphens, and other multi-byte equivalents to simple single-byte punctuation.
	For example:
	* 2018u 'map to 0027'
	* 2019u 'map to 0027'
	* 201Bu 'map to 0027'
	– whitespace:
	Minimizes whitespace by eliminating unnecessary characters.
	For example, retain blanklines, but remove any extra newlines and interspersed spaces or tabs: " \n \n " => "\n\n"
	– widechar:
	Normalizes wide, multi-byte digits and (a-z) letters to single-byte.
	These are multi-byte equivalents for 0-9 and a-z A-Z, which can show up in ZH/JA formatted text.
	For example:
	`{ "normalize" : "options", "norm_options" : [ "whitespace" ] }`
	Default value: None

extended	Increases the output limit of a VARCHAR2 string to 32767 bytes, without requiring you to set the max_string_size parameter to extended. **Default value**: 4000 or 32767 (when max_string_size=extended)

Example

```
SELECT D.id doc,
    JSON_VALUE(C.column_value, '$.chunk_id' RETURNING NUMBER) AS id,
    JSON_VALUE(C.column_value, '$.chunk_offset' RETURNING NUMBER) AS pos,
    JSON_VALUE(C.column_value, '$.chunk_length' RETURNING NUMBER) AS siz,
    JSON_VALUE(C.column_value, '$.chunk_data') AS txt
```

```
FROM docs D,
   dbms_vector.utl_to_chunks(D.text,
   JSON('{ "by"       : "words",
           "max"      : "100",
           "overlap"  : "0",
           "split"    : "recursively",
           "language" : "american",
           "normalize": "all" }')) C;
```

End-to-end examples:

To run end-to-end example scenarios using this function, see Perform Chunking With Embedding and Configure Chunking Parameters.

211.1.17 UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS

Use the `DBMS_VECTOR.UTL_TO_EMBEDDING` and `DBMS_VECTOR.UTL_TO_EMBEDDINGS` chainable utility functions to generate one or more vector embeddings from textual documents and images.

Purpose

To automatically generate vector embeddings from a set of textual documents and images.

- Text to Vector:

  You can perform a text-to-embedding transformation by accessing:

  - Oracle Database as the service provider: Calls an ONNX format embedding model that you load into the database (default setting)
  - Third-party embedding model: Makes a REST API call to either a remote service provider (Cohere, Google AI, Hugging Face, Generative AI, OpenAI, or Vertex AI) or a local service provider (Ollama)

- Image to Vector:

  You can also perform an image-to-embedding transformation. For this operation, this API makes a REST call to your chosen image embedding model or multimodal embedding model by Vertex AI (which is the only supported third-party provider).

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

- Text to Vector:

```
DBMS_VECTOR.UTL_TO_EMBEDDING (
    DATA           IN CLOB,
    PARAMS         IN JSON default NULL
) return VECTOR;

DBMS_VECTOR.UTL_TO_EMBEDDINGS (
    DATA           IN VECTOR_ARRAY_T,
    PARAMS         IN JSON default NULL
) return VECTOR_ARRAY_T;
```

- Image to Vector:

```
DBMS_VECTOR.UTL_TO_EMBEDDING (
    DATA           IN BLOB,
    MODALITY       IN VARCHAR2,
    PARAMS         IN JSON default NULL
) return VECTOR;
```

DATA

`UTL_TO_EMBEDDING` accepts the input as `CLOB` containing textual data (text strings or small documents) or as `BLOB` containing media data (for media files such as images). It then converts the text or image input to a single embedding (`VECTOR`).

`UTL_TO_EMBEDDINGS` converts an array of chunks (`VECTOR_ARRAY_T`) to an array of embeddings (`VECTOR_ARRAY_T`).

A generated embedding output includes:

```
{
    "embed_id"    :  NUMBER,
    "embed_data"  : "VARCHAR2(4000)",
    "embed_vector": "CLOB"
}
```

Where,

- `embed_id` displays the ID number of each embedding.
- `embed_data` displays the input text that is transformed into embeddings.
- `embed_vector` displays the generated vector representations.

MODALITY

For `BLOB` inputs, specify the type of content to vectorize. The only supported value is `image`.

PARAMS

Specify input parameters in JSON format, depending on the service provider that you want to use.

If using Oracle Database as the provider:

```
{
  "provider" : "database",
  "model"    : "<in-database ONNX embedding model filename>"
}
```

Table 211-14 Database Provider Parameter Details

Parameter	Description
`provider`	Specify `database` (default setting) to use Oracle Database as the provider. With this setting, you must load an ONNX format embedding model into the database.
`model`	User-specified name under which the imported ONNX embedding model is stored in Oracle Database. If you do not have an embedding model in ONNX format, then perform the steps listed in Convert Pretrained Models to ONNX Format.

If using a third-party provider:

Set the following parameters along with additional embedding parameters specific to your provider:

- For `UTL_TO_EMBEDDING`:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for embedding service>",
  "model"           : "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<additional REST provider parameter>": "<REST provider parameter
value>"
}
```

- For `UTL_TO_EMBEDDINGS`:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for embedding service>",
  "model"           : "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "batch size"      : "<number of vectors to request at a time>",
  "<additional REST provider parameter>": "<REST provider parameter
value>"
}
```

Table 211-15 Third-Party Provider Parameter Details

Parameter	Description
`provider`	Third-party service provider that you want to access for this operation. A REST call is made to the specified provider to access its embedding model. For image input, specify `vertexai`. For text input, specify one of the following values: • `cohere` • `googleai` • `huggingface` • `ocigenai` • `openai` • `vertexai`
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the third-party embedding model in the form: *`schema.model_name`* If you do not specify a schema, then the schema of the procedure invoker is used. **Note**: • For accurate results, ensure that the chosen text embedding model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. • To get image embeddings, you can use any image embedding model or multimodal embedding model supported by Vertex AI. Multimodal embedding is a technique that vectorizes data from different modalities such as text and images. When using a multimodal embedding model to generate embeddings, ensure that you use the same model to vectorize both types of content (text and images). By doing so, the resulting embeddings are compatible and situated in the same vector space, which allows for effective comparison between the two modalities during similarity searches.
`transfer_timeout`	Maximum time to wait for the request to complete. The default value is `60` seconds. You can increase this value for busy web servers.
`batch_size`	Maximum number of vectors to request at a time. For example, for a batch size of `50`, if `100` chunks are passed, then this API sends two requests with an array of `50` strings each. If `30` chunks are passed (which is lesser than the defined batch size), then the API sends those in a single request. For REST calls, it is more efficient to send a batch of inputs at a time rather than requesting a single input per call. Increasing the batch size can provide better performance, whereas reducing the batch size may reduce memory and data usage, especially if your provider has a rate limit. The default or maximum allowed value depends on the third-party provider settings.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"       : "cohere",
  "credential_name": "COHERE_CRED",
  "url"            : "https://api.cohere.example.com/embed",
  "model"          : "embed-model",
  "input_type"     : "search_query"
}
```

Google AI example:

```
{
  "provider"       : "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url"            : "https://googleapis.example.com/models/",
  "model"          : "embed-model"
}
```

Hugging Face example:

```
{
  "provider"       : "huggingface",
  "credential_name": "HF_CRED",
  "url"            : "https://api.huggingface.example.com/",
  "model"          : "embed-model"
}
```

Generative AI example:

```
{
  "provider"       : "ocigenai",
  "credential_name": "OCI_CRED",
  "url"            : "https://generativeai.oci.example.com/embedText",
  "model"          : "embed-model",
  "batch_size"     : 10
}
```

Ollama example:

```
{
  "provider"       : "ollama",
  "host"           : "local",
```

```
  "url"            : "http://localhost:11434/api/embeddings",
  "model"          : "llama3"
}
```

OpenAI example:

```
{
  "provider"       : "openai",
  "credential_name": "OPENAI_CRED",
  "url"            : "https://api.openai.example.com/embeddings",
  "model"          : "embed-model"
}
```

Vertex AI example:

```
{
  "provider"       : "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url"            : "https://googleapis.example.com/models/",
  "model"          : "embed-model"
}
```

Table 211-16 Additional REST Provider Parameter Details

Parameter	Description
`input_type`	Type of input to vectorize.

> **Note:**
>
> The generated embedding results may be different between requests for the same input and configuration, depending on your embedding model or floating point precision. However, this does not affect your queries (and provides semantically correct results) because the vector distance will be similar.

Examples

You can use `UTL_TO_EMBEDDING` in a `SELECT` clause and `UTL_TO_EMBEDDINGS` in a `FROM` clause, as follows:

- The following examples use `UTL_TO_EMBEDDING` to generate an embedding with `Hello world` as input, by accessing the Generative AI embedding model:

```
-- declare embedding parameters

var params clob;

begin
 :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
```

```
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname",
  "batch_size": 10
}';
end;
/

-- get text embedding: PL/SQL example

declare
  input clob;
  v vector;
begin
  input := 'Hello world';

  v := dbms_vector.utl_to_embedding(input, json(params));
  dbms_output.put_line(vector_serialize(v));
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/

-- get text embedding: select example

select dbms_vector.utl_to_embedding('Hello world', json(:params)) from
dual;
```

The following examples use `UTL_TO_EMBEDDING` to generate an embedding with `parrots.jpg` as input and modality as `image`, by accessing the Vertex AI's multimodal embedding model.

```
-- declare embedding parameters

var params clob;

begin
  :params := '
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://LOCATION-aiplatform.googleapis.com/v1/projects/PROJECT/
locations/LOCATION/publishers/google/models/",
  "model": "multimodalembedding:predict"
}';
end;
/

-- get image embedding: PL/SQL example

declare
  v vector;
  output clob;
begin
```

```
  v := dbms_vector.utl_to_embedding(
    to_blob(bfilename('VEC_DUMP', 'parrots.jpg')), 'image', json(:params));
  output := vector_serialize(v);
  dbms_output.put_line('vector data=' || dbms_lob.substr(output, 100) ||
'...');
end;
/

-- get image embedding: select example

select dbms_vector.utl_to_embedding(
  to_blob(bfilename('VEC_DUMP', 'parrots.jpg')), 'image', json(:params));
```

End-to-end examples:

To run end-to-end example scenarios using `UTL_TO_EMBEDDING`, see Generate Embedding.

- The following example uses `UTL_TO_EMBEDDINGS` to generate embeddings with a PDF document (stored in the `documentation_tab` table) as input, by calling an ONNX format model loaded into the database:

```
SELECT et.* from documentation_tab dt,dbms_vector.utl_to_embeddings(
  dbms_vector.utl_to_chunks(dbms_vector.utl_to_text(dt.data)),
  json(:embed_params)) et;
```

End-to-end examples:

To run end-to-end example scenarios using `UTL_TO_EMBEDDINGS`, see Perform Chunking With Embedding.

211.1.18 UTL_TO_GENERATE_TEXT

Use the `DBMS_VECTOR.UTL_TO_GENERATE_TEXT` chainable utility function to generate a text response for a given prompt or an image, by accessing third-party text generation models.

Purpose

To communicate with Large Language Models (LLMs) through natural language conversations. You can generate a textual answer, description, or summary for prompts and images, given as input to LLM-powered chat interfaces.

- Prompt to Text:

  A prompt can be an input text string, such as a question that you ask an LLM. For example, "`What is Oracle Text?`". A prompt can also be a command, such as "`Summarize the following ...`", "`Draft an email asking for ...`", or "`Rewrite the following ...`", and can include results from a search. The LLM responds with a textual answer or description based on the specified task in the prompt.

  For this operation, this API makes a REST call to either a remote third-party provider (Cohere, Google AI, Hugging Face, Generative AI, OpenAI, or Vertex AI) or a local third-party provider (Ollama).

- Image to Text:

  You can also prompt with a media file, such as an image, to extract text from pictures or photos. You supply a text question as the prompt (such as "`What is this image about?`"

or "`How many birds are there in this painting?`") along with the image. The LLM responds with a textual analysis or description of the contents of the image.

For this operation, this API makes a REST call to either a remote third-party provider (Google AI, Hugging Face, OpenAI, or Vertex AI) or a local third-party provider (Ollama).

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

This function accepts the input as `CLOB` containing text data (for textual prompts) or as `BLOB` containing media data (for media files such as images). It then processes this information to generate a new `CLOB` containing the generated text.

- Prompt to Text:

```
DBMS_VECTOR.UTL_TO_GENERATE_TEXT (
        DATA          IN CLOB,
        PARAMS        IN JSON default NULL
) return CLOB;
```

- Image to Text:

```
DBMS_VECTOR.UTL_TO_GENERATE_TEXT(
          TEXT_DATA      IN CLOB,
          MEDIA_DATA     IN BLOB,
          MEDIA_TYPE     IN VARCHAR2 default 'image/jpeg',
          PARAMS         IN JSON default NULL
) return CLOB;
```

DATA and TEXT_DATA

Specify the textual prompt as `CLOB` for the `DATA` or `TEXT_DATA` clause.

> **Note:**
>
> Hugging Face uses an image captioning model that does not require a prompt, when giving an image as input. If you input a prompt along with an image, then the prompt will be ignored.

MEDIA_DATA

Specify the `BLOB` file, such as an image or a visual PDF file.

MEDIA_TYPE

Specify the image format for the given image or visual PDF file (`BLOB` file) in one of the supported image data MIME types. For example:

- For PNG: `image/png`
- For JPEG: `image/jpeg`
- For PDF: `application/pdf`

> **Note:**
>
> For a complete list of the supported image formats, refer to your third-party provider's documentation.

PARAMS

Specify the following input parameters in JSON format, depending on the service provider that you want to access for text generation:

```
{
  "provider"         : "<AI service provider>",
  "credential_name"  : "<credential name>",
  "url"              : "<REST endpoint URL for text generation service>",
  "model"            : "<text generation model name>",
  "transfer_timeout" : <maximum wait time for the request to complete>,
  "<additional REST provider parameter>": "<REST provider parameter value>"
}
```

Table 211-17 UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
`provider`	Supported REST provider that you want to access to generate text. Specify one of the following values: For `CLOB` input: • `cohere` • `googleai` • `huggingface` • `ocigenai` • `openai` • `vertexai` For `BLOB` input: • `googleai` • `huggingface` • `openai` • `vertexai`

Table 211-17 (Cont.) UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the third-party text generation model in the form: *`schema.model_name`* If the model name is not schema-qualified, then the schema of the procedure invoker is used.
`transfer_timeout`	Maximum time to wait for the request to complete. The default value is `60` seconds. You can increase this value for busy web servers.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"        : "cohere",
  "credential_name" : "COHERE_CRED",
  "url"             : "https://api.cohere.example.com/chat",
  "model"           : "generate-text-model"
}
```

Google AI example:

```
{
  "provider"       : "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url"            : "https://googleapis.example.com/models/",
  "model"          : "generate-text-model"
}
```

Hugging Face example:

```
{
  "provider"       : "huggingface",
  "credential_name": "HF_CRED",
  "url"            : "https://api.huggingface.example.com/models/",
  "model"          : "generate-text-model"
}
```

Generative AI example:

```
{
  "provider"        : "ocigenai",
  "credential_name" : "GENAI_CRED",
  "url"             : "https://generativeai.oci.example.com/generateText",
  "model"           : "generate-text-model",
  "inferenceRequest": {
    "maxTokens"     : 300,
    "temperature"   : 1
  }
}
```

or more current chat models may implement:

```
{
  "provider"        : "ocigenai",
  "credential_name" : "OCI_CRED",
  "url"             : "https://inference.generativeai.oci.example.com/actions/
chat",
  "model"           : "generate-text-model",
  "chatRequest"     : {
    "maxTokens"     : 256
  }
}
```

Ollama example:

```
{
  "provider"       : "ollama",
  "host"           : "local",
  "url"            : "http://localhost:11434/api/generate",
  "model"          : "llama3"
}
```

OpenAI example:

```
{
  "provider"        : "openai",
  "credential_name" : "OPENAI_CRED",
  "url"             : "https://api.openai.example.com",
  "model"           : "generate-text-model",
  "max_tokens"      : 60,
```

```
  "temperature"     : 1.0
}
```

Vertex AI example:

```
{
  "provider"         : "vertexai",
  "credential_name"  : "VERTEXAI_CRED",
  "url"              : "https://googleapis.example.com/models/",
  "model"            : "generate-text-model",
  "generation_config": {
    "temperature"    : 0.9,
    "topP"           : 1,
    "candidateCount" : 1,
    "maxOutputTokens": 256
  }
}
```

Table 211-18 Additional REST Provider Parameter Details

Parameter	Description
`max_tokens`	Maximum number of tokens in the output text.
`temperature`	Degree of randomness used when generating the output text, in the range of `0.0-5.0`. To generate the same output for a prompt, use `0`. To generate a random new text for that prompt, increase the temperature. **Note**: Start with the temperature set to `0`. If you do not require random results, a recommended temperature value is between `0` and `1`. A higher value is not recommended because a high temperature may produce creative text, which might also include hallucinations.
`topP`	Probability of tokens in the output, in the range of `0.0-1.0`. A lower value provides less random responses and a higher value provides more random responses.
`candidateCount`	Number of response variations to return, in the range of `1-4`.
`maxOutputTokens`	Maximum number of tokens to generate for each response.

Examples

- Prompt to Text:

  The following statements generate text by making a REST call to Generative AI. Here, the prompt is "`What is Oracle Text?`".

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
```

```
}';

select dbms_vector.utl_to_generate_text(
 'What is Oracle Text?',
 json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'What is Oracle Text?';

  params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
}';

  output := dbms_vector.utl_to_generate_text(input, json(params));
  dbms_output.put_line(output);
  if output is not null then
    dbms_lob.freetemporary(output);
  end if;
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

End-to-end examples:

To run end-to-end example scenarios, see Generate Text Response.

- Image to Text:

  The following statements generate text by making a REST call to OpenAI. Here, the input is an image (`sample_image.jpeg`) along with the prompt "`Describe this image?`".

```
-- select example

var input clob;
var media_data blob;
var media_type clob;
var params clob;

begin
  :input := 'Describe this image';
  :media_data := load_blob_from_file('DEMO_DIR', 'sample_image.jpeg');
  :media_type := 'image/jpeg';
  :params := '
{
```

```
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/chat/completions",
  "model": "generate.modelname",
  "max_tokens": 256
}';
end;
/

select dbms_vector.utl_to_generate_text(:input, :media_data, :media_type,
json(:params));

-- PL/SQL example

declare
  input clob;
  media_data blob;
  media_type varchar2(32);
  params clob;
  output clob;

begin
  input := 'Describe this image';
  media_data := load_blob_from_file('DEMO_DIR', 'image_file');
  media_type := 'image/jpeg';
  params := '
{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/chat/completions",
  "model": "generate.modelname",
  "max_tokens": 256
}';

  output := dbms_vector.utl_to_generate_text(
    input, media_data, media_type, json(params));
  dbms_output.put_line(output);

  if output is not null then
    dbms_lob.freetemporary(output);
  end if;
  if media_data is not null then
    dbms_lob.freetemporary(media_data);
  end if;
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

End-to-end examples:

To run end-to-end example scenarios, see Describe Image Content.

212
DBMS_VECTOR_CHAIN

The DBMS_VECTOR_CHAIN package provides APIs to support advanced operations with Oracle AI Vector Search, such as chunking and embedding data along with text generation and summarization capabilities. It is more suitable for text processing with similarity search and hybrid search, using functionality that can be pipelined together for an end-to-end search.

These functions accept their respective input parameters in JSON format.

212.1 Summary of DBMS_VECTOR_CHAIN Subprograms

This table lists the DBMS_VECTOR_CHAIN subprograms and briefly describes them.

Table 212-1 ***DBMS_VECTOR_CHAIN Package Subprograms***

Subprogram	Description
Chainable Utility (UTL) Functions:	
These functions are a set of modular and flexible functions within vector utility PL/SQL packages. You can chain these together to automate end-to-end data transformation and similarity search operations.	
UTL_TO_TEXT	Extracts plain text data from documents
UTL_TO_CHUNKS	Splits data into smaller pieces or chunks
UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS	Converts data to one or more vector embeddings
UTL_TO_SUMMARY	Extracts a summary from documents
UTL_TO_GENERATE_TEXT	Generates text for a prompt (input string) or an image
Credential Helper Procedures:	
These procedures enable you to securely manage authentication credentials in the database. You require these credentials to enable access to third-party service providers for making REST calls.	
CREATE_CREDENTIAL	Creates a credential name
DROP_CREDENTIAL	Drops an existing credential name
Preference Helper Procedures:	
These procedures enable you to manage vectorizer preferences, to be used with the CREATE_HYBRID_VECTOR_INDEX and ALTER_INDEX SQL statements when creating or managing hybrid vector indexes.	
CREATE_PREFERENCE	Creates a vectorizer preference
DROP_PREFERENCE	Drops an existing vectorizer preference
Chunker Helper Procedures:	
These procedures enable you to configure vocabulary and language data (abbreviations), to be used with the VECTOR_CHUNKS SQL function or UTL_TO_CHUNKS PL/SQL function.	
CREATE_VOCABULARY	Loads your token vocabulary file into the database
DROP_VOCABULARY	Removes existing vocabulary data

Table 212-1 (Cont.) *DBMS_VECTOR_CHAIN Package Subprograms*

Subprogram	Description
CREATE_LANG_DATA	Loads your language data file into the database
DROP_LANG_DATA	Removes existing abbreviation data
Data Access Function:	
This function enables you to enhance search operations.	
RERANK	Reorders search results for more relevant output

> **Note:**
>
> The `DBMS_VECTOR_CHAIN` package requires you to install the `CONTEXT` component of Oracle Text, an Oracle Database technology that provides indexing, term extraction, text analysis, text summarization, word and theme searching, and other utilities.
>
> Due to underlying dependance on the text processing capabilities of Oracle Text, note that both the `UTL_TO_TEXT` and `UTL_TO_SUMMARY` chainable utility functions and all the chunker helper procedures are available only in this package through Oracle Text.

212.1.1 CREATE_CREDENTIAL

Use the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` credential helper procedure to create a credential name for storing user authentication details in Oracle Database.

Purpose

To securely manage authentication credentials in the database. You require these credentials to enable access during REST API calls to your chosen third-party service provider, such as Cohere, Google AI, Hugging Face, Oracle Cloud Infrastructure (OCI) Generative AI, OpenAI, or Vertex AI.

A credential name holds authentication parameters, such as user name, password, access token, private key, or fingerprint.

Note that if you are using Oracle Database as the service provider, then you do not need to create a credential.

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL (
    CREDENTIAL_NAME     IN VARCHAR2,
    PARAMS              IN JSON DEFAULT NULL
);
```

CREDENTIAL_NAME

Specify a name of the credential that you want to create for holding authentication parameters.

PARAMS

Specify authentication parameters in JSON format, based on your chosen service provider.

Generative AI requires the following authentication parameters:

```
{
"user_ocid"       : "<user ocid>",
"tenancy_ocid"    : "<tenancy ocid>",
"compartment_ocid": "<compartment ocid>",
"private_key"     : "<private key>",
"fingerprint"     : "<fingerprint>"
}
```

Cohere, Google AI, Hugging Face, OpenAI, and Vertex AI require the following authentication parameter:

```
{ "access_token": "<access token>" }
```

Table 212-2 Parameter Details

Parameter	Description
`user_ocid`	Oracle Cloud Identifier (OCID) of the user, as listed on the User Details page in the OCI console.
`tenancy_ocid`	OCID of your tenancy, as listed on the Tenancy Details page in the OCI console.
`compartment_ocid`	OCID of your compartment, as listed on the Compartments information page in the OCI console.

Table 212-2 (Cont.) Parameter Details

Parameter	Description

`private_key`	OCI private key.
	Note: The generated private key may appear as:
	
	`-----BEGIN RSA PRIVATE KEY-----`
	`<private key string>`
	`-----END RSA PRIVATE KEY-----`
	
	You pass the *`<private key string>`* value (excluding the `BEGIN` and `END` lines), either as a single line or as multiple lines.

`fingerprint`	Fingerprint of the OCI profile key, as listed on the User Details page under API Keys in the OCI console.
`access_token`	Access token obtained from your third-party service provider.

Required Privilege

You need the `CREATE CREDENTIAL` privilege to call this API.

Examples

- For Generative AI:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();

jo.put('user_ocid','ocid1.user.oc1..aabbalbbaa1112233aabbaabb1111222aa1111b
b');

jo.put('tenancy_ocid','ocid1.tenancy.oc1..aaaaalbbbb1112233aaaabbaa1111222a
aa111a');

jo.put('compartment_ocid','ocid1.compartment.oc1..ababalabab1112233abababab
1111222aba11ab');
  jo.put('private_key','AAAaaaBBB11112222333...AAA111AAABBB222aaa1a/+');
  jo.put('fingerprint','01:1a:a1:aa:12:a1:12:1a:ab:12:01:ab:a1:12:ab:1a');
  dbms_vector_chain.create_credential(
    credential_name   => 'OCI_CRED',
    params            => json(jo.to_string));
end;
/
```

- For Cohere:

```
declare
  jo json_object_t;
begin
  jo := json_object_t();
  jo.put('access_token', 'A1Aa0abA1AB1a1Abc123ab1A123ab123AbcA12a');
  dbms_vector_chain.create_credential(
```

```
        credential_name   => 'COHERE_CRED',
        params            => json(jo.to_string));
    end;
    /
```

End-to-end examples:

To run end-to-end example scenarios using this procedure, see Use LLM-Powered APIs to Generate Summary and Text.

212.1.2 CREATE_LANG_DATA

Use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper procedure to load your own language data file into the database.

Purpose

To create custom language data for your chosen language (specified using the `language` chunking parameter).

A language data file contains language-specific abbreviation tokens. You can supply this data to the chunker to help in accurately determining sentence boundaries of chunks, by using knowledge of the input language's end-of-sentence (EOS) punctuations, abbreviations, and contextual rules.

Usage Notes

- All supported languages are distributed with the default language-specific abbreviation dictionaries. You can create a language data based on the abbreviation tokens loaded in the `schema.table.column`, using a user-specified language data name (`PREFERENCE_NAME`).
- After loading your language data, you can use language-specific chunking by specifying the `language` chunking parameter with `VECTOR_CHUNKS` or `UTL_TO_CHUNKS`.
- You can query these data dictionary views to access existing language data:
  - `ALL_VECTOR_LANG` displays all available languages data.
  - `USER_VECTOR_LANG` displays languages data from the schema of the current user.
  - `ALL_VECTOR_ABBREV_TOKENS` displays abbreviation tokens from all available language data.
  - `USER_VECTOR_ABBREV_TOKENS` displays abbreviation tokens from the language data owned by the current user.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_LANG_DATA (
    PARAMS       IN JSON default NULL
);
```

PARAMS

Specify the input parameters in JSON format:

```
{
    table_name,
    column_name,
```

```
    language,
    preference_name
}
```

Table 212-3 Parameter Details

Parameter	Description	Required	Default Value
table_name	Name of the table (along with the optional table owner) in which you want to load the language data	Yes	No value
column_name	Column name in the language data table in which you want to load the language data	Yes	No value
language	Any supported language name, as listed in Supported Languages and Data File Locations.	Yes	No value
preference_name	User-specified preference name for this language data	Yes	No value

Example

```
declare
    params CLOB := '{"table_name"      : "eos_data_1",
                     "column_name"     : "token",
                     "language"        : "indonesian",
                     "preference_name" : "my_lang_1"}';
begin
    DBMS_VECTOR_CHAIN.CREATE_LANG_DATA(
        JSON (params));
end;
/
```

End-to-end example:

To run an end-to-end example scenario using this procedure, see Create and Use Custom Language Data.

- Text Processing Views

212.1.3 CREATE_PREFERENCE

Use the DBMS_VECTOR_CHAIN.CREATE_PREFERENCE preference helper procedure to create a vectorizer preference, to be used when creating or updating hybrid vector indexes.

Purpose

To create a vectorizer preference. This allows you to customize vector search parameters of a hybrid vector indexing pipeline. The goal of a vectorizer preference is to provide you with a

straightforward way to configure how to chunk or embed your documents, without requiring a deep understanding of various chunking or embedding strategies.

A **vectorizer** preference is a JSON object that collectively holds user-specified values related to the following chunking, embedding, or vector index creation parameters:

- Chunking (`UTL_TO_CHUNKS` or `VECTOR_CHUNKS`)
- Embedding (`UTL_TO_EMBEDDING`, `UTL_TO_EMBEDDINGS`, or `VECTOR_EMBEDDING`)
- Vector index creation (`distance`, `accuracy`, and `vector_idxtype`)

After creating a vectorizer preference, you can use the `VECTORIZER` parameter to pass this preference name in the `paramstring` of the `PARAMETERS` clause for `CREATE_HYBRID_VECTOR_INDEX` and `ALTER_INDEX` SQL statements.

Usage Notes

- Creating a preference is optional. If you do not specify any optional preference, then the index is created with system defaults.
- All vector index preferences follow the same JSON syntax as defined for their corresponding `DBMS_VECTOR` and `DBMS_VECTOR_CHAIN` APIs.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_PREFERENCE (
    PREF_NAME      IN VARCHAR2,
    PREF_TYPE      IN VARCHAR2,
    PARAMS         IN JSON default NULL
);
```

PREF_NAME

Specify the name of the vectorizer preference to create.

PREF_TYPE

Type of preference. The only supported preference type is:

```
DBMS_VECTOR_CHAIN.VECTORIZER
```

PARAMS

Specify vector search-specific parameters in JSON format.

- **Embedding Parameter**:

  ```
  { "model" : <embedding_model_for_vector_generation> }
  ```

  For example:

  ```
  { "model" : MY_INDB_MODEL }
  ```

  `model` specifies the name under which your ONNX embedding model is stored in the database.

  If you do not have an in-database embedding model in ONNX format, then perform the steps listed in *Oracle Database AI Vector Search User's Guide*.

- **Chunking Parameters**:

```
{
    "by"           :  mode,
    "max"          :  max,
    "overlap"      :  overlap,
    "split"        :  split_condition,
    "custom_list"  :  split_chars1, ...,
    "vocabulary"   :  vocabulary_name,
    "language"     :  nls_language,
    "normalize"    :  normalize_mode,
    "norm_options" :  normalize_option1, ...,
    "extended"     :  boolean
}
```

For example:

```
JSON('
  { "by"           :    "vocabulary",
    "vocabulary"   :    "myvocab",
    "max"          :    "100",
    "overlap"      :    "0",
    "split"        :    "custom",
    "custom_list"  :    [ "<p>" , "<s>" ],
    "language"     :    "american",
    "normalize"    :    "options",
    "norm_options" :    [ "whitespace" ]
  }')
```

Parameter	Description and Acceptable Values
`by`	Specify a mode for splitting your data, that is, to split by counting the number of characters, words, or vocabulary tokens. **Valid values**: – `characters` (or `chars`): Splits by counting the number of characters. – `words`: Splits by counting the number of words. Words are defined as sequences of alphabetic characters, sequences of digits, individual punctuation marks, or symbols. For segmented languages without whitespace word boundaries (such as Chinese, Japanese, or Thai), each native character is considered a word (that is, unigram). – `vocabulary`: Splits by counting the number of vocabulary tokens. Vocabulary tokens are words or word pieces, recognized by the vocabulary of the tokenizer that your embedding model uses. You can load your vocabulary file using the chunker helper API `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY`. **Note**: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. **Default value**: `words`

Parameter	Description and Acceptable Values
`max`	Specify a limit on the maximum size of each chunk. This setting splits the input text at a fixed point where the maximum limit occurs in the larger text. The units of `max` correspond to the `by` mode, that is, to split data when it reaches the maximum size limit of a certain number of characters, words, numbers, punctuation marks, or vocabulary tokens. **Valid values**: – `by characters`: `50` to `4000` characters – `by words`: `10` to `1000` words – `by vocabulary`: `10` to `1000` tokens **Default value**: `100`

Parameter	Description and Acceptable Values

split [by]	Specify where to split the input text when it reaches the maximum size limit. This helps to keep related data together by defining appropriate boundaries for chunks.
	Valid values:
	– none:
	Splits at the max limit of characters, words, or vocabulary tokens.
	– newline, blankline, and space:
	These are single-split character conditions that split at the last split character before the max value.
	Use newline to split at the end of a line of text. Use blankline to split at the end of a blank line (sequence of characters, such as two newlines). Use space to split at the end of a blank space.
	– recursively:
	This is a multiple-split character condition that breaks the input text using an ordered list of characters (or sequences).
	recursively is predefined as BLANKLINE, newline, space, none in this order:
	1. If the input text is more than the max value, then split by the first split character.
	2. If that fails, then split by the second split character.
	3. And so on.
	4. If no split characters exist, then split by max wherever it appears in the text.
	– sentence:
	This is an end-of-sentence split condition that breaks the input text at a sentence boundary.
	This condition automatically determines sentence boundaries by using knowledge of the input language's sentence punctuation and contextual rules. This language-specific condition relies mostly on end-of-sentence (EOS) punctuations and common abbreviations.
	Contextual rules are based on word information, so this condition is only valid when splitting the text by words or vocabulary (not by characters).
	Note: This condition obeys the by word and max settings, and thus may not determine accurate sentence boundaries in some cases. For example, when a sentence is larger than the max value, it splits the sentence at max. Similarly, it includes multiple sentences in the text only when they fit within the max limit.
	– custom:
	Splits based on a custom split characters list. You can provide custom sequences up to a limit of 16 split character strings, with a maximum length of 10 each.
	Specify an array of valid text literals using the custom_list parameter.
	`{ "split" : "custom", "custom_list" : [ "split_chars1", ... ] }`
	For example:
	`{ "split" : "custom", "custom_list" : [ "<p>" , "<s>" ] }`
	Note: You can omit sequences only for tab (\t), newline (\n), and linefeed (\r).
	Default value: recursively

Parameter	Description and Acceptable Values
`overlap`	Specify the amount (as a positive integer literal or zero) of the preceding text that the chunk should contain, if any. This helps in logically splitting up related text (such as a sentence) by including some amount of the preceding chunk text. The amount of overlap depends on how the maximum size of the chunk is measured (in characters, words, or vocabulary tokens). The overlap begins at the specified `split` condition (for example, at `newline`). **Valid value**: `5%` to `20%` of `max` **Default value**: `0`
`language`	Specify the language of your input data. This clause is important, especially when your text contains certain characters (for example, punctuations or abbreviations) that may be interpreted differently in another language. **Valid values**: – NLS-supported language name or its abbreviation, as listed in *Oracle Database Globalization Support Guide*. – Custom language name or its abbreviation, as listed in Supported Languages and Data File Locations. You use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper API to load language-specific data (abbreviation tokens) into the database, for your specified language. **Default value**: `NLS_LANGUAGE` from session

Parameter	Description and Acceptable Values

normalize	Automatically pre-processes or post-processes issues (such as multiple consecutive spaces and smart quotes) that may arise when documents are converted into text. Oracle recommends you to use a normalization mode to extract high-quality chunks.
	Valid values:
	– none:
	Applies no normalization.
	– all:
	Normalizes common multi-byte (unicode) punctuation to standard single-byte.
	– options:
	Specify an array of normalization options using the norm_options parameter.
	`{ "normalize" : "options", "norm_options" : [ "normalize_option1", ... ] }`
	* punctuation:
	Includes smart quotes, smart hyphens, and other multi-byte equivalents to simple single-byte punctuation.
	For example:
	* 2018u 'map to 0027'
	* 2019u 'map to 0027'
	* 201Bu 'map to 0027'
	* whitespace:
	Minimizes whitespace by eliminating unnecessary characters.
	For example, retain blanklines, but remove any extra newlines and interspersed spaces or tabs: " \n \n " => "\n\n"
	* widechar:
	Normalizes wide, multi-byte digits and (a-z) letters to single-byte.
	These are multi-byte equivalents for 0-9 and a-z A-Z, which can show up in ZH/JA formatted text.
	For example:
	`{ "normalize" : "options", "norm_options" : [ "whitespace" ] }`
	Default value: None

extended	Increases the output limit of a VARCHAR2 string to 32767 bytes, without requiring you to set the max_string_size parameter to extended. **Default value**: 4000 or 32767 (when max_string_size=extended)

- **Vector Index Parameters**:

```
{
  "distance"        :  <vector_distance>,
  "accuracy"        :  <vector_accuracy>,
  "vector_idxtype"  :  <vector_idxtype>
}
```

For example:

```
{
  "distance"        :  COSINE,
  "accuracy"        :  95,
  "vector_idxtype"  :  HNSW
}
```

Parameter	Description
distance	Distance computation metric as COSINE, MANHATTAN, DOT, EUCLIDEAN, L2_SQUARED, or EUCLIDEAN_SQUARED. **Note**: Currently, the HAMMING and JACCARD vector distance metrics are not supported with hybrid vector indexes. For detailed information on each of these metrics, see Vector Distance Functions and Operators. **Default value**: COSINE
accuracy	Target accuracy at which the approximate search should be performed when running an approximate search query using vector indexes. You can specify non-default target accuracy values either by specifying a percentage value or by specifying internal parameters values, depending on the index type you are using. – For an IVF approximate search: Specify a target accuracy percentage value to influence the number of partitions used to probe the search. Instead of specifying a target accuracy percentage value, you can specify the NEIGHBOR PARTITION PROBES parameter to impose a certain maximum number of partitions to be probed by the search. See Understand Inverted File Flat Vector Indexes. – For an HNSW approximate search: Specify a target accuracy percentage value to influence the number of candidates considered to probe the search. Instead of specifying a target accuracy percentage value, you can specify the EFSEARCH parameter to impose a certain maximum number of candidates to be considered while probing the index. See Understand Hierarchical Navigable Small World Indexes. Valid range for both IVF and HNSW vector indexes is: ACCURACY: > 0 and <= 100 **Default value**: None
vector_idxtype	Type of vector index to create: – IVF for the Inverted File Flat (IVF) vector index – HNSW for the Hierarchical Navigable Small World (HNSW) vector index For detailed information on each of these indexes, see Manage the Different Categories of Vector Indexes. **Default value**: IVF

Example

```
begin
  DBMS_VECTOR_CHAIN.CREATE_PREFERENCE(
    'my_vec_spec',
     DBMS_VECTOR_CHAIN.VECTORIZER,
    json('{"vector_idxtype" :  "hnsw",
           "model"          :  "my_doc_model",
           "by"             :  "words",
           "max"            :  100,
```

```
           "overlap"        :  10,
           "split"          :  "recursively"}'));
end;
/

CREATE HYBRID VECTOR INDEX my_hybrid_idx on
    doc_table(text_column)
    parameters('VECTORIZER my_vec_spec');
```

212.1.4 CREATE_VOCABULARY

Use the `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY` chunker helper procedure to load your own token vocabulary file into the database.

Purpose

To create custom token vocabulary that is recognized by the tokenizer used by your vector embedding model.

A vocabulary contains a set of tokens (words and word pieces) that are collected during a model's statistical training process. You can supply this data to the chunker to help in accurately selecting the text size that approximates the maximum input limit imposed by the tokenizer of your embedding model.

Usage Notes

- Usually, the supported vocabulary files (containing recognized tokens) are included as part of a model's distribution. Oracle recommends to use the vocabulary files associated with your model.

  If a vocabulary file is not available, then you may download one of the following files depending on the tokenizer type:

  – **WordPiece**:

    Vocabulary file (`vocab.txt`) for the "bert-base-uncased" (English) or "bert-base-multilingual-cased" model

  – **Byte-Pair Encoding (BPE)**:

    Vocabulary file (`vocab.json`) for the "GPT2" model

    Use the following python script to extract the file:

    ```
    import json
    import sys

    with open(sys.argv[1], encoding="utf-8") as f:
      d = json.load(f)
      for term in d:
        print(term)
    ```

  – **SentencePiece**:

    Vocabulary file (`tokenizer.json`) for the "xlm-roberta-base" model

Use the following python script to extract the file:

```
import json
import sys

with open(sys.argv[1], encoding="utf-8") as f:
  d = json.load(f)
  for entry in d["model"]["vocab"]:
    print(entry[0])
```

Ensure to save your vocabulary files in `UTF-8` encoding.

- You can create a vocabulary based on the tokens loaded in the `schema.table.column`, using a user-specified vocabulary name (`vocabulary_name`).

  After loading your vocabulary data, you can use the `by vocabulary` chunking mode (with `VECTOR_CHUNKS` or `UTL_TO_CHUNKS`) to split input data by counting the number of tokens.

- You can query these data dictionary views to access existing vocabulary data:
  - `ALL_VECTOR_VOCAB` displays all available vocabularies.
  - `USER_VECTOR_VOCAB` displays vocabularies from the schema of the current user.
  - `ALL_VECTOR_VOCAB_TOKENS` displays a list of tokens from all available vocabularies.
  - `USER_VECTOR_VOCAB_TOKENS` displays a list of tokens from the vocabularies owned by the current user.

Syntax

```
DBMS_VECTOR_CHAIN.CREATE_VOCABULARY(
    PARAMS      IN JSON default NULL
);
```

PARAMS

Specify the input parameters in JSON format:

```
{
    table_name,
    column_name,
    vocabulary_name,
    format,
    cased
}
```

Table 212-4 Parameter Details

Parameter	Description	Required	Default Value
`table_name`	Name of the table (along with the optional table owner) in which you want to load the vocabulary file	Yes	No value
`column_name`	Column name in the vocabulary table in which you want to load the vocabulary file	Yes	No value

Table 212-4 (Cont.) Parameter Details

Parameter	Description	Required	Default Value
vocabulary_name	User-specified name of the vocabulary, along with the optional owner name (if other than the current owner)	Yes	No value
format	• xlm for SentencePiece tokenization • bert for WordPiece tokenization • gpt2 for BPE tokenization	Yes	No value
cased	Character-casing of the vocabulary, that is, vocabulary to be treated as cased or uncased	No	false

Example

```
DECLARE
  params clob := '{"table_name"       : "doc_vocabtab",
                   "column_name"      : "token",
                   "vocabulary_name"  : "doc_vocab",
                   "format"           : "bert",
                   "cased"            : false}';

BEGIN
  dbms_vector_chain.create_vocabulary(json(params));
END;
/
```

End-to-end example:

To run an end-to-end example scenario using this procedure, see Create and Use Custom Vocabulary.

212.1.5 DROP_CREDENTIAL

Use the DBMS_VECTOR_CHAIN.DROP_CREDENTIAL credential helper procedure to drop an existing credential name from the data dictionary.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_CREDENTIAL (
    CREDENTIAL_NAME      IN VARCHAR2
);
```

CREDENTIAL_NAME

Specify the credential name that you want to drop.

Examples

- For Generative AI:

```
exec dbms_vector_chain.drop_credential('OCI_CRED');
```

- For Cohere:

```
exec dbms_vector_chain.drop_credential('COHERE_CRED');
```

212.1.6 DROP_LANG_DATA

Use the `DBMS_VECTOR_CHAIN.DROP_LANG_DATA` chunker helper procedure to remove abbreviation data from the data dictionary.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_LANG_DATA(
    PREF_NAME     IN VARCHAR2
);
```

LANG

Specify the name of the language data that you want to drop for a given language.

Example

```
DBMS_VECTOR_CHAIN.DROP_LANG_DATA('indonesian');
```

212.1.7 DROP_PREFERENCE

Use the `DBMS_VECTOR_CHAIN.DROP_PREFERENCE` preference helper procedure to remove an existing Vectorizer preference.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_PREFERENCE (PREF_NAME);
```

PREF_NAME

Name of the Vectorizer preference to drop.

Example

```
DBMS_VECTOR_CHAIN.DROP_PREFERENCE ('scott_vectorizer');
```

212.1.8 DROP_VOCABULARY

Use the `DBMS_VECTOR_CHAIN.DROP_VOCABULARY` chunker helper procedure to remove vocabulary data from the data dictionary.

Syntax

```
DBMS_VECTOR_CHAIN.DROP_VOCABULARY(
    VOCABULARY_NAME    IN VARCHAR2
);
```

VOCAB_NAME

Specify the name of the vocabulary that you want to drop, in the form:

vocabulary_name

or

owner.vocabulary_name

Example

```
DBMS_VECTOR_CHAIN.DROP_VOCABULARY('MY_VOCAB_1');
```

212.1.9 RERANK

Use the `DBMS_VECTOR_CHAIN.RERANK` function to reassess and reorder an initial set of results to retrieve more relevant search output.

Purpose

To improve the relevance and quality of search results in both similarity search and Retrieval Augmented Generation (RAG) scenarios.

Reranking improves the quality of information ingested into an LLM by ensuring that the most relevant documents or chunks are prioritized. This helps to reduce hallucinations and improves the accuracy of generated outputs.

For this operation, Oracle AI Vector Search supports reranking models provided by Cohere and Vertex AI.

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

```
DBMS_VECTOR_CHAIN.RERANK(
                QUERY      IN CLOB,
                DOCUMENTS  IN JSON,
                PARAMS     IN JSON default NULL
) return JSON;
```

This function accepts the input containing a query as `CLOB` and a list of documents in `JSON` format. It then processes this information to generate a `JSON` object containing a reranked list of documents, sorted by score.

For example, a reranked output includes:

```
{
    "index"   : "1",
    "score"   : "0.99",
    "content" : "Jupiter boasts an impressive system of 95 known moons."
}
```

Where,

- `index` specifies the position of the document in the list of input text.
- `score` specifies the relevance score.
- `content` specifies the input text corresponding to the index.

QUERY

Specify the search query (typically from an initial search) as `CLOB`.

DOCUMENTS

Specify a JSON array of strings (list of potentially relevant documents to rerank) in the following format:

```
{
  "documents": [
  "string1",
  "string2",
    ...
```

```
  ]
}
```

PARAMS

Specify the following list of parameters in JSON format. All these parameters are mandatory.

```
{
  "provider"         : "<service provider>",
  "credential_name"  : "<credential name>",
  "url"              : "<REST endpoint URL for reranking>",
  "model"            : "<reranking model name>",
  ...
}
```

Table 212-5 RERANK Parameter Details

Parameter	Description
`provider`	Supported REST provider to access for reranking: • `cohere` • `vertexai`
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the reranking model in the form: *`schema.model_name`* If the model name is not schema-qualified, then the schema of the procedure invoker is used.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters for reranking.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"         : "cohere",
  "credential_name"  : "COHERE_CRED",
  "url"              : "https://api.cohere.example.com/rerank",
  "model"            : "rerank-model",
  "return_documents": false,
  "top_n"            : 3
}
```

Vertex AI example:

```
{
  "provider"          : "vertexai",
  "credential_name"   : "VERTEXAI_CRED",
  "url"               : "https://googleapis.example.com/
default_ranking_config:rank",
  "model"             : "rerank-model",
  "ignoreRecordDetailsInResponse" : true,
  "topN"              : 3
  }
```

Table 212-6 Additional REST Provider Parameter Details

Parameter	Description
`return_documents`	Whether to return search results with original documents or input text (`content`): • `false` (default, also recommended) to not return any input text (return only index and score) • `true` to return input text along with index and score **Note**: With Cohere as the provider, Oracle recommends that you keep this option disabled for better performance. You may choose to enable it for debugging purposes when you need to view the original text.
`ignoreRecordDetailsInResponse`	Whether to return search results with original record details or input text (`content`): • `false` (default) to return input text along with index and score • `true` (recommended) to not return any input text (return only index and score) **Note**: With Vertex AI as the provider, Oracle recommends that you keep this option enabled for better performance. You may choose to disable it for debugging purposes when you need to view the original text.
`top_n` or `topN`	The number of most relevant documents to return.

Examples

- Using Cohere:

```
declare
  params clob;
  reranked_output json;
begin
  params := '
```

```
{
  "provider": "cohere",
  "credential_name": "COHERE_CRED",
  "url": "https://api.cohere.com/v1/rerank",
  "model": "rerank-english-v3.0",
  "return_documents": true,
  "top_n": 3
}';

  reranked_output := dbms_vector_chain.rerank(:query,
json(:initial_retrieval_docs), json(params));
  dbms_output.put_line(json_serialize(reranked_output));
end;
/
```

- Using Vertex AI:

```
declare
  params clob;
  reranked_output json;
begin
  params := '
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://discoveryengine.googleapis.com/v1/projects/1085581009881/
locations/global/rankingConfigs/default_ranking_config:rank",
  "model": "semantic-ranker-512@latest",
  "ignoreRecordDetailsInResponse": false,
  "topN": 3
}';

  reranked_output := dbms_vector_chain.rerank(:query,
json(:initial_retrieval_docs), json(params));
  dbms_output.put_line(json_serialize(reranked_output));
end;
/
```

End-to-end example:

To run an end-to-end example scenario using this function, see Use Reranking for Better RAG Results.

212.1.10 UTL_TO_CHUNKS

Use the `DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS` chainable utility function to split a large plain text document into smaller chunks of text.

Purpose

To perform a text-to-chunks transformation. This chainable utility function internally calls the `VECTOR_CHUNKS` SQL function for the operation.

To embed a large document, you may first need to split it into multiple appropriate-sized segments or chunks through a splitting process known as chunking (as explained in Understand the Stages of Data Transformations). A chunk can be words (to capture specific

words or word pieces), sentences (to capture a specific meaning), or paragraphs (to capture broader themes). A single document may be split into multiple chunks, each transformed into a vector.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_CHUNKS (
    DATA         IN CLOB | VARCHAR2
    PARAMS       IN JSON default NULL
) return VECTOR_ARRAY_T;
```

DATA

This function accepts the input data type as `CLOB` or `VARCHAR2`.

It returns an array of `CLOB`s, where each `CLOB` contains a chunk along with its metadata in JSON format, as follows:

```
{
    "chunk_id"     : NUMBER,
    "chunk_offset" : NUMBER,
    "chunk_length" : NUMBER,
    "chunk_data"   : "VARCHAR2(4000)"
}
```

For example:

```
{"chunk_id":1,"chunk_offset":1,"chunk_length":6,"chunk_data":"sample"}
```

Where,

- `chunk_id` specifies the chunk ID for each chunk.
- `chunk_offset` specifies the original position of each chunk in the source document, relative to the start of document which has a position of `1`.
- `chunk_length` specifies the character length of each chunk.
- `chunk_data` displays text pieces from each chunk.

PARAMS

Specify input parameters in JSON format.

```
{
    "by"           :     mode,
    "max"          :     max,
    "overlap"      :     overlap,
    "split"        :     split_condition,
    "custom_list"  :     [ split_chars1, ... ],
    "vocabulary"   :     vocabulary_name,
    "language"     :     nls_language,
    "normalize"    :     normalize_mode,
    "norm_options" :     [ normalize_option1, ... ],
    "extended"     :     boolean
}
```

For example:

```
JSON('
  { "by"           :    "vocabulary",
    "vocabulary"   :    "myvocab",
    "max"          :    "100",
    "overlap"      :    "0",
    "split"        :    "custom",
    "custom_list"  :    [ "<p>" , "<s>" ],
    "language"     :    "american",
    "normalize"    :    "options",
    "norm_options" :    [ "whitespace" ]
  }')
```

Here is a complete description of these parameters:

Parameter	Description and Acceptable Values
`by`	Specify a mode for splitting your data, that is, to split by counting the number of characters, words, or vocabulary tokens. **Valid values**: • `characters` (or `chars`): Splits by counting the number of characters. • `words`: Splits by counting the number of words. Words are defined as sequences of alphabetic characters, sequences of digits, individual punctuation marks, or symbols. For segmented languages without whitespace word boundaries (such as Chinese, Japanese, or Thai), each native character is considered a word (that is, unigram). • `vocabulary`: Splits by counting the number of vocabulary tokens. Vocabulary tokens are words or word pieces, recognized by the vocabulary of the tokenizer that your embedding model uses. You can load your vocabulary file using the chunker helper API `DBMS_VECTOR_CHAIN.CREATE_VOCABULARY`. **Note**: For accurate results, ensure that the chosen model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. **Default value**: `words`
`max`	Specify a limit on the maximum size of each chunk. This setting splits the input text at a fixed point where the maximum limit occurs in the larger text. The units of `max` correspond to the `by` mode, that is, to split data when it reaches the maximum size limit of a certain number of characters, words, numbers, punctuation marks, or vocabulary tokens. **Valid values**: • `by characters`: `50` to `4000` characters • `by words`: `10` to `1000` words • `by vocabulary`: `10` to `1000` tokens **Default value**: `100`

Parameter	Description and Acceptable Values

split [by]	Specify where to split the input text when it reaches the maximum size limit. This helps to keep related data together by defining appropriate boundaries for chunks.
	Valid values:
	• none:
	Splits at the max limit of characters, words, or vocabulary tokens.
	• newline, blankline, and space:
	These are single-split character conditions that split at the last split character before the max value.
	Use newline to split at the end of a line of text. Use blankline to split at the end of a blank line (sequence of characters, such as two newlines). Use space to split at the end of a blank space.
	• recursively:
	This is a multiple-split character condition that breaks the input text using an ordered list of characters (or sequences).
	recursively is predefined as BLANKLINE, newline, space, none in this order:
	1. If the input text is more than the max value, then split by the first split character.
	2. If that fails, then split by the second split character.
	3. And so on.
	4. If no split characters exist, then split by max wherever it appears in the text.
	• sentence:
	This is an end-of-sentence split condition that breaks the input text at a sentence boundary.
	This condition automatically determines sentence boundaries by using knowledge of the input language's sentence punctuation and contextual rules. This language-specific condition relies mostly on end-of-sentence (EOS) punctuations and common abbreviations.
	Contextual rules are based on word information, so this condition is only valid when splitting the text by words or vocabulary (not by characters).
	Note: This condition obeys the by word and max settings, and thus may not determine accurate sentence boundaries in some cases. For example, when a sentence is larger than the max value, it splits the sentence at max. Similarly, it includes multiple sentences in the text only when they fit within the max limit.
	• custom:
	Splits based on a custom split characters list. You can provide custom sequences up to a limit of 16 split character strings, with a maximum length of 10 each.
	Specify an array of valid text literals using the custom_list parameter.
	`{ "split" : "custom", "custom_list" : [ "split_chars1", ... ] }`
	For example:
	`{ "split" : "custom", "custom_list" : [ "<p>" , "<s>" ] }`
	Note: You can omit sequences only for tab (\t), newline (\n), and linefeed (\r).
	Default value: recursively

Parameter	Description and Acceptable Values
`overlap`	Specify the amount (as a positive integer literal or zero) of the preceding text that the chunk should contain, if any. This helps in logically splitting up related text (such as a sentence) by including some amount of the preceding chunk text. The amount of overlap depends on how the maximum size of the chunk is measured (in characters, words, or vocabulary tokens). The overlap begins at the specified `split` condition (for example, at `newline`). **Valid value**: `5%` to `20%` of `max` **Default value**: `0`
`language`	Specify the language of your input data. This clause is important, especially when your text contains certain characters (for example, punctuations or abbreviations) that may be interpreted differently in another language. **Valid values**: • NLS-supported language name or its abbreviation, as listed in *Oracle Database Globalization Support Guide*. • Custom language name or its abbreviation, as listed in Supported Languages and Data File Locations. You use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper API to load language-specific data (abbreviation tokens) into the database, for your specified language. **Default value**: `NLS_LANGUAGE` from session

Parameter	Description and Acceptable Values

normalize	Automatically pre-processes or post-processes issues (such as multiple consecutive spaces and smart quotes) that may arise when documents are converted into text. Oracle recommends you to use a normalization mode to extract high-quality chunks.
	Valid values:
	• none:
	Applies no normalization.
	• all:
	Normalizes common multi-byte (unicode) punctuation to standard single-byte.
	• options:
	Specify an array of normalization options using the norm_options parameter.
	`{ "normalize" : "options", "norm_options" : [ "normalize_option1", ... ] }`
	– punctuation:
	Includes smart quotes, smart hyphens, and other multi-byte equivalents to simple single-byte punctuation.
	For example:
	* 2018u 'map to 0027'
	* 2019u 'map to 0027'
	* 201Bu 'map to 0027'
	– whitespace:
	Minimizes whitespace by eliminating unnecessary characters.
	For example, retain blanklines, but remove any extra newlines and interspersed spaces or tabs: " \n \n " => "\n\n"
	– widechar:
	Normalizes wide, multi-byte digits and (a-z) letters to single-byte.
	These are multi-byte equivalents for 0-9 and a-z A-Z, which can show up in ZH/JA formatted text.
	For example:
	`{ "normalize" : "options", "norm_options" : [ "whitespace" ] }`
	Default value: None

extended	Increases the output limit of a VARCHAR2 string to 32767 bytes, without requiring you to set the max_string_size parameter to extended. **Default value**: 4000 or 32767 (when max_string_size=extended)

Example

```
SELECT D.id doc,
    JSON_VALUE(C.column_value, '$.chunk_id' RETURNING NUMBER) AS id,
    JSON_VALUE(C.column_value, '$.chunk_offset' RETURNING NUMBER) AS pos,
    JSON_VALUE(C.column_value, '$.chunk_length' RETURNING NUMBER) AS siz,
    JSON_VALUE(C.column_value, '$.chunk_data') AS txt
```

```
FROM docs D,
   dbms_vector_chain.utl_to_chunks(D.text,
   JSON('{ "by"        : "words",
           "max"       : "100",
           "overlap"   : "0",
           "split"     : "recursively",
           "language"  : "american",
           "normalize": "all" }')) C;
```

End-to-end examples:

To run end-to-end example scenarios using this function, see Perform Chunking With Embedding and Configure Chunking Parameters.

Related Topics

- VECTOR_CHUNKS

212.1.11 UTL_TO_EMBEDDING and UTL_TO_EMBEDDINGS

Use the `DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDING` and `DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDINGS` chainable utility functions to generate one or more vector embeddings from textual documents and images.

Purpose

To automatically generate vector embeddings from a set of textual documents and images.

- Text to Vector:

  You can perform a text-to-embedding transformation by accessing:

  - Oracle Database as the service provider: Calls an ONNX format embedding model that you load into the database (default setting)
  - Third-party embedding model: Makes a REST API call to either a remote service provider (Cohere, Google AI, Hugging Face, Generative AI, OpenAI, or Vertex AI) or a local service provider (Ollama)

- Image to Vector:

  You can also perform an image-to-embedding transformation. For this operation, this API makes a REST call to your chosen image embedding model or multimodal embedding model by Vertex AI (which is the only supported third-party provider).

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

- Text to Vector:

```
DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDING (
    DATA           IN CLOB,
    PARAMS         IN JSON default NULL
) return VECTOR;

DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDINGS (
    DATA           IN VECTOR_ARRAY_T,
    PARAMS         IN JSON default NULL
) return VECTOR_ARRAY_T;
```

- Image to Vector:

```
DBMS_VECTOR_CHAIN.UTL_TO_EMBEDDING (
    DATA           IN BLOB,
    MODALITY       IN VARCHAR2,
    PARAMS         IN JSON default NULL
) return VECTOR;
```

DATA

`UTL_TO_EMBEDDING` accepts the input as `CLOB` containing textual data (text strings or small documents) or as `BLOB` containing media data (for media files such as images). It then converts the text or image input to a single embedding (`VECTOR`).

`UTL_TO_EMBEDDINGS` converts an array of chunks (`VECTOR_ARRAY_T`) to an array of embeddings (`VECTOR_ARRAY_T`).

A generated embedding output includes:

```
{
    "embed_id"    : NUMBER,
    "embed_data"  : "VARCHAR2(4000)",
    "embed_vector": "CLOB"
}
```

Where,

- `embed_id` displays the ID number of each embedding.
- `embed_data` displays the input text that is transformed into embeddings.
- `embed_vector` displays the generated vector representations.

MODALITY

For `BLOB` inputs, specify the type of content to vectorize. The only supported value is `image`.

PARAMS

Specify input parameters in JSON format, depending on the service provider that you want to use.

If using Oracle Database as the provider:

```
{
  "provider" : "database",
  "model"    : "<in-database ONNX embedding model filename>"
}
```

Table 212-7 Database Provider Parameter Details

Parameter	Description
`provider`	Specify `database` (default setting) to use Oracle Database as the provider. With this setting, you must load an ONNX format embedding model into the database.
`model`	User-specified name under which the imported ONNX embedding model is stored in Oracle Database. If you do not have an embedding model in ONNX format, then perform the steps listed in Convert Pretrained Models to ONNX Format.

If using a third-party provider:

Set the following parameters along with additional embedding parameters specific to your provider:

- For `UTL_TO_EMBEDDING`:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for embedding service>",
  "model"           : "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<additional REST provider parameter>": "<REST provider parameter
value>"
}
```

- For `UTL_TO_EMBEDDINGS`:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for embedding service>",
  "model"           : "<REST provider embedding model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "batch size"      : "<number of vectors to request at a time>",
  "<additional REST provider parameter>": "<REST provider parameter
value>"
}
```

Table 212-8 Third-Party Provider Parameter Details

Parameter	Description
`provider`	Third-party service provider that you want to access for this operation. A REST call is made to the specified provider to access its embedding model. For image input, specify `vertexai`. For text input, specify one of the following values: • `cohere` • `googleai` • `huggingface` • `ocigenai` • `openai` • `vertexai`
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the third-party embedding model in the form: *`schema.model_name`* If you do not specify a schema, then the schema of the procedure invoker is used. **Note**: • For accurate results, ensure that the chosen text embedding model matches the vocabulary file used for chunking. If you are not using a vocabulary file, then ensure that the input length is defined within the token limits of your model. • To get image embeddings, you can use any image embedding model or multimodal embedding model supported by Vertex AI. Multimodal embedding is a technique that vectorizes data from different modalities such as text and images. When using a multimodal embedding model to generate embeddings, ensure that you use the same model to vectorize both types of content (text and images). By doing so, the resulting embeddings are compatible and situated in the same vector space, which allows for effective comparison between the two modalities during similarity searches.
`transfer_timeout`	Maximum time to wait for the request to complete. The default value is `60` seconds. You can increase this value for busy web servers.
`batch size`	Maximum number of vectors to request at a time. For example, for a batch size of `50`, if `100` chunks are passed, then this API sends two requests with an array of `50` strings each. If `30` chunks are passed (which is lesser than the defined batch size), then the API sends those in a single request. For REST calls, it is more efficient to send a batch of inputs at a time rather than requesting a single input per call. Increasing the batch size can provide better performance, whereas reducing the batch size may reduce memory and data usage, especially if your provider has a rate limit. The default or maximum allowed value depends on the third-party provider settings.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"       : "cohere",
  "credential_name": "COHERE_CRED",
  "url"            : "https://api.cohere.example.com/embed",
  "model"          : "embed-model",
  "input_type"     : "search_query"
}
```

Google AI example:

```
{
  "provider"       : "googleai",
  "credential_name": "GOOGLEAI_CRED",
  "url"            : "https://googleapis.example.com/models/",
  "model"          : "embed-model"
}
```

Hugging Face example:

```
{
  "provider"       : "huggingface",
  "credential_name": "HF_CRED",
  "url"            : "https://api.huggingface.example.com/",
  "model"          : "embed-model"
}
```

Generative AI example:

```
{
  "provider"       : "ocigenai",
  "credential_name": "OCI_CRED",
  "url"            : "https://generativeai.oci.example.com/embedText",
  "model"          : "embed-model",
  "batch_size"     : 10
}
```

Ollama example:

```
{
  "provider"       : "ollama",
  "host"           : "local",
```

```
  "url"            : "http://localhost:11434/api/embeddings",
  "model"          : "llama3"
}
```

OpenAI example:

```
{
  "provider"       : "openai",
  "credential_name": "OPENAI_CRED",
  "url"            : "https://api.openai.example.com/embeddings",
  "model"          : "embed-model"
}
```

Vertex AI example:

```
{
  "provider"       : "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url"            : "https://googleapis.example.com/models/",
  "model"          : "embed-model"
}
```

Table 212-9 Additional REST Provider Parameter Details

Parameter	Description
`input_type`	Type of input to vectorize.

> **Note:**
>
> The generated embedding results may be different between requests for the same input and configuration, depending on your embedding model or floating point precision. However, this does not affect your queries (and provides semantically correct results) because the vector distance will be similar.

Examples

You can use `UTL_TO_EMBEDDING` in a `SELECT` clause and `UTL_TO_EMBEDDINGS` in a `FROM` clause, as follows:

- The following examples use `UTL_TO_EMBEDDING` to generate an embedding with `Hello world` as input, by accessing the Generative AI embedding model:

```
-- declare embedding parameters

var params clob;

begin
 :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
```

```
  "url": "https://generativeai.oci.example.com/embedText",
  "model": "embed.modelname",
  "batch_size": 10
}';
end;
/

-- get text embedding: PL/SQL example

declare
  input clob;
  v vector;
begin
  input := 'Hello world';

  v := dbms_vector_chain.utl_to_embedding(input, json(params));
  dbms_output.put_line(vector_serialize(v));
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/

-- get text embedding: select example

select dbms_vector_chain.utl_to_embedding('Hello world', json(:params))
from dual;
```

The following examples use `UTL_TO_EMBEDDING` to generate an embedding with `parrots.jpg` as input and modality as `image`, by accessing the Vertex AI's multimodal embedding model.

```
-- declare embedding parameters

var params clob;

begin
  :params := '
{
  "provider": "vertexai",
  "credential_name": "VERTEXAI_CRED",
  "url": "https://LOCATION-aiplatform.googleapis.com/v1/projects/PROJECT/
locations/LOCATION/publishers/google/models/",
  "model": "multimodalembedding:predict"
}';
end;
/

-- get image embedding: PL/SQL example

declare
  v vector;
  output clob;
begin
```

```
  v := dbms_vector_chain.utl_to_embedding(
    to_blob(bfilename('VEC_DUMP', 'parrots.jpg')), 'image', json(:params));
  output := vector_serialize(v);
  dbms_output.put_line('vector data=' || dbms_lob.substr(output, 100) ||
'...');
end;
/

-- get image embedding: select example

select dbms_vector_chain.utl_to_embedding(
  to_blob(bfilename('VEC_DUMP', 'parrots.jpg')), 'image', json(:params));
```

End-to-end examples:

To run end-to-end example scenarios using `UTL_TO_EMBEDDING`, see Generate Embedding.

- The following example uses `UTL_TO_EMBEDDINGS` to generate embeddings with a PDF document (stored in the `documentation_tab` table) as input, by calling an ONNX format model loaded into the database:

```
SELECT et.* from documentation_tab dt,dbms_vector_chain.utl_to_embeddings(
  dbms_vector_chain.utl_to_chunks(dbms_vector_chain.utl_to_text(dt.data)),
  json(:embed_params)) et;
```

End-to-end examples:

To run end-to-end example scenarios using `UTL_TO_EMBEDDINGS`, see Perform Chunking With Embedding.

212.1.12 UTL_TO_GENERATE_TEXT

Use the `DBMS_VECTOR_CHAIN.UTL_TO_GENERATE_TEXT` chainable utility function to generate a text response for a given prompt or an image, by accessing third-party text generation models.

Purpose

To communicate with Large Language Models (LLMs) through natural language conversations. You can generate a textual answer, description, or summary for prompts and images, given as input to LLM-powered chat interfaces.

- Prompt to Text:

  A prompt can be an input text string, such as a question that you ask an LLM. For example, "`What is Oracle Text?`". A prompt can also be a command, such as "`Summarize the following ...`", "`Draft an email asking for ...`", or "`Rewrite the following ...`", and can include results from a search. The LLM responds with a textual answer or description based on the specified task in the prompt.

  For this operation, this API makes a REST call to either a remote third-party provider (Cohere, Google AI, Hugging Face, Generative AI, OpenAI, or Vertex AI) or a local third-party provider (Ollama).

- Image to Text:

  You can also prompt with a media file, such as an image, to extract text from pictures or photos. You supply a text question as the prompt (such as "`What is this image about?`"

or "How many birds are there in this painting?") along with the image. The LLM responds with a textual analysis or description of the contents of the image.

For this operation, this API makes a REST call to either a remote third-party provider (Google AI, Hugging Face, OpenAI, or Vertex AI) or a local third-party provider (Ollama).

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

This function accepts the input as CLOB containing text data (for textual prompts) or as BLOB containing media data (for media files such as images). It then processes this information to generate a new CLOB containing the generated text.

- Prompt to Text:

```
DBMS_VECTOR_CHAIN.UTL_TO_GENERATE_TEXT (
        DATA          IN CLOB,
        PARAMS        IN JSON default NULL
) return CLOB;
```

- Image to Text:

```
DBMS_VECTOR_CHAIN.UTL_TO_GENERATE_TEXT(
          TEXT_DATA      IN CLOB,
          MEDIA_DATA     IN BLOB,
          MEDIA_TYPE     IN VARCHAR2 default 'image/jpeg',
          PARAMS         IN JSON default NULL
) return CLOB;
```

DATA and TEXT_DATA

Specify the textual prompt as CLOB for the DATA or TEXT_DATA clause.

> **Note:**
>
> Hugging Face uses an image captioning model that does not require a prompt, when giving an image as input. If you input a prompt along with an image, then the prompt will be ignored.

MEDIA_DATA

Specify the `BLOB` file, such as an image or a visual PDF file.

MEDIA_TYPE

Specify the image format for the given image or visual PDF file (`BLOB` file) in one of the supported image data MIME types. For example:

- For PNG: `image/png`
- For JPEG: `image/jpeg`
- For PDF: `application/pdf`

> **Note:**
>
> For a complete list of the supported image formats, refer to your third-party provider's documentation.

PARAMS

Specify the following input parameters in JSON format, depending on the service provider that you want to access for text generation:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for text generation service>",
  "model"           : "<text generation model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<additional REST provider parameter>": "<REST provider parameter value>"
}
```

Table 212-10 UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
`provider`	Supported REST provider that you want to access to generate text. Specify one of the following values: For `CLOB` input: • `cohere` • `googleai` • `huggingface` • `ocigenai` • `openai` • `vertexai` For `BLOB` input: • `googleai` • `huggingface` • `openai` • `vertexai`

Table 212-10 (Cont.) UTL_TO_GENERATE_TEXT Parameter Details

Parameter	Description
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the third-party text generation model in the form: *`schema.model_name`* If the model name is not schema-qualified, then the schema of the procedure invoker is used.
`transfer_timeout`	Maximum time to wait for the request to complete. The default value is `60` seconds. You can increase this value for busy web servers.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"       : "cohere",
  "credential_name": "COHERE_CRED",
  "url"            : "https://api.cohere.example.com/chat",
  "model"          : "generate-text-model"
}
```

Google AI example:

```
{
  "provider"        : "googleai",
  "credential_name" : "GOOGLEAI_CRED",
  "url"             : "https://googleapis.example.com/models/",
  "model"           : "generate-text-model"
}
```

Hugging Face example:

```
{
  "provider"        : "huggingface",
  "credential_name" : "HF_CRED",
  "url"             : "https://api.huggingface.example.com/models/",
  "model"           : "generate-text-model"
}
```

Generative AI example:

```
{
  "provider"        : "ocigenai",
  "credential_name" : "GENAI_CRED",
  "url"             : "https://generativeai.oci.example.com/generateText",
  "model"           : "generate-text-model",
  "inferenceRequest": {
    "maxTokens"     : 300,
    "temperature"   : 1
  }
}
```

or more current chat models may implement:

```
{
  "provider"        : "ocigenai",
  "credential_name" : "OCI_CRED",
  "url"             : "https://inference.generativeai.oci.example.com/actions/
chat",
  "model"           : "generate-text-model",
  "chatRequest"     : {
    "maxTokens"     : 256
  }
}
```

Ollama example:

```
{
  "provider"       : "ollama",
  "host"           : "local",
  "url"            : "http://localhost:11434/api/generate",
  "model"          : "llama3"
}
```

OpenAI example:

```
{
  "provider"        : "openai",
  "credential_name" : "OPENAI_CRED",
  "url"             : "https://api.openai.example.com",
  "model"           : "generate-text-model",
  "max_tokens"      : 60,
```

```
  "temperature"     : 1.0
}
```

Vertex AI example:

```
{
  "provider"         : "vertexai",
  "credential_name"  : "VERTEXAI_CRED",
  "url"              : "https://googleapis.example.com/models/",
  "model"            : "generate-text-model",
  "generation_config": {
    "temperature"    : 0.9,
    "topP"           : 1,
    "candidateCount" : 1,
    "maxOutputTokens": 256
  }
}
```

Table 212-11 Additional REST Provider Parameter Details

Parameter	Description
`max_tokens`	Maximum number of tokens in the output text.
`temperature`	Degree of randomness used when generating the output text, in the range of `0.0-5.0`. To generate the same output for a prompt, use `0`. To generate a random new text for that prompt, increase the temperature. **Note**: Start with the temperature set to `0`. If you do not require random results, a recommended temperature value is between `0` and `1`. A higher value is not recommended because a high temperature may produce creative text, which might also include hallucinations.
`topP`	Probability of tokens in the output, in the range of `0.0-1.0`. A lower value provides less random responses and a higher value provides more random responses.
`candidateCount`	Number of response variations to return, in the range of `1-4`.
`maxOutputTokens`	Maximum number of tokens to generate for each response.

Examples

- Prompt to Text:

  The following statements generate text by making a REST call to Generative AI. Here, the prompt is "`What is Oracle Text?`".

```
-- select example

var params clob;
exec :params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
```

```
}';

select dbms_vector_chain.utl_to_generate_text(
 'What is Oracle Text?',
 json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'What is Oracle Text?';

  params := '
{
  "provider": "ocigenai",
  "credential_name": "OCI_CRED",
  "url": "https://generativeai.oci.example.com/generateText",
  "model": "generate.modelname"
}';

  output := dbms_vector_chain.utl_to_generate_text(input, json(params));
  dbms_output.put_line(output);
  if output is not null then
    dbms_lob.freetemporary(output);
  end if;
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

End-to-end examples:

To run end-to-end example scenarios, see Generate Text Response.

- Image to Text:

  The following statements generate text by making a REST call to OpenAI. Here, the input is an image (`sample_image.jpeg`) along with the prompt "`Describe this image?`".

```
-- select example

var input clob;
var media_data blob;
var media_type clob;
var params clob;

begin
  :input := 'Describe this image';
  :media_data := load_blob_from_file('DEMO_DIR', 'sample_image.jpeg');
  :media_type := 'image/jpeg';
  :params := '
{
```

```
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/chat/completions",
  "model": "generate.modelname",
  "max_tokens": 256
}';
end;
/

select
dbms_vector_chain.utl_to_generate_text(:input, :media_data, :media_type,
json(:params));

-- PL/SQL example

declare
  input clob;
  media_data blob;
  media_type varchar2(32);
  params clob;
  output clob;

begin
  input := 'Describe this image';
  media_data := load_blob_from_file('DEMO_DIR', 'image_file');
  media_type := 'image/jpeg';
  params := '
{
  "provider": "openai",
  "credential_name": "OPENAI_CRED",
  "url": "https://api.openai.example.com/chat/completions",
  "model": "generate.modelname",
  "max_tokens": 256
}';

  output := dbms_vector_chain.utl_to_generate_text(
    input, media_data, media_type, json(params));
  dbms_output.put_line(output);

  if output is not null then
    dbms_lob.freetemporary(output);
  end if;
  if media_data is not null then
    dbms_lob.freetemporary(media_data);
  end if;
exception
  when OTHERS THEN
    DBMS_OUTPUT.PUT_LINE (SQLERRM);
    DBMS_OUTPUT.PUT_LINE (SQLCODE);
end;
/
```

End-to-end examples:

To run end-to-end example scenarios, see Describe Image Content.

212.1.13 UTL_TO_TEXT

Use the `DBMS_VECTOR_CHAIN.UTL_TO_TEXT` chainable utility function to convert an input document (for example, PDF, DOC, JSON, XML, or HTML) to plain text.

Purpose

To perform a file-to-text transformation by using the Oracle Text component (`CONTEXT`) of Oracle Database.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_TEXT (
    DATA           IN CLOB | BLOB,
    PARAMS         IN JSON default NULL
) return CLOB;
```

DATA

This function accepts the input data type as `CLOB` or `BLOB`. It can read documents from a remote location or from files stored locally in the database tables.

It returns a plain text version of the document as `CLOB`.

Oracle Text supports around 150 file types. For a complete list of all the supported document formats, see *Oracle Text Reference*.

PARAMS

Specify the following input parameter in JSON format:

```
{
    "plaintext" : "true or false",
    "charset"   : "UTF8"
}
```

Table 212-12 Parameter Details

Parameter	Description
`plaintext`	Plain text output. The default value for this parameter is `true`, that is, by default the output format is plain text. If you do not want to return the document as plain text, then set this parameter to `false`.
`charset`	Character set encoding. Currently, only `UTF8` is supported.

Example

```
select DBMS_VECTOR_CHAIN.UTL_TO_TEXT (
    t.blobdata,
     json('{
            "plaintext": "true",
```

```
            "charset"  : "UTF8"
           }')
) from tab t;
```

End-to-end example:

To run an end-to-end example scenario using this function, see Convert File to Text to Chunks to Embeddings Within Oracle Database.

212.1.14 UTL_TO_SUMMARY

Use the `DBMS_VECTOR_CHAIN.UTL_TO_SUMMARY` chainable utility function to generate a summary for textual documents.

Purpose

To perform a text-to-summary transformation by accessing:

- Oracle Database as the service provider: Uses the in-house implementation with Oracle Database, leveraging a document gist (or summary) generated by Oracle Text (default setting)
- Third-party summarization model: Makes a REST API call to either a remote service provider (Cohere, Google AI, Hugging Face, Generative AI, OpenAI, or Vertex AI) or a local service provider (Ollama)

A summary is a short and concise extract with key features of a document that best represents what the document is about as a whole. A summary can be free-form paragraphs or bullet points based on the format that you specify.

> **WARNING:**
>
> Certain features of the database may allow you to access services offered separately by third-parties, for example, through the use of JSON specifications that facilitate your access to REST APIs.
>
> Your use of these features is solely at your own risk, and you are solely responsible for complying with any terms and conditions related to use of any such third-party services. Notwithstanding any other terms and conditions related to the third-party services, your use of such database features constitutes your acceptance of that risk and express exclusion of Oracle's responsibility or liability for any damages resulting from such access.

Syntax

```
DBMS_VECTOR_CHAIN.UTL_TO_SUMMARY (
    DATA          IN CLOB,
    PARAMS        IN JSON default NULL
) return CLOB;
```

DATA

This function accepts the input data type in plain text as `CLOB`.

It returns a summary of the input document also as `CLOB`.

PARAMS

Specify summary parameters in JSON format, depending on the service provider that you want to use for document summarization.

If using Oracle Database as the provider:

```
{
  "provider"     : "database",
  "glevel"       : "<summary format>",
  "numParagraphs": <number in the range 1-16>,
  "maxPercent"   : <number in the range 1-100>,
  "num_themes"   : <number in the range 1-50>,
  "language"     : "<name of the language>"
}
```

Table 212-13 Database Provider Parameter Details

Parameter	Description
`provider`	Specify `database` (default setting) to access Oracle Database as the provider. Oracle Text is internally used to extract a document `gist` or summary from user data.
`glevel`	Format to display the summary: • `SENTENCE` | `S`: As a list of sentences • `PARAGRAPH` | `P`: In a free-form paragraph
`numParagraphs`	Maximum number of document paragraphs (or sentences) selected for the summary. The default value is `16`. The `numParagraphs` parameter is used only when this parameter yields a smaller summary size than the summary size yielded by the `maxPercent` parameter, because the function always returns the smallest size summary.
`maxPercent`	Maximum number of document paragraphs (or sentences) selected for the summary, as a percentage of the total paragraphs (or sentences) in the document. The default value is `10`. The `maxPercent` parameter is used only when this parameter yields a smaller summary size than the summary size yielded by the `numParagraphs` parameter, because the function always returns the smallest size summary.
`num_themes`	Number of theme summaries to produce. For example, if you specify `10`, then this function returns the top 10 theme summaries. If you specify `0` or `NULL`, then this function returns all themes in a document. The default value is `50`. If the document contains more than 50 themes, only the top 50 themes show conceptual hierarchy.
`language`	Language name of your summary text, as listed in Supported Languages and Data File Locations.

If using a third-party provider:

Set the following parameters along with additional summarization parameters specific to your provider:

```
{
  "provider"        : "<AI service provider>",
  "credential_name" : "<credential name>",
  "url"             : "<REST endpoint URL for summarization service>",
```

```
  "model"           : "<REST provider summarization model name>",
  "transfer_timeout": <maximum wait time for the request to complete>,
  "<additional REST provider parameter>": "<REST provider parameter value>"
}
```

Table 212-14 Third-Party Provider Parameter Details

Parameter	Description
`provider`	Third-party service provider that you want to access to get the summary. A REST call is made to the specified provider to access its text summarization model. Specify one of the following values: • `cohere` • `googleai` • `huggingface` • `ocigenai` • `openai` • `vertexai`
`credential_name`	Name of the credential in the form: *`schema.credential_name`* A credential name holds authentication credentials to enable access to your provider for making REST API calls. You need to first set up your credential by calling the `DBMS_VECTOR_CHAIN.CREATE_CREDENTIAL` helper function to create and store a credential, and then refer to the credential name here. See CREATE_CREDENTIAL.
`url`	URL of the API endpoint for each REST call. **Note**: For a list of all supported REST endpoints, see Supported Third-Party Provider Operations and Endpoints.
`model`	Name of the third-party text summarization model in the form: *`schema.model_name`* If the model name is not schema-qualified, then the schema of the procedure invoker is used. **Note**: For Generative AI, you must specify *`schema.model_name`*.
`transfer_timeout`	Maximum time to wait for the request to complete. The default value is `60` seconds. You can increase this value for busy web servers.

Additional REST provider parameters:

Optionally, specify additional provider-specific parameters.

> **Important:**
>
> The following examples are for illustration purposes. For accurate and up-to-date information on additional parameters to use, refer to your third-party provider's documentation.

Cohere example:

```
{
  "provider"        : "cohere",
```

```
  "credential_name" : "COHERE_CRED",
  "url"             : "https://api.cohere.example.com/summarize",
  "model"           : "summarize-model",
  "length"          : "medium",
  "format"          : "paragraph",
  "temperature"     : 1.0
}
```

Google AI example:

```
{
  "provider"         : "googleai",
  "credential_name"  : "GOOGLEAI_CRED",
  "url"              : "https://googleapis.example.com/models/",
  "model"            : "summarize-model",
  "generation_config": {
    "temperature"    : 0.9,
    "topP"           : 1,
    "candidateCount" : 1,
    "maxOutputTokens": 256
  }
}
```

Hugging Face example:

```
{
  "provider"          : "huggingface",
  "credential_name"   : "HF_CRED",
  "url"               : "https://api.huggingface.example.co/models/",
  "model"             : "summarize-model"
}
```

Generative AI example:

```
{
 "provider"           : "ocigenai",
 "credential_name"    : "OCI_CRED",
 "url"                : "https://generativeai.oci.example.com/summarizeText",
 "model"              : "summarize-model",
 "length"             : "MEDIUM",
 "format"             : "PARAGRAPH"
}
```

Ollama example:

```
{
  "provider"       : "ollama",
  "host"           : "local",
  "url"            : "http://localhost:11434/api/generate",
  "model"          : "llama3"
}
```

OpenAI example:

```
{
  "provider"          : "openai",
  "credential_name"   : "OPENAI_CRED",
  "url"               : "https://api.openai.example.com",
  "model"             : "summarize-model",
  "max_tokens"        : 256,
  "temperature"       : 1.0
}
```

Vertex AI example:

```
{
  "provider"          : "vertexai",
  "credential_name"   : "VERTEXAI_CRED",
  "url"               : "https://googleapis.example.com/models/",
  "model"             : "summarize-model",
  "generation_config" : {
    "temperature"     : 0.9,
    "topP"            : 1,
    "candidateCount"  : 1,
    "maxOutputTokens" : 256
  }
}
```

Table 212-15 Additional REST Provider Parameter Details

Parameter	Description
`length`	Approximate length of the summary text: • `SHORT`: Roughly up to 2 sentences • `MEDIUM`: Between 3 and 5 sentences • `LONG`: 6 or more sentences • `AUTO`: The model chooses a length based on the input size **Note**: For Generative AI, you must enter this value in uppercase.
`format`	Format to display the summary: • `PARAGRAPH`: In a free-form paragraph • `BULLETS`: In bullet points **Note**: For Generative AI, you must enter this value in uppercase.
`temperature`	Degree of randomness used when generating output text, in the range of `0.0-5.0`. To generate the same output for a prompt, use `0`. To generate a random new text for that prompt, increase the temperature. Default temperature is `1` and the maximum temperature is `5`. **Note**: To summarize a text, start with the temperature set to `0`. If you do not require random results, a recommended temperature value is `0.2` for Generative AI and between `0` and `1` for Cohere. Use a higher value if for example you plan to perform a selection of the various summaries afterward. Do not use a high temperature for summarization because a high temperature encourages the model to produce creative text, which might also include hallucinations.

Table 212-15 (Cont.) Additional REST Provider Parameter Details

Parameter	Description
`extractiveness`	How much to reuse the input in the summary: • `LOW`: Summaries with low extractiveness tend to paraphrase. • `HIGH`: Summaries with high extractiveness lean toward reusing sentences verbatim. **Note**: For Generative AI, you must enter this value in uppercase.
`max_tokens`	Maximum number of tokens in the output text.
`topP`	Probability of tokens in the output, in the range of `0.0-1.0`. A lower value provides less random responses and a higher value provides more random responses.
`candidateCount`	Number of response variations to return, in the range of `1-4`.
`maxOutputTokens`	Maximum number of tokens to generate for each response.

> **Note:**
>
> When specifying the `length`, `format`, and `extractiveness` parameters for Generative AI, ensure to enter the values in uppercase letters.

Examples

These statements generate a summary from an extract on "Transactions", by accessing the Generative AI summarization model.

```
-- select example

var params clob;
exec :params := '
{
 "provider": "ocigenai",
 "credential_name": "OCI_CRED",
 "url": "https://generativeai.oci.example.com/summarizeText",
 "model": "summarize.modelname",
 "temperature": "0.0",
 "extractiveness": "LOW"
}';

select dbms_vector_chain.utl_to_summary(
 'A transaction is a logical, atomic unit of work that contains one or more
SQL statements.  An RDBMS must be able to group SQL statements so that they
are either all committed, which means they are applied to the database, or
all rolled back, which means they are undone.  An illustration of the need
for transactions is a funds transfer from a savings account to a checking
account. The transfer consists of the following separate operations:
    1. Decrease the savings account.
    2. Increase the checking account.
    3. Record the transaction in the transaction journal.
    Oracle Database guarantees that all three operations succeed or fail as a
unit. For example, if a hardware failure prevents a statement in the
```

```
transaction from executing, then the other statements must be rolled back.
    Transactions set Oracle Database apart from a file system. If you perform
an atomic operation that updates several files, and if the system fails
halfway through, then the files will not be consistent. In contrast, a
transaction moves an Oracle database from one consistent state to another.
The basic principle of a transaction is "all or nothing": an atomic operation
succeeds or fails as a whole.',
 json(:params)) from dual;

-- PL/SQL example

declare
  input clob;
  params clob;
  output clob;
begin
  input := 'A transaction is a logical, atomic unit of work that contains one

Related Topics

- CREATE_LANG_DATA
  Use the `DBMS_VECTOR_CHAIN.CREATE_LANG_DATA` chunker helper procedure to load your own language data file into the database.

213
DBMS_WARNING

The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_WARNING Subprograms

213.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is SYSTEM, then the user must have ALTER SYSTEM privilege.

213.2 Summary of DBMS_WARNING Subprograms

This table lists the DBMS_WARNING subprograms and briefly describes them.

Table 213-1 ***DBMS_WARNING Package Subprograms***

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure	Modifies the current session or system warning settings of the warning_category previously supplied
ADD_WARNING_SETTING_NUM Procedure	Modifies the current session or system warning settings of the or warning_number previously supplied
GET_CATEGORY Function	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure	Replaces previous settings with the new value

213.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE`/`DISABLE`/`ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 213-2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
`warning_category`	Name of the category. Allowed values are `ALL`, `INFORMATIONAL`, `SEVERE` and `PERFORMANCE`.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

213.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE`/ `ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 213-3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
`warning_number`	The warning number. Allowed values are all valid warning numbers.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.

Table 213-3 (Cont.) ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

Example 213-1 Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

```
BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                        'ENABLE',
                                        'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                        'ENABLE',
                                        'SESSION');
END;
```

213.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
   warning_number  IN   pls_integer)
RETURN VARCHAR2;
```

Parameters

Table 213-4 GET_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

213.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2)
RETURN warning_value;
```

Parameters

Table 213-5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

213.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER)
RETURN warning_value;
```

Parameters

Table 213-6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

213.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
 RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have SELECT or READ privilege on v$parameter or v$paramater2 fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using SET_WARNING_SETTING_STRING.

213.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` or `ALTER SYSTEM` command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
   warning_value   IN   VARCHAR2,
   scope           IN   VARCHAR2);
```

Parameters

Table 213-7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
`warning_value`	The new string that will constitute the new value.
`scope`	This will specify if the changes are being done in the session context, or system context. Allowed values are `SESSION` or `SYSTEM`.

214
DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

215
DBMS_WORKLOAD_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAY package.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_WORKLOAD_CAPTURE Subprograms

> **See Also:**
>
> *Oracle Database Testing Guide* for more information about database replay

215.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

215.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser`/`somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

215.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the `DBMS_WORKLOAD_CAPTURE` package subprograms in alphabetical order.

Table 215-1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures	Adds a specified filter
DECRYPT_CAPTURE Procedure	This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as `AES128`, `AES192`, or `AES256`.
DELETE_CAPTURE_INFO Procedure	Deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID
DELETE_FILTER Procedure	Deletes a specified filter
ENCRYPT_CAPTURE Procedure	This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as `AES128`, `AES192`, or `AES256`.
EXPORT_AWR Procedure	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`
IMPORT_AWR Function	Imports the AWR snapshots associated with a given capture ID
REPORT Function	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

215.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   NUMBER NOT NULL);
```

Parameters

Table 215-2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: • INSTANCE_NUMBER - type NUMBER • USER - type STRING • MODULE - type STRING • ACTION - type STRING • PROGRAM - type STRING • SERVICE - type STRING • PDB_NAME - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.
- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an INCLUSION mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from SCOTT, you can add the following filter before starting a capture.

  ```
  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
  ```

- Multiple filters are evaluated according to the logical disjunction operator OR. Therefore, if you want to record workload for both SCOTT and JOHN, you add an additional filter:

  ```
  EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
  ```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME',
'CDB1_PDB1');
```

- To use DBMS_APPLICATION_INFO to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION',
'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
```

215.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (
   src_dir               IN   VARCHAR2,
   dst_dir               IN   VARCHAR2);
```

Parameters

Table 215-3 DECRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be decrypted. This parameter is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory This parameter is case sensitive.

Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

215.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
   capture_id     IN   NUMBER);
```

Parameters

Table 215-4 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

215.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
   filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

Table 215-5 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	Filter to be deleted

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.

215.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in START_CAPTURE procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
   src_dir     IN VARCHAR2,
   dst_dir     IN VARCHAR2,
   encryption  IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

Table 215-6 ENCRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive.
encryption	Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256.

Usage Notes

For encrypted capture, the ENCRYPT_CAPTURE Procedure relies on a software keystore. The identifier is oracle.rat.database_replay.encryption (case-sensitive).

215.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id     IN NUMBER);
```

Parameters

Table 215-7 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

215.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
   timeout     IN   NUMBER  DEFAULT 30
   reason       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 215-8 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send it's acknowledgement to FINISH_CAPTURE.

  To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.

215.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir      IN    VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 215-9 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function simply returns that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row is inserted to DBA_WORKLOAD_CAPTURES and that row's ID is returned.

215.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id       IN   NUMBER,
   staging_schema   IN   VARCHAR2,
   force_cleanup    IN   BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 215-10 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema.The SYS schema is not a valid input. (Mandatory, Case sensitive).

Table 215-10 (Cont.) IMPORT_AWR Function Parameters

Parameter	Description

force_cleanup	Values:
	• TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:
	`SELECT table_name FROM dba_tables`
	`WHERE owner = staging_schema`
	`AND table_name like 'WR_$%';`
	Use this option only if you are sure that there are no important data in any such tables in the staging_schema.
	• FALSE - (default) no tables dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

- EXPORT_AWR Procedure
  This procedure exports the AWR snapshots associated with a given capture ID.

215.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
   capture_id      IN   NUMBER,
   format          IN   VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 215-11 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB.

Table 215-12 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Used as input to the format argument to generate the text version of the report

215.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
   name              IN  VARCHAR2,
   dir               IN  VARCHAR2,
   duration          IN  NUMBER   DEFAULT NULL,
   default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
   auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE,
   capture_sts       IN  BOOLEAN  DEFAULT FALSE,
   sts_cap_interval  IN  NUMBER   DEFAULT 300,
   plsql_mode        IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
   encryption        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 215-13 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. • If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) • If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. • If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) • If FALSE, no database instance is automatically unrestricted.
capture_sts	If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Table 215-13 (Cont.) START_CAPTURE Procedure Parameters

Parameter	Description
plsql_mode	Specifies the PL/SQL capture mode: • TOP_LEVEL — only top-level PL/SQL calls are captured • EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured
encryption	Specify if sensitive data in workload capture is encrypted or not. The possible values are: • NULL — capture files are not encrypted • AES128 — capture files are encrypted using AES128 • AES192 — capture files are encrypted using AES192 • AES256 — capture files is encrypted using AES256 The default value is NULL.

Usage Notes

- All user requests sent to database after a successful invocation of START_CAPTURE are recorded in the given dir directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the FINISH_CAPTURE Procedure is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until FINISH_CAPTURE is executed, whichever occurs first.
- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as SMON, PMON, MMON) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in RESTRICTED mode using STARTUP RESTRICT are UNRESTRICTED upon a successful invocation of START_CAPTURE Use FALSE for the auto_unrestrict input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when START_CAPTURE is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after START_CAPTURE are replayed.
- For encrypted capture, the START_CAPTURE Procedure relies on a software keystore. The identifier is oracle.rat.database_replay.encryption (case-sensitive).
- You must configure a software keystore in auto-login mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

216
DBMS_WORKLOAD_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides a interface to replay a workload capture.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms

> **See Also:**
>
> *Oracle Database Testing Guide* for more information about database replay

216.1 DBMS_WORKLOAD_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics

- DBMS_WORKLOAD_CAPTURE
  The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

216.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

216.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

Table 216-1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_CAPTURE Function	Adds the given capture to the current schedule
ADD_FILTER Procedure	Adds a filter to replay only a subset of the captured workload
ADD_SCHEDULE_ORDERING Function	Adds a schedule order between two captures
ASSIGN_GROUP_TO_INSTANCE Procedure	Modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`
BEGIN_REPLAY_SCHEDULE Procedure	Initiates the creation of a reusable replay schedule
CALIBRATE Function	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure	Cancels the workload replay in progress
COMPARE_PERIOD_REPORT Procedure	Generates a report comparing a replay to its capture or to another replay of the same capture
COMPARE_SQLSET_REPORT Function	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
CREATE_FILTER_SET Procedure	Uses the replay filters added to create a set of filters to use against the replay in `replay_dir`
DELETE_FILTER Procedure	Deletes the named filter
DELETE_REPLAY_INFO Procedure	Deletes the rows in `DBA_WORKLOAD_REPLAYS` that corresponds to the given workload replay ID
END_REPLAY_SCHEDULE Procedure	Wraps up the creation of the current schedule
EXPORT_AWR Procedure	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GENERATE_CAPTURE_SUBSET Procedure	Creates a new capture from an existing workload capture

Table 216-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
GET_DIVERGING_STATEMENT Function	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GET_REPLAY_DIRECTORY Function	Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure.
GET_REPLAY_INFO Function	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
GET_REPLAY_TIMEOUT Procedure	Retrieves the replay timeout setting
IMPORT_AWR Function	Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
INITIALIZE_CONSOLIDATED_REPLAY Procedure	Puts the database state in `INIT` for a multiple-capture replay
INITIALIZE_REPLAY Procedure	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function	Reports whether the replay is currently paused
LOAD_LONG_SQLTEXT Procedure	Loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view
PAUSE_REPLAY Procedure	Pauses the in-progress workload replay
POPULATE_DIVERGENCE Procedure	Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_CONSOLIDATED_REPLAY Procedure	Puts the database in a special "Prepare" mode for a multiple-capture replay
PREPARE_REPLAY Procedure	Puts the database in a special "Prepare" mode
PROCESS_CAPTURE Procedure	Processes the workload capture found in `capture_dir` in place
REMAP_CONNECTION Procedure	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
REMOVE_CAPTURE Procedure	Removes the given capture from the current schedule
REMOVE_SCHEDULE_ORDERING Procedure	Removes an existing schedule order from the current replay schedule
REPORT Function	Generates a report on the given workload replay
RESUME_REPLAY Procedure	Resumes a paused workload replay
REUSE_REPLAY_FILTER_SET Procedure	Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function
SET_ADVANCED_PARAMETER Procedure	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
SET_REPLAY_DIRECTORY Procedure	Sets a directory that contains multiple workload captures as the current replay directory
SET_REPLAY_TIMEOUT Procedure	Sets the replay timeout setting
SET_SQL_MAPPING Procedure	Specifies SQL statements to be skipped or replaced during a database replay operation

Table 216-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
SET_USER_MAPPING Procedure	Sets a new schema or user name to be used during replay instead of the captured user
START_CONSOLIDATED_REPLAY Procedure	Starts the replay of a multiple-capture capture
START_REPLAY Procedure	Starts the workload replay
USE_FILTER_SET Procedure	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

216.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;

DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
   capture_dir_name      IN    VARCHAR2,
   start_delay_seconds   IN    NUMBER  DEFAULT 0,
   stop_replay           IN    BOOLEAN FALSE,
   take_begin_snapshot   IN    BOOLEAN TRUE,
   take_end_snapshot     IN    BOOLEAN TRUE,
   query_only            IN    VARCHAR2 DEFAULT 'N')
 RETURN NUMBER;
```

Parameters

Table 216-2 ADD_CAPTURE Function Parameters

Parameter	Description
capture_dir_name	Name of the OS directory containing the capture under the replay top-level directory
start_delay_seconds	Delay time in seconds before the replay of this capture starts
stop_replay	Stop the replay after it finishes
take_begin_snapshot	Take an AWR snapshot when the replay of this capture starts
take_end_snapshot	Take an AWR snapshot when the replay of this capture finishes
query_only	Replay only the read-only queries of this workload capture

Usage Notes

The SET_REPLAY_DIRECTORY Procedure must have already been called.

216.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname           IN VARCHAR2,
   fattribute      IN VARCHAR2,
   fvalue          IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname           IN VARCHAR2,
   fattribute      IN VARCHAR2,
   fvalue          IN NUMBER);
```

Parameters

Table 216-3 ADD_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING : • USER • MODULE • ACTION • PROGRAM • SERVICE • CONNECTION_STRING
fvalue	(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture.

216.3.3 ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, schedule_capture_id and waitfor_capture_id form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function. The order is that replay of capture indicated by schedule_capture_id will not start unless the replay of capture indicated by waiting_for_capture_id finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
   schedule_capture_id     IN VARCHAR2,
   waitfor_capture_id      IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 216-4 ADD_SCHEDULE_ORDERING Function Parameters

Parameter	Description
schedule_capture_id	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by waitfor_capture_id runs to completion.
waitfor_capture_id	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by schedule_capture_id will not start until the replay of this capture runs to completion.

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

216.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view DBA_WORKLOAD_GROUP_ASSIGNMENTS.

Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
   group_id          IN INTEGER,
   instance_number   IN INTEGER);
```

Parameters

Table 216-5 ASSIGN_GROUP_TO_INSTANCE Procedure Parameters

Parameter	Description
group_id	The identifier of the specified group of capture files
instance_number	The number used for instance registration. It is equivalent to the INSTANCE_NUMBER column in V$INSTANCE.

> **See Also:**
>
> - `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in *Oracle Database Reference*
> - `V$INSTANCE` in *Oracle Database Reference*

216.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE  (
   replay_dir_obj      IN     VARCHAR2,
   schedule_name       IN     VARCHAR2);
```

Parameters

Table 216-6 BEGIN_REPLAY_SCHEDULE Procedure Parameters

Parameter	Description
`replay_dir_obj`	Directory object that points to the replay directory that contains all the capture directories involved in the schedule
`schedule_name`	Name of the schedule to be replayed

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The SET_REPLAY_DIRECTORY Procedure has already been called.

216.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML `CLOB`.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
  RETURN CLOB;
```

Parameters

Table 216-7 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of processes allowed for each CPU (default is 4)
threads_per_process	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

216.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
   error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-8 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

216.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
   replay_id1   IN   NUMBER,
   replay_id2   IN   NUMBER,
   format       IN   VARCHAR2,
   result       OUT  CLOB );
```

Parameters

Table 216-9 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

216.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
   replay_id1    IN NUMBER,
   replay_id2    IN NUMBER,
   format        IN VARCHAR2,
   r_level       IN VARCHAR2 DEFAULT 'ALL',
   r_sections    IN VARCHAR2 DEFAULT 'ALL',
   result        OUT CLOB )
  RETURN VARCHAR2;
```

Parameters

Table 216-10 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.

Table 216-10 (Cont.) COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
r_sections	See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
result	Output of the report (CLOB)

216.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at replay_dir.

It includes all the replay filters that have already been added by the ADD_FILTER Procedure. After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in replay_dir by calling the USE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
   replay_dir       IN  VARCHAR2,
   filter_set       IN  VARCHAR2,
   default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 216-11 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Object directory of the replay to be filtered
filter_set	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as INCLUSION filters or EXCLUSION filters.) If it is INCLUDE, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as EXCLUSION filters, and will determine the workload that will not be replayed. If it is EXCLUDE, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using he ADD_SCHEDULE_ORDERING Function are treated as INCLUSION filters, and will determine the workload that is replayed. Default: INCLUDE and all the filters specified are assumed to be EXCLUSION filters

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

216.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
   fname    IN  VARCHAR2);
```

Parameters

Table 216-12 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.

216.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
   replay_id    IN  NUMBER);
```

Parameters

Table 216-13 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to DBA_WORKLOAD_REPLAYS.ID

216.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The BEGIN_REPLAY_SCHEDULE Procedure must have already been called.

216.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id    IN  NUMBER);
```

Parameters

Table 216-14 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

216.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
   input_capture_dir          IN   VARCHAR2,
   output_capture_dir         IN   VARCHAR2,
   new_capture_name           IN   VARCHAR2,
   begin_time                 IN   NUMBER,
   begin_include_incomplete   IN   BOOLEAN DEFAULT TRUE,
   end_time                   IN   NUMBER,
   end_include_incomplete     IN   BOOLEAN DEFAULT FALSE,
   parallel_level             IN   NUMBER DEFAULT NULL);
```

Parameters

Table 216-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture
new_capture_name	(Mandatory) Name of new capture
begin_time	Start of the time range - time offset in seconds from the start of a workload capture
begin_include_incomplete	Column to include incomplete calls caused by begin_time
end_time	End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.
end_include_incomplete	Column to include incomplete calls caused by end_time
parallel_level	Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

216.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
   replay_id    IN NUMBER,
   stream_id    IN NUMBER,
   call_counter IN NUMBER)
  RETURN CLOB;
```

Parameters

Table 216-16 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
replay_id	ID of the replay in which that call diverged
stream_id	Stream ID of the diverging call
call_counter	Call counter of the diverging call

Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID

  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

216.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns `NULL` if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
   RETURN VARCHAR2;
```

Related Topics

- SET_REPLAY_DIRECTORY Procedure
  This procedure sets a directory that contains multiple workload captures as the current replay directory.

216.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
   replay_dir    IN VARCHAR2,
   load_details  IN BOOLEAN DFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 216-17 GET_REPLAY_INFO Function Parameters

Parameter	Description
`replay_dir`	(Mandatory) Name of the workload replay directory object (case sensitive).
`load_details`	Load the divergence and tracked commits data. The default value is `FALSE`.

Return Values

The procedure returns the `CAPTURE_ID`, which can be associated with both `DBA_WORKLOAD_CAPTURES.ID` and `DBA_WORKLOAD_REPLAYS.CAPTURE_ID` to access the imported information.

Usage Notes

- The procedure first imports a row into `DBA_WORKLOAD_CAPTURES` which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into `DBA_WORKLOAD_REPLAYS`.
- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.

216.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN,
   min_delay     OUT  NUMBER,
   max_delay     OUT  NUMBER,
   delay_factor  OUT  NUMBER);
```

Parameters

Table 216-18 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
`enabled`	`TRUE` if the timeout action is enabled, `FALSE` otherwise.
`min_delay`	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than `min_delay`.
`max_delay`	Upper bound of call delay in minutes. The timeout action throws `ORA-15569` when the delay is more than `max_delay`.
`delay_factor`	Factor for the call delay that is between `min_delay` and `max_delay`. The timeout action throws `ORA-15569` when the current replay elapsed time is more than the product of capture elapsed time and `delay_factor`.

Usage Notes

This procedure can be called anytime during replay.

216.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
   replay_id       IN   NUMBER,
   staging_schema  IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 216-19 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots must be imported
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

216.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the SET_REPLAY_DIRECTORY Procedure, pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
   replay_name        IN    VARCHAR2,
   schedule_name      IN    VARCHAR2,
   plsql_mode         IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 216-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
schedule_name	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir.

Table 216-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
plsql_mode	Specifies the replay options for PL/SQL calls: • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Usage Notes

Prerequisites:

- Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The SET_REPLAY_DIRECTORY Procedure has been called.

216.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
   replay_name     IN  VARCHAR2,
   replay_dir      IN  VARCHAR2,
   plsql_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
   rac_inst_list   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-21 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data
plsql_mode	Specifies the replay options for PL/SQL calls: • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Table 216-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
rac_inst_list	Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: `rac_inst_list='1,3,5'`

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

  For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, the user could invoke the following:

  ```
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.
- For encrypted capture, the `INITIALIZE_REPLAY` Procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

Related Topics

- PAUSE_REPLAY Procedure
  This procedure pauses the in-progress workload replay.
- INITIALIZE_REPLAY Procedure
  This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).
- PROCESS_CAPTURE Procedure
  This procedure processes the workload capture found in `capture_dir` in place.
- REMAP_CONNECTION Procedure
  This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

216.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
   RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the PAUSE_REPLAY Procedure has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a prerequisite.

216.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (
   capture_id     IN  NUMBER);
```

Parameters

Table 216-22 LOAD_LONG_SQLTEXT Procedure Parameters

Parameter	Description
capture_id	Internal key for the workload capture

> **Note:**
>
> This procedure is available starting with Oracle Database Release 18c.

> **See Also:**
>
> `DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

216.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

216.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
   replay_id    IN   NUMBER,
   stream_id    IN   NUMBER DEFAULT NULL,
   call_counter IN   NUMBER DEFAULT NULL);
```

Parameters

Table 216-23 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.

Related Topics

- GET_DIVERGING_STATEMENT Function
  This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

216.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the PREPARE_REPLAY Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization          IN BOOLEAN,
   connect_time_scale       IN NUMBER    DEFAULT 100,
   think_time_scale         IN NUMBER    DEFAULT 100,
   think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
   capture_sts              IN BOOLEAN   DEFAULT FALSE,
```

```
   sts_cap_interval          IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'SCN',
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300);
```

Parameters

Table 216-24 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
`synchronization`	Sets the synchronization mode for replay: • `'TIME'` — The synchronization will be based on the time the action took place during capture (clock-based time). • `'SCN'` — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • `'OBJECT_ID'` — Every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This value is deprecated. For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter: • TRUE means `'SCN'` • FALSE means `'TIME'`
`connect_time_scale`	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. `DEFAULT VALUE` is 100. See "Example 216-1".
`think_time_scale`	Scales the time elapsed between two successive user calls "Example 216-1"from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. `DEFAULT VALUE` is 100. See "Example 216-2".
`think_time_auto_correct`	Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. `DEFAULT` is `TRUE` which is to reduce think time if replay goes slower than capture. See "Example 216-3".

Table 216-24 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

- PREPARE_REPLAY Procedure
  This procedure puts the database state in PREPARE FOR REPLAY mode.

216.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN BOOLEAN,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300,
   rac_mode                  IN NUMBER    DEFAULT GLOBAL_SYNC,
   query_only                IN BOOLEAN   DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'SCN',
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1,
   capture_sts               IN BOOLEAN   DEFAULT FALSE,
   sts_cap_interval          IN NUMBER    DEFAULT 300),
   rac_mode                  IN NUMBER    DEFAULT GLOBAL_SYNC,
   query_only                IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 216-25 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	Sets the synchronization mode for replay: • 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). • 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • 'OBJECT_ID' — Every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This value is deprecated. For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter: • TRUE means 'SCN' • FALSE means 'TIME'
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 216-1".
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 216-2".
think_time_auto_correct	Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 216-3".
scale_up_multiplier	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the scale_up_multiplier. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
capture_sts	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Table 216-25 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
rac_mode	Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: • GLOBAL_SYNC — Synchronization across all Oracle RAC instances. This is the default value. • PER_INSTANCE_CLIENT — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. • PER_INSTANCE_SYNC — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance
query_only	Replays only the read-only queries of the workload capture. The default value is FALSE.

Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.
- With regard to scale_up_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. SELECT FOR UPDATE statements are also skipped.
  - Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by think_time_scale, connect_time_scale, and think_time_auto_correct. Also, the queries are made to wait for the appropriate commits.
  - No replay data or error divergence records are generated for the scale-up sessions.
  - All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 216-1 Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect  (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect  (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect  ( 5m after)
```

```
12:15 : Second session connect (15m after)
12:21 : Third session connect  (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect  (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect  (84m after)
```

Example 216-2 Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min  (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Example 216-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
        call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
        call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

216.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
   capture_dir            IN   VARCHAR2,
   parallel_level         IN   NUMBER DEFAULT NULL,
   synchronization        IN   VARCHAR2 DEFAULT 'SCN',
   plsql_mode             IN   VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 216-26 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
`capture_dir`	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
`parallel_level`	Number of Oracle processes used to process the capture in parallel. The `NULL` default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.
`synchronization`	Determines the synchronization mode that the user will be able to use for replay: • `'TIME'` — When `'TIME'` is selected, the replay can use `'TIME'` synchronization mode only. When `'TIME'` synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). • `'SCN'` — When `'SCN'` is selected, the replay can use the `'TIME'` or `'SCN'` synchronization mode. This is the default. When `'SCN'` synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. • `'OBJECT_ID'` — When `'OBJECT_ID'` is selected, replay can use the `'TIME'`, `'SCN'`, or `'OBJECT_ID'` synchronization mode. When `'OBJECT_ID'` synchronization mode is used for replay, every replayed action will be executed only *after* the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.

Table 216-26 (Cont.) PROCESS_CAPTURE Procedure Parameters

Parameter	Description
plsql_mode	Specifies the processing mode for PL/SQL: • 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. • 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in capture_dir.
- Before a workload capture can be replayed in a particular database version, the capture must be processed using PROCESS_CAPTURE in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in rec_dir in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory rec_dir:

  ```
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, rec_dir contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.
- For encrypted capture, the PROCESS_CAPTURE procedure relies on Oracle wallet. The identifier is oracle.rat.database_replay.encryption (case-sensitive).

216.3.30 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);

DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   capture_number        IN  VARCHAR2,
```

```
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);
```

Parameters

Table 216-27 REMAP_CONNECTION Procedure Parameters

Parameter	Description
capture_number	Pointing to a capture of the current replay schedule
connection_id	ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID.
replay_connection	New connection string to be used during replay

Usage Notes

- Prior to calling REMAP_CONNECTION all replay connection strings are set to NULL by default. If a replay_connection is NULL, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable TNS_ADMIN is defined and the user does not call the REMAP_CONNECTION Procedure, then the wrc executable will connect to the server specified in the tnsnames.ora file pointed to by TNS_ADMIN.
- A valid replay_connection must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given connection_id.
- Use the DBA_WORKLOAD_CONNECTION_MAP view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

216.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
   schedule_capture_number    IN     NUMBER);
```

Parameters

Table 216-28 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
schedule_capture_number	Unique ID that identifies this capture within this schedule

216.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the ADD_SCHEDULE_ORDERING Function (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
   schedule_capture_id     IN         NUMBER,
   waitfor_capture_id      IN         NUMBER);
```

Parameters

Table 216-29 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
`schedule_capture_id`	Points to a capture that has been added to the current replay schedule (see procedure description).
`waitfor_capture_id`	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The BEGIN_REPLAY_SCHEDULE Procedure must have been called.
- The replay schedule order should have already been added using the ADD_SCHEDULE_ORDERING Function.

216.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
   replay_id          IN NUMBER,
   format             IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 216-30 REPORT Function Parameters

Parameter	Description
`replay_id`	(Mandatory) Specifies the ID of the workload replay whose report is requested.

Table 216-30 (Cont.) REPORT Function Parameters

Parameter	Description
format	(Mandatory) Specifies the report format. Valid values: • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a CLOB

216.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.

216.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function.

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the CREATE_FILTER_SET Procedure to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
   replay_dir  IN VARCHAR2,
   filter_set  IN VARCHAR2);
```

Parameters

Table 216-31 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

Related Topics

- ADD_SCHEDULE_ORDERING Function
  This function adds a schedule order between two captures.

216.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   NUMBER);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   BOOLEAN);
```

Parameters

Table 216-32 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the `COMMIT` issued by replay sessions is `NOWAIT`. The default value for this parameter is `FALSE`. In this case all the `COMMIT`s are issued with the mode they were captured (`wait`, `no-wait`, `batch`, `no-batch`). If the parameter is set to `TRUE`, then all `COMMIT`s are issued in `no-wait` mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent `COMMIT`s. Setting the parameter to `TRUE` will significantly decrease the waits on the `'log file sync'` event during the replay with respect to capture.

Related Topics

- PREPARE_REPLAY Procedure
  This procedure puts the database state in `PREPARE FOR REPLAY` mode.

216.3.37 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
   replay_dir    IN    VARCHAR2);
```

Parameters

Table 216-33 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
replay_dir	Name of the OS directory containing the captures for a workload consolidation

216.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
   enabled       OUT  BOOLEAN DEFAULT TRUE,
   min_delay     OUT  NUMBER DEFAULT 10,
   max_delay     OUT  NUMBER DEFAULT 120,
   delay_factor  OUT  NUMBER DEFAULT 8);
```

Parameters

Table 216-34 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE to enable the timeout action, and FALSE to disable.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.

- Once a replay timeout action is enabled, a user call will exit with `ORA-15569` if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter `min_delay`, then the timeout action is non-operational.
  - If the delay in minutes is more than a upper bound specified by parameter `max_delay`, the timeout action will abort the user call and throw `ORA-15569`.
  - For delay that is between the lower bound and upper bound, the user call will abort with `ORA-15569` only when the current replay elapsed time is more than the product of capture elapsed time and parameter `delay_factor`.

216.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
   schedule_cap_id      IN NUMBER,
   sql_id               IN VARCHAR2,
   operation            IN VARCHAR2,
   replacement_sql_text IN VARCHAR2 DEFAULT NULL);

PROCEDURE SET_SQL_MAPPING (
   sql_id               IN VARCHAR2,
   operation            IN VARCHAR2,
   replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216-35 SET_SQL_MAPPING Procedure Parameters

Parameter	Description
`schedule_cap_id`	ID of a capture in the schedule
`sql_id`	SQL identifier of the SQL statement at the time of capture
`operation`	Directs that one of the following actions be performed for the specified statement during database replay: • `'SKIP'` — Skip the SQL statement identified by `sql_id` • `'REPLACE'` — Replace this SQL statement identified by `sql_id` with the SQL statement in the `replacement_sql_text` parameter

Usage Notes

- `replacement_sql_text`: When `'SKIP'` is specified for the `operation` parameter, this parameter is NULL. When `'REPLACE'` is specified for the `operation` parameter, this parameter's value is the SQL statement to be used.
- `schedule_cap_id` is used for consolidated replay.

216.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   schedule_cap_id      IN NUMBER,
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
   capture_user         IN VARCHAR2,
   replay_user          IN VARCHAR2);
```

Parameters

Table 216-36 SET_USER_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of the a capture in the schedule
capture_user	User name during the time of the workload capture
replay_user	User name to which captured user is remapped during replay.

Usage Notes

- A schedule_cap_id of NULL is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If replay_user is set to NULL, then the mapping is disabled.
- After multiple calls with the same capture_user, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

  ```
  SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
  ```

- The overloaded version without the schedule_cap_id calls the one with the schedule_cap_id argument by passing in NULL.
- Mappings are stored in a table made public through the view DBA_WORKLOAD_USER_MAP. To remove old mappings execute

  ```
  DELETE * FROM DBA_WORKLOAD_USER_MAP
  ```

216.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the PREPARE_REPLAY Procedure was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

216.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  ```
  $ wrc mode=calibrate replaydir=.
  ```

216.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   capture_number   IN    VARCHAR2,
   filter_set       IN    VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   filter_set       IN    VARCHAR2);
```

Parameters

Table 216-37 USE_FILTER_SET Procedure Parameters

Parameter	Description
`capture_number`	Pointing to a capture of the current replay schedule

Table 216-37 (Cont.) USE_FILTER_SET Procedure Parameters

Parameter	Description
`filter_set`	Name of the filter set

Usage Notes

The filter set must have been created by calling the CREATE_FILTER_SET Procedure.

217
DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- Examples
- Data Structures
- Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about the Automatic Workload Repository

217.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
   DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
     1557521192,  1, 5390, 5392) ) ;
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

217.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type
- AWRRPT_INSTANCE_LIST_TYPE Table Type

217.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
   baseline_name      VARCHAR2(64),
   dbid               NUMBER NOT NULL,
   instance_number    NUMBER NOT NULL,
   beg_time           DATE NOT NULL,
   end_time           DATE NOT NULL,
   metric_id          NUMBER NOT NULL,
   metric_name        VARCHAR2(64) NOT NULL,
   metric_unit        VARCHAR2(64) NOT NULL,
   num_interval       NUMBER NOT NULL,
   interval_size      NUMBER NOT NULL,
   average            NUMBER NOT NULL,
   minimum            NUMBER NOT NULL,
   maximum            NUMBER NOT NULL);
```

Fields

Table 217-1 AWR_BASELINE_METRIC_TYPE Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

217.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics

- SELECT_BASELINE_METRIC Function
  This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

217.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

217.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the `DBMS_WORKLOAD_REPOSITORY` subprograms and briefly describes them.

Table 217-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure	Adds a colored SQL ID
ASH_GLOBAL_REPORT_HTML Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_ANALYTICS Function	Displays the ASH Analytics active report
ASH_REPORT_HTML Function	Displays the ASH report in HTML
ASH_REPORT_TEXT Function	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_HTML Functions	Displays the Global AWR Compare Periods Report in HTML
AWR_GLOBAL_DIFF_REPORT_TEXT Functions	Displays the Global AWR Compare Periods Report in text
AWR_EXP Procedure	Extracts AWR data from the AWR schema into a dump file.
AWR_GLOBAL_REPORT_HTML Functions	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions	Displays the Global AWR report in text
AWR_IMP Procedure	Loads the AWR data from a dump file into the `SYS` schema.
AWR_REPORT_HTML Function	Displays the AWR report in HTML
AWR_REPORT_TEXT Function	Displays the AWR report in text

Table 217-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
AWR_SET_REPORT_THRESHOLDS Procedure	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function	Displays the AWR SQL Report in text format
CONTROL_RESTRICTED_SNAPSHOT Procedure	Controls the AWR snapshot creation for a database in the *restricted session* mode.
CREATE_BASELINE Functions & Procedures	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures	Creates a baseline template
CREATE_REMOTE_SNAPSHOT Function and Procedure	Creates a manual *remote* snapshot immediately using the Remote Management Framework (RMF)
CREATE_SNAPSHOT Function and Procedure	Creates a manual *local* snapshot immediately
DROP_BASELINE Procedure	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure	Drops a range of snapshots
LOCAL_AWR_DBID Function	Returns the database identifier for the local AWR database
MODIFY_BASELINE_WINDOW_SIZE Procedure	Modifies the window size for the Default Moving Window Baseline
MODIFY_SNAPSHOT_SETTINGS Procedures	Modifies the snapshot settings
PURGE_SQL_DETAILS Procedure	Purges SQL details, specifically rows from `WRH$_SQLTEXT` and `WRH$_SQL_PLAN` that do not have corresponding rows (DBID, SQL_ID) in `WRH$_SQLSTAT`.
REGISTER_REMOTE_DATABASE Procedures	Registers a remote database in the AWR using the Remote Management Framework (RMF)
REMOVE_COLORED_SQL Procedure	Removes a colored SQL ID
RENAME_BASELINE Procedure	Renames a baseline
SELECT_BASELINE_DETAILS Function	Shows the values of the metrics corresponding to a baseline for a range of snapshots
SELECT_BASELINE_METRIC Function	Shows the values of the metrics corresponding to a baseline for all the snapshots
UNREGISTER_REMOTE_DATABASE Procedures	Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)
UPDATE_DATAFILE_INFO Procedure	Updates the data file and tablespace information stored in the AWR with the current information in the database
UPDATE_OBJECT_INFO Procedure	Updates rows of `WRH$_SEG_STAT_OBJ` table that represent objects in the local database

217.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time.To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 217-3 *ADD_COLORED_SQL Procedure Parameters*

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional DBID, defaults to Local `DBID`

217.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
   l_dbid           IN NUMBER,
   l_inst_num       IN VARCHAR2((1023),
   l_btime          IN DATE,
   l_etime          IN DATE,
   l_options        IN NUMBER    DEFAULT 0,
   l_slot_width     IN NUMBER    DEFAULT 0,
   l_sid            IN NUMBER    DEFAULT NULL,
   l_sql_id         IN VARCHAR2  DEFAULT NULL,
   l_wait_class     IN VARCHAR2  DEFAULT NULL,
   l_service_hash   IN NUMBER    DEFAULT NULL,
   l_module         IN VARCHAR2  DEFAULT NULL,
   l_action         IN VARCHAR2  DEFAULT NULL,
   l_client_id      IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry    IN VARCHAR2  DEFAULT NULL,
   l_data_src       IN NUMBER    DEFAULT 0,
   l_container      IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 217-4 *ASH_GLOBAL_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL

statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

```
l_sql_id =>  'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 217-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

217.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
   l_dbid          IN VARCHAR2(1023),
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 217-6 *ASH_GLOBAL_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL

statement, such as SQL_ID 'abcdefghij123 ' pass that SQL_ID value to the l_sql_id argument:

```
l_sql_id =>  'abcdefghij123'
```

Table 217-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

217.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
   dbid           IN NUMBER DEFAULT NULL,
   inst_id        IN NUMBER DEFAULT NULL,
   begin_time     IN DATE,
   end_time       IN DATE,
   report_level   IN VARCHAR2 DEFAULT NULL,
   filter_list    IN VARCHAR2 DEFAULT NULL)
 RETURN CLOB;
```

Parameters

Table 217-8 ASH_REPORT_ANALYTICS Parameters

Parameter	Description
dbid	Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.
inst_id	Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.
begin_time	The start time of the interval for which the ASH report is required.
end_time	The end time of the interval for which the ASH report is required.
report_level	Describes the list of components to build.
filter_list	Describes the list of filters to apply. Its default value is NULL (no filters to apply).

Return Values

Returns the ASH Analytics active report.

217.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 217-9 *ASH_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number

Table 217-9 (Cont.) *ASH_REPORT_HTML Parameters*

Parameter	Description
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Can be used to specify a data source (see Usage Notes) • 1 => memory (V$ACTIVE_SESION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpti.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For

example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src =>  1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID '`abcdefghij123` ' pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id =>  'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE` "`PAYROLL`" and `ACTION` "`PROCESS`", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 217-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
`l_sid`	Session ID (for example, `V$SESSION.SID`)	No
`l_sql_id`	SQL ID (for example, `V$SQL.SQL_ID`)	Yes
`l_wait_class`	Wait class name (for example, `V$EVENT_NAME.WAIT_CLASS`)	Yes
`l_service_hash`	Service name hash (for example, `V$ACTIVE_SERVICES.NAME_HASH`)	No
`l_module`	Module name (for example, `V$SESSION.MODULE`)	Yes
`l_action`	Action name (for example, `V$SESSION.ACTION`)	Yes
`l_client_id`	Client ID for end-to-end backtracing (for example, `V$SESSION.CLIENT_IDENTIFIER`)	Yes

217.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
```

```
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0,
   l_container     IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 217-11 *ASH_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Can be used to specify a data source (see Usage Notes) • 1 => memory (V$ACTIVE_SESION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
l_container	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V$CONTAINERS. Behavior is as follows: • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for l_container regarding the connected PDB. Note: If while connected to a PDB you request information from another PDB this produces an empty report.

Return Values

The output will be one column of `VARCHAR2(80)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID '`abcdefghij123` ' pass that `SQL_ID` value to the `l_sql_id` argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

Table 217-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
`l_sid`	Session ID (for example, `V$SESSION.SID`)	No
`l_sql_id`	SQL ID (for example, `V$SQL.SQL_ID`)	Yes
`l_wait_class`	Wait class name (for example, `V$EVENT_NAME.WAIT_CLASS`)	Yes
`l_service_hash`	Service name hash (for example, `V$ACTIVE_SERVICES.NAME_HASH`)	No
`l_module`	Module name (for example, `V$SESSION.MODULE`)	Yes
`l_action`	Action name (for example, `V$SESSION.ACTION`)	Yes
`l_client_id`	Client ID for end-to-end backtracing (for example, `V$SESSION.CLIENT_IDENTIFIER`)	Yes
`l_plsql_entry`	PL/SQL entry point (for example, "`SYS.DBMS_LOB.*`")	Yes
`l_data_src`	Wildcards are not allowed for `l_data_src` as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE` "`PAYROLL`" and `ACTION` "`PROCESS`", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

217.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 217-13 *AWR_DIFF_REPORT_HTML Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

217.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
```

```
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 217-14 *AWR_DIFF_REPORT_TEXT Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

217.3.9 AWR_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_EXP(
   dmpfile              IN   VARCHAR2   DEFAULT 'awrdat',
   dmpdir               IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
   dbid                 IN   NUMBER     DEFAULT NULL,
   bid                  IN   NUMBER     DEFAULT 1,
   eid                  IN   NUMBER     DEFAULT 1000000);
```

Parameters

Table 217-15 *AWR_EXP Procedure Parameters*

Parameter	Description
dmpfile	The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is dmpfile.dmp. The `dmpfile.log` log file shows the status of the export job. The default value for the prefix is `awrdat`.

Table 217-15 (Cont.) *AWR_EXP Procedure Parameters*

Parameter	Description
dmpdir	Name of the Directory Object for the file system directory where the extract dump file will be written. The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: create directory dmpdir as '/directory/path'. The default value is DATA_PUMP_DIR.
dbid	The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID.
bid	The begin snapshot ID for snapshots to be exported. The default value is 1.
eid	The end Snapshot Id for snapshots to be exported. The default value is 10000000.

217.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 217-16 *AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(1500).

217.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1         IN    NUMBER,
   inst_num1     IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1          IN    NUMBER,
   eid1          IN    NUMBER,
   dbid2         IN    NUMBER,
   inst_num2     IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2          IN    NUMBER,
   eid2          IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1         IN    NUMBER,
   inst_num1     IN    VARCHAR2,
   bid1          IN    NUMBER,
   eid1          IN    NUMBER,
   dbid2         IN    NUMBER,
   inst_num2     IN    VARCHAR2,
   bid2          IN    NUMBER,
   eid2          IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 217-17 *AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(320).

217.3.12 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 217-18 *AWR_GLOBAL_REPORT_HTML Function Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	Report level (currently not used)

Return Values

The output will be one column of VARCHAR2(1500).

217.3.13 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 217-19 *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.

Table 217-19 (Cont.) *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(320).

217.3.14 AWR_IMP Procedure

This procedure loads the AWR data from a dump file into the SYS schema.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP(
   dmpfile              IN   VARCHAR2   DEFAULT 'awrdat',
   dmpdir               IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
   new_dbid             IN   NUMBER     DEFAULT NULL);
```

Parameters

Table 217-20 *AWR_IMP Procedure Parameters*

Parameter	Description
dmpfile	The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data. The default value is awrdat.
dmpdir	The name of the Directory Object for the file system directory where the load dump file is located. The default value is DATA_PUMP_DIR.
new_dbid	The database ID to be used instead of existing database ID.

217.3.15 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 217-21 *AWR_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: • l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

217.3.16 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 217-22 AWR_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_insT_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID

Table 217-22 (Cont.) AWR_REPORT_TEXT Parameters

Parameter	Description
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: • l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

217.3.17 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
   top_n_events         IN   NUMBER DEFAULT NULL,
   top_n_files          IN   NUMBER DEFAULT NULL,
   top_n_segments       IN   NUMBER DEFAULT NULL,
   top_n_services       IN   NUMBER DEFAULT NULL,
   top_n_sql            IN   NUMBER DEFAULT NULL,
   top_n_sql_max        IN   NUMBER DEFAULT NULL,
   top_sql_pct          IN   NUMBER DEFAULT NULL,
   shmem_threshold      IN   NUMBER DEFAULT NULL,
   versions_threshold   IN   NUMBER DEFAULT NULL,
   top_n_disks          IN   NUMBER DEFAULT NULL,
   outlier_pct          IN   NUMBER DEFAULT NULL,
   outlier_cpu_pct      IN   NUMBER DEFAULT NULL);
```

Parameters

Table 217-23 *AWR_SET_REPORT_THRESHOLDS Procedure Parameters*

Parameter	Description
top_n_events	Number of most significant wait events to be included
top_n_files	Number of most active files to be included
top_n_segments	Number of most active segments to be included
top_n_services	Number of most active services to be included
top_n_sql	Number of most significant SQL statements to be included
top_n_sql_max	Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct

Table 217-23 (Cont.) *AWR_SET_REPORT_THRESHOLDS Procedure Parameters*

Parameter	Description
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold
top_n_disks	Number of cell disks with most I/O
outlier_pct	Percentage of maximum capacity before displaying outliers for Exadata sections
outlier_cpu_pct	Threshold for mean percentage CPU to display outliers

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

217.3.18 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0,
   l_con_dbid  IN    NUMBER DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 217-24 *AWR_SQL_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID

Table 217-24 (Cont.) *AWR_SQL_REPORT_HTML Parameters*

Parameter	Description
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.
l_con_dbid	Container database identifier. If NULL (default), then l_con_dbid is set equal to l_dbid

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

217.3.19 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0,
   l_con_dbid  IN    NUMBER DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 217-25 *AWR_SQL_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.
l_con_dbid	Container database identifier. If NULL (default), then l_con_dbid is set equal to l_dbid

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

217.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

> **Note:**
>
> To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
   allow IN BOOLEAN);
```

Parameters

Table 217-26 CONTROL_RESTRICTED_SNAPSHOT Parameters

Parameter	Description
`allow`	This parameter can have one of the following values: • `TRUE`: AWR snapshots can be created for the database in the *restricted session* mode. • `FALSE`: AWR snapshots cannot be created for the database in the *restricted session* mode.

217.3.21 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL)
 RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);
 RETURN NUMBER;
```

Parameters

Table 217-27 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline.
end_snap_id	End snapshot sequence number for the baseline.
start_time	Start time for the baseline.
end_time	End time for the baseline.
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                  end_snap_id   => 107,
                                                  baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

217.3.22 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name           IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER   DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   day_of_week             IN VARCHAR2,
   hour_in_day             IN NUMBER,
   duration                IN NUMBER,
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name_prefix    IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER   DEFAULT NULL);
```

Parameters

Table 217-28 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

217.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_id     IN NUMBER,
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_id     IN NUMBER,
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   flush_level    IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   flush_level    IN VARCHAR2 DEFAULT 'BESTFIT')
 RETURN NUMBER;
```

Parameters

Table 217-29 CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
node_id	RMF node identifier of the database for which the snapshot needs to be created.
node_name	RMF node name of the database for which the snapshot needs to be created.
topology_name	RMF topology name of the database for which the snapshot needs to be created.

Table 217-29 (Cont.) CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
flush_level	The flush level can be one of the following: • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

217.3.24 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
   dbid        IN NUMBER   DEFAULT NULL,
   source_name IN VARCHAR2 DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
```

```
   dbid        IN NUMBER   DEFAULT NULL,
   source_name IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 217-30 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	The flush level can be one of the following: • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.
dbid	Database ID of the database for which the snapshot needs to be created.
source_name	Name of the database for which the snapshot needs to be created.

Examples

This example creates a snapshot of the local database with the flush level of ALL:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

217.3.25 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
   baseline_name  IN  VARCHAR2,
   cascade        IN  BOOLEAN  DEFAULT FALSE,
   dbid           IN  NUMBER   DEFAULT NULL);
```

Parameters

Table 217-31 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database ID for which the baseline needs to be dropped (defaults to local DBID).

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
       baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

217.3.26 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
   template_name    IN VARCHAR2,
   dbid             IN NUMBER   DEFAULT NULL);
```

Parameters

Table 217-32 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.

217.3.27 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
   low_snap_id    IN  NUMBER,
   high_snap_id   IN  NUMBER,
   dbid           IN  NUMBER   DEFAULT NULL);
```

Parameters

Table 217-33 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (defaults to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the `Drop Snapshot` action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

217.3.28 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()
 RETURN NUMBER;
```

217.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
   window_size     IN   NUMBER,
   dbid            IN   NUMBER   DEFAULT NULL);
```

Parameters

Table 217-34 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (defaults to local DBID).

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

217.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention       IN  NUMBER    DEFAULT  NULL,
   interval        IN  NUMBER    DEFAULT  NULL,
   topnsql         IN  NUMBER    DEFAULT  NULL,
   dbid            IN  NUMBER    DEFAULT  NULL,
   tablespace_name     IN  VARCHAR2  DEFAULT  NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention       IN  NUMBER    DEFAULT NULL,
   interval        IN  NUMBER    DEFAULT NULL,
   topnsql         IN  VARCHAR2,
   dbid            IN  NUMBER    DEFAULT  NULL,
   tablespace_name     IN  VARCHAR2  DEFAULT  NULL);
```

Parameters

Table 217-35 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the interval setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.

Table 217-35 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
topnsql	• If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. • If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.
tablespace_name	Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval  =>  60,
  retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

217.3.31 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from WRH$_SQLTEXT, WRH$_SQL_PLAN, and WRH$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
   numrows IN NUMBER DEFAULT NULL,
   dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 217-36 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
numrows	Number of rows
dbid	Database ID (default to local DBID)

217.3.32 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
   node_id  IN NUMBER);

DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217-37 REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	RMF node identifier of the database that needs to be registered in the AWR.
node_name	RMF node name of the database that needs to be registered in the AWR.
topology_name	RMF topology name of the database that needs to be registered in the AWR.

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

217.3.33 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
   sql_id         IN VARCHAR2,
   dbid           IN NUMBER DEFAULT NULL);
```

Parameters

Table 217-38 *REMOVE_COLORED_SQL Procedure Parameters*

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

217.3.34 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
   old_baseline_name     IN   VARCHAR2,
   new_baseline_name     IN VARCHAR2,
   dbid                  IN NUMBER   DEFAULT NULL);
```

Parameters

Table 217-39 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name.
new_baseline_name	New baseline name.
dbid	Database ID for which the baseline needs to be renamed (defaults to local DBID).

217.3.35 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
   l_baseline_id    IN  NUMBER,
   l_begin_snap     IN  NUMBER DEFAULT NULL,
   l_end_snap       IN  NUMBER DEFAULT NULL,
   l_dbid           IN  NUMBER DEFAULT NULL)
 RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 217-40 SELECT_BASELINE_DETAILS Function Parameters

Parameter	Description
l_baseline_id	ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.
l_begin_snap	Start snapshot sequence number for the baseline.
l_end_snap	End snapshot sequence number for the baseline.
l_dbid	Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.

217.3.36 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
   l_baseline_name     IN VARCHAR2,
   l_dbid              IN NUMBER DEFAULT NULL,
   l_instance_num      IN NUMBER DEFAULT NULL)
 RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 217-41 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
l_baseline_name	Name of the baseline for which the metrics need to be viewed.
l_dbid	Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.
l_instance_num	The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL.

217.3.37 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
   node_id        IN NUMBER,
   remote_check   IN BOOLEAN  DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
   node_name      IN VARCHAR2,
   topology_name  IN VARCHAR2 DEFAULT NULL,
   remote_check   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 217-42 UNREGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	Identifier of the remote database whose data needs to be removed from the AWR.
node_name	Name of the remote database whose data needs to be removed from the AWR.
topology_name	RMF topology name of the remote database.
remote_check	If set to TRUE, the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to FALSE, the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

217.3.38 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

217.3.39 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
   maxrows    IN  NUMBER  DEFAULT 0);
```

Parameters

Table 217-43 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
`maxrows`	Maximum number of rows to be updated. Default= `0`, meaning there is no limit.

218
DBMS_XDB

The `DBMS_XDB` package supports the following features:

> **Note:**
>
> The Oracle XML DB Repository is deprecated with Oracle Database 23ai.
>
> Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- DBMS_XDB Overview
- DBMS_XDB Security Model
- DBMS_XDB Constants
- Summary of DBMS_XDB Subprograms

> **See Also:**
>
> - *Oracle XML DB Developer's Guide*

218.1 DBMS_XDB Overview

`DBMS_XDB` provides a range of management functions.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides LINK Procedures, EXISTSRESOURCE Function, LOCKRESOURCE Function, GETLOCKTOKEN Procedure, UNLOCKRESOURCE Function, CREATERESOURCE Functions, RENAMERESOURCE Procedure, DELETERESOURCE Procedure, GETRESOID Function, CREATEOIDPATH Function, and CREATEFOLDER Function subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database.

Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, and CHANGEPRIVILEGES Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction

218.2 DBMS_XDB Security Model

Owned by `XDB`, the `DBMS_XDB` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

218.3 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12*c*.

They are relocated to either the DBMS_XDB_CONFIG package or the DBMS_XDB_REPOS package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their `DBMS_XDB` context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 218-1 DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.	DBMS_XDB_REPOS
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.	DBMS_XDB_REPOS
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.	DBMS_XDB_REPOS
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the corresponding row in the metadata table	DBMS_XDB_REPOS
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row in the metadata table	DBMS_XDB_REPOS
DEFAULT_LOCK_TIMEOUT CONSTANT	PLS_INTEGER	(60*60)	Default time (in seconds) after which lock will expire	DBMS_XDB_REPOS
LINK_TYPE_HARD	NUMBER	1	Type of link to be created (default)	DBMS_XDB_REPOS
LINK_TYPE_WEAK	NUMBER	2	Type of link to be created	DBMS_XDB_REPOS

Table 218-1 (Cont.) DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
LINK_TYPE_SYMBOLIC	NUMBER	3	Type of link to be created	DBMS_XDB_REPOS
ON_DENY_NEXT_CUSTOM	NUMBER	1	If access denied, the next custom authorization is tried	DBMS_XDB_CONFIG
ON_DENY_BASIC	NUMBER	2	If access denied, basic authentication is used	DBMS_XDB_CONFIG

218.4 Summary of DBMS_XDB Subprograms

This table lists the DBMS_XDB subprograms and briefly describes them.

Table 218-2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
ENABLEDIGESTAUTHENTICATION Procedure	Enables digest authentication
EXISTSRESOURCE Function	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a a REF to an XMLTYPE

Table 218-2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an `XMLTYPE`
GETHTTPREQUESTHEADER Function	Gets the values of the passed header
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns `TRUE` if the resource has BLOB content
HASCHARCONTENT Function	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function	Returns `TRUE` if the resource has `REF` to XML content
ISFOLDER Function	Returns `TRUE` if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

218.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ACLCHECKPRIVILEGES Function.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 218-3 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
`acl_path`	Absolute path in the Hierarchy for ACL document
`owner`	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

218.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the APPENDRESOURCEMETADATA Procedure.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 218-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the`REF` passed in must be unique. In other words, there must not be a`REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

218.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12*c*.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEOWNER Procedure.

Syntax

```
DBMS_XDB.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 218-5 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

218.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12*c*.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEPRIVILEGES Function.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
   res_path    IN    VARCHAR2,
   ace         IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 218-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

218.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHECKPRIVILEGES Function.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
   res_path    IN  VARCHAR2,
   privs       IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 218-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

218.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEFOLDER Function.

Syntax

```
DBMS_XDB.CREATEFOLDER(
   path    IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-8 CREATEFOLDER Function Parameters

Parameter	Description
`path`	Path name for the new folder

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if `'/folder1/folder2'` is passed as the path parameter, then `'/folder1'` must already exist.

218.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

> **Note:**
>
> This funtion is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEOIDPATH Function.

Syntax

```
DBMS_XDB.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 218-9 CREATEOIDPATH Function Parameters

Parameter	Description
`oid`	Object ID of the resource

218.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATERESOURCE Functions.

Syntax

Given a `REF` to an existing `XMLType` row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BLOB` as its contents, and specifies character set of the source `BLOB`:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
```

```
    data           IN  BLOB,
    csid           IN  NUMBER :=0,
    createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BFILE` as its contents, and specifies character set of the source `BFILE`:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `CLOB` as its contents:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 218-10 CREATERESOURCE Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if `/foo/bar.txt` is passed in, then folder `/foo` must already exist.
`data`	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
`datarow`	`REF` to an `XMLType` row to be used as the contents

Table 218-10 (Cont.) CREATERESOURCE Function Parameters

Parameter	Description
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: • From the abspath extension, determine the resource's MIME type. • If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; • Otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

218.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCE Procedure.

Syntax

```
DBMS_XDB.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 218-11 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a a resource is deleted; defined in Table 218-1: • DELETE_RESOURCE • DELETE_RECURSIVE • DELETE_FORCE • DELETE_RECURSIVE_FORCE

218.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCEMETADATA Procedures.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 218-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	`REF` to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: • `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table • `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

218.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ENABLEDIGESTAUTHENTICATION Procedure.

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

218.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the EXISTSRESOURCE Function.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

218.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETACLDOCUMENT Function.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 218-14 GETACLDOCUMENT Function Parameters

Parameter	Description
`abspath`	Path name of the resource whose ACL document is required

Return Values

The `XMLType` for ACL document.

218.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a `BLOB`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTBLOB Function.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
     abspath     IN      VARCHAR2,
     csid        OUT     PLS_INTEGER,
     locksrc     IN      BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 218-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

218.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTCLOB Function.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 218-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

218.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTVARCHAR2 Function.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
     abspath     IN      VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 218-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as a string.

218.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLREF Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
     abspath     IN      VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 218-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

218.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an XMLTYPE.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLTYPE Function.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 218-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

218.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

> **Note:**
>
> This procedure is deprecated in Release 12*c*.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name    IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 218-20 GETHTTPREQUESTHEADER Function Parameters

Parameter	Description
header_name	Passed header

Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

218.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETLOCKTOKEN Procedure.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
   path         IN      VARCHAR2,
   locktoken    OUT     VARCHAR2);
```

Parameters

Table 218-21 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have READPROPERTIES privilege on the resource.

218.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETPRIVILEGES Function.

Syntax

```
DBMS_XDB.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 218-22 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

218.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETRESOID Function.

Syntax

```
DBMS_XDB.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 218-23 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

218.4.23 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETXDB_TABLESPACE Function.

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

218.4.24 HASBLOBCONTENT Function

This deprecated function returns TRUE if the resource has BLOB content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASBLOBCONTENT Function.

Syntax

```
DBMS_XDB.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-24 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

218.4.25 HASCHARCONTENT Function

This deprecated function returns `TRUE` if the resource has character content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASCHARCONTENT Function.

Syntax

```
DBMS_XDB.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-25 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

218.4.26 HASXMLCONTENT Function

This deprecated function returns `TRUE` if the resource has XML content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLCONTENT Function.

Syntax

```
DBMS_XDB.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-26 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

218.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLREFERENCE Function.

Syntax

```
DBMS_XDB.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-27 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

218.4.28 ISFOLDER Function

This deprecated function returns TRUE if the resource is a folder or container.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ISFOLDER Function.

Syntax

```
DBMS_XDB.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-28 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

218.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LINK Procedures.

Syntax

```
DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 218-29 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link

Table 218-29 (Cont.) LINK Procedure Parameters

Parameter	Description
`linktype`	Type of link to be created: • `DBMS_XDB.LINK_TYPE_HARD` (default) • `DBMS_XDB.LINK_TYPE_WEAK` • `DBMS_XDB.LINK_TYPE_SYMBOLIC`

218.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LOCKRESOURCE Function.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 218-30 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` obtains a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

218.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PROCESSLINKS Procedure.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 218-31 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If `TRUE`, process links of all resources in the folder hierarchy rooted at the specified resource. If `FALSE`, process links of all documents in this folder only.

218.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PURGERESOURCEMETADATA Procedure.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 218-32 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

218.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the RENAMERESOURCE Procedure.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 218-33 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

218.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SETACL Procedure.

Syntax

```
DBMS_XDB.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 218-34 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

218.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SPLITPATH Procedure.

Syntax

```
DBMS_XDB.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 218-35 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

218.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the TOUCHRESOURCE Procedure.

Syntax

```
DBMS_XDB.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 218-36 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

218.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UNLOCKRESOURCE Function.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 218-37 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

`TRUE` if operation successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

218.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

> **Note:**
>
> This procedure is deprecated in Release 12*c*. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UPDATERESOURCEMETADATA Procedures.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its `REF`. It replaces that piece of metadata with user-defined metadata which is either in the form of a `REF` to `XMLTYPE` or an `XMLTYPE`.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
```

```
   oldns          IN   VARCHAR2,
   oldname        IN   VARCHAR,
   newmetadata    IN   REF SYS.XMLTYPE);
```

Parameters

Table 218-38 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`oldmetadata`	`REF` to the old of metadata
`newmetadata`	`REF` to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
`oldns`	Namespace identifying old metadata
`oldname`	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

219
DBMS_XA

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Data Structures
- Summary of DBMS_XA Subprograms

> **See Also:**
>
> *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

219.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

219.2 DBMS_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

`FORCE ANY TRANSACTION` privilege is required for users who need to manipulate XA transactions created by other users.

219.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in Table 219-1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 219-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in Table 219-2 for Possible Return Values

Table 219-2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch

Table 219-2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVAL	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

219.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple

connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

219.5 DBMS_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

OBJECT Types

- DBMS_XA_XID Object Type

TABLE Types

- DBMS_XA_XID_ARRAY Table Type

219.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

> **Note:**
>
> For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
       gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
       gtrid     IN   RAW,
       bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
       formatid  IN   NUMBER,
       gtrid     IN   RAW,
       bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

Attributes

Table 219-3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

219.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of xid that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

219.6 Summary of DBMS_XA Subprograms

This table lists the DBMS_XA subprograms and briefly describes them.

Table 219-4 DBMS_XA Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function	Commits the global transaction specified by xid
XA_END Function	Disassociates the current session from the transaction branch specified by xid
XA_FORGET Function	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function	Prepares the transaction branch specified in xid for committing the transaction subsequently if possible
XA_RECOVER Function	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function	Sets the transaction timeout in seconds for the current session
XA_START Function	Associates the current session with the transaction branch specified by xid

219.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

219.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
   xid       IN  DBMS_XA_XID,
   onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 219-5 *XA_COMMIT Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`onePhase`	If `TRUE`, apply single phase commit

Return Values

See Table 219-2. Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

219.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 219-6 *XA_END Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`flag`	See Table 219-1.

Return Values

See Table 219-2. Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by xid from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT` is not allowed in a subordinate session.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session.

219.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (
   xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 219-7 *XA_FORGET Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See Table 219-2. Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

219.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
 RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

219.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 219-8 *XA_PREPARE Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type

Return Values

See Table 219-2. Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

219.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
 RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

219.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
   xid       IN  DBMS_XA_XID)
 RETURN PLS_INTEGER;
```

Parameters

Table 219-9 *XA_ROLLBACK Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type

Return Values

See Table 219-2. Possible return values are: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, or `XA_HEURMIX`.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

219.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
   seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 219-10 *XA_SETTIMEOUT Function Parameters*

Parameter	Description
`seconds`	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See Table 219-2. Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, or `XAER_INVAL`.

Usage Notes

Only if return value is `XA_OK`, is the timeout value successfully set.

219.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the `xid`.

Syntax

```
DBMS_XA.XA_START (
   xid   IN  DBMS_XA_XID,    flag  IN  PLS_INTEGER)  RETURN PLS_INTEGER;
```

Parameters

Table 219-11 *XA_START Function Parameters*

Parameter	Description
`xid`	See DBMS_XA_XID Object Type
`flag`	See Table 219-1.

Return Values

See Table 219-2

Usage Notes

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.

220
DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- DBMS_XDB_ADMIN Security Model
- Summary of DBMS_XDB_ADMIN Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for information about Oracle XML DB Repository

220.1 DBMS_XDB_ADMIN Security Model

Owned by `XDB`, the `DBMS_XDB_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

220.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 220-1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATENONCEKEY Procedure	Generates a nonce value for use in digest authentication
INSTALLDEFAULTWALLET Procedure	Installs the default XDB wallet in the default XDB wallet directory
MOVEXDB_TABLESPACE Procedure	Moves the XDB (user) to the specified tablespace
REBUILDHIERARCHICALINDEX Procedure	Rebuilds the hierarchical index after import or export operations

220.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

220.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/`*`db_name`*`/xdb_wallet` where *db_name* is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `SYS` can install or replace the default wallet.

220.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
   new_tablespace   IN  VARCHAR2);
```

Parameters

Table 220-2 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
`new_tablespace`	Name of the tablespace to where the XDB is moved

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command.Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

220.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

221
DBMS_XDB_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_XDB_CONFIG Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

221.1 DBMS_XDB_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system.
This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

> **Note:**
>
> The Oracle XML DB Repository is deprecated with Oracle Database 23ai.
>
> Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package DBMS_XDB_CONFIG is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

221.2 DBMS_XDB_CONFIG Security Model

Owned by XDB, the DBMS_XDB_CONFIG package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

221.3 DBMS_XDB_CONFIG Constants

The DBMS_XDB_CONFIG package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 221-1 DBMS_XDB_CONFIG Constants

Constant	Type	Value	Description
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port
XDB_ENDPOINT_RHTTP	NUMBER	3	Defining listener for a remote HTTP port
XDB_ENDPOINT_RHTTPS	NUMBER	4	Defining listener for a remote HTTPS port
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol

221.4 Summary of DBMS_XDB_CONFIG Subprograms

The DBMS_XDB_CONFIG package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 221-2 DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDHTTPEXPIREMAPPING Procedure	Adds to XDB$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure	Adds a mime mapping to XDB configuration
ADDSCHEMALOCMAPPING Procedure	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure	Adds a security role REF to a specified servlet in XDB configuration
ADDXMLEXTENSION Procedure	Adds adds the following XML extension to the XDB configuration under <xml-extensions>: <extension>extension</extension>

Table 221-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
CFG_GET Function	Retrieves the session's configuration information as an `XMLType` instance
CFG_REFRESH Procedure	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure	Updates the configuration information and commits the change.
DELETEHTTPEXPIREMAPPING Procedure	Deletes from `XDB$CONFIG` all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure	Deletes the mime mapping for a specified extension from the XDB configuration
DELETESCHEMALOCMAPPING Procedure	Deletes the schema location mapping for a specified schema URL from the XDB configuration
DELETESERVLET Procedure	Deletes a servlet from the XDB configuration
DELETESERVLETMAPPING Procedure	Deletes the servlet mapping for a specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure	Enables enables digest authentication
GETFTPPORT Function	Gets the value of the current FTP port
GETHTTPPORT Function	Gets the value of the current HTTP port
GETHTTPCONFIGREALM Function	Gets the realm name
GETHTTPSPORT Function	Gets the value of the current HTTPS port
GETLISTENERENDPOINT Procedure	Gets the parameters of a listener end point corresponding to the XML DB HTTP server
GETREMOTEHTTPPORT Function	Gets the value of a remote HTTP port
GETREMOTEHTTPSPORT Function	Gets the value of a remote HTTPS port
ISGLOBALPORTENABLED Function	Returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure setting
SETFTPPORT Procedure	Sets the FTP port to a new value
SETHTTPPORT Procedure	Sets the HTTP port to a new value
SETHTTPCONFIGREALM Procedure	Sets the realm to a new value
SETHTTPSPORT Procedure	Sets the HTTPS port to a new value
SETLISTENERENDPOINT Procedure	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`)

Table 221-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
SETREMOTEHTTPPORT Procedure	Sets the remote HTTP port to a new value
SETREMOTEHTTPSPORT Procedure	Sets the remote HTTPS port to a new value
USEDPORT Procedure	Obtains the port numbers used by other pluggable databases in the same consolidation database

221.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
     pattern    IN    VARCHAR2,
     expire     IN    VARCHAR2);
```

Parameters

Table 221-3 *ADDHTTPEXPIREMAPPING Procedure Parameters*

Parameter	Description
`pattern`	URL pattern (only * accepted as wildcards)

`expire`	Expiration directive, follows the `ExpireDefault` in Apache's `mod_expires`:
	`base [plus] (num type)*`
	`-- base: now | modification`
	`-- type: year|years|month|months|week|weeks|day|days|minute|minutess|second|seconds`

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
             '/public/test2/*', 'modification plus 1 day 30 seconds');
```

221.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
     extension     IN   VARCHAR2,
     mimetype      IN   VARCHAR2);
```

Parameters

Table 221-4 *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

221.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
     namespace     IN   VARCHAR2,
     element       IN   VARCHAR2,
     schemaURL     IN   VARCHAR2);
```

Parameters

Table 221-5 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

221.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
     <servlet-name>name</servlet-name>     <servlet-language>language</servlet-language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
    name         IN   VARCHAR2,
    language     IN   VARCHAR2,
    dispname     IN   VARCHAR2,
```

```
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL,
    schema      IN   VARCHAR2 := NULL);
```

Parameters

Table 221-6 ADDSERVLET Procedure Parameters

Parameter	Description
`name`	Servlet name
`language`	Must be one of "C", "Java", "PL/SQL"
`dispname`	Display name
`icon`	Icon
`descript`	Description
`class`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`jspfile`	This parameter is not supported. Always provide `NULL` value for this parameter. System throws an error if the value is not `NULL`.
`plsql`	The `class` / `jspfile` / `plsql` function corresponding to this servlet. The first non-`NULL` argument amongst these three is chosen, and the others are treated as `NULL`.
`schema`	Schema is used to specify `servlet-schema` xml element name in `xdbconfig.xml`. It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.

221.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
     <servlet-pattern>pattern</servlet-pattern>
     <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,     name      IN   VARCHAR2);
```

Parameters

Table 221-7 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
`pattern`	Sservlet pattern
`name`	Servlet name

221.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
VARCHAR2,     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 221-8 *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
`servname`	Sservlet name
`rolename`	Role name
`rolelink`	Role link
`descript`	Description

221.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

It adds the following XML extension to the XDB configuration, under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 221-9 *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
`extension`	XML extension to be added

221.4.8 CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET
 RETURN SYS.XMLType;
```

221.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

221.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(
   xdbconfig    IN   SYS.XMLTYPE);
```

Parameters

Table 221-10 CFG_UPDATE Procedure Parameters

Parameter	Description
`xdbconfig`	The new configuration data

221.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from `XDB$CONFIG` all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
     pattern   IN    VARCHAR2);
```

Parameters

Table 221-11 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
`pattern`	URL pattern (only * accepted as wildcards)

221.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2);
```

Parameters

Table 221-12 *DELETEMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is to be deleted

221.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 221-13 *DELETESCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
schemaURL	Schema URL

221.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
     name         IN   VARCHAR2);
```

Parameters

Table 221-14 *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

221.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
     name       IN    VARCHAR2);
```

Parameters

Table 221-15 ***DELETESERVLETMAPPING Procedure Parameters***

Parameter	Description
name	Servlet name

221.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
     servname     IN    VARCHAR2,     rolename     IN    VARCHAR2);
```

Parameters

Table 221-16 ***DELETESERVLETSECROLE Procedure Parameters***

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

221.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(
     extension     IN    VARCHAR2);
```

Parameters

Table 221-17 ***DELETEXMLEXTENSION Procedure Parameters***

Parameter	Description
extension	XML extension to be deleted

221.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

221.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT
 RETURN NUMBER;
```

221.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
 RETURN VARCHAR2;
```

221.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT
 RETURN NUMBER;
```

221.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
 RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

221.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,    port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 221-18 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
`endpoint`	End point to be retrieved. Its value can be `XDB_ENDPOINT_HTTP` or `XDB_ENDPOINT_HTTP2`.
`host`	Interface on which the listener end point listens
`port`	Port on which the listener end point listens
`protocol`	Transport protocol accepted by the listener end point

221.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
 RETURN NUMBER;
```

221.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
 RETURN NUMBER;
```

221.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the `GlobalPortEnabled` setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

221.4.27 SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 221-19 SETFTPPORT Procedure Parameters

Parameter	Description
`new_port`	Value to which the FTP port is set

221.4.28 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 221-20 SETHTTPPORT Procedure Parameters

Parameter	Description
`new_port`	Value to which the HTTP port is set

221.4.29 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
   realm IN VARCHAR2);
```

Parameters

Table 221-21 SETHTTPPORT Procedure Parameters

Parameter	Description
realm	Realm as defined in IETF's RFC2617

221.4.30 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 221-22 SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

221.4.31 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
   host      IN  VARCHAR2,    port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 221-23 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen

Table 221-23 (Cont.) SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

221.4.32 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when l_access is set to TRUE) or to listen on both localhost and non-localhost interfaces (when l_access is set to FALSE).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
   l_access   BOOLEAN);
```

Parameters

Table 221-24 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
l_access.	TRUE or FALSE.

221.4.33 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 221-25 SETREMOTEHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTP port is set

221.4.34 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
   new_port  IN  NUMBER);
```

Parameters

Table 221-26 SETREMOTEHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTPS port is set

221.4.35 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

222
DBMS_XDB_CONSTANTS

The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XDB_CONSTANTS Subprograms

222.1 DBMS_XDB_CONSTANTS Security Model

Owned by XDB, the DBMS_XDB_CONSTANTS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

222.2 Summary of DBMS_XDB_CONSTANTS Subprograms

This table lists the DBMS_XDB_CONSTANTS subprograms and briefly describes them.

Table 222-1 DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
ENCODING_DEFAULT Function	Returns 'AL32UTF8'
ENCODING_ISOLATIN1 Function	Returns 'WE8ISO8859P1'
ENCODING_UTF8 Function	Returns 'AL32UTF8'
ENCODING_WIN1252 Function	Returns 'WE8MSWIN1252'
NAMESPACE_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
NAMESPACE_METADATA Function	Returns 'http://xmlns.oracle.com/xdbuserMetaData'
NAMESPACE_ORACLE Function	Returns 'http://xmlns.oracle.com'
NAMESPACE_ORACLE_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NAMESPACE_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
NAMESPACE_RESOURCE_EVENT Function	Returns 'http://xmlns.oracle.com/resourceEvent'
NAMESPACE_RESOURCE_CONFIG Function	Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'
NAMESPACE_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
NAMESPACE_XMLDIFF Function	Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'
NAMESPACE_XMLINSTANCE Function	Returns 'http://www.w3.org/2001/XMLSchema-instance'

Table 222-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
NAMESPACE_XMLSCHEMA Function	Returns 'http://www.w3.org/2001/XMLSchema'
NSPREFIX_ACL_ACL Function	Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
NSPREFIX_RESCONFIG_RC Function	Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'
NSPREFIX_RESOURCE_R Function	Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
NSPREFIX_XDB_XDB Function	Returns 'http://xmlns.oracle.com/xdb'
NSPREFIX_XMLINSTANCE_XSI Function	Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
NSPREFIX_XMLDIFF_XD Function	Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
NSPREFIX_XMLSCHEMA_XSD Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
SCHEMAURL_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
SCHEMAELEM_RES_ACL Function	Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'
SCHEMAELEM_RESCONTENT_BINARY Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
SCHEMAELEM_RESCONTENT_TEXT Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
SCHEMAURL_RESOURCE Function	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
SCHEMAURL_XDBSCHEMA Function	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
XDBSCHEMA_PREFIXES Function	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'
XSD_ATTRIBUTE Function	Returns 'attribute'
XSD_COMPLEX_TYPE Function	Returns 'complexType'
XSD_ELEMENT Function	Returns 'element'
XSD_GROUP Function	Returns 'group'

222.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

222.2.2 ENCODING_ISOLATIN1 Function

This function returns `'WE8ISO8859P1'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'WE8ISO8859P1'
```

222.2.3 ENCODING_UTF8 Function

This function returns `'AL32UTF8'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'AL32UTF8'
```

222.2.4 ENCODING_WIN1252 Function

This function returns `'WE8MSWIN1252'`.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'WE8MSWIN1252'
```

222.2.5 NAMESPACE_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'http://xmlns.oracle.com/xdb/acl.xsd'
```

222.2.6 NAMESPACE_METADATA Function

This function returns `'http://xmlns.oracle.com/xdbuserMetaData'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdbuserMetaData'`

222.2.7 NAMESPACE_ORACLE Function

This function returns `'http://xmlns.oracle.com'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com'`

222.2.8 NAMESPACE_ORACLE_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb'`

222.2.9 NAMESPACE_RESOURCE Function

This function returns `'/XDBResource.xsd'`

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd`

222.2.10 NAMESPACE_RESOURCE_EVENT Function

This function returns `'http://xmlns.oracle.com/resourceEvent'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/resourceEvent'`

222.2.11 NAMESPACE_RESOURCE_CONFIG Function

This function returns `'http://xmlns.oracle.com/XDBResConfig.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/XDBResConfig.xsd'`

222.2.12 NAMESPACE_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

222.2.13 NAMESPACE_XMLDIFF Function

This function returns `'http://xmlns.oracle.com/xdb/xdiff.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/xdiff.xsd'`

222.2.14 NAMESPACE_XMLINSTANCE Function

This function returns `'http://www.w3.org/2001/XMLSchema-instance'`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema-instance'`

222.2.15 NAMESPACE_XMLSCHEMA Function

This function returns `'http://www.w3.org/2001/XMLSchema'`.

Syntax

```
DBMS_XDB_CONSTANTS. NAMESPACE_XMLSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://www.w3.org/2001/XMLSchema'`

222.2.16 NSPREFIX_ACL_ACL Function

This function returns `'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'`

222.2.17 NSPREFIX_RESCONFIG_RC Function

This function returns `''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'`

222.2.18 NSPREFIX_RESOURCE_R Function

This function returns `'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
```

222.2.19 NSPREFIX_XDB_XDB Function

This function returns `'http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'http://xmlns.oracle.com/xdb'
```

222.2.20 NSPREFIX_XMLINSTANCE_XSI Function

This function returns `'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
```

222.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns `'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
```

222.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'`.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
```

222.2.23 SCHEMAURL_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'http://xmlns.oracle.com/xdb/acl.xsd'
```

222.2.24 SCHEMAELEM_RES_ACL Function

This function returns `'http://xmlns.oracle.com/xdb/acl.xsd#acl'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'http://xmlns.oracle.com/xdb/acl.xsd#acl'
```

222.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

```
'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
```

222.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'`

222.2.27 SCHEMAURL_RESOURCE Function

This function returns `'http://xmlns.oracle.com/xdb/XDBResource.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBResource.xsd'`

222.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns `'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'http://xmlns.oracle.com/xdb/XDBSchema.xsd'`

222.2.29 XDBSCHEMA_PREFIXES Function

This function returns `'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`.

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'`

222.2.30 XSD_ATTRIBUTE Function

This function returns `'attribute'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'attribute'`

222.2.31 XSD_COMPLEX_TYPE Function

This function returns `'complexType'`.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
  RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'complexType'`

222.2.32 XSD_ELEMENT Function

This function returns `'element'`.

Syntax

```
DBMS_XDB_CONSTANTS. XSD_ELEMENT
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'element'`

222.2.33 XSD_GROUP Function

This function returns `'group'`

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP
 RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`'group'`

223
DBMS_XDB_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_XDB_REPOS Subprograms

> **See Also:**
>
> Oracle XML DB Developer's Guide for more information regarding:
>
> - Using and managing repository resources
> - ACL-based security management (controlling access to repository resources)
> - Managing XLink and XInclude links
> - Loading documents into the repository
> - Creating, deleting, and managing resource metadata

223.1 DBMS_XDB_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, DBMS_XDBZ, and DBMS_XDB_VERSION - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

223.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `SYS` or XDB. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or XDB, or the current user has the `XDBADMIN` or `DBA` role.

223.3 DBMS_XDB_REPOS Constants

The DBMS_XDB_REPOS package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

Table 223-1 DBMS_XDB_REPOS Constants

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the row in the metadata
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row
DEFAULT_LOCK_TIMEOUT	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
LINK_TYPE_HARD	NUMBER	1	Hard link of a folder to a resource
LINK_TYPE_WEAK	NUMBER	2	Weak link of a folder to a resource
LINK_TYPE_SYMBOLIC	NUMBER	3	Symbolic link of a folder to a resource

223.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the DBMS_XDB_REPOS subprograms and briefly describes them.

Table 223-2 DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CHANGEOWNER Procedure	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function	Creates a virtual path to the resource based on object ID

Table 223-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
CREATERESOURCE Functions	Creates a new resource
DELETERESOURCE Procedure	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
EXISTSRESOURCE Function	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function	Retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`
GETCONTENTXMLTYPE Function	Retrieves the contents of a resource returned as an `XMLTYPE`
GETLOCKTOKEN Procedure	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function	Gets all privileges granted to the current user on a specified resource
GETRESOID Function	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function	Returns `TRUE` if the resource has BLOB content
HASCHARCONTENT Function	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function	Returns `TRUE` if the resource has `REF` to XML content
ISFOLDER Function	Returns `TRUE` if the resource is a folder or container
LINK Procedures	Creates a link to an existing resource
LOCKRESOURCE Function	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure	Deletes all user metadata from a resource
RENAMERESOURCE Procedure	Renames the XDB resource
SETACL Procedure	Sets the ACL on a specified resource
SPLITPATH Procedure	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures	Updates metadata for a resource

223.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 223-3 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
`acl_path`	Absolute path in the Hierarchy for ACL document
`owner`	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

223.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 223-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the`REF` passed in must be unique. In

other words, there must not be a`REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.

- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

223.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 223-5 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

223.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 223-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Path name of the resource for which privileges need to be changed
`ace`	An `XMLType` instance of the `<ace>` element which specifies the `<principal>`, the operation `<grant>` and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (`grant`/`deny`) already exists in the ACL, the new ACE is added at the end of the ACL.

223.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 223-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

223.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-8 CREATEFOLDER Function Parameters

Parameter	Description
`path`	Path name for the new folder

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if `'/folder1/folder2'` is passed as the path parameter, then `'/folder1'` must already exist.

223.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 223-9 CREATEOIDPATH Function Parameters

Parameter	Description
`oid`	Object ID of the resource

223.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Creates a new resource with a specified `XMLType` data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Given a `REF` to an existing `XMLType` row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BLOB` as its contents, and specifies character set of the source `BLOB`:

```
DBMS_XDB_REPOS.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BFILE` as its contents, and specifies character set of the source `BFILE`:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0)
 RETURN BOOLEAN;
```

Creates a resource with a specified `CLOB` as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 223-10 CREATERESOURCE Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if `/foo/bar.txt` is passed in, then folder `/foo` must already exist.
`data`	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
`datarow`	`REF` to an `XMLType` row to be used as the contents
`csid`	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: • From the abspath extension, determine the resource's MIME type. • If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; • Otherwise, it is defaulted to the database character set.
`schemaurl`	For XML data, schema URL data conforms to (default `NULL`)
`elem`	Element name (default `NULL`)

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

223.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 223-11 DELETERESOURCE Procedure Parameters

Parameter	Description
`path`	Path name of the resource to delete
`delete_option`	The option that controls how a a resource is deleted: • `DELETE_RESOURCE` • `DELETE_RECURSIVE` • `DELETE_FORCE` • `DELETE_RECURSIVE_FORCE`

223.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 223-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: • DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table • DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

223.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

223.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 223-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

223.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 223-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

223.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 223-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

223.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 223-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

223.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 223-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

223.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an `XMLTYPE`.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE(
     abspath     IN      VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 223-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
`abspath`	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

223.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(
   path          IN      VARCHAR2,
   locktoken     OUT     VARCHAR2);
```

Parameters

Table 223-20 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

223.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(
   res_path     IN      VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 223-21 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

223.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 223-22 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

223.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

223.4.22 HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-23 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

223.4.23 HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-24 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

223.4.24 HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-25 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

223.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
     abspath     IN      VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-26 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` resource has a `REF` to XML content.

223.4.26 ISFOLDER Function

This function returns `TRUE` if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
     abspath     IN      VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-27 ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource is a folder or container.

223.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);
```

```
DBMS_XDB_REPOS.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 223-28 LINK Procedure Parameters

Parameter	Description
`srcpath`	Path name of the resource to which a link is created
`linkfolder`	Folder in which the new link is placed
`linkname`	Name of the new link
`linktype`	Type of link to be created: • `DBMS_XDB.LINK_TYPE_HARD` (default) • `DBMS_XDB.LINK_TYPE_WEAK` • `DBMS_XDB.LINK_TYPE_SYMBOLIC`

223.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 223-29 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` obtains a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

223.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 223-30 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If `TRUE`, process links of all resources in the folder hierarchy rooted at the specified resource. If `FALSE`, process links of all documents in this folder only.

223.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2);
```

Parameters

Table 223-31 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource

223.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 223-32 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

223.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 223-33 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

223.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 223-34 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

223.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
     abspath     IN      VARCHAR2);
```

Parameters

Table 223-35 TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

223.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 223-36 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

223.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 223-37 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`oldmetadata`	`REF` to the old of metadata
`newmetadata`	`REF` to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
`oldns`	Namespace identifying old metadata
`oldname`	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

224
DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XBD_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

> **Note:**
>
> The Oracle XML DB Repository is deprecated with Oracle Database 23ai.
>
> Oracle recommends that you replace any functionality used in XML DB Repository with alternative technologies.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XDB_VERSION Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

224.1 DBMS_XDB_VERSION Security Model

Owned by `XDB`, the `DBMS_XDB_VERSION` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

224.2 Summary of DBMS_XDB_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

Table 224-1 ***DBMS_XDB_VERSION Package Subprograms***

Method	Description
CHECKIN Function	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure	Checks out a VCR before updating or deleting it
GETCONTENTSBLOBBYRESID Function	Obtain contents as a `BLOB`
GETCONTENTSCLOBBYRESID Function	Obtain contents as a `CLOB`

Table 224-1 (Cont.) *DBMS_XDB_VERSION Package Subprograms*

Method	Description
GETCONTENTSXMLBYRESID Function	Obtain contents as an `XMLType`
GETPREDECESSORS Function	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function	Obtains the resource as an `XMLType`, given the resource object ID
GETSUCCESSORS Function	Retrieves the list of successors by path name
GETSUCCSBYRESID Function	Retrieves the list of successors by resource id
MAKEVERSIONED Function	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

224.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
   pathname VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 224-2 CHECKIN Function Parameters

Parameter	Description
`pathname`	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

224.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
   pathname    VARCHAR2);
```

Parameters

Table 224-3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

224.2.3 GETCONTENTSBLOBBYRESID Function

This function obtain contents as a `BLOB`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN BLOB;
```

Parameters

Table 224-4 GETCONTENTSBLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

224.2.4 GETCONTENTSCLOBBYRESID Function

This function obtains contents as a `CLOB`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYRESID(
   resid     DBMS_XDB.resid_type)
 RETURN CLOB;
```

Parameters

Table 224-5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

224.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN XMLType;
```

Parameters

Table 224-6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Return Values

If the contents are not valid XML, returns NULL.

224.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
   pathname       VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 224-7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if pathname is illegal.

224.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
   resid      resid_type)
 RETURN resid_list_type;
```

Parameters

Table 224-8 GETPREDSBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Usage Notes

Getting predecessors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `RESID` is illegal.

224.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
   resid      resid_type)
 RETURN XMLType;
```

Parameters

Table 224-9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

224.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
   pathname VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 224-10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

224.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid    resid_type)
  RETURN resid_list_type;
```

Parameters

Table 224-11 GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.

224.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 224-12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

224.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname    VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 224-13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.

225
DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XDBRESOURCE Subprograms

> **See Also:**
>
> Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

225.1 DBMS_XDBRESOURCE Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAKEDOCUMENT routine.

225.2 DBMS_XDBRESOURCE Security Model

Owned by XDB, the DBMS_XDBRESOURCE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

225.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the DBMS_XDBRESOURCE subprograms and briefly describes them.

Table 225-1 ***DBMS_XDBRESOURCE Package Subprograms***

Subprogram	Description
FREERESOURCE Procedure	Frees any memory associated with an XDBResource
GETACL Function	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function	Returns the ACL Document for the given resource as XMLType
GETAUTHOR Function	Given an XDBResource, returns its author
GETCHARACTERSET Function	Given an XDBResource, returns its character set
GETCOMMENT Function	Given an XDBResource, returns its comment

Table 225-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
GETCONTENTBLOB Function	Returns the contents of the resource as a `BLOB`
GETCONTENTCLOB Function	Returns the contents of the resource as a `CLOB`
GETCONTENTREF Function	Returns the contents of the resource as an `XMLTypeRef`
GETCONTENTTYPE Function	Given an XDBResource, returns its content-type
GETCONTENTXML Function	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function	Returns the contents of the resource as a string
GETCREATIONDATE Function	Given an XDBResource, returns its creation date
GETCREATOR Function	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function	Given an XDBResource, returns its display name
GETLANGUAGE Function	Given an XDBResource, returns its language
GETLASTMODIFIER Function	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function	Given an XDBResource, returns its modification date
GETOWNER Function	Given an XDBResource, returns its owner.
GETREFCOUNT Function	Given an XDBResource, returns its reference count
GETVERSIONID Function	Given an XDBResource, returns its version ID.
HASACLCHANGED Function	Returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise
HASAUTHORCHANGED Function	Returns `TRUE` if the ACL of the given resource has changed `FALSE` otherwise
HASCHANGED Function	Returns `TRUE` if the element or attribute represented by the given XPath has changed, `FALSE` otherwise
HASCHARACTERSETCHANGED Function	Returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise
HASCOMMENTCHANGED Function	Returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise
HASCONTENTCHANGED Function	Returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise
HASCONTENTTYPECHANGED Function	Returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise
HASCREATIONDATECHANGED Function	Returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise
HASCREATORCHANGED Function	Returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise
HASCUSTOMMETADATACHANGED Function	Returns `TRUE` if custom-metadata for this XPath has changed, `FALSE` otherwise
HASDISPLAYNAMECHANGED Function	Returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise
HASLANGUAGECHANGED Function	Returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise

Table 225-1 (Cont.) *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
HASLASTMODIFIERCHANGED Function	Returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise
HASMODIFICATIONDATECHANGED Function	Returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise
HASOWNERCHANGED Function	Returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise
HASREFCOUNTCHANGED Function	Returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise
HASVERSIONIDCHANGED Function	Returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise
ISFOLDER Function	Returns `TRUE` if the given resource is a folder, `FALSE` otherwise
ISNULL Function	Returns `TRUE` if input resource is `NULL`, `FALSE` otherwise
MAKEDOCUMENT Function	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure	Updates the resource with any modifications
SETACL Procedure	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure	Sets the character set of the given XDBResource to a specified character set
SETCOMMENT Procedure	Sets a comment associated with the given XDBResource
SETCONTENT Procedures	Replaces the contents of the given resource with the given `CLOB`
SETCONTENTTYPE Procedure	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure	Sets the display name of the given XDBResource
SETLANGUAGE Procedure	Sets the language of the given XDBResource
SETOWNER Procedure	Sets the owner of the given XDBResource

225.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

225.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESOURCE.GETACL (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-3 GETACL Function Parameters

Parameter	Description
res	XDBResource

225.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as `XMLType`.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (
   res    IN     XDBResource)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 225-4 GETACLDOCFROMRES Function Parameters

Parameter	Description
res	XDBResource

225.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-5 GETAUTHOR Function Parameters

Parameter	Description
res	XDBResource

225.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

225.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-7 GETCOMMENT Function Parameters

Parameter	Description
res	XDBResource

225.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a `BLOB`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (
   res     IN     XDBResource,
   csid    OUT    PLS_INTEGER)
 RETURN BLOB;
```

Parameters

Table 225-8 GETCONTENTBLOB Function Parameters

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

225.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (
   res    IN    XDBResource)
 RETURN CLOB;
```

Parameters

Table 225-9 GETCONTENTCLOB Function Parameters

Parameter	Description
res	XDBResource

225.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-10 GETCONTENTREF Function Parameters

Parameter	Description
res	XDBResource

225.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-11 GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

225.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (
   res    IN     XDBResource)
 RETURN XMLType;
```

Parameters

Table 225-12 GETCONTENTXML Function Parameters

Parameter	Description
res	XDBResource

225.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

225.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
   res    IN     XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 225-14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

225.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

225.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
   res         IN    XDBResource,
   xpath       IN    VARCHAR2,    namespace  IN    VARCHAR2)
 RETURN XMLType;
```

Parameters

Table 225-16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

225.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

225.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

225.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-19 GETLASTMODIFIER Function Parameters

Parameter	Description
res	XDBResource

225.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (
   res    IN     XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 225-20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

225.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (
   res    IN     XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 225-21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

225.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (
   res    IN     XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 225-22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

225.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (
   res    IN     XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 225-23 GETVERSIONID Function Parameters

Parameter	Description
res	XDBResource

225.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-24 HASACLCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
   res          IN    XDBResource,
   xpath        IN    VARCHAR2,
   namespace    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 225-26 HASCHANGED Function Parameters

Parameter	Description
`res`	XDBResource
`xpath`	XPath to check
`bnamespace`	Namespace to use

225.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.28 HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-29 HASCONTENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.29 HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-32 HASCREATORCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.36 HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.37 HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-38 HASOWNERCHANGED Function Parameters

Parameter	Description
res	XDBResource

225.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.39 HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

225.3.40 ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

225.3.41 ISNULL Function

This function returns TRUE if input resource is NULL.

Syntax

```
DBMS_XDBRESOURCE.ISNULL (
   res    IN     XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 225-42 ISNULL Function Parameters

Parameter	Description
res	Input resource

225.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

> **See Also:**
>
> The DBMS_XMLDOM package

Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
   res    IN     XDBResource)
 RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 225-43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

225.3.43 SAVE Procedure

This procedures updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (
   res    IN    XDBResource);
```

Parameters

Table 225-44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

225.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESOURCE.SETACL (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 225-45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

225.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
   res     IN OUT  XDBResource,
   author  IN      VARCHAR2);
```

Parameters

Table 225-46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource
author	Author

225.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (
   res      IN OUT  XDBResource,
   charSet  IN      VARCHAR2);
```

Parameters

Table 225-47 SETCHARACTERSET Procedure Parameters

Parameter	Description
res	XDBResource
charset	New character set

225.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
   res      IN OUT  XDBResource,
   comment  IN      VARCHAR2);
```

Parameters

Table 225-48 SETCOMMENT Procedure Parameters

Parameter	Description
res	XDBResource
comment	New comment

225.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BFILE,
   csid     IN      NUMBER);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BLOB,
   csid     IN      PLS_INTEGER);

DBMS_XDBRESOURCE.SETCONTENT (
```

```
   res      IN OUT  XDBResource,
   data     IN      CLOB);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      REF SYS.XMLType,
   sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      SYS.XMLType);
```

Parameters

Table 225-49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

225.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENTTYPE (
   res         IN OUT  XDBResource,
   conttype    IN      VARCHAR2);
```

Parameters

Table 225-50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

225.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
   res          IN OUT  XDBResource,
   xpath        IN      VARCHAR2,
```

```
   namespace    IN      VARCHAR2,
   newMetadata  IN      XMLType);
```

Parameters

Table 225-51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

225.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
   res      IN OUT  XDBResource,
   name     IN      VARCHAR2);
```

Parameters

Table 225-52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

225.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given `XDBResource`.

Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 225-53 SETLANGUAGE Procedure Parameters

Parameter	Description
res	XDBResource

Table 225-53 (Cont.) SETLANGUAGE Procedure Parameters

Parameter	Description
ACLPath	New path

225.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (
   res      IN OUT  XDBResource,
   owner    IN      VARCHAR2);
```

Parameters

Table 225-54 SETOWNER Procedure Parameters

Parameter	Description
res	XDBResource
owner	New owner

Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.

226
DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- Security Model
- Constants
- Summary of DBMS_XDBZ Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

226.1 DBMS_XDBZ Security Model

Owned by `XDB`, the `DBMS_XDBZ` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

226.2 DBMS_XDBZ Constants

The `DBMS_XDBZ` package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 226-1 *DBMS_XDBZ Constants* - Name Format

Constant	Type	Value	Description
`NAME_FORMAT_SHORT`	`PLS_INTEGER`	`1`	DB user name or LDAP nickname
`NAME_FORMAT_DISTINGUISHED`	`PLS_INTEGER`	`2`	LDAP distinguished name

Table 226-2 *DBMS_XDBZ Constants* - Enable Option

Constant	Type	Value	Description
`ENABLE_CONTENTS`	`PLS_INTEGER`	`1`	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure

Table 226-2 (Cont.) *DBMS_XDBZ Constants* - Enable Option

Constant	Type	Value	Description
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 226-3 *DBMS_XDBZ Constants* - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

226.3 Summary of DBMS_XDBZ Subprograms

This table lists the DBMS_XDBZ subprograms and briefly describes them.

Table 226-4 *DBMS_XDBZ Package Subprograms*

Method	Description
DISABLE_HIERARCHY Procedure	Disables repository support for the specified XMLTYPE table or view
ENABLE_HIERARCHY Procedure	Enables repository support for the specified XMLType table or view
GET_ACLOID Function	Retrieves the ACL Object ID for the specified resource
GET_USERID Function	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function	Determines if repository support for the specified XMLType table or view is enabled
PURGELDAPCACHE Function	Purges the LDAP nickname cache

226.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

226.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular `XMLType` table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
   object_schema IN VARCHAR2,
   object_name   IN VARCHAR2);
```

Parameters

Table 226-5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	Schema name of the `XMLType` table or view
`object_name`	Name of the `XMLType` table or view

226.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular `XMLType` table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
   object_schema   IN   VARCHAR2,
   object_name     IN   VARCHAR2,
   hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 226-6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	Schema name of the `XMLType` table or view
`object_name`	Name of the `XMLType` table or view

Table 226-6 (Cont.) ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
hierarchy_type	How to enable the hierarchy. • ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository • ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

226.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
   aclpath    IN   VARCHAR2,
   acloid     OUT  RAW)
 RETURN BOOLEAN;
```

Parameters

Table 226-7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

Return Values

Returns TRUE if successful.

226.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
   username IN  VARCHAR2,
   userid   OUT RAW,
   format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
 RETURN BOOLEAN;
```

Parameters

Table 226-8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: • DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname • DBMS_XDBZ.NAME_FORMAT_DISTINGUISHIED -- LDAP distinguished name.

Return Values

Returns TRUE if successful.

226.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
   object_schema    IN  VARCHAR2,
   object_name      IN  VARCHAR2,
   hierarchy_type   IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
 RETURN BOOLEAN;
```

Parameters

Table 226-9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view
hierarchy_type	Type of hierarchy to check for: • IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS • IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

226.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
 RETURN BOOLEAN;
```

227
DBMS_XEVENT

The DBMS_XEVENTpackage provides event-related types and supporting subprograms.

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_XEVENT Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

227.1 DBMS_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

227.2 DBMS_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

Table 227-1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	

Table 227-1 (Cont.) DBMS_XEVENT Constants

Name	Type	Value	Description
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

227.3 Subprogram Groups

The subprograms in the DBMS_XEVENT package can be divided in groups.

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms

227.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 227-2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event
GETEVENT Function	Returns a value identifying the triggering event
ISNULL Functions	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 227-3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function	Returns an `XDBLink` object for the target resource
GETLOCK Function	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function	Returns the original `XDBResource` object before the operation was executed
GETOPENACCESSMODE Function	Returns the access mode for the open operation
GETOPENDENYMODE Function	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function	Returns the value of a request or session-specific parameter
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function	Returns the `XDBPath` object representing the path of the resource for which the event was fired
GETRESOURCE Function	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins

Table 227-3 (Cont.) XDBRepositoryEvent Subprograms

Subprogram	Description
GETXDBEVENT Function	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type
ISNULL Functions	Returns `TRUE` if input argument is `NULL`
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure	sets the `BLOB` from which the rendered contents can be read

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 227-4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure	Clears the handler list
GETFIRST Function	Returns the first handler in the list
GETNAME Function	Returns the next handler in the list
ISNULL Functions	Returns `TRUE` if input argument is `NULL`
REMOVE Procedure	Removes the specified handler from the handler list

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 227-5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function	Returns the implementation language of the handler
GETSCHEMA Function	Returns the schema of the handler's source
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 227-6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function	Returns the string representation of the path
GETPARENTPATH Function	Returns the parent's path
ISNULL Functions	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.3.6 DBMS_XEVENT XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 227-7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDOID Function	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function	Returns the link's parent folder's name
GETPARENTOID Function	Returns the link's parent folder's OID
ISNULL Functions	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

227.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

Table 227-8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure	Clears the handler list	XDBHandlerList Type Subprograms
GETAPPLICATIONDATA Function	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms
GETCHILDOID Function	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms
GETCURRENTUSER Function	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms
GETEVENT Function	Returns a value identifying the triggering event	XDBEvent Type Subprograms

Table 227-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETFIRST Function	Returns the first handler in the list	XDBHandlerList Type Subprograms
GETHANDLERLIST Function	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms
GETINTERFACE Function	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms
GETLANGUAGE Function	Returns the implementation language of the handler	XDBHandler Type Subprograms
GETLINK Function	Returns an `XDBLink` object for the target resource	XDBRepositoryEvent Type Subprograms
GETLOCK Function	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms
GETNAME Function	Returns the string representation of the path	XDBPath Type Subprograms
GETNAME Function	Returns the next handler in the list	XDBHandlerList Type Subprograms
GETOLDRESOURCE Function	Returns the original `XDBResource` object before the operation was executed	XDBRepositoryEvent Type Subprograms
GETOPENACCESSMODE Function	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOPENDENYMODE Function	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms
GETOUTPUTSTREAM Function	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms
GETPARAMETER Function	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms
GETPARENT Function	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms
GETPARENTNAME Function	Returns the link's parent folder's name	XDBLink Type Subprograms
GETPARENTOID Function	Returns the link's parent folder's OID	XDBLink Type Subprograms
GETPARENTNAME Function	Returns the parent's path	XDBPath Type Subprograms
GETPATH Function	Returns the `XDBPath` object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms
GETRESOURCE Function	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms
GETSCHEMA Function	Returns the schema of the handler's source	XDBHandler Type Subprograms

Table 227-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms
GETXDBEVENT Function	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type	XDBRepositoryEvent Type Subprograms
ISNULL Functions	Returns `TRUE` if input argument is `NULL`	XDBEvent Type Subprograms XDBRepositoryEvent Type Subprograms XDBHandlerList Type Subprograms XDBHandler Type Subprograms XDBPath Type Subprograms
REMOVE Procedure	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms
SETRENDERSTREAM Procedure	sets the `BLOB` from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms

227.4.1 CLEAR Procedure

This procedure clears the handler list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl       IN OUT   XDBHandlerList);
```

Parameters

Table 227-9 CLEAR Procedure Parameters

Parameter	Description
`hl`	Handler list

227.4.2 GETAPPLICATIONDATA Function

This function returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev   IN   XDBRepositoryEvent)
  RETURN XMLType;
```

Parameters

Table 227-10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.3 GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 227-11 GETCHILDOID Function Parameters

Parameter	Description
link	Link

227.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:**
>
> XDBEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev   IN   XDBEvent)
  RETURN VARCHAR2;
```

Parameters

Table 227-12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

227.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:**
>
> XDBEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev   IN   XDBEvent)
  RETURN XDBEventID;
```

Parameters

Table 227-13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

227.4.6 GETFIRST Function

This function returns the first handler in the list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 227-14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

227.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBHandlerList;
```

Parameters

Table 227-15 GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev   IN   XDBRepositoryEvent)
  RETURN VARCHAR2;
```

Parameters

Table 227-16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 227-17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

227.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLink;
```

Parameters

Table 227-18 GETLINK Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

227.4.11 GETLINKNAME Function

This function returns the name of the link.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 227-19 GETLINKNAME Function Parameters

Parameter	Description
`link`	Link

227.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation.I t is only valid for lock and unlock events.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLock;
```

Parameters

Table 227-20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 227-21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

227.4.14 GETNAME Function

This function returns the string representation of the path.

> **See Also:**
>
> XDBPath Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
  RETURN VARCHAR2;
```

Parameters

Table 227-22 GETNAME Function Parameters

Parameter	Description
path	Path

227.4.15 GETNEXT Function

This function returns the next handler in the list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 227-23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

227.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 227-24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 227-25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- `XDBRepositoryEvent.OPEN_ACCESS_READ` (value 1)

- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

227.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 227-26 GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

227.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev   IN   XDBRepositoryEvent)
  RETURN BLOB;
```

Parameters

Table 227-27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the key parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 227-28 GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: • ACCEPT • ACCEPT-LANGUAGE • ACCEPT-CHARSET • ACCEPT_ENCODING

227.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 227-29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 227-30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

227.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

> **See Also:**
>
> XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 227-31 GETPARENTOID Function Parameters

Parameter	Description
link	Link

227.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

> **See Also:**
>
> XDBPath Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path   IN   XDBPath,
   level   IN   INTEGER)
  RETURN XDBPath;
```

Parameters

Table 227-32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

227.4.25 GETPATH Function

This function returns the XDBPath object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBPath;
```

Parameters

Table 227-33 GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 227-34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 227-35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

227.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

> **See Also:**
>
> XDBHandler Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 227-36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

227.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 227-37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 227-38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

> **See Also:**
>
> XDBRepositoryEvent Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBETEVENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters

Table 227-39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

227.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

> **See Also:**
>
> - XDBEvent Type Subprograms for other subprograms in this group
> - XDBRepositoryEvent Type Subprograms for other subprograms in this group
> - XDBHandlerList Type Subprograms for other subprograms in this group
> - XDBHandler Type Subprograms for other subprograms in this group
> - XDBPath Type Subprograms for other subprograms in this group
> - XDBLink Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN   XDBEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN   XDBRepositoryEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN   XDBHandlerList)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN   XDBHandler)
  RETURN BOOLEAN;
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN   XDBPath)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN   XDBLink)
  RETURN BOOLEAN;
```

Parameters

Table 227-40 ISNULL Function Parameters

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler
path	Path

227.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

> **See Also:**
>
> XDBHandlerList Type Subprograms for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

Table 227-41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

227.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);
```

Parameters

Table 227-42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

227.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN   XDBRepositoryEvent,
    istr  IN   BLOB);
```

Parameters

Table 227-43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

228
DBMS_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Types
- Exceptions
- Subprogram Groups
- Subprogram Groups
- Summary of DBMS_XMLDOM Subprograms

> **See Also:**
>
> *Oracle XML Developer's Kit Programmer's Guide*

228.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

> **Note:**
>
> Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

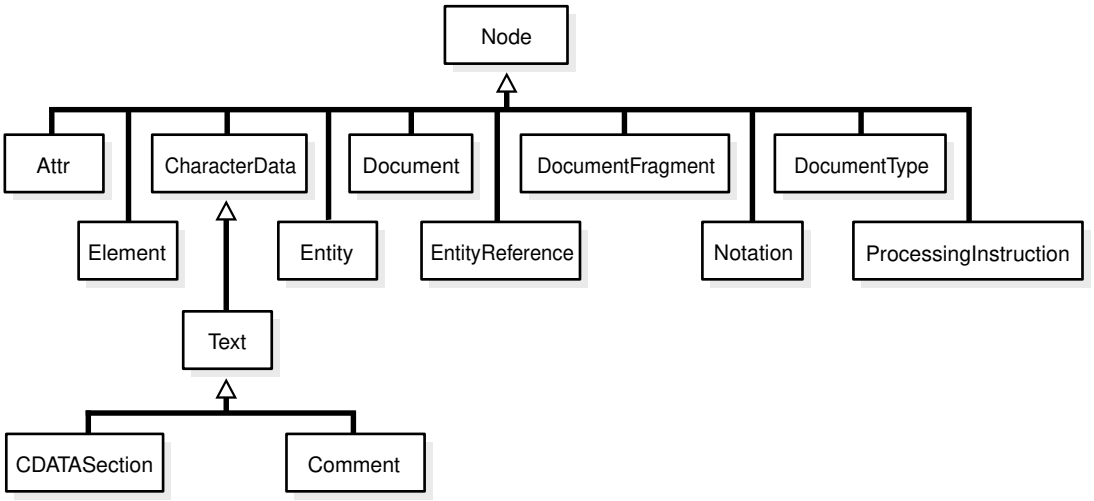
One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and

applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a `DOMNode n`, the APPENDCHILD FunctionPL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement elem`SETATTRIBUTE Procedures, use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 228-1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNode`s can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `make`*`XXX`* functions, where `DOM`*`XXX`* is the desired DOM type.

Figure 228-1 Inheritance Diagram for DOM Types



The implementation of this interface follows the REC-DOM-Level-1-19981001.

228.2 DBMS_XMLDOM Security Model

Owned by `XDB`, the `DBMS_XMLDOM` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

228.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 228-1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

228.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the DBMS_XMLDOM.DOMTYPE package.

Table 228-2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDataSection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.

Table 228-2 (Cont.) XDB_XMLDOM Types

Type	Description
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

228.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS_XMLDOM:

Table 228-3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

228.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms
- DOMAttr Subprograms
- DOMCDataSection Subprograms

- DOMCharacterData Subprograms
- DOMComment Subprograms
- DOMDocument Subprograms
- DOMDocumentFragment Subprograms
- DOMDocumentType Subprograms
- DOMElement Subprograms
- DOMEntity Subprograms
- DOMEntityReference Subprograms
- DOMImplementation Subprograms
- DOMNamedNodeMap Subprograms
- DOMNodeList Subprograms
- DOMNotation Subprograms
- DOMProcessingInstruction Subprograms
- DOMText Subprograms

228.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

Table 228-4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function	Adopts a node from another document
APPENDCHILD Function	Appends a new child to the node
CLONENODE Function	Clones the node
FREENODE Procedure	Frees all resources associated with the node
GETATTRIBUTES Function	Retrieves the attributes of the node
GETCHILDNODES Function	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the node
GETFIRSTCHILD Function	Retrieves the first child of the node
GETLASTCHILD Function	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions	Retrieves the node's namespace URI
GETNEXTSIBLING Function	Retrieves the next sibling of the node
GETNODENAME Function	Retrieves the Name of the Node
GETNODETYPE Function	Retrieves the Type of the node
GETNODEVALUE Function	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function	Retrieves the owner document of the node

Table 228-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
GETPARENTNODE Function	Retrieves the parent of this node
GETPREFIX Function	Retrieves the namespace prefix
GETPREVIOUSSIBLING Function	Retrieves the previous sibling of the node
GETSCHEMANODE Function	Retrieves the associated schema URI
HASATTRIBUTES Function	Tests if the node has attributes
HASCHILDNODES Function	Tests if the node has child nodes
IMPORTNODE Function	Imports a node from another document
INSERTBEFORE Function	Inserts a child before the reference child
ISNULL Functions	Tests if the node is `NULL`
MAKEATTR Function	Casts the node to an Attribute
MAKECDATASECTION Function	Casts the node to a CData Section
MAKECHARACTERDATA Function	Casts the node to Character Data
MAKECOMMENT Function	Casts the node to a Comment
MAKEDOCUMENT Function	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type
MAKEELEMENT Function	Casts the node to a DOM Element
MAKEENTITY Function	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference
MAKENOTATION Function	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction
MAKETEXT Function	Casts the node to a DOM Text
REMOVECHILD Function	Removes a specified child from a node
REPLACECHILD Function	Replaces the old child with a new child
SETNODEVALUE Procedure	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream
SETPREFIX Procedure	Sets the namespace prefix
USEBINARYSTREAM Function	Establishes that the stream is valid
WRITETOBUFFER Procedures	Writes the contents of the node to a buffer
WRITETOCLOB Procedures	Writes the contents of the node to a `CLOB`
WRITETOFILE Procedures	Writes the contents of the node to a file

228.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions	Retrieves the local name of the attribute
GETNAME Functions	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function	Tests if attribute was specified in the element
GETVALUE Function	Retrieves the value of the attribute
ISNULL Functions	Tests if the Attribute node is `NULL`
MAKENODE Functions	Casts the Attribute to a node
SETVALUE Procedure	Sets the value of the attribute

228.6.3 DBMS_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `CDataSection` is `NULL`
MAKENODE Functions	Casts the `CDatasection` to a node

228.6.4 DBMS_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure	Appends the specified data to the node data
DELETEDATA Procedure	Deletes the data from the specified offSets
GETDATA Functions	Retrieves the data of the node
GETLENGTH Functions	Retrieves the length of the data
INSERTDATA Procedure	Inserts the data in the node at the specified offSets
ISNULL Functions	Tests if the CharacterData is `NULL`
MAKENODE Functions	Casts the CharacterData to a node
REPLACEDATA Procedure	Changes a range of characters in the node

Table 228-7 (Cont.) Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
SETDATA Procedures	Sets the data to the node
SUBSTRINGDATA Function	Retrieves the substring of the data

228.6.5 DBMS_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the comment is `NULL`
MAKENODE Functions	Casts the Comment to a node

228.6.6 DBMS_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions	Creates an Attribute
CREATECDATASECTION Function	Creates a `CDataSection` node
CREATECOMMENT Function	Creates a Comment node
CREATEDOCUMENT Function	Creates a new Document
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment
CREATEELEMENT Functions	Creates a new Element
CREATEENTITYREFERENCE Function	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction
CREATETEXTNODE Function	Creates a Text node
FREEDOCFRAG Procedure	Frees the document fragment
FREEDOCUMENT Procedure	Frees the document
GETCHARSET Function	Retrieves the characterset of the `DOM` document
GETDOCTYPE Function	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function	Retrieves the DOM implementation

Table 228-9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
GETSTANDALONE Function	Retrieves the standalone property of the document
GETVERSION Function	Retrieves the version of the document
GETXMLTYPE Function	Retrieves the `XMLType` associated with the DOM Document
ISNULL Functions	Tests if the document is `NULL`
MAKENODE Functions	Casts the document to a node
NEWDOMDOCUMENT Functions	Creates a new document
SETCHARSET Procedure	Sets the characterset of the `DOM` document
SETDOCTYPE Procedure	Sets the DTD of the document
SETSTANDALONE Procedure	Sets the standalone property of the document
SETVERSION Procedure	Sets the version of the document
WRITETOBUFFER Procedures	Writes the document to a buffer
WRITETOCLOB Procedures	Writes the document to a `CLOB`
WRITETOFILE Procedures	Writes the document to a file

228.6.7 DBMS_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure	Frees the specified document fragment
ISNULL Functions	Tests if the DocumentFragment is `NULL`
MAKENODE Functions	Casts the Document Fragment to a node
WRITETOBUFFER Procedures	Writes the contents of a document fragment into a buffer

228.6.8 DBMS_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function	Finds the specified entity in the document type
FINDNOTATION Function	Finds the specified notation in the document type
GETENTITIES Function	Retrieves the nodemap of entities in the Document type
GETNAME Functions	Retrieves the name of the Document type

Table 228-11 (Cont.) Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions	Retrieves the public ID of the document type
GETSYSTEMID Functions	Retrieves the system ID of the document type
ISNULL Functions	Tests if the Document Type is `NULL`
MAKENODE Functions	Casts the document type to a node

228.6.9 DBMS_XMLDOM DOMElement Subprograms

This table lists the DOMElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 228-12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure	Frees memory allocated to a DOMElement handle
GETATTRIBUTE Functions	Retrieves the attribute node by name
GETATTRIBUTENODE Functions	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions	Retrieves the qualified name of the element
GETTAGNAME Function	Retrieves the Tag name of the element
HASATTRIBUTE Functions	Tests if an attribute exists
ISNULL Functions	Tests if the Element is `NULL`
MAKENODE Functions	Casts the Element to a node
NORMALIZE Procedure	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures	Sets the attribute specified by the name
SETATTRIBUTENODE Functions	Sets the attribute node in the element

228.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

Table 228-13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function	Retrieves the notation name of the entity
GETPUBLICID Functions	Retrieves the public Id of the entity
GETSYSTEMID Functions	Retrieves the system Id of the entity
ISNULL Functions	Tests if the Entity is `NULL`
MAKENODE Functions	Casts the Entity to a node

228.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

Table 228-14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `DOMEntityReference` is `NULL`
MAKENODE Functions	Casts the `DOMEntityReference` to `NULL`

228.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

Table 228-15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the `DOMImplementation` node is `NULL`
HASFEATURE Function	Tests if the `DOMImplementation` implements a feature

228.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

Table 228-16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions	Retrieves the number of items in the map
GETNAMEDITEM Function	Retrieves the item specified by the name
ISNULL Functions	Tests if the `NamedNodeMap` is `NULL`
ITEM Functions	Retrieves the item given the index in the map
REMOVENAMEDITEM Function	Removes the item specified by name
SETNAMEDITEM Function	Sets the item in the map specified by the name

228.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

Table 228-17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure	Frees all resources associated with a nodelist
GETLENGTH Functions	Retrieves the number of items in the list
ISNULL Functions	Tests if the `NodeList` is `NULL`
ITEM Functions	Retrieves the item given the index in the list

228.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

Table 228-18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions	Retrieves the public Id of the notation
GETSYSTEMID Functions	Retrieves the system Id of the notation
ISNULL Functions	Tests if the Notation is `NULL`
MAKENODE Functions	Casts the notation to a node

228.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

Table 228-19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions	Retrieves the data of the processing instruction
GETTARGET Function	Retrieves the target of the processing instruction
ISNULL Functions	Tests if the Processing Instruction is `NULL`
MAKENODE Functions	Casts the Processing Instruction to a node
SETDATA Procedures	Sets the data of the processing instruction

228.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

Table 228-20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions	Tests if the text is `NULL`
MAKENODE Functions	Casts the text to a node
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes

228.7 Summary of DBMS_XMLDOM Subprograms

This table lists the DBMS_XMLDOM subprograms and briefly describes them.

Table 228-21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function	Adopts a node from another document	DOMNode Subprograms
APPENDCHILD Function	Appends a new child to the node	DOMNode Subprograms
APPENDDATA Procedure	Appends the specified data to the node data	DOMCharacterData Subprograms
CLONENODE Function	Clones the node	DOMNode Subprograms
CREATEATTRIBUTE Functions	Creates an Attribute	DOMDocument Subprograms
CREATECDATASECTION Function	Creates a `CDataSection` node	DOMDocument Subprograms
CREATECOMMENT Function	Creates a Comment node	DOMDocument Subprograms
CREATEDOCUMENT Function	Creates a new Document	DOMDocument Subprograms
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment	DOMDocument Subprograms
CREATEELEMENT Functions	Creates a new Element	DOMDocument Subprograms
CREATEENTITYREFERENCE Function	Creates an Entity reference	DOMDocument Subprograms
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction	DOMDocument Subprograms
CREATETEXTNODE Function	Creates a Text node	DOMDocument Subprograms
DELETEDATA Procedure	Deletes the data from the specified offSets	DOMCharacterData Subprograms
FINDENTITY Function	Finds the specified entity in the document type	DOMDocumentType Subprograms
FINDNOTATION Function	Finds the specified notation in the document type	DOMDocumentType Subprograms
FREEDOCFRAG Procedure	Frees the document fragment	DOMDocument Subprograms and DOMDocumentFragment Subprograms
FREEDOCUMENT Procedure	Frees the document	DOMDocument Subprograms
FREEELEMENT Procedure	Frees memory allocated to a DOMElement handle	DOMElement Subprograms
FREENODE Procedure	Frees all resources associated with the node	DOMNode Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
FREENODELIST Procedure	Frees all resources associated with a nodelist	DOMNodeList Subprograms
GETATTRIBUTE Functions	Retrieves the attribute node by name	DOMElement Subprograms
GETATTRIBUTENODE Functions	Retrieves the attribute node by name	DOMElement Subprograms
GETATTRIBUTES Function	Retrieves the attributes of the node	DOMNode Subprograms
GETCHARSET Function	Retrieves the characterset of the `DOM` document	DOMDocument Subprograms
GETCHILDNODES Function	Retrieves the children of the node	DOMNode Subprograms
GETCHILDRENBYTAGNAME Functions	Retrieves children of the element by tag name	DOMCharacterData Subprograms
GETDATA Functions	Retrieves • the data of the node • the data of the processing instruction	• DOMCharacterData Subprograms • DOMProcessingInstruction Subprograms
GETDOCTYPE Function	Retrieves the DTD of the document	DOMDocument Subprograms
GETDOCUMENTELEMENT Function	Retrieves the root element of the document	DOMDocument Subprograms
GETELEMENTSBYTAGNAME Functions	Retrieves • the elements in the DOMNODELIST by tag name • elements in the subtree of a DOMNODELIST by tagname	• DOMDocument Subprograms • DOMElement Subprograms
GETENTITIES Function	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms
GETEXPANDEDNAME Procedure and Functions	Retrieves • the expanded name of the node • the expanded name of the attribute • the expanded name of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms
GETFIRSTCHILD Function	Retrieves the first child of the node	DOMNode Subprograms
GETIMPLEMENTATION Function	Retrieves the DOM implementation	DOMDocument Subprograms
GETLASTCHILD Function	Retrieves the last child of the node	DOMNode Subprograms
GETLENGTH Functions	Retrieves • the length of the data • the number of items in the map • the number of items in the list	• DOMCharacterData Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms
GETLOCALNAME Procedure and Functions	Retrieves • the local part of the qualified name • the local name of the attribute • the local name of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNAME Functions	Retrieves • the name of the attribute • the name of the Document type	• DOMAttr Subprograms • DOMDocumentType Subprograms
GETNAMEDITEM Function	Retrieves • an item specified by name • and namespace URI)	• DOMNamedNodeMap Subprograms • DOMNamedNodeMap Subprograms
GETNAMESPACE Procedure and Functions	Retrieves • the node's namespace URI • the NS URI of the attribute • the NS URI of the element	• DOMNode Subprograms • DOMAttr Subprograms • DOMElement Subprograms
GETNEXTSIBLING Function	Retrieves the next sibling of the node	DOMNode Subprograms
GETNODENAME Function	Retrieves the Name of the Node	DOMNode Subprograms
GETNODETYPE Function	Retrieves the Type of the node	DOMNode Subprograms
GETNODEVALUE Function	Retrieves the Value of the Node	DOMNode Subprograms
GETNODEVALUEASBINARYSTREAM Function & Procedure	Retrieves the Node Value as binary stream	DOMNode Subprograms
GETNODEVALUEASCHARACTERSTREAM Function & Procedure	Retrieves the Node Value as character stream	DOMNode Subprograms
GETNOTATIONNAME Function	Retrieves the notation name of the entity	DOMEntity Subprograms
GETNOTATIONS Function	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms
GETTARGET Function	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms
GETOWNERDOCUMENT Function	Retrieves the owner document of the node	DOMNode Subprograms
GETOWNERELEMENT Function	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms
GETPARENTNODE Function	Retrieves the parent of this node	DOMNode Subprograms
GETPREFIX Function	Retrieves the namespace prefix)	DOMNode Subprograms
GETPREVIOUSSIBLING Function	Retrieves the previous sibling of the node	DOMNode Subprograms
GETPUBLICID Functions	Retrieves • the public ID of the document type • the public Id of the entity • the public Id of the notation	• DOMDocumentType Subprograms • DOMEntity Subprograms • DOMNotation Subprograms
GETQUALIFIEDNAME Functions	Retrieves • the Qualified Name of the attribute • the qualified name of the element	• DOMAttr Subprograms • DOMElement Subprograms
GETSCHEMANODE Function	Retrieves the associated schema URI	DOMNode Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETSPECIFIED Function	Tests if attribute was specified in the element.	DOMAttr Subprograms
GETSTANDALONE Function	Retrieves the standalone property of the document	DOMDocument Subprograms
GETSYSTEMID Functions	Retrieves • the system ID of the document type • the system Id of the entity • the system Id of the notation	• DOMDocumentType Subprograms • DOMEntity Subprograms • DOMNotation Subprograms
GETTAGNAME Function	Retrieves the Tag name of the element	DOMElement Subprograms
GETVALUE Function	Retrieves the value of the attribute	DOMAttr Subprograms
GETVERSION Function	Retrieves the version of the document	DOMDocument Subprograms)
GETXMLTYPE Function	Retrieves the `XMLType` associated with the DOM Document	DOMDocument Subprograms
HASATTRIBUTES Function	Tests if the node has attributes	DOMNode Subprograms
HASATTRIBUTE Functions	Tests if an attribute exists	DOMElement Subprograms
HASCHILDNODES Function	Tests if the node has child nodes	DOMNode Subprograms
HASFEATURE Function	Tests if the `DOMImplementation` implements a feature	DOMImplementation Subprograms
IMPORTNODE Function	Imports a node from another document	DOMNode Subprograms
INSERTBEFORE Function	Inserts a child before the reference child	DOMNode Subprograms
INSERTDATA Procedure	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions	Tests • if the node is NULL • if the Attribute node is NULL • if the CDataSection is NULL • if the CharacterData is NULL • if the comment is NULL • if the document is NULL • if the DocumentFragment is NULL • if the Document Type is NULL • if the Element is NULL • if the Entity is NULL • if the DOMEntityReference is NULL • if the DOMImplementation node is NULL • if the NamedNodeMap is NULL • if the NodeList is NULL • if the Notation is NULL • if the Processing Instruction is NULL • if the text is NULL	• DOMNode Subprograms • DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMImplementation Subprograms • DOMNamedNodeMap Subprograms • DOMNodeList Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms
ITEM Functions	Retrieves • the item given the index in the map • the item given the index in the NodeList	• DOMNamedNodeMap Subprograms • DOMNodeList Subprograms
MAKEATTR Function	Casts the node to an Attribute	DOMNode Subprograms
MAKECDATASECTION Function	Casts the node to a CData Section	DOMNode Subprograms
MAKECHARACTERDATA Function	Casts the node to Character Data	DOMNode Subprograms
MAKECOMMENT Function	Casts the node to a Comment	DOMNode Subprograms
MAKEDOCUMENT Function	Casts the node to a DOM Document	DOMNode Subprograms
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment	DOMNode Subprograms)
MAKEDOCUMENTTYPE Function	Casts the node to a DOM Document Type	DOMNode Subprograms
MAKEELEMENT Function	Casts the node to a DOM ElemenT	DOMNode Subprograms
MAKEENTITY Function	Casts the node to a DOM Entity	DOMNode Subprograms
MAKEENTITYREFERENCE Function	Casts the node to a DOM Entity Reference	DOMNode Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKENODE Functions	Casts • the Attribute to a node • the `CDatasection` to a node • the CharacterData to a node • the Comment to a node • the document to a node • the Document Fragment to a node • the document type to a node • the Element to a node • the Entity to a node • • the `DOMEntityReference` to `NULL` • the notation to a node • the Processing Instruction to a node • the text to a node	• DOMAttr Subprograms • DOMCDataSection Subprograms • DOMCharacterData Subprograms • DOMComment Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms • DOMDocumentType Subprograms • DOMElement Subprograms • DOMEntity Subprograms • DOMEntityReference Subprograms • DOMNotation Subprograms • DOMProcessingInstruction Subprograms • DOMText Subprograms
MAKENOTATION Function	Casts the node to a DOM Notation	DOMNode Subprograms
MAKEPROCESSINGINSTRUCTION Function	Casts the node to a DOM Processing Instruction	DOMNode Subprograms
MAKETEXT Function	Casts the node to a DOM Text	DOMNode Subprograms
NEWDOMDOCUMENT Functions	Creates a new document	DOMDocument Subprograms
NORMALIZE Procedure	Normalizes the text children of the element	DOMElement Subprograms
REMOVEATTRIBUTE Procedures	Removes the attribute specified by the name	DOMElement Subprograms
REMOVEATTRIBUTENODE Function	Removes the attribute node in the element	DOMElement Subprograms
REMOVECHILD Function	Removes a specified child from a node	DOMNode Subprograms
REMOVENAMEDITEM Function	Removes the item specified by name	DOMNamedNodeMap Subprograms
REPLACECHILD Function	Replaces the old child with a new child	DOMNode Subprograms
REPLACEDATA Procedure	Changes a range of characters in the node	DOMCharacterData Subprograms
RESOLVENAMESPACEPREFIX Function	Resolve the prefix to a namespace URI	DOMElement Subprograms
SETATTRIBUTE Procedures	Sets the attribute specified by the name	DOMElement Subprograms
SETATTRIBUTENODE Functions	Sets the attribute node in the element	DOMElement Subprograms

Table 228-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETCHARSET Procedure	Sets the characterset of the DOM document	DOMDocument Subprograms
SETDATA Procedures	Sets • the data to the node • the data of the processing instruction	• DOMCharacterData Subprograms • DOMProcessingInstruction Subprograms
SETDOCTYPE Procedure	Sets the DTD of the document.	DOMDocument Subprograms
SETNAMEDITEM Function	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms
SETNODEVALUE Procedure	Sets the Value of the node	DOMNode Subprograms
SETNODEVALUEASBINARYSTREAM Function & Procedure	Sets the Node Value as a binary stream	DOMNode Subprograms
SETNODEVALUEASCHARACTERSTREAM Function & Procedure	Sets the Node Value as a character stream	DOMNode Subprograms
SETPREFIX Procedure	Sets the namespace prefix	DOMNode Subprograms
SETSTANDALONE Procedure	Sets the standalone property of the document	DOMDocument Subprograms
SETVALUE Procedure	Sets the value of the attribute	DOMAttr Subprograms
SETVERSION Procedure	Sets the version of the document	DOMDocument Subprograms
SPLITTEXT Function	Splits the contents of the text node into 2 text nodes	DOMText Subprograms
SUBSTRINGDATA Function	Retrieves the substring of the data	DOMCharacterData Subprograms
USEBINARYSTREAM Function	Strabismus that the stream is valid for use	DOMNode Subprograms
WRITETOBUFFER Procedures	Writes • the contents of the node to a buffer • the document to a buffer • the contents of a document fragment into a buffer	• DOMNode Subprograms • DOMDocument Subprograms • DOMDocumentFragment Subprograms
WRITETOCLOB Procedures	Writes • the contents of the node to a CLOB • the document to a CLOB	• DOMNode Subprograms • DOMDocument Subprograms
WRITETOFILE Procedures	Writes • the contents of the node to a file • the document to a file	• DOMNode Subprograms • DOMDocument Subprograms

228.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

> **See Also:**
>
> DOMNode Subprograms for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc             IN   DOMDocument,
   importedNode    IN   DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 228-22 ADOPTNODE Function Parameters

Parameter	Description
`doc`	Document that is adopting the node
`importedNode`	Node to adopt

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

228.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
   n           IN    DOMNode,
   newchild    IN    DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 228-23 APPENDCHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The child to be appended to the list of children of node n

228.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.APPENDDATA(
   cd      IN    DOMCHARACTERDATA,
   arg     IN    VARCHAR2);
```

Parameters

Table 228-24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

228.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.CLONENODE(
   n       IN    DOMNODE,
   deep    IN    BOOLEAN)
 RETURN DOMNODE;
```

Parameters

Table 228-25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

228.7.5 CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN     DOMDOCUMENT,
   name     IN     VARCHAR2)
 RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN     DOMDOCUMENT,
   qname     IN     VARCHAR2,
   ns       IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 228-26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name

Table 228-26 (Cont.) CREATEATTRIBUTE Function Parameters

Parameter	Description
ns	Namespace

228.7.6 CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
   doc      IN       DOMDOCUMENT,
   data     IN       VARCHAR2)
 RETURN DOMCDATASECTION;
```

Parameters

Table 228-27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

228.7.7 CREATECOMMENT Function

This function creates a DOMCOMMENT node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
   doc       IN       DOMDOCUMENT,
   data      IN       VARCHAR2)
 RETURN DOMCOMMENT;
```

Parameters

Table 228-28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

228.7.8 CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
   namespaceURI      IN     VARCHAR2,
   qualifiedName     IN     VARCHAR2,
   doctype           IN     DOMTYPE := NULL)
 RETURN DOMDOCUMENT;
```

Parameters

Table 228-29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

228.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
   doc       IN      DOMDOCUMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 228-30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

228.7.10 CREATEELEMENT Functions

This function creates a DOMELEMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN      DOMDOCUMENT,
   tagName     IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN     DOMDOCUMENT,
   tagName     IN     VARCHAR2,
   ns          IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Parameters

Table 228-31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

228.7.11 CREATEENTITYREFERENCE Function

This function creates a `DOMENTITYREFERENCE` node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
   doc         IN     DOMDOCUMENT,
   name        IN     VARCHAR2)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 228-32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
`doc`	`DOMDOCUMENT`
`name`	New entity reference name

228.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a `DOMPROCESSINGINSTRUCTION` node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
   doc       IN      DOMDocument,
   target    IN      VARCHAR2,
   data      IN      VARCHAR2)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 228-33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
`doc`	`DOMDOCUMENT`
`target`	Target of the new processing instruction

Table 228-33 (Cont.) CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
data	Content data of the new processing instruction

228.7.13 CREATETEXTNODE Function

This function creates a DOMTEXT node.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
   doc      IN     DOMDocument,
   data     IN     VARCHAR2)
 RETURN DOMTEXT;
```

Parameters

Table 228-34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

228.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.DELETEDATA(
   cd         IN     DOMCHARACTERDATA,
   offset     IN     NUMBER,
   cnt        IN     NUMBER);
```

Parameters

Table 228-35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

228.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.FINDENTITY(
   dt      IN      DOMDOCUMENTTYPE,
   name    IN      VARCHAR2,
   par     IN      BOOLEAN)
 RETURN  DOMENTITY;
```

Parameters

Table 228-36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

228.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
   dt         IN     DOMDocumentType,
   name       IN     VARCHAR2)
 RETURN DOMNOTATION;
```

Parameters

Table 228-37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

228.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

> **See Also:**
>
> DOMDocument Subprograms and DOMDocumentFragment Subprograms

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
   df     IN     DOMDOCUMENTFRAGMENT);
```

Parameters

Table 228-38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

228.7.18 FREEDOCUMENT Procedure

This procedure frees `DOMDOCUMENT` object.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
   doc      IN      DOMDOCUMENT);
```

Parameters

Table 228-39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

> **See Also:**
>
> DBMS_XMLDOM DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.FREEELEMENT(
    elem IN DOMELEMENT);
```

Parameters

Table 228-40 FREEELEMENT Procedure Parameters

Parameter	Description
elem	Of type DOMELEMENT

228.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.FREENODE(
   n       IN      DOMNODE);
```

Parameters

Table 228-41 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

228.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

> **See Also:**
>
> DBMS_XMLDOM DOMNodeList Subprograms

Syntax

```
DBMS_XMLDOM.FREENODELIST(
   nl IN DOMNodeList);
```

Parameters

Table 228-42 FREENODELIST Procedure Parameters

Parameter	Description
nl	Of type DOMNODELIST

228.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an DOMELEMENT by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem       IN      DOMELEMENT,
   name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 228-43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

228.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2)
 RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 228-44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

228.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
   n       IN       DOMNode)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 228-45 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

228.7.25 GETCHARSET Function

This function retrieves the characterset of the DOM document.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETCHARSET(
   doc IN     DOMDocument)
 RETURN VARCHAR2;
```

Parameters

Table 228-46 GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

Usage Notes

For a newly parsed document, we return the database characterset. Once the `SETCHARSET` Procedure is called with a non-`NULL` value for `charset`, that `charset` is returned.

228.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
   n       IN     DOMNode)
 RETURN DOMNodeList;
```

Parameters

Table 228-47 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

228.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem       IN       DOMElement,
   name       IN       VARCHAR2)
 RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem       IN       DOMElement,
   name       IN       VARCHAR2,
   ns         IN       VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 228-48 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

228.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.GETDATA(
   cd      IN    DOMCHARACTERDATA)
 RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.GETDATA(
   pi      IN    DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 228-49 GETDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

228.7.29 GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
   doc      IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 228-50 GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
   doc      IN      DOMDOCUMENT)
 RETURN DOMELEMENT;
```

Parameters

Table 228-51 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc         IN      DOMDOCUMENT,
   tagname     IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Parameters

Table 228-52 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

228.7.32 GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.GETENTITIES(
   dt       IN     DOMDocumentType)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 228-53 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

228.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: DOMNode Subprograms)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   n        IN       DOMNODE
   data     OUT      VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   a        IN      DOMAttr)
 RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-54 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the `Node`
a	DOMATTR
elem	DOMELEMENT

228.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
   n       IN       DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 228-55 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

228.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
   doc       IN      DOMDOCUMENT)
 RETURN DOMIMPLEMENTATION;
```

Parameters

Table 228-56 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
   n      IN    DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 228-57 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

228.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   cd      IN      DOMCHARACTERDATA)
 RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   nnm       IN      DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.GETLENGTH(
   nl      IN     DOMNODELIST)
 RETURN NUMBER;
```

Parameters

Table 228-58 GETLENGTH Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

228.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.GETLOCALNAME(
   n        IN     DOMNODE,
   data     OUT    VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETLOCALNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: DOMElement Subprograms)

```
DBMS_XMLDOM.GETLOCALNAME(
   elem        IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-59 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMElement.

228.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETNAME(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Parameters

Table 228-60 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

228.7.40 GETNAMEDITEM Function

`GETNAMEDITEM` retrieves a node specified by name.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2)
 RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2,
   ns     IN  VARCHAR2)
 RETURN DOMNODE;
```

Parameters

Table 228-61 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

228.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   n        IN     DOMNODE,
   data     OUT    VARCHAR2);
```

Retrieves the namespace of the `DOMATTR` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the namespace of the `DOMELEMENT` (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETNAMESPACE(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-62 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

228.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNode;
```

Parameters

Table 228-63 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

228.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODETYPE(
   n        IN      DOMNODE)
 RETURN NUMBER;
```

Parameters

Table 228-64 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

228.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODENAME(
   n        IN      DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 228-65 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

228.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
   n        IN      DOMNODE)
 RETURN VARCHAR2;*
```

Parameters

Table 228-66 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

228.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 228-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

228.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN     DOMNODE)
 RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN    DOMNODE,
   value     IN    SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 228-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

228.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

> **See Also:**
>
> DOMEntity Subprograms

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent        IN     DOMENTITY)
 RETURN VARCHAR2;
```

Parameters

Table 228-69 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOMENTITY

228.7.49 GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

> **See Also:**
>
> DOMDocumentType Subprograms

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
   dt        IN      DOMDOCUMENTTYPE)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 228-70 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

228.7.50 GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

> **See Also:**
>
> DOMProcessingInstruction Subprograms

Syntax

```
DBMS_XMLDOM.GETTARGET(
   pi        IN      DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 228-71 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

228.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENT;
```

Parameters

Table 228-72 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

228.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
   a        IN      DOMATTR)
 RETURN DOMElement;
```

Parameters

Table 228-73 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

228.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
   n        IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 228-74 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

228.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n        IN      DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 228-75 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

228.7.55 GETPREVIOUSSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETPREVIOUSSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 228-76 GETPREVIOUSSIBLING Function Parameters

Parameter	Description
n	DOMNODE

228.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.GETPUBLICID(
   n         IN      DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 228-77 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

228.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   a         IN      DOMATTR)
 RETURN VARCHAR2;
```

Returns the qualified name of the `DOMElement` (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   elem      IN      DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-78 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

228.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n        IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 228-79 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

228.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
   a        IN      DOMATTR)
 RETURN BOOLEAN;
```

Parameters

Table 228-80 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

228.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
   doc        IN      DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-81 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

228.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.GETSYSTEMID(
   n         IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 228-82 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

228.7.62 GETTAGNAME Function

This function returns the name of the DOMELEMENT.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-83 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

228.7.63 GETVALUE Function

This function retrieves the value of the attribute.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.GETVALUE(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Parameters

Table 228-84 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

228.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc       IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 228-85 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
   doc        IN     DOMDOCUMENT)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 228-86 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

228.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem      IN  DOMELEMENT,
   name      IN  VARCHAR2)
 RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem      IN  DOMELEMENT,
   name      IN  VARCHAR2,
   ns        IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 228-87 HASATTRIBUTE Function Parameters

Parameter	Description
`elem`	The `DOMELEMENT`
`name`	Attribute name; * matches any attribute
`ns`	Namespace

228.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
   n        IN      DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 228-88 HASATTRIBUTES Function Parameters

Parameter	Description
`n`	`DOMNODE`

228.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 228-89 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

228.7.69 HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

> **See Also:**
>
> DOMImplementation Subprograms

Syntax

```
DBMS_XMLDOM.HASFEATURE(
   di       IN     DOMIMPLEMENTATION,
   feature  IN     VARCHAR2,
   version  IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 228-90 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

228.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
   doc            IN  DOMDOCUMENT,
   importedNode   IN  DOMNODE,
   deep           IN  BOOLEAN)
  RETURN DOMNODE;
```

Parameters

Table 228-91 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. • If this value is TRUE, the entire subtree of the node will be imported with the node. • If this value is FALSE, only the node itself will be imported.

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

228.7.71 INSERTBEFORE Function

This function inserts the node newchild before the existing child node refchild. If refchild is NULL, insert newchild at the end of the list of children.

If newchild is a DOCUMENTFRAGMENT object, all of its children are inserted, in the same order, before refchild. If the newchild is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
   n          IN     DOMNODE,
   newchild   IN     DOMNODE,
   refchild   IN     DOMNODE)
  RETURN DOMNode;
```

Parameters

Table 228-92 INSERTBEFORE Function Parameters

Parameter	Description
n	DOMNODE

Table 228-92 (Cont.) INSERTBEFORE Function Parameters

Parameter	Description
newChild	The child to be inserted in the DOMNODE
refChild	The reference node before which the newchild is to be inserted

228.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

Table 228-93 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

228.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.ISNULL(
  n         IN     DOMNODE)
 RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.ISNULL(
   a        IN     DOMATTR)
 RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms):

```
DBMS_XMLDOM.ISNULL(
   cds       IN      DOMCDATASECTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.ISNULL(
   cd        IN      DOMCHARACTERDATA)
 RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms):

```
DBMS_XMLDOM.ISNULL(
   com        IN      DOMCOMMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.ISNULL(
   doc        IN      DOMDOCUMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.ISNULL(
   df        IN      DOMDOCUMENTFRAGMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.ISNULL(
   dt        IN      DOMDOCUMENTTYPE)
 RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.ISNULL(
   elem      IN      DOMELEMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.ISNULL(
   ent        IN      DOMENTITY)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms):

```
DBMS_XMLDOM.ISNULL(
   EREF       IN      DOMENTITYREFERENCE)
 RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms):

```
DBMS_XMLDOM.ISNULL(
   di        IN      DOMIMPLEMENTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.ISNULL(
   nnm        IN      DOMNAMEDNODEMAP)
 RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.ISNULL(
   nl        IN      DOMNODELIST)
 RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.ISNULL(
   n        IN      DOMNOTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.ISNULL(
   pi        IN      DOMPROCESSINGINSTRUCTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms):

```
DBMS_XMLDOM.ISNULL(
   t        IN      DOMTEXT)
 RETURN BOOLEAN;
```

Parameters

Table 228-94 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check

Table 228-94 (Cont.) ISNULL Function Parameters

Parameter	Description
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

228.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the INDEX parameter. If INDEX is greater than or equal to the number of nodes in this map, this returns NULL (See Also: DOMNamedNodeMap Subprograms):

```
DBMS_XMLDOM.ITEM(
   nnm       IN     DOMNAMEDNODEMAP,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the INDEX parameter. If index is greater than or equal to the number of nodes in the list, this returns NULL (See Also: DOMNodeList Subprograms):

```
DBMS_XMLDOM.ITEM(
   nl        IN     DOMNODELIST,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Parameters

Table 228-95 ITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
index	The index in the node map at which the item is to be retrieved
nl	DOMNODELIST
index	The index in the NodeList used to retrieve the item

228.7.75 MAKEATTR Function

This function casts a specified `DOMNODE` to a `DOMATTR`, and returns the `DOMATTR`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEATTR(
   n        IN      DOMNODE)
 RETURN DOMATTR;
```

Parameters

Table 228-96 MAKEATTR Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.76 MAKECDATASECTION Function

This function casts a specified `DOMNODE` to a `DOMCDATASECTION`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
   n        IN      DOMNODE)
 RETURN DOMCDATASECTION;
```

Parameters

Table 228-97 MAKECDATASECTION Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.77 MAKECHARACTERDATA Function

This function casts a specified `DOMNODE` to a `DOMCHARACTERDATA`, and returns the `DOMCHARACTERDATA`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
   n        IN      DOMNode)
 RETURN DOMCharacterData;
```

Parameters

Table 228-98 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.78 MAKECOMMENT Function

This function casts a specified `DOMNODE` to a `DOMCOMMENT`, and returns the `DOMCOMMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
   n        IN      DOMNODE)
 RETURN DOMCOMMENT;
```

Parameters

Table 228-99 MAKECOMMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
   n        IN      DOMNODE)
 RETURN DOMDocument;
```

Parameters

Table 228-100 MAKEDOCUMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 228-101 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTTYPE` and returns the `DOMDOCUMENTTYPE`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 228-102 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	`DOMNODE` to cast.

228.7.82 MAKEELEMENT Function

This function casts a specified `DOMNODE` to a `DOMELEMENT`, and returns the `DOMELEMENT`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
   n        IN      DOMNODE)
 RETURN DOMELEMENT;
```

Parameters

Table 228-103 MAKEELEMENT Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.83 MAKEENTITY Function

This function casts a specified `DOMNODE` to a `DOMENTITY`, and returns the `DOMENTITY`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n        IN      DOMNODE)
 RETURN DOMENTITY;
```

Parameters

Table 228-104 MAKEENTITY Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.84 MAKEENTITYREFERENCE Function

This function casts a specified `DOMNODE` to a `DOMENTITYREFERENCE`, and returns the `DOMENTITYREFERENCE`.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
   n        IN      DOMNODE)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 228-105 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	`DOMNODE` to cast

228.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   a         IN     DOMATTR)
 RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   cds       IN     DOMCDATASECTION)
 RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   cd        IN     DOMCHARACTERDATA)
 RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   com       IN     DOMCOMMENT)
 RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   doc       IN     DOMDOCUMENT)
 RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   df        IN     DOMDOCUMENTFRAGMENT)
 RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   elem       IN     DOMELEMENT)
 RETURN DOMNODE;
```

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   ent        IN     DOMENTITY)
 RETURN DOMNODE;
```

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   eref       IN     DOMENTITYREFERENCE)
 RETURN DOMNODE;
```

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   n        IN     DOMNOTATION)
 RETURN DOMNODE;
```

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN DOMNODE;
```

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms):

```
DBMS_XMLDOM.MAKENODE(
   t        IN     DOMTEXT)
 RETURN DOMNODE;
```

Parameters

Table 228-106 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast

Table 228-106 (Cont.) MAKENODE Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION to cast
t	DOMTEXT to cast

228.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
   n        IN      DOMNODE)
 RETURN DOMNOTATION;
```

Parameters

Table 228-107 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

228.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n        IN      DOMNODE)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 228-108 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

228.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.MAKETEXT(
   n        IN      DOMNODE)
 RETURN DOMTEXT;
```

Parameters

Table 228-109 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

228.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc     IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl        IN     CLOB)
 RETURN DOMDOCUMENT;
```

Parameters

Table 228-110 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
cl	CLOB source for the DOMDOCUMENT

228.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.NORMALIZE(
   elem       IN     DOMELEMENT);
```

Parameters

Table 228-111 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

228.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2,
   ns       IN    VARCHAR2);
```

Parameters

Table 228-112 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

228.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
   elem       IN     DOMELEMENT,
   oldAttr    IN     DOMATTR)
  RETURN DOMAttr;
```

Parameters

Table 228-113 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

228.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
   n          IN     DOMNode,
   oldchild   IN     DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 228-114 REMOVECHILD Function Parameters

Parameter	Description
`n`	`DOMNODE`
`oldCHild`	The child of the node `n` to be removed

228.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2)
 RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2,
```

```
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 228-115 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

228.7.95 REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
   n           IN     DOMNode,
   newchild    IN     DOMNode,
   oldchild    IN     DOMNode)
 RETURN DOMNode;
```

Parameters

Table 228-116 REPLACECHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The new child which is to replace the old child
oldchild	The child of the node n which is to be replaced

228.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.REPLACEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER,
   arg       IN     VARCHAR2);
```

Parameters

Table 228-117 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

228.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

> **See Also:**
>
> DOMElement Subprograms

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
   elem       IN     DOMELEMENT,
   prefix     IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 228-118 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

228.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2,
   ns         IN  VARCHAR2);
```

Parameters

Table 228-119 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

228.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

> **See Also:**
>
> DOMElement Subprograms

Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR)
 RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR,
   ns        IN  VARCHAR2)
 RETURN DOMATTR;
```

Parameters

Table 228-120 SETATTRIBUTENODE Function Parameters

Parameter	Description
`elem`	The `DOMELEMENT`
`newAttr`	The new `DOMATTR`
`ns`	The namespace

228.7.100 SETCHARSET Procedure

This function sets the characterset of the DOM document.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETCHARSET(
   doc      IN    DOMDocument,
   charset  IN    VARCHAR2);
```

Parameters

Table 228-121 SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Characterset

Usage Notes

This is used for WRITETOFILE Procedures if not explicitly specified at that time.

228.7.101 SETDATA Procedures

This overloaded procedure sets character data or DOMPROCESSINGINSTRUCTION content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms):

```
DBMS_XMLDOM.SETDATA(
   cd       IN     DOMCHARACTERDATA,
   data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms):

```
DBMS_XMLDOM.SETDATA(
   pi       IN     DOMPROCESSINGINSTRUCTION,
   data     IN     VARCHAR2);
```

Parameters

Table 228-122 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

228.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc      IN   DOMDocument,
  name     IN   VARCHAR2,
  sysid    IN   VARCHAR2,
  pubid    IN   VARCHAR2);
```

Parameters

Table 228-123 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

228.7.103 SETNAMEDITEM Function

This function adds a node using its NodeName attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

> **See Also:**
>
> DOMNamedNodeMap Subprograms

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN      DOMNAMEDNODEMAP,
   arg      IN      DOMNODE)
 RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN      DOMNAMEDNODEMAP,
   arg       IN     DOMNODE,
   ns       IN      VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 228-124 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its NodeName attribute
ns	Namespace

228.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.SETNODEVALUE(
   n         IN     DOMNODE,
   nodeValue IN     VARCHAR2);
```

Parameters

Table 228-125 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

228.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL XMLBINARYOUTPUTSTREAM into which the caller can write the node value. The datatype of the node must be RAW or BLOB – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n       IN      DOMNODE)
 RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n         in    DOMNODE,
   value     in    SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 228-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

228.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

> **See Also:**
>
> DOMNode Subprograms

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN      DOMNODE)
 RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or `CLOB`, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN    DOMNODE,
   value     IN    SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 228-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

228.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.SETPREFIX(
   n       IN     DOMNODE,
   prefix  IN     VARCHAR2);
```

Parameters

Table 228-128 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

228.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
   doc         IN     DOMDOCUMENT,
   newvalue    IN     VARCHAR2);
```

Parameters

Table 228-129 SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

228.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

> **See Also:**
>
> DOMAttr Subprograms

Syntax

```
DBMS_XMLDOM.SETVALUE(
   a        IN     DOMATTR,
   value    IN     VARCHAR2);
```

Parameters

Table 228-130 SETVALUE Procedure Parameters

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

228.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

> **See Also:**
>
> DOMDocument Subprograms

Syntax

```
DBMS_XMLDOM.SETVERSION(
   doc         IN     DOMDOCUMENT,
   version     IN     VARCHAR2);
```

Parameters

Table 228-131 SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

228.7.111 SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

> **See Also:**
>
> DBMS_XMLDOM DOMText Subprograms

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
   t         IN     DOMTEXT,
   offset    IN     NUMBER)
 RETURN DOMText;
```

Parameters

Table 228-132 SPLITTEXT Function Parameters

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

228.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

> **See Also:**
>
> DOMCharacterData Subprograms

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
```

```
   cnt       IN     NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 228-133 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

228.7.113 USEBINARYSTREAM Function

This function returns TRUE if the datatype of the node is RAW or BLOB, so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM.

If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

> **See Also:**
>
> DOMNode Subprograms

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM   (
   n         IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 228-134 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

228.7.114 WRITETOBUFFER Procedures

WRITETOBUFFER is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   n         IN       DOMNODE,
   buffer    IN OUT   VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   doc       IN       DOMDOCUMENT,
   buffer    IN OUT   VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms):

```
DBMS_XMLDOM.WRITETOBUFFER(
   df        IN       DOMDOCUMENTFRAGMENT,
   buffer    IN OUT   VARCHAR2);
```

Parameters

Table 228-135 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

228.7.115 WRITETOCLOB Procedures

`WRITETOCLOB` is an overloaded procedure that writes an XML node or document to a specified `CLOB`.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified `CLOB` using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOCLOB(
   n         IN       DOMNODE,
   cl        IN OUT   CLOB);
```

Writes XML document to a specified `CLOB` using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOCLOB(
   doc       IN       DOMDOCUMENT,
   cl        IN OUT   CLOB);
```

Parameters

Table 228-136 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

228.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2,
   charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc       IN   DOMDOCUMENT,
   fileName  IN   VARCHAR2,
   charset   IN   VARCHAR2);
```

Parameters

Table 228-137 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE

Table 228-137 (Cont.) WRITETOFILE Procedure Parameters

Parameter	Description
`fileName`	File to which to write. The filename should be in the format of `database_directory_object_name/filename`, for example `mydir/filename` (on windows, use `\` instead of `/`).
`charset`	specified character set
`doc`	`DOMDOCUMENT`
`charset`	Character set

229
DBMS_XMLGEN

The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format.

> **Note:**
>
> The PL/SQL package DBMS_XMLGEN is deprecated in Oracle Database 23ai.
>
> DBMS_XMLGEN is a non-standard Oracle-proprietary package that is provided to generate and convert XML documents from SQL queries or with PL/SQL. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use SQL/XML operators to generate XML from relational columns instead. Using ANSI SQL/XML operators for any generation and modification of XML documents provides a standardized and future-proof way to work with XML documents.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Security Model
- Summary of DBMS_XMLGEN Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide,* or more information on XML support and on examples of using DBMS_XMLGEN

229.1 DBMS_XMLGEN Security Model

Owned by XDB, the DBMS_XMLGEN package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

229.2 Summary of DBMS_XMLGEN Subprograms

This table lists the DBMS_XMLGEN subprograms and briefly describes them.

Table 229-1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure	Closes the context and releases all resources
CONVERT Functions	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions	Gets the XML document
GETXMLTYPE Functions	Gets the XML document and returns it as `XMLType`
NEWCONTEXT Functions	Creates a new context handle
NEWCONTEXTFROMHIERARCHY Function	Obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result
RESTARTQUERY Procedure	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure	Sets whether special characters such as `$,` which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure	Sets `NULL` handling options
SETROWSETTAG Procedure	Sets the name of the element enclosing the entire result
SETROWTAG Procedure	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure	Forces the use of the collection column name appended with the tag `_ITEM` for collection elements
USENULLATTRIBUTEINDICATOR Procedure	Specifies whether to use an XML attribute to indicate `NULL`ness, or to do it by omitting the inclusion of the particular entity in the XML document.

229.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
   ctx  IN ctxHandle);
```

Parameters

Table 229-2 CLOSECONTEXT Procedure Parameters

Parameter	Description
`ctx`	The context handle to close.

229.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML `CLOB` data in encoded or decoded format. There are several version of the function.

Syntax

Uses `XMLDATA` in string form (`VARCHAR2`):

```
DBMS_XMLGEN.CONVERT (
   xmlData IN VARCHAR2,
   flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses `XMLDATA` in `CLOB` form:

```
DBMS_XMLGEN.CONVERT (
   xmlData IN CLOB,
   flag    IN NUMBER := ENTITY_ENCODE)
 RETURN CLOB;
```

Parameters

Table 229-3 CONVERT Function Parameters

Parameter	Description
`xmlData`	The XML `CLOB` data to be encoded or decoded.
`flag`	The flag setting; `ENTITY_ENCODE` (default) for encode, and `ENTITY_DECODE` for decode.

Usage Notes

This function escapes the XML data if the `ENTITY_ENCODE` is specified. For example, the escaped form of the character < is `<`. Unescaping is the reverse transformation.

229.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
   ctx     IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 229-4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

229.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functionscall is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   tmpclob      IN OUT NCOPY CLOB,
   dtdOrSchema  IN number := NONE)
 RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Parameters

Table 229-5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

229.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   ctx           IN ctxhandle,
   dtdOrSchema   IN number := NONE)
 RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN sys.XMLType
```

Parameters

Table 229-6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

229.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
      query     IN VARCHAR2)
 RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
   queryString  IN SYS_REFCURSOR)
 RETURN ctxHandle;
```

Parameters

Table 229-7 NEWCONTEXT Function Parameters

Parameter	Description
`query`	The query, in the form of a `VARCHAR`, the result of which must be converted to XML.
`queryString`	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

229.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
   queryString IN VARCHAR2)
 RETURN ctxHandle;
```

Parameters

Table 229-8 NEWCONTEXTFROMHIERARCHY Function Parameters

Parameter	Description
`queryString`	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a `CONNECT BY` clause, and the result must have the same property as the result set generated by a `CONNECT BY` query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

229.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 229-9 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

229.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to <.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx   IN ctxHandle,
conv  IN BOOLEAN);
```

Parameters

Table 229-10 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
ctx	The context handle obtained from one of the NEWCONTEXT Functions call.
conv	TRUE indicates that conversion is needed.

229.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
ctx      IN ctxHandle,
maxRows  IN NUMBER);
```

Parameters

Table 229-11 SETMAXROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`maxRows`	The maximum number of rows to get for each call to GETXML Functions

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

229.2.11 SETNULLHANDLING Procedure

This procedure sets `NULL` handling options, handled through the `flag` parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

Parameters

Table 229-12 SETNULLHANDLING Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`flag`	The `NULL` handling option set. • `DROP_NULLS CONSTANT NUMBER:= 0;` (Default) Leaves out the tag for `NULL` elements. • `NULL_ATTR CONSTANT NUMBER:= 1;` Sets `xsi:nil="true"`. • `EMPTY_TAG CONSTANT NUMBER:= 2;` Sets, for example, `<foo/>`.

229.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 229-13 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.
rowSetTagName	The name of the document element. Passing `NULL` indicates that you do not want the `ROWSET` element present.

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

229.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
ctx         IN ctxHandle,
rowTagName  IN VARCHAR2);
```

Parameters

Table 229-14 SETROWTAG Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from the NEWCONTEXT Functions call.
`rowTagName`	The name of the `ROW` element. Passing `NULL` indicates that you do not want the `ROW` element present.

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

229.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
ctx       IN ctxHandle,
skipRows  IN NUMBER);
```

Parameters

Table 229-15 SETSKIPROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`skipRows`	The number of rows to skip for each call to `getXML`.

Related Topics

- GETXML Functions
  This function gets the XML document. The function is overloaded.

229.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
   ctx  IN ctxHandle);
```

Parameters

Table 229-16 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
`ctx`	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

229.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx       IN   ctxType,
attrind   IN   BOOLEAN := TRUE);
```

Parameters

Table 229-17 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
`ctx`	Context handle.
`attrind`	Use attribute to indicate `NULL`?

230
DBMS_XMLINDEX

The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLINDEX Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

230.1 DBMS_XMLINDEX Overview

DBMS_XMLINDEX provides a mechanism for asynchronous index maintenance.

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. DBMS_XMLINDEX provides this mechanism.

230.2 DBMS_XMLINDEX Security Model

Owned by XDB, the DBMS_XMLINDEX package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

230.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the DBMS_XMLINDEX subprograms and briefly describes them.

Table 230-1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure	Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
CREATENUMBERINDEX Procedure	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex

Table 230-1 (Cont.) DBMS_XMLINDEX Package Subprograms

Subprogram	Description
DROPPARAMETER Procedure	Drops the XMLIndex parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure	Modifies the XMLIndex parameter string that is associated with a given parameter name
PROCESS_PENDING Procedure	Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex
REGISTERPARAMETER Procedure	Registers a parameter string and XMLIndex parameter string pair in XDB
SYNCINDEX Procedure	Synchronizes the index manually

230.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2,
   date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 230-2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

230.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
   xml_index_schema    IN   VARCHAR2,
   xml_index_name      IN   VARCHAR2,
   num_index_name      IN   VARCHAR2,
   num_index_clause    IN   VARCHAR2,
   xmltypename         IN   VARCHAR2);
```

Parameters

Table 230-3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
`xml_index_schema`	Name of the owner of the `XMLIndex`
`xml_index_name`	Name of the `XMLIndex`
`num_index_name`	Name of the secondary index to be created for number values in the `VALUE` column of the `PATH TABLE` of `XMLIndex` named `xml_index_name` and owned by `xml_index_schema`
`num_index_clause`	Storage clause to be applied to the number index during its creation. This is a string argument appended to the `CREATE INDEX` statement for creating the number index.
`xmltypename`	The type to which values in the `VALUE` column of the path table are to be cast. Acceptable values are the following strings: `FLOAT`, `DOUBLE`, `DECIMAL`, `INTEGER`, `NONPOSITIVEINTEGER`, `NEGATIVEINTEGER`, `LONG`, `INT`, `SHORT`, `BYTE`, `NONNEGATIVEINTEGER`, `UNSIGNEDLONG`, `UNSIGNEDINT`, `UNSIGNEDSHORT`, `UNSIGNEDBYTE`, `POSITIVEINTEGER`.

230.3.3 DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
   name        IN      VARCHAR2);
```

Parameters

Table 230-4 DROPPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
   'myIndexParam');
```

230.3.4 MODIFYPARAMETER Procedure

This procedure modifies the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 230-5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string
`parameter`	`XMLIndex` parameter clause that can appear in a `CREATE INDEX` or an `ALTER INDEX` statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

230.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a `NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN` operation on an `XMLIndex`.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
   xml_index_schema    IN     VARCHAR2,
   xml_index_name      IN     VARCHAR2,
   pending_row_count   OUT    BINARY_INTEGER,
   error_row_count     OUT    BINARY_INTEGER);
```

Parameters

Table 230-6 PROCESS_PENDING Procedure Parameters

Parameter	Description
`xml_index_schema`	Name of the owner of the `XMLIndex`

Table 230-6 (Cont.) PROCESS_PENDING Procedure Parameters

Parameter	Description
xml_index_name	Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION
pending_row_count	Number of pending rows to be processed
error_row_count	Number of rows for which indexing may have failed because of an error

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in SYS_AIXSXI_######_PENDINGTAB and errors in SYS_AIXSXI_#####_ERRORTAB.. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
   'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

230.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 230-7 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx
```

```
PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
GROUP MASTERGROUP XMLTABLE PO_TAB
('/p:PurchaseOrder'
    COLUMNS
       REFERENCE VARCHAR2(30) PATH 'p:Reference',
       REQUESTOR VARCHAR2(30) PATH 'p:Requestor' )
GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
('/p:PurchaseOrder/p:LineItems/p:LineItem'
    COLUMNS
       LINENUMBER NUMBER(38) PATH '@p:ItemNumber',
       QUANTITY NUMBER(38) PATH '@p:Quantity',
       DESCRIPTION VARCHAR2(256) PATH 'p:Description'));
```

230.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base `XMLTYPE` column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
   xml_index_schema      IN VARCHAR2,
   xml_index_name        IN VARCHAR2,
   partition_name        IN VARCHAR2 DEFAULT NULL,
   reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 230-8 SYNCINDEX Procedure Parameters

Parameter	Description
`xml_index_schema`	Name of the owner of the XMLIndex
`xml_schema_name`	Name of the XMLIndex
`partition_name`	[Currently not supported]
`reindex`	Default is `FALSE`. If set to `TRUE`, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

231
DBMS_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_XMLPARSER Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

231.1 DBMS_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

231.2 Summary of DBMS_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

Table 231-1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER	Frees a parser object.
GETDOCTYPE	Gets parsed DTD.
GETDOCUMENT	Gets DOM document.
GETRELEASEVERSION	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE	Returns validation mode.
NEWPARSER	Returns a new parser instance
PARSE	Parses XML stored in the given url/file.
PARSEBUFFER	Parses XML stored in the given buffer
PARSECLOB	Parses XML stored in the given clob
PARSEDTD	Parses DTD stored in the given url/file
PARSEDTDBUFFER	Parses DTD stored in the given buffer
PARSEDTDCLOB	Parses DTD stored in the given clob
SETBASEDIR	Sets base directory used to resolve relative URLs.
SETDOCTYPE	Sets DTD.
SETERRORLOG	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE	Sets white space preserve mode
SETVALIDATIONMODE	Sets validation mode.
SHOWWARNINGS	Turns warnings on or off.

231.2.1 FREEPARSER

This procedures frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameters

Table 231-2 FREEPARSER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

231.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(
  p Parser)
RETURN DOMDocumentType;
```

Parameters

Table 231-3 GETDOCTYPE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

231.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(
  p Parser)
RETURN DOMDocument;
```

Parameters

Table 231-4 GETDOCUMENT Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

231.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

231.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(
  p Parser)
RETURN BOOLEAN;
```

Parameters

Table 231-5 GETVALIDATIONMODE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

231.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser
RETURN Parser;
```

231.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(
  p Parser,
  url VARCHAR2);
```

Parameters

Table 231-6 PARSE Subprogram Parameters

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

231.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
  p   Parser,
doc VARCHAR2);
```

Parameters

Table 231-7 PARSEBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

231.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
  p   Parser,
doc CLOB);
```

Parameters

Table 231-8 PARSECLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

Table 231-8 (Cont.) PARSECLOB Procedure Parameters

Parameter	IN / OUT	Description
doc	(IN)	XML document buffer to parse.

231.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
  p     Parser,
  url   VARCHAR2,
  root  VARCHAR2);
```

Parameters

Table 231-9 PARSEDTD Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

231.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
  p    Parser,
  dtd  VARCHAR2,
  root VARCHAR2);
```

Parameters

Table 231-10 PARSEDTDBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

Table 231-10 (Cont.) PARSEDTDBUFFER Procedure Parameters

Parameter	IN / OUT	Description
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

231.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(
  p    Parser,
  dtd  CLOB,
  root VARCHAR2);
```

Parameters

Table 231-11 PARSEDTDCLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

231.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(
  p   Parser,
  dir VARCHAR2);
```

Parameters

Table 231-12 SETBASEDIR Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

231.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
  p   Parser,
  dtd DOMDocumentType);
```

Parameters

Table 231-13 SETDOCTYPE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

231.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
  p        Parser,
  fileName VARCHAR2);
```

Parameters

Table 231-14 SETERRORLOG Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

231.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(
  p   Parser,
  yes BOOLEAN);
```

Parameters

Table 231-15 SETPRESERVEWHITESPACE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

231.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

Syntax

```
PROCEDURE setValidationMode(
  p   Parser,
  yes BOOLEAN);
```

Parameters

Table 231-16 SETVALIDATIONMODE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

231.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
  p   Parser,
  yes BOOLEAN);
```

Paramters

Table 231-17 SHOWWARNINGS Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

232
DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script dbmsxsch.sql during Oracle database installation.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_XMLSCHEMA Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

232.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

232.2 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

232.3 DBMS_XMLSCHEMA Constants

The DBMS_XMLSCHEMA package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- Table 232-1
- Table 232-2
- Table 232-3

Table 232-1 *DBMS_XMLSCHEMA Constants* - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to DELETE_CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 232-2 *DBMS_XMLSCHEMA Constants* - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS

Table 232-2 (Cont.) *DBMS_XMLSCHEMA Constants* - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 232-3 *DBMS_XMLSCHEMA Constants* - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

232.4 Views

This table lists the views used by the DBMS_XMLSCHEMA package

The columns of these views are described in detail in the *Oracle Database Reference*

Table 232-4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system

Table 232-4 (Cont.) Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMlType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

232.5 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only INPLACE_TRACE. Do not also use INPLACE_EVOLVE. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

232.6 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the DBMS_XMLSCHEMA subprograms and briefly describes them.

Table 232-5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure	Removes the schema from the database
INPLACEEVOLVE Procedure	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure	Removes the XML schema
REGISTERSCHEMA Procedures	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.

Table 232-5 (Cont.) DBMS_XMLSCHEMA Package Subprograms

Method	Description
REGISTERURI Procedure	Registers an XML schema specified by a URI name

232.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
   schemaurl IN VARCHAR2);
```

Parameters

Table 232-6 COMPILESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema

232.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

> **See Also:**
>
> – "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
>
> – *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
   schemaurls       IN  XDB$STRUBG_LIST_T,
   newschemas       IN  XMLSequenceType,
   transforms       IN  XMLSequenceType :=NULL,
   preserveolddocs  IN  BOOLEAN :=FALSE,
   maptablename     IN  VARCHAR2 :=NULL,
   generatetables   IN  BOOLEAN :=TRUE,
   force            IN  BOOLEAN :=FALSE,
   schemaowners     IN  XDB$STRING_LIST_T :=NULL
   parallelDegree   IN  PLS_INTEGER := 0,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 232-7 COPYEVOLVE Procedure Parameters

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: • SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms • SCHEMA_OWNER -VARCHAR2(30) - Owner of the schema • ELEMENT_NAME - VARCHAR2(256)- Element to which this table conforms • TAB_NAME - VARCHAR2(65) - Qualified table name: *<owner_name>.<table_name>* • COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) • TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: • new tables will not be generated after registration of new schemas • preserveolddocs must be TRUE • maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.

Table 232-7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.

232.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
   schemaurl      IN  VARCHAR2,
   delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 232-8 DELETESCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL identifying the schema to be deleted

Table 232-8 (Cont.) DELETESCHEMA Procedure Parameters

Parameter	Description
delete_option	Delete options: • DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema • DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. • DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. • DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 232-9 DELETESCHEMA Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

232.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
   schemaURL     IN   VARCHAR2,
   diffXML       IN   XMLType,
   flags         IN   NUMBER);
```

Parameters

Table 232-10 INPLACEEVOLVE Procedure Parameters

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.

Table 232-10 (Cont.) INPLACEEVOLVE Procedure Parameters

Parameter	Description
`flags`	The following bits may be set in this parameter to control the behavior of this procedure: • `INPLACE_EVOLVE` (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. • `INPLACE_TRACE` (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition: • Bit `INPLACE_EVOLVE` carries out those evolution steps and replaces the old XML schema with the new. • Bit `INPLACE_TRACE` saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid `XPATH` expressions and for `XDIFF` documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

232.6.5 PURGESCHEMA Procedure

This procedure removes the XML schema.

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);
```

Parameters

Table 232-11 PURGESCHEMA Procedure Parameters

Parameter	Description
`schemaid`	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

232.6.6 REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

> **Note:**
>
> As of Oracle Database 11*g* Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

> **See Also:**
>
> "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  VARCHAR2,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
```

```
   schemadoc         IN  BLOB,
   local             IN  BOOLEAN := TRUE,
   genTypes          IN  BOOLEAN := TRUE,
   genBean           IN  BOOLEAN := FASLE,
   force             IN  BOOLEAN := FALSE,
   owner             IN  VARCHAR2 := NULL,
   enablehierarchy   IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options           IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl         IN  VARCHAR2,
   schemadoc         IN  BLOB,
   local             IN  BOOLEAN := TRUE,
   gentypes          IN  BOOLEAN := TRUE,
   genbean           IN  BOOLEAN := TRUE,
   gentables         IN  BOOLEAN := TRUE,
   force             IN  BOOLEAN := TRUE,
   owner             IN  VARCHAR2 := '',
   csid              IN  NUMBER,
   enablehierarchy   IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options           IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `CLOB`

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl         IN  VARCHAR2,
   schemadoc         IN  CLOB,
   local             IN  BOOLEAN := TRUE,
   gentypes          IN  BOOLEAN := TRUE,
   genbean           IN  BOOLEAN := FALSE,
   force             IN  BOOLEAN := FALSE,
   owner             IN  VARCHAR2 := NULL,
   options           IN  PLS_INTEGER := 0);
```

Registers the schema specified as an `XMLTYPE`.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl         IN  VARCHAR2,
   schemadoc         IN  SYS.XMLTYPE,
   local             IN  BOOLEAN := TRUE,
   gentypes          IN  BOOLEAN := TRUE,
   genbean           IN  BOOLEAN := FALSE,
   force             IN  BOOLEAN := FALSE,
   owner             IN  VARCHAR2 := NULL,
   enablehierarchy   IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options           IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl         IN  VARCHAR2,
   schemadoc         IN  SYS.URIType,
   local             IN  BOOLEAN := TRUE,
   gentypes          IN  BOOLEAN := TRUE,
```

```
  genbean          IN  BOOLEAN := FALSE,
  force            IN  BOOLEAN := FALSE,
  owner            IN  VARCHAR2 := NULL,
  enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options          IN  PLS_INTEGER := 0);
```

Parameters

Table 232-12 REGSITERSCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? • By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... • If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.
genbean	Determines whether the schema compiler generates Java beans. By default, FALSE. Oracle recommends that this parameter always be set to FALSE.
gentables	Determines whether the schema compiler generates default tables. By default, TRUE
force	If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	• ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema • ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. • ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 232-12 (Cont.) REGSITERSCHEMA Procedure Parameters

Parameter	Description
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: • REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column) • REGISTER_BINARYXML - Register the schema for Binary XML • REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

232.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

> **Note:**
>
> As of Oracle Database 11g Release 2 (11.2) the genbean parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
   schemaurl      IN  VARCHAR2,
   schemadocuri   IN  VARCHAR2,
   local          IN  BOOLEAN := TRUE,
   gentypes       IN  BOOLEAN := TRUE,
   genbean        IN  BOOLEAN := FALSE,
   gentables      IN  BOOLEAN := TRUE,
   force          IN  BOOLEAN := FALSE,
   owner          IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 232-13 REGISTERURI Procedure Parameters

Parameter	Description
schemaurl	Uniquely identifies the schema document. Can be used inside schemaLocation attribute of XML Schema import element.

Table 232-13 (Cont.) REGISTERURI Procedure Parameters

Parameter	Description
schemadocuri	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the urifactory, and invokes the REGISTERSCHEMA Procedures.
local	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.
gentypes	Determines whether the compiler generate object types. By default, TRUE.
genbean	Determines whether the compiler generate Java beans. By default, FALSE.
gentables	Determines whether the compiler generate default tables. TRUE by default.
force	TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
options	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits: • REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)

233
DBMS_XMLSCHEMA_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

233.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

233.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by `XDB`, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

233.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

Table 233-1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
ADDXDBNAMESPACE Procedure	Adds the XDB namespace required for XDB annotation
DISABLEDEFAULTTABLECREATION Procedure	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element

Table 233-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
DISABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to `FALSE`
ENABLEDEFAULTTABLECREATION Procedure	Enables the creation of `ALL` top level tables by removing the empty default table name annotation
ENABLEMAINTAINDOM Procedure	Sets the DOM fidelity attribute to `TRUE`
GETSCHEMAANNOTATIONS Function	Creates a document containing the differences between the annotated XML schema and the original XML schema
GETSIDXDEFFROMVIEW Function	Takes a XMLTABLE view definition on a xmltype column or table and it returns a `CLOB` which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table
PRINTWARNINGS Procedure	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
REMOVEANYSTORAGE Procedure	Removes the setting of the SQL type from the `ANY` child of the complex type with the given name
REMOVEDEFAULTTABLE Procedure	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
REMOVEMAINTAINDOM Procedure	Removes all annotations used to maintain DOM from the given schema
REMOVEOUTOFLINE Procedure	Removes any existing `SQLInline` attributes to prevent out-of-line storage
REMOVESQLCOLLTYPE Procedure	Removes a SQL collection type.
REMOVESQLNAME Procedure	Removes a `SQLNAME` from a global element
REMOVESQLTYPE Procedure	Removes a SQL type
REMOVESQLTYPEMAPPING Procedure	Removes the SQL type mapping for the given schema type.
REMOVETABLEPROPS Procedure	Removes the table storage properties from the `CREATE TABLE` statement
REMOVETIMESTAMPWITHTIMEZONE Procedure	Removes he setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema
SETANYSTORAGE Procedure	Assigns a SQL datatype to the `ANY` child of the complex type with the given name
SETDEFAULTTABLE Procedure	Sets the name of the table for the specified global element
SETOUTOFLINE Procedure	Sets the `SQLInline` attribute to `FALSE`
SETSCHEMAANNOTATATIONS Procedure	Takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema
SETSQLCOLLTYPE Procedure	Assigns a SQL type name for a collection
SETSQLNAME Procedure	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
SETSQLTYPE Procedure	Assigns a SQL type to a global object
SETSQLTYPEMAPPING Procedure	Defines a mapping of schema type and SQL type
SETTABLEPROPS Procedure	Specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement

Table 233-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
SETTIMESTAMPWITHTIMEZONE Procedure	Sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema

233.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
   xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 233-2 ADDXDBNAMESPACE Procedure Parameters

Parameter	Description
`xmschema`	Gets an XML Schema as `XMLTYPE`, performs the annotation and returns it

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

233.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType,
   globalElementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
   xmlschema         IN OUT XMLType);
```

Parameters

Table 233-3 DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

The purchaseOrder element will have an annotation similar to xdb:defaultTable="".

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                                       'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

233.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to FALSE.

There are two overloads. The first sets DOM fidelity attribute to FALSE for all complex types, and the second sets it to FALSE for the named complex type. This is equivalent to adding xdb:maintainDOM="false" on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2,
   overwrite       IN BOOLEAN default TRUE);
```

Parameters

Table 233-4 DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

233.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2);;);
```

Parameters

Table 233-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
gloablElementName	Name of the global element in the schema

Usage Notes

This procedure does not affect elements that have a default table name.

233.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to TRUE for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema       IN OUT XMLType,
   overwrite       IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
   xmlschema        IN OUT XMLType,
   complexTypeName  IN VARCHAR2,
   overwrite        IN BOOLEAN default TRUE);
```

Parameters

Table 233-6 ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type

Table 233-6 (Cont.) ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`

233.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
   xmlschema IN xmlType)
  RETURN XMLType;
```

Parameters

Table 233-7 GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
`xmlschema`	The original XML schema

Return Values

This function returns the document `annotations.xml` as an `XMLType`.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

> **See Also:**
>
> SETSCHEMAANNOTATATIONS Procedure

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in SETSCHEMAANNOTATATIONS Procedure.

233.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
   viewName   IN xmlType)
  RETURN CLOB;
```

Parameters

Table 233-8 GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

233.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
   value       IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-9 PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

233.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
   xmlschema       IN OUT XMLType,
   complexTypeName IN VARCHAR2);
```

Parameters

Table 233-10 REMOVEANYSTORAGE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated.
`complexTypeName`	The name of the complex type.

Usage Notes

This procedure reverses the SETANYSTORAGE Procedure.

233.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
   xmlschema          IN OUT XMLTYPE,
   globalElementName  IN     VARCHAR2);
```

Parameters

Table 233-11 REMOVEDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema

Example

Annotations can be verified anytime using "`select out from annotation_tab`".

```
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
   xml_schema XMLTYPE;
BEGIN
```

```
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                              'purchaseOrder');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

233.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
   xmlschema    IN OUT XMLType);
```

Parameters

Table 233-12 REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

233.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the `SQLInline` attribute for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema           IN OUT  XMLType,
   elementName         IN      VARCHAR2,
   elementType         IN      VARCHAR2,
   overwrite           IN      BOOLEAN default TRUE);
```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localElementName   IN      VARCHAR2);
```

Removes the `SQLInline` attribute for the referenced global element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2);
```

Parameters

Table 233-13 REMOVEOUTOFLINE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
elementType	The element type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

This procedure reverses SETOUTOFLINE Procedure.

233.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema   IN OUT XMLType,
   elementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
   xmlschema        IN OUT XMLType,
   globalObject     IN VARCHAR2,
   globalName       IN VARCHAR2,
   localElementName IN VARCHAR2);
```

Parameters

Table 233-14 REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
globalObject	The global object (global complex type or global element)
globalName	The name of the global object
localElementName	The name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETSQLCOLLTYPE Procedure.

233.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-15 REMOVESQLNAME Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalObject`	Global object (global complex type or global element)
`globalObjectName`	Name of the global object
`localObject`	Object descended from the global object
`localObjectName`	Name of the local object
`sqlName`	Name of the SQL attribute that corresponds to the element defined in the XML schema
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

233.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema in out XMLType,
   globalElementName   IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
   xmlschema           IN OUT  XMLTYPE,
   globalObject        IN      VARCHAR2,
   globalObjectName    IN      VARCHAR2,
   localObject         IN      VARCHAR2,
   localObjectName     IN      VARCHAR2);
```

Parameters

Table 233-16 REMOVESQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated.
globalObject	Global object (global complex type or global element)
globalElementName	Name of the global element.
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object

Usage Notes

This procedure reverses the SETSQLTYPE Procedure.

233.3.16 REMOVESQLTYPEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEMAPPING (
   xmlschema        IN OUT  XMLTYPE,
   schemaTypeName   IN      VARCHAR2);
```

Parameters

Table 233-17 REMOVESQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated

Table 233-17 (Cont.) REMOVESQLTYPEMAPPING Procedure Parameters

Parameter	Description
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the SETSQLTYPEMAPPING Procedure.

233.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the CREATE TABLE statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalElementName    IN      VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2);
```

Parameters

Table 233-18 REMOVETABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element

Usage Notes

This procedure reverses the SETTABLEPROPS Procedure.

233.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the TimeStampWithTimeZone datatype from all dateTime typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
   xmlschema         IN OUT  XMLTYPE,
   schemaTypeName    IN      VARCHAR2);
```

Parameters

Table 233-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the SETTIMESTAMPWITHTIMEZONE Procedure.

233.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the ANY child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE )
   xmlschema       IN OUT  XMLType,
   complexTypeName IN      VARCHAR2,
   sqlTypeName     IN      VARCHAR2,
   overwrite       IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-20 SETANYSTORAGE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
complexTypeName	Name of the complex type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The xsd:any child of complex type Items is assigned an annotation similar to xdb:SQLType="VARCHAR".

```
DECLARE   xml_schema  XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items',                                        'VARCHAR');   UPDATE annotation_tab SET
out = xml_schema;END;
/
```

233.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
   xmlschema           IN  OUT  XMLTYPE,
   globalElementName   IN       VARCHAR2,
   tableName           IN       VARCHAR2,
   overwrite           IN       BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 233-21 SETDEFAULTTABLE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema
`tableName`	Name being assigned to the table
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

233.3.21 SETOUTOFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInLine=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding `'4096 column limit'` errors during XML schema registration, when some elements have complex types with many elements.

> **Also See:**
>
> *Oracle XML DB Developer's Guide*

There are three overloads.

Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema           IN OUT  XMLType,
   elementName         IN      VARCHAR2,
```

```
   elementType        IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localElementName   IN      VARCHAR2,
   defaultTableName   IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
   xmlschema         IN OUT  XMLType,
   reference         IN      VARCHAR2,
   defaultTableName  IN      VARCHAR2,
   overwrite         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-22 SETOUTOFLINE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated.
`elementName`	The element name
`elementType`	The element type
`defaultTableName`	The name of the default table.
`globalObject`	The global object (global complex type or global element)
`globalObjectName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element.
`reference`	A reference to a global element
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```
DECLARE
   xml_schema xmltype;
BEGIN
SELECT OUT INTO xml_schema FROM annotation_tab;
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                      'ipo:comment',
                                      'CMMNT_DEFAULT_TABLE');
UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

233.3.22 SETSCHEMAANNOTATATIONS Procedure

This procedure takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
   xmlschema     IN OUT xmlType,
   annotations   IN VARCHAR2);
```

Parameters

Table 233-23 SETSCHEMAANNOTATIONS Procedure Parameters

Parameter	Description
`xmlschema`	An XML schema to be patched.
`annotations`	The differences document produced by calling `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` on the original XML schema and an annotated XML schema.

Usage Notes

`DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.*x*).

> **See Also:**
>
> GETSCHEMAANNOTATIONS Function

Example

The following example illustrates `DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS` shown here and GETSCHEMAANNOTATIONS Function.

```
-- test getannotations and apply them
declare
 xml_schema xmltype;
 xml_schema2 xmltype;
 annotations xmltype;
begin
   select out into xml_schema from annotation_tab;

   -- get the annotations from the schema
   annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);
```

```
   -- apply the annotations to the schema
   select inp into xml_schema2 from annotation_tab;

   DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

   update annotation_tab t set t.out = xml_schema2;
end;
/
```

233.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates `SQLType`s with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT   XMLTYPE,
   elementName        IN       VARCHAR2,
   sqlCollType        IN       VARCHAR2,
   overwrite          IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
   xmlschema          IN OUT XMLType,
   globalObject       IN VARCHAR2,
   globalObjectName   IN VARCHAR2,
   localElementName   IN VARCHAR2,
   sqlCollType        IN VARCHAR2,
   overwrite          IN BOOLEAN default TRUE );
```

Parameters

Table 233-24 SETSQLCOLLTYPE Procedure Parameters

Parameter	Description
`xmlschema`	The XML schema to be annotated
`elementName`	The element name
`sqlCollType`	The SQL collection type
`globalObject`	The global object (global complex type or global element)
`globalObjectName`	The name of the global object
`localElementName`	The name of a local element that descends from the global element
`overwrite`	A boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```
declare
   xml_schema xmltype;
begin
```

```
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                           'item',
                                           'ITEM_SQL_COL_TYPE',TRUE);
   UPDATE annotation_tab SET out = xml_schema;
end;
```

233.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
   xmlschema          IN OUT  XMLType,
   globalObject       IN      VARCHAR2,
   globalObjectName   IN      VARCHAR2,
   localObject        IN      VARCHAR2,
   localObjectName    IN      VARCHAR2,
   sqlName            IN      VARCHAR2,
   overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-25 SETSQLNAME Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalObject`	Global object (global complex type or global element)
`globalObjectName`	Name of the global object
`localObject`	Object descended from the global object
`localObjectName`	Name of the local object
`sqlName`	Name of the SQL attribute that corresponds to the element defined in the XML schema
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
   xml_schema   XMLTYPE;
BEGIN
   SELECT out INTO xml_schema FROM annotation_tab;
   DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
   UPDATE annotation_tab SET out = xml_schema;
END;
/
```

233.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema            IN OUT   XMLTYPE,
   globalElementName    IN       VARCHAR2,
   sqlType              IN       VARCHAR2,
   overwrite            IN       BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
   xmlschema           IN OUT   XMLTYPE,
   globalObject        IN       VARCHAR2,
   globalObjectName    IN       VARCHAR2,
   localObject         IN       VARCHAR2,
   localObjectName     IN       VARCHAR2,
   sqlType             IN       VARCHAR2,
   overwrite           IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-26 SETSQLTYPE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalObject`	Global object (global complex type or global element)
`globalObjectName`	Name of the global object
`globalElementName`	Name of the global element
`localObject`	Object descended from the global object
`localObjectName`	Name of the local object
`sqlType`	SQL type assigned to the named global element
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `purchaseOrder` element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the `shipTo` element has one similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE
   xml_schema  xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                      'purchaseOrder',
                                      'PO_SQLTYPE');
  UPDATE annotation_tab SET out = xml_schema;
END;
/
```

```
DECLARE   xml_schema   xmltype;BEGIN  SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
'element','purchaseOrder',
'element' ,'shipTo',                                          'VARCHAR');  UPDATE
annotation_tab SET out = xml_schema;END;
/
```

233.3.26 SETSQLTYPEMAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the `SETSQLTYPE` procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPEMAPPING (
   xmlschema         IN OUT   XMLType,
   schemaTypeName    IN       VARCHAR2,
   sqlTypeName       IN       VARCHAR2,
   overwrite         IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-27 SETSQLTYPEMAPPING Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`schemaTypeName`	Schema type
`sqlTypeName`	Name of the SQL type
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`

Example

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```
declare   xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',                                          'DATE');UPDATE annotation_tab SET out =
xml_schema;end;
/
```

233.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLType,
```

```
   globalElementName    IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
   xmlschema            IN OUT  XMLTYPE,
   globalObject         IN      VARCHAR2,
   globalObjectName     IN      VARCHAR2,
   localElementName     IN      VARCHAR2,
   tableProps           IN      VARCHAR2,
   overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-28 SETTABLEPROPS Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`globalElementName`	Name of the global element in the schema
`tableProps`	Table properties
`globalObject`	Global object (global complex type or global element)
`globalObjectName`	Name of the global object
`localElementName`	Name of a local element that descends from the global element
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```
DECLARE   xml_schema XMLTYPE;BEGIN   SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
 'purchaseOrder' ,'CACHE');   UPDATE annotation_tab SET out = xml_schema;END;
/
```

233.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
   xmlschema      IN OUT   XMLTYPE,
   overwrite      IN       BOOLEAN DEFAULT TRUE);
```

Parameters

Table 233-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
`xmlschema`	XML schema to be annotated
`overwrite`	Boolean that indicates whether or not the procedure overwrites element attributes. The default is `TRUE`.

234
DBMS_XMLSCHEMA_UTIL

The `DBMS_XMLSCHEMA_UTIL` package provides an interface for XML schema validation.

This chapter contains the following topics:

- DBMS_XMLSCHEMA_UTIL Security Model
- Summary of DBMS_XMLSCHEMA_UTIL Subprograms

> **See Also:**
>
> - *Oracle XML DB Developer's Guide*

234.1 DBMS_XMLSCHEMA_UTIL Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_XMLSCHEMA_UTIL` package

234.2 Summary of DBMS_XMLSCHEMA_UTIL Subprograms

This topic lists the `DBMS_XMLSCHEMA_UTIL` subprograms in alphabetical order and briefly describes them.

Table 234-1 *DBMS_XMLSCHEMA_UTIL Package Subprograms*

Subprogram	Description
CONFORMING Function	Validates an XML document against a schema
VALIDATE Procedure	Validates an XML document against a schema

234.2.1 CONFORMING Function

This function is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.CONFORMING (
   doc             IN NUMBER,
   sch             IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 234-2 CONFORMING Function Parameters

Parameter	Description
doc	The XML instance
sch	The XML schema

Function Exceptions

The exceptions of `DBMS_XMLSCHEMA_UTIL.CONFORMING` function are as follows:

- The function returns zero if the schema is legal and the document conforms to the schema; otherwise it returns an LSX error code from the schema validation.

> **Note:**
>
> The function takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
SELECT DBMS_XMLSCHEMA_UTIL.CONFORMING(
     XMLType('<A/>'),
     XMLType(
    '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
      <xs:element name="A" type="xs:string"/>
     </xs:schema>')) "LSX CODE"
    FROM DUAL;
```

234.2.2 VALIDATE Procedure

This procedure is used to validate an XML document against a schema.

Syntax

```
DBMS_XMLSCHEMA_UTIL.VALIDATE (
   doc             IN XMLTYPE,
   sch             IN XMLTYPE);
```

Parameters

Table 234-3 VALIDATE Procedure Parameters

Parameter	Description
doc	The XML instance
sch	The XML schema

Procedure Exceptions

The exceptions of `DBMS_XMLSCHEMA_UTIL.VALIDATE` procedure are as follows:

- The procedure raises ORA-31154 if either the schema is not legal, or the document does not conform to the schema.

> **Note:**
>
> The procedure takes an xml data instance and xml schema instance. The user does not have to register the schema.

Example: The document conforms to the schema

```
BEGIN
      DBMS_XMLSCHEMA_UTIL.VALIDATE(
         XMLType('<A/>'),
         XMLType(
                 '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
                  <xs:element name="A" type="xs:string"/>
                  </xs:schema>'));
END;
/
```

235
DBMS_XMLSTORAGE_MANAGE

The DBMS_XMLSTORAGE_MANAGE package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

235.1 DBMS_XMLSTORAGE_MANAGE Overview

DBMS_XMLSTORAGE_MANAGE contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

235.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the DBMS_XMLSTORAGE_MANAGE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

235.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the DBMS_XML_STORAGE package subprograms.

Table 235-1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
DISABLEINDEXESANDCONSTRAINTS Procedure	Disables the indexes and constraints for XMLType tables and XMLType columns
ENABLEINDEXESANDCONSTRAINTS Procedure	Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables

Table 235-1 (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
EXCHANGEPOSTPROC Procedure	Enable constraints after exchange partition
EXCHANGEPREPROC Procedure	Disable constraints before exchange partition
INDEXXMLREFERENCES Procedure	Creates unique indexes on the `REF` columns of the given XML type table or the XML type column of a given table
REFPARTITIONEXCHANGEIN Procedure	This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an `xmltype` column with a local `xmlindex`.
REFPARTITIONEXCHANGEOUT Procedure	Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.
RENAMECOLLECTIONTABLE Procedure	Renames a collection table to the given table name
SCOPEXMLREFERENCES Procedure	Scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types
XPATH2TABCOLMAPPING Function	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

235.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for `XMLType` tables and `XMLType` columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
   owner_name    IN  VARCHAR2 DEFAULT USER,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2 DEFAULT NULL,
   clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 235-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
`owner_name`	Owner's name
`table_name`	Name of the `XMLType` table that the procedure is being performed on
`column_name`	`XMLType` column name
`clear`	Boolean that when set to `TRUE` clears all stored index and constraint data for the table before the procedure executes. The default is `FALSE`, which does not clear them.

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

> **Note:**
>
> If the DISABLEINDEXESANDCONTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.

Example

The following example illustrates the use of clear in the DISABLEINDEXESANDCONSTRAINTS procedure and the ENABLEINDEXESANDCONSTRAINTS Procedure.

First, add a not-NULL constraint on comment element of the PURCHASEORDER_TAB table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check            ("XMLDATA"."comment" IS
NOT NULL);
```

Then, disable all the indexes and constraints by passing the clear as TRUE, by calling the DISABLEINDEXESANDCONSTRAINTS procedure:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB',NULL,TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint c1 in the ALTER table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
   tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the ENABLEINDEXESANDCONSTRAINTS procedure. It raises an error because c1, the not null constraint, is violated by the bulk load operation:

```
BEGIN
     XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
                                          ( USER,'PURCHASEORDER_TAB');
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER,'PURCHASEORDER_TAB');
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
     WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
     xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
                                          ( USER,'PURCHASEORDER_TAB');
END;
/
```

235.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2,
   column_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 235-3 ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
`owner_user`	Owner's name
`table_name`	Name of the table that the indexes and constraints are being removed from
`column_name`	Column name

Usage Notes

This procedure reverses DISABLEINDEXESANDCONSTRAINTS Procedure.

Example

See DISABLEINDEXESANDCONSTRAINTS Procedure

235.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 235-4 EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

235.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (
   owner_name   IN VARCHAR2 DEFAULT USER,
   table_name   IN VARCHAR2);
```

Parameters

Table 235-5 EXCHANGEPREPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

235.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the `REF` columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple `REF` columns, it appends `_1`, `_2`, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
   owner_name     IN VARCHAR2 DEFAULT USER,
   table_name     IN VARCHAR2,
   column_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 235-6 INDEXXMLREFERENCES Procedure Parameters

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

Usage Notes

This procedure is only used if the REFs are scoped. See SCOPEXMLREFERENCES Procedure.

Indexed REFs lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFs.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFs recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

> **Note:**
>
> This procedure is limited to the structured storage model.

235.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
   owner_name                IN VARCHAR2,
   parent_table_name         IN VARCHAR2,
```

```
   child_table_name           IN VARCHAR2,
   parent_exchange_table_name IN VARCHAR2,
   child_exchange_table_name  IN VARCHAR2,
   parent_exchange_stmt       IN CLOB,
   child_exchange_stmt        IN CLOB);
```

Parameters

Table 235-7 REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

235.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
   owner_name                 IN VARCHAR2,
   parent_table_name          IN VARCHAR2,
   child_table_name           IN VARCHAR2,
   parent_exchange_table_name IN VARCHAR2,
   child_exchange_table_name  IN VARCHAR2,
   parent_exchange_stmt       IN CLOB,
   child_exchange_stmt        IN CLOB);
```

Parameters

Table 235-8 REFPARTITIONEXCHANGEOUT Parameters

Parameter	Description
owner_name	owner's name

Table 235-8 (Cont.) REFPARTITIONEXCHANGEOUT Parameters

Parameter	Description
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

235.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the XMLtype base table or an XMLType column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
   owner_name             IN VARCHAR2 DEFAULT USER,
   table_name             IN VARCHAR2,
   column_name            IN VARCHAR2 DEFAULT NULL,
   xpath                  IN VARCHAR2,
   collection_table_name  IN VARCHAR2
   namespaces             IN VARCHAR2 default NULL);  // For release 11.2 only
```

Parameters

Table 235-9 RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
owner_name	The name of the owner
table_name	The name of a base table that can be used as the starting point for specifying the collection table
column_name	An XMLType column that can be the starting point for specifying the collection table
xpath	The XPath expression that specifies the collection table
collection_table_name	The name of the collection table

Table 235-9 (Cont.) RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
`namespaces`	For Oracle Database 11*g* Release 2 (11.2) and higher. The namespaces used in XPath.

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

> **Note:**
>
> This procedure is limited to the structured storage model.

For Oracle Database 11*g* Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
            USER,
            'EMP_TAB',
            NULL,
            '"XMLDATA"."EMPLOYEE"."NAME"',
           ''EMP_TAB_NAMELIST);
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call  XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
               USER,
               'EMP_TAB',
               NULL,
               '/e:Employee/Name',
               'EMP_TAB_NAMELIST',
               '''http://www.oracle.com/emp.xsd'' as "e"');
```

235.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used SETOUTOFLINE Procedure in the DBMS_XMLSTORAGE_MANAGE package to avoid raising `'4096 column limit'` errors during XML schema registration, you should also use SCOPEXMLREFERENCES Procedure.
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

> **Note:**
>
> This procedure is limited to the structured storage model.

235.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   owner_name    IN  VARCHAR2 DEFAULT USER,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2 DEFAULT NULL,
   xpath         IN  VARCHAR2,
   namespaces    IN  VARCHAR2 DEFAULT NULL)
 RETURN XMLTYPE;
```

Parameters

Table 235-10 XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
`owner_user`	Owner's name
`table_name`	Name of the base table
`column_name`	Optional name of the XML type column if `table_name` is not an XMLtype table. If table_name refers to XMLType table then `column_name` should be NULL.
`xpath`	Path expression in DOT notation or XPath notation (see examples below)

Table 235-10 (Cont.) XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
namespaces	Optional namespace definitions for path expression

Examples

XPath2TablColMapping evaluated on XMLType table with Xpath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER, 'XML_TAB', '', '//n1:item/n1:location',''''xdbXmark'' as "n1"'')
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table `SYS_NT12345` and column `location`.

XPath2TablColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
   USER,'PurchaseOrderTab','XMLCOL','xmldata.LineItems.LineItem', '')
FROM DUAL;
```

236
DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

> **Note:**
>
> The PL/SQL package DBMS_XMLSTORE is deprecated in Oracle Database 23ai.
>
> DBMS_XMLSTORE is a non-standard Oracle-proprietary package that enables you to store and manipulate XML data in Oracle Database. This package is deprecated, and can be desupported in a future release. Oracle recommends that you use regular SQL DML and with standard XQuery and SQL/XML to store and manage XML data. Using standard functionality provides future-proof way to store and manipulate XML data.

This chapter contains the following sections:

- Security Model
- Types
- Summary of DBMS_XMLSTORE Subprograms

> **See Also:**
>
> *Oracle XML DB Developer's Guide*

236.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

236.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

Table 236-1 ***Types of DBMS_XMLSTORE***

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT.

236.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the `DBMS_XMLSTORE` subprograms and briefly describes them.

Table 236-2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST	Clears the key column list.
CLEARUPDATECOLUMNLIST	Clears the update column list.
CLOSECONTEXT	It closes/deallocates a particular save context.
DELETEXML	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT	Creates a save context, and returns the context handle.
SETKEYCOLUMN	This method adds a column to the key column list.
SETROWTAG	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN	Adds a column to the "update column list".
UPDATEXML	Updates the table given the XML document.

236.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Table 236-3 CLEARKEYCOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

236.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Table 236-4 CLEARUPDATECOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

236.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

Table 236-5 CLOSECONTEXT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

236.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxPType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 236-6 DELETEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

236.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless SETUPDATECOLUMN is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;

FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 236-7 INSERTXML Function Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

236.3.6 NEWCONTEXT

`NEWCONTEXT` creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Table 236-8 NEWCONTEXT Function Parameters

Parameter	IN / OUT	Description
`targetTable`	`(IN)`	The target table into which to load the XML document.

236.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Table 236-9 SETKEYCOLUMN Procedure Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column to be added to the key column list; cannot be `NULL`.

236.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Table 236-10 SETROWTAG Procedure Parameters

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`tag`	`(IN)`	Tag name.

236.3.9 SETUPDATECOLUMN

`SETUPDATECOLUMN` adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Table 236-11 SETUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

236.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `CLOB`.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `XMLType`.

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 236-12 UPDATEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

237
DBMS_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

> **See Also:**
>
> - For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
> - For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*
> - For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- Overview
- Security Model
- Examples
- Summary of DBMS_XPLAN Subprograms

237.1 DBMS_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle
- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

237.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires SELECT or READ privileges on the following fixed views: VSQL_PLAN, VSESSION and V$SQL_PLAN_STATISTICS_ALL. This function also requires SELECT/READ permissions on V$SQL.

DISPLAY_AWR Function requires the user to have SELECT or READ privileges on DBA_HIST_SQL_PLAN, AWR_ROOT_SQL_PLAN, AWR_PDB_SQL_PLAN, AWR_ROOT_SQLTEXT, DBA_HIST_SQLTEXT, AWR_PDB_SQLTEXT, and V$DATABASE.

DISPLAY_SQLSET Function requires the user to have the SELECT or READ privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

DISPLAY_SQL_PLAN_BASELINE Function requires the user to have the SELECT or READ privilege on DBA_SQL_PLAN_BASELINES as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of SELECT_CATALOG_ROLE.

237.3 DBMS_XPLAN Data Structures

The DBMS_XPLAN package defines a TABLE type.

Table Types

- DBMS_XPLAN PLAN_OBJECT_LIST Table Type

237.3.1 DBMS_XPLAN PLAN_OBJECT_LIST Table Type

This type allows for a list of generic objects as input to the COMPARE_PLANS function.

Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the generic_plan_object superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for cursor_cache_object, then it matches all cursor cache statements with the specified SQL ID.

Table 237-1 Plan Sources for PLAN_OBJECT_LIST

Plan Source	Specification	Description
Plan table	`plan_table_object(owner, plan_table_name, statement_id, plan_id)`	The parameters are as follows: • `owner`—The owner of the plan table • `plan_table_name`—The name of the plan table • `statement_id`—The ID of the statement (optional) • `plan_id`—The ID of the plan (optional)
Cursor cache	`cursor_cache_object(sql_id, child_number)`	The parameters are as follows: • `sql_id`—The SQL ID of the plan • `child_number`—The child number of the plan in the cursor cache (optional)
AWR	`awr_object(sql_id, dbid, con_dbid, plan_hash_value)`	The parameters are as follows: • `sql_id`—The SQL ID of the plan • `dbid`—The database ID (optional) • `con_dbid`—The CDB ID (optional) • `plan_hash_value`—The hash value of the plan (optional)
SQL tuning set	`sqlset_object (sqlset_owner, sqlset_name, sql_id, plan_hash_value)`	The parameters are as follows: • `sqlset_owner`—The owner of the SQL tuning set • `sqlset_name`—The name of the SQL tuning set • `sql_id`—The SQL ID of the plan • `plan_hash_value`—The hash value of the plan (optional)
SQL plan management	`spm_object (sql_handle, plan_name)`	The parameters are as follows: • `sql_handle`—The SQL handle of plans protected by SQL plan management • `plan_name`—The name of the SQL plan baseline (optional)
SQL profile	`sql_profile_object (profile_name)`	The `profile_name` parameter specifies the name of the SQL profile.
Advisor	`advisor_object (task_name, execution_name, sql_id, plan_id)`	The parameters are as follows: • `task_name`—The name of the advisor task • `execution_name`—The name of the task execution • `sql_id`—The SQL ID of the plan • `plan_id`—The advisor plan ID (optional)

237.4 Examples

These examples show sample uses of DBMS_XPLAN.

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a `SELECT` statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
-------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."ENAME"='benoit')

15 rows selected.
```

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
   WHERE   e.deptno = d.deptno
   AND   e.empno=7369;

ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
-------------------------------------------------------------------
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
```

```
AND e.empno=7369

-----------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-----------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
|*  1 |  HASH JOIN         |      |     1 |    16 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    13 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    12 |     3  (34)| 00:00:01 |
-----------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."EMPNO"=7369)

21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID         CHILD_NUMBER
----------     ------------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
-------------------------------------------------------------
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

-----------------------------------------------------------------------------
| Id  | Operation           | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-----------------------------------------------------------------------------
|   0 | SELECT STATEMENT    |      |       |       |     7 (100)|          |
|   1 |  SORT GROUP BY      |      |     4 |    64 |     7  (43)| 00:00:01 |
|*  2 |   HASH JOIN         |      |    14 |   224 |     6  (34)| 00:00:01 |
|   3 |    TABLE ACCESS FULL| DEPT |     4 |    44 |     3  (34)| 00:00:01 |
|   4 |    TABLE ACCESS FULL| EMP  |    14 |    70 |     3  (34)| 00:00:01 |
-----------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE sql_text LIKE
'%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename    ='hermann'
   ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

```
-----------------------------------------------------------------------------------------------------------------
| Id | Operation          | Name    | Rows | Bytes | Cost (%CPU)| Time     | TQ    |INOUT |PQ Distrib   |
-----------------------------------------------------------------------------------------------------------------
| 0  | SELECT STATEMENT   |         | 1    | 117   | 6 (50)     | 00:00:01 |       |      |             |
| 1  | PX COORDINATOR     |         |      |       |            |          |       |      |             |
| 2  | PX SEND QC (ORDER) |:TQ10003 | 1    | 117   | 6 (50)     | 00:00:01 | Q1,03 | P->S | QC (ORDER)  |
| 3  | SORT ORDER BY      |         | 1    | 117   | 6 (50)     | 00:00:01 | Q1,03 | PCWP |             |
| 4  | PX RECEIVE         |         | 1    | 117   | 5 (40)     | 00:00:01 | Q1,03 | PCWP |             |
| 5  | PX SEND RANGE      |:TQ10002 | 1    | 117   | 5 (40)     | 00:00:01 | Q1,02 | P->P | RANGE       |
|* 6 | HASH JOIN          |         | 1    | 117   | 5 (40)     | 00:00:01 | Q1,02 | PCWP |             |
| 7  | PX RECEIVE         |         | 1    | 87    | 2 (50)     | 00:00:01 | Q1,02 | PCWP |             |
| 8  | PX SEND HASH       |:TQ10001 | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | P->P | HASH        |
| 9  | PX BLOCK ITERATOR  |         | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWC |             |
|* 10| TABLE ACCESS FULL  | EMP     | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWP |             |
| 11 | BUFFER SORT        |         |      |       |            |          | Q1,02 | PCWC |             |
| 12 | PX RECEIVE         |         | 4    | 120   | 3 (34)     | 00:00:01 | Q1,02 | PCWP |             |
| 13 | PX SEND HASH       |:TQ10000 | 4    | 120   | 3 (34)     | 00:00:01 |       | S->P | HASH        |
| 14 | TABLE ACCESS FULL  | DEPT    | 4    | 120   | 3 (34)     | 00:00:01 |       |      |             |
-----------------------------------------------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
---------------------------------------------------
```

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global

temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

237.5 Summary of DBMS_XPLAN Subprograms

This table lists the DBMS_XPLAN subprograms and briefly describes them.

Table 237-2 ***DBMS_XPLAN Package Subprograms***

Subprogram	Description
COMPARE_PLANS Function	Compares each plan in a list with a reference plan and returns the report
DIFF_PLAN Function	Compares plans
DISPLAY Function	Displays the contents of the plan table
DISPLAY_AWR Function	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function	Displays the execution plan of any cursor in the cursor cache
DISPLAY_PLAN Function	Displays the contents of the plan table in a variety of formats with `CLOB` output type
DISPLAY_SQL_PLAN_BASELINE Function	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function	Displays the execution plan of a given statement stored in a SQL tuning set

237.5.1 COMPARE_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

Syntax

```
DBMS_XPLAN.COMPARE_PLANS(
   reference_plan    IN generic_plan_object,
   compare_plan_list IN plan_object_list,
   type              IN VARCHAR2 := 'TEXT',
   level             IN VARCHAR2 := 'TYPICAL',
   section           IN VARCHAR2 := 'ALL')
 RETURN CLOB;
```

Parameters

Table 237-3 COMPARE_PLANS Function Parameters

Parameter	Description
reference_plan	The reference plan. This plan should always evaluate to a single plan.
compare_plan_list	List of plans to compare with reference plan. The compare_plan_list is a list of generic_object and each generic_object could correspond to one or more plans.
type	Type of the report. Possible values are: • TEXT • HTML • XML
level	Format of the report. Possible values are: • BASIC • TYPICAL • ALL
section	A particular section in the report. Possible values are: • SUMMARY • FINDINGS • PLANS • INFORMATION • ERRORS

Example 237-1 Examples

The following examples illustrate the usage of COMPARE_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
                - plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
                plan_object_list( spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL_024d0f7d21351f5d' and plan name is 'SQL_PLAN_sdfjkd'. Returns the report in the text format (default).

```
var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
```

```
              plan_object_list( cursor_cache_object('8mkxm7ur07za0'),
sqlset_object('SH', 'SQLT_WORKLOAD', '               6vfqvav0rgyad'),
awr_object('6vfqvav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_               sdfjkd'), plan_table_object('SH', 'plan_table', NULL, 38),
sql_profile_object('pe3r3ejsfd'), a              dvisor_object('TASK_1228',
'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
              level => 'ALL', section => 'SUMMARY');
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- cursor_cache_object('8mkxm7ur07za0'): All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- sqlset_object('SH', 'SQLT_WORKLOAD', '6vfqvav0rgyad'): All the plans generated in the SQL tuning set SH. SQLT_WORKLOAD for the SQL ID '6vfqvav0rgyad'.
- awr_object('6vfqvav0rgyad', 5): All the plans in AWR that are captured for database ID 5 and SQL ID '6vfqvav0rgyad'.
- spm_object ('SQL_024d0f7d21351f5d, 'SQL_PLAN_sdfjkd'): The plan baseline for the query with SQL handle 'SQL_024d0f7d21351f5d' with name 'SQL_PLAN_sdfjkd'.
- plan_table_object('SH', 'plan_table', NULL, 38): Plan stored in SH.plan_table identified by plan_id=38.
- sql_profile_object('pe3r3ejsfd'): Plan identified by the SQL profile name 'pe3r3ejsfd'.
- advisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0')): All the plans stored in SQL advisor identified by task name 'TASK_1228', execution name 'EXEC_1928' and SQL ID '8mkxm7ur07za0'.

237.5.2 DIFF_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a `task_id` that can be used to retrieve the report of findings.

Syntax

```
DBMS_XPLAN.DIFF_PLAN(
   sql_text     IN   CLOB,
   outline      IN   CLOB,
   user_name    IN   VARCHAR2 := 'NULL')
 RETURN VARCHAR2;
```

Parameters

Table 237-4 DIFF_PLAN Function Parameters

Parameter	Description
`sql_text`	The text of the SQL statement.
`outline`	Used to generate the target plan.
`user_name`	The parsing schema name default to current user.

237.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
   table_name     IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
   statement_id   IN  VARCHAR2  DEFAULT  NULL,
   format         IN  VARCHAR2  DEFAULT  'TYPICAL',
   filter_preds   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 237-5 DISPLAY Function Parameters

Parameter	Description
`table_name`	Specifies the table name where the plan is stored. This parameter defaults to `PLAN_TABLE`, which is the default plan table for the `EXPLAIN PLAN` command. If `NULL` is specified it also defaults to `PLAN_TABLE`.
`statement_id`	Specifies the `statement_id` of the plan to be displayed. This parameter defaults to `NULL`, which is the default when the `EXPLAIN PLAN` command is executed without a `set statement_id` clause. If no `statement_id` is specified, the function shows you the plan of the most recent explained statement.

Table 237-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts the following values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

> **WARNING:**
>
> Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "`my_plan_table`":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by '`foo`', such as `statement_id='sales_query'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

237.5.4 DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in AWR.

> **Note:**
>
> This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER DEFAULT NULL,
   db_id             IN      NUMBER DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 237-6 DISPLAY_AWR Table Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.

Table 237-6 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, AWR_ROOT_SQL_PLAN, AWR_PDB_SQL_PLAN, DBA_HIST_SQLTEXT, AWR_ROOT_SQLTEXT, AWR_PDB_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message. By default, select privilege for these views is granted to the select_catalog role.
- The following examples show different ways of using the format parameter:
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM   DBA_HIST_SQLTEXT ht, table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null,
null,  'ALL' )) tf
WHERE  ht.sql_text like '%TOTO%';
```

237.5.5 DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
   sql_id            IN  VARCHAR2  DEFAULT  NULL,
   cursor_child_no   IN  NUMBER    DEFAULT  0,
   format            IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

Table 237-7 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of the child_number=0 cursor matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.

Table 237-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: – Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join. – Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans. – Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this. – Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer. For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter

Table 237-7 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	statistics_level to ALL), this format shows IO statistics for `ALL` (or only for the `LAST` as shown below) executions of the cursor. • `MEMSTATS` - Assuming that PGA memory management is enabled (that is, `pga_aggregate_target` parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • `ALLSTATS` - A shortcut for `'IOSTATS MEMSTATS'` • `LAST` - By default, plan statistics are shown for all executions of the cursor. The keyword `LAST` can be specified to see only the statistics for the last execution. The following formats are deprecated but supported for backward compatibility: • `RUNSTATS_TOT` - Same as `IOSTATS`, that is, displays IO statistics for all executions of the specified cursor. • `RUNSTATS_LAST` - Same as `IOSTATS LAST`, that is, displays the runtime statistics for the last execution of the cursor You can prefix format keywords with the sign '`-`' to exclude the specified information. For example, '`-PROJECTION`' excludes projection information.

Usage Notes

- To use the `DISPLAY_CURSOR` functionality, the calling user must have `SELECT` or `READ` privilege on the fixed views `V$SQL_PLAN_STATISTICS_ALL`, `V$SQL` and `V$SQL_PLAN`, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the `format` parameter:
  - Use '`ALL -PROJECTION -NOTE`' to display everything except the projection and note sections.
  - Use '`TYPICAL PROJECTION`' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply '`PROJECTION`' is equivalent.
  - Use '`-BYTES -COST -PREDICATE`' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use '`BASIC ROWS`' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last `SQL` statement executed by the current session:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

237.5.6 DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
   table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',
   statement_id     IN    VARCHAR2   DEFAULT NULL,
   format           IN    VARCHAR2   DEFAULT 'TYPICAL',
   filter_preds     IN    VARCHAR2   DEFAULT NULL,
   type             IN    VARCHAR2   DEFAULT 'TEXT')
  RETURN CLOB;
```

Parameters

Table 237-8 DISPLAY_PLAN Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Table 237-8 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts five values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). • ADAPTIVE: Displays the default plan, and for each dynamic subplan (if stipulated): - A list of the rowsources from the original which may be replaced, and the rowsources to replace them - If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
type	Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE). '

Return Values

Returns the requested report as `CLOB`

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

> **WARNING:**
>
> Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

237.5.7 DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
   sql_handle      IN VARCHAR2 := NULL,
   plan_name       IN VARCHAR2 := NULL,
   format          IN VARCHAR2 := 'TYPICAL')
 RETURN dbms_xplan_type_table;
```

Parameters

Table 237-9 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies a SQL statement whose plans are to be displayed.
`plan_name`	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
`format`	Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: `BASIC`, `TYPICAL`, and `ALL`.

Return Values

A PL/SQL type table

Usage Notes

This function uses plan information stored in the plan baseline to explain and display the plans. The `plan_id` stored in the SQL management base may not match the `plan_id` of the generated plan. A mismatch between the stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle `SYS_SQL_b1d49f6074ab95af` using `TYPICAL` format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string `HR2` using `BASIC` format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE sql_text
LIKE '%HR2%') pb,
     TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

237.5.8 DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN NUMBER := NULL,
   format           IN  VARCHAR2  := 'TYPICAL',
   sqlset_owner     IN  VARCHAR2  := NULL)
  RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 237-10 DISPLAY_SQLSET Function Parameters

Parameter	Description
`sqlset_name`	Name of the SQL Tuning Set

Table 237-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
`sql_id`	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function `DBMS_SQLTUNE.SELECT_SQLSET`
`plan_hash_value`	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.

Table 237-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan • IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter STATISTICS_LEVEL to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. • MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. • ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' • LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: • RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.

Table 237-10 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	• RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.
sqlset_owner	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

237.5.9 DISPLAY_WORKLOAD_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

> **Note:**
>
> This function replaces `DISPLAY_AWR`, which is deprecated.

Syntax

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER   DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT 'TYPICAL'
   dbid              IN      NUMBER   DEFAULT NULL,
   con_dbid          IN      NUMBER   DEFAULT NULL,
   awr_location      IN      VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

Parameters

Table 237-11 DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
`sql_id`	Specifies the `SQL_ID` of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column `SQL_ID` in `DBA_HIST_SQLTEXT`.
`plan_hash_value`	Specifies the `PLAN_HASH_VALUE` of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given `SQL_ID`.

Table 237-11 (Cont.) DISPLAY_WORKLOAD_REPOSITORY Table Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: • BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. • TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). • SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. • ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: • ROWS - if relevant, shows the number of rows estimated by the optimizer • BYTES - if relevant, shows the number of bytes estimated by the optimizer • COST - if relevant, shows optimizer cost information • PARTITION - if relevant, shows partition pruning information • PARALLEL - if relevant, shows PX information (distribution method and table queue information) • PREDICATE - if relevant, shows the predicate section • PROJECTION -if relevant, shows the projection section • ALIAS - if relevant, shows the "Query Block Name / Object Alias" section • REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) • NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.
dbid	Identifies the plans for a specific database. If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.
con_dbid	Identifies the plans for a specific container. If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').
awr_location	Specifies the location of the AWR repository. Supported values are: • AWR_ROOT when the AWR to be accessed is in the root container. This is the default. • 'AWR_PDB', if the AWR to be accessed is in the local container.

Example 237-2 Querying an AWR Plan

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint `DBA_HIST_SQLTEST` to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000

SELECT t.*
FROM   DBA_HIST_SQLTEXT ht,
       TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
         (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE  ht.SQL_TEXT LIKE '%sAleS%';

SQL_ID 2f4cx9qjnqd70
--------------------
select count(*) from sh.sAleS

Plan hash value: 1123225294

-------------------------------------------------------------------------------
----------------------------
| Id  | Operation                      | Name            | Rows  | Cost
(%CPU)| Time     | Pstart| Pstop |
-------------------------------------------------------------------------------
----------------------------
|   0 | SELECT STATEMENT               |                 |       |    27
(100)|          |       |       |

   3 - SEL$1 / "SALES"@"SEL$1"
```

238
DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- DBMS_XSLPROCESSOR Overview
- DBMS_XSLPROCESSOR Security Model
- Summary of DBMS_XSLPROCESSOR Subprograms

> **See Also:**
>
> – *Oracle XML DB Developer's Guide*

238.1 DBMS_XSLPROCESSOR Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

238.2 DBMS_XSLPROCESSOR Security Model

Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

238.3 Summary of DBMS_XSLPROCESSOR Subprograms

This table lists the `DBMS_XSLPROCESSOR` subprograms and briefly describes them.

Table 238-1 *DBMS_XSLPROCESSOR Package Subprograms*

Method	Description
FREEPROCESSOR Procedure	Frees a processor object
FREESTYLESHEET Procedure	Frees a stylesheet object
NEWPROCESSOR Function	Returns a new processor instance
NEWSTYLESHEET Functions	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures	Transforms an input XML document
REMOVEPARAM Procedure	Removes a top-level stylesheet parameter
RESETPARAMS Procedure	Resets the top-level stylesheet parameters
SELECTNODES Function	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure	Sets errors to be sent to the specified file
SETPARAM Procedure	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure	Turns warnings on or off
TRANSFORMNODE Function	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure	Gets the value of the first node that matches a pattern

238.3.1 FREEPROCESSOR Procedure

This procedure frees a `Processor` object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p  IN  Processor);
```

Parameters

Table 238-2 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

238.3.2 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

Table 238-3 FREESTYLESHEET Procedure Parameters

Parameter	Description
ss	Stylesheet

238.3.3 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

238.3.4 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   xmldoc  IN   DOMDOCUMENT,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   inp    IN   VARCHAR2,
   ref    IN   VARCHAR2)
 RETURN Stylesheet;
```

Parameters

Table 238-4 NEWSTYLESHEET Function Parameters

Parameter	Description
xmldoc	`DOMDocument` to use for construction
inp	Input URL to use for construction
ref	Reference URL

238.3.5 PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input `XMLDocument` using given `DOMDocument` and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p      IN   Processor,
   ss     IN   Stylesheet,
   xmldoc IN   DOMDOCUMENT),
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN   Stylesheet,
   url   IN   VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as `CLOB` and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN  Stylesheet,
   clb   IN  CLOB)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
   p           IN    Processor,
   ss          IN    Stylesheet,
   xmldoc      IN    DOMDOCUMENT,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   url        IN    VARCHAR2,
   dir        IN    VARCHAR2,
   fileName   IN    VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
   ss         IN      Stylesheet,
   xmldoc     IN      DOMDOCUMENT,
   cl         IN OUT  CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   xmldf      IN    DOMDOCUMENTFRAGMENT,
   dir        IN    VARCHAR2,
   filename   IN    VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN       Processor,
   ss         IN       Stylesheet,
   xmldf      IN       DOMDOCUMENTFRAGMENT,
   buf        IN OUT   VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
   ss         IN      Stylesheet,
   xmldf      IN      DOMDOCUMENTFRAGMENT,
   cl         IN OUT  CLOB);
```

Parameters

Table 238-5 PROCESSXSL Function and Procedure Parameters

Parameter	Description
`p`	`Processor` instance
`ss`	`Stylesheet` instance
`xmldoc`	XML document being transformed
`url`	URL for the information being transformed
`clb`	`CLOB` containing information to be transformed
`dir`	Directory where processing output file is saved
`filename`	Processing output file
`cl`	`CLOB` to which the processing output is saved

Table 238-5 (Cont.) PROCESSXSL Function and Procedure Parameters

Parameter	Description
xmldf	XMLDocumentFragment being transformed

238.3.6 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
   ss      IN  Stylesheet,
   name    IN  VARCHAR2);
```

Parameters

Table 238-6 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

238.3.7 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
   ss  IN   Stylesheet);
```

Parameters

Table 238-7 RESETPARAMS Procedure Parameters

Parameter	Description
ss	Stylesheet instance

238.3.8 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 238-8 SELECTNODES Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

238.3.9 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 238-9 SELECTSINGLENODE Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

238.3.10 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

> **Note:**
>
> This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
   p         IN   Processor,
   fileName  IN   VARCHAR2);
```

Parameters

Table 238-10 SETERRORLOG Procedure Parameters

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

238.3.11 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
   ss      IN   Stylesheet,
   name    IN   VARCHAR2,
   value   IN   VARCHAR2);
```

Parameters

Table 238-11 SETPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter
value	Value of the parameter

238.3.12 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
   p     IN   Processor,
   yes   IN   BOOLEAN);
```

Parameters

Table 238-12 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

238.3.13 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
   n    IN  DOMNODE,
   ss   IN  Stylesheet)
 RETURN DOMDocumentFragment;
```

Parameters

Table 238-13 TRANSFORMNODE Function Parameters

Parameter	Description
`n`	`DOMNode` to transform
`ss`	Stylesheet to use

238.3.14 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  namespace   IN    VARCHAR2 := NULL)
 RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  val         OUT   VARCHAR2,
  namespace   IN    VARCHAR2 := NULL);
```

Parameters

Table 238-14 VALUEOF Function and Procedure Parameters

Parameter	Description
`n`	Node whose value is being retrieved
`pattern`	Pattern to use
`val`	Retrieved value
namespace	Namespace to use

239
DBMS_XSTREAM_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_XSTREAM_ADM Subprograms

> **See Also:**
>
> - *Oracle Database XStream Guide*
> - *Oracle Call Interface Programmer's Guide*
> - *Oracle Database XStream Java API Reference*

239.1 DBMS_XSTREAM_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

239.2 DBMS_XSTREAM_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

See Also:

- GRANT_ADMIN_PRIVILEGE Procedure
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

239.3 DBMS_XSTREAM_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

See Also:

DBMS_APPLY_ADM for details about which subprograms can manage outbound servers and inbound servers

239.4 Summary of DBMS_XSTREAM_ADM Subprograms

This table lists the `DBMS_XSTREAM_ADM` subprograms and briefly describes them.

Table 239-1 DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure	Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_OUTBOUND Procedure	Creates an XStream outbound server that dequeues LCRs from the specified queue
ADD_SCHEMA_PROPAGATION_RULES Procedure	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure	Adds rules to a rule set of XStream clients.
ADD_SUBSET_OUTBOUND_RULES Procedure	Adds subset rules to an outbound server configuration
ADD_SUBSET_PROPAGATION_RULES Procedure	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure	Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure	This procedure adds rules to a rule set of an XStream client.
ALTER_INBOUND Procedure	Modifies an XStream inbound server
ALTER_OUTBOUND Procedure	Modifies an XStream outbound server
CREATE_INBOUND Procedure	Creates an XStream inbound server and its queue
CREATE_OUTBOUND Procedure	Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs
DELETE_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
DROP_INBOUND Procedure	Removes an inbound server configuration

Table 239-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
DROP_OUTBOUND Procedure	Removes an outbound server configuration
ENABLE_GG_XSTREAM_FOR_STREAMS Procedure	Enables XStream performance optimizations for Oracle Replication components
GET_MESSAGE_TRACKING Function	Returns the tracking label for the current session
GET_TAG Function	Gets the binary tag for all redo entries generated by the current session
IS_GG_XSTREAM_FOR_STREAMS Function	Returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components
KEEP_COLUMNS Procedure	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MERGE_STREAMS Procedure	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the `MERGE_STREAMS` procedure to merge the two streams
PURGE_SOURCE_CATALOG Procedure	Removes all Oracle Replication data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure	Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure	Removes the specified `ANYDATA` queue
REMOVE_RULE Procedure	Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.
REMOVE_SUBSET_OUTBOUND_RULES Procedure	Removes subset rules from an outbound server configuration
REMOVE_XSTREAM_CONFIGURATION Procedure	Removes the XStream configuration at the local database
RENAME_COLUMN Procedure	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_TRACKING Procedure	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_PARAMETER Procedure	Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process

Table 239-1 (Cont.) DBMS_XSTREAM_ADM Package Subprograms

Subprogram	Description
SET_TAG Procedure	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream
SPLIT_STREAMS Procedure	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process
START_OUTBOUND Procedure	Starts an XStream outbound server
STOP_OUTBOUND Procedure	Stops an XStream outbound server

Note:

All subprograms commit unless specified otherwise.

239.4.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

Oracle Database XStream Guide for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 239-2 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.

Table 239-2 (Cont.) ADD_COLUMN Procedure Parameters

Parameter	Description
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function returns the current date and time. 'SYSDATE' uses the time zone of either the database host system or the database, depending on the setting of the TIME_AT_DBTIMEZONE initialization parameter. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds. 'SYSTIMESTAMP' uses the time zone of either the database host system or the database, depending on the setting of the TIME_AT_DBTIMEZONE initialization parameter. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified. **See Also:** *Oracle Database Reference* for more information about the TIME_AT_DBTIMEZONE parameter.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.

table_name	column_name	step_number	Result
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

239.4.2 ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   include_dml              IN   BOOLEAN   DEFAULT TRUE,
   include_ddl              IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
   source_database          IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name            OUT  VARCHAR2,
   ddl_rule_name            OUT  VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   and_condition            IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   include_dml              IN   BOOLEAN   DEFAULT TRUE,
   include_ddl              IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
   source_database          IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   and_condition            IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 239-3 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 239-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 239-3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number

is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

  This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

> **Note:**
>
> If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN   VARCHAR2  DEFAULT NULL,
   source_container_name  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-4 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.

Table 239-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.

Table 239-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long,

then the database name is truncated. A capture process or apply process uses the rules for filtering.

> **See Also:**
>
> - "Operational Notes"
> - "Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.4 ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the CREATE_OUTBOUND Procedure.

To create the capture process individually, use one of the following packages:

- `DBMS_XSTREAM_ADM`
- `DBMS_CAPTURE_ADM`

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

> **Note:**
>
> - A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
> - This procedure enables the outbound server that it creates.
> - Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
   server_name             IN  VARCHAR2,
   queue_name              IN  VARCHAR2   DEFAULT NULL,
   source_database         IN  VARCHAR2   DEFAULT NULL,
   table_names             IN  DBMS_UTILITY.UNCL_ARRAY,
   schema_names            IN  DBMS_UTILITY.UNCL_ARRAY,
   connect_user            IN  VARCHAR2   DEFAULT NULL,
   comment                 IN  VARCHAR2   DEFAULT NULL,
   capture_name            IN  VARCHAR2   DEFAULT NULL,
   start_scn               IN  NUMBER     DEFAULT NULL,
   start_time              IN  TIMESTAMP  DEFAULT NULL,
   include_dml             IN  BOOLEAN    DEFAULT TRUE,
   include_ddl             IN  BOOLEAN    DEFAULT FALSE,
   source_root_name        IN  VARCHAR2   DEFAULT NULL,
   source_container_name   IN  VARCHAR2   DEFAULT NULL,
   lcrid_version           IN  NUMBER     DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_OUTBOUND(
   server_name             IN  VARCHAR2,
   queue_name              IN  VARCHAR2   DEFAULT NULL,
   source_database         IN  VARCHAR2   DEFAULT NULL,
   table_names             IN  VARCHAR2   DEFAULT NULL,
   schema_names            IN  VARCHAR2   DEFAULT NULL,
   connect_user            IN  VARCHAR2   DEFAULT NULL,
   comment                 IN  VARCHAR2   DEFAULT NULL,
   capture_name            IN  VARCHAR2   DEFAULT NULL,
   start_scn               IN  NUMBER     DEFAULT NULL,
   start_time              IN  TIMESTAMP  DEFAULT NULL,
   include_dml             IN  BOOLEAN    DEFAULT TRUE,
   include_ddl             IN  BOOLEAN    DEFAULT FALSE,
   source_root_name        IN  VARCHAR2   DEFAULT NULL,
   source_container_name   IN  VARCHAR2   DEFAULT NULL,
   lcrid_version           IN  NUMBER     DEFAULT NULL);
```

Parameters

Table 239-5 ADD_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
queue_name	The name of the local queue from which the outbound server dequeues LCRs, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default. If NULL, the procedure raises an error.

Table 239-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
table_names	The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
connect_user	The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user. If NULL, then the current user is the default.
comment	An optional comment associated with the outbound server.
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If the specified name matches the name of an existing capture process for an apply process, then an error is raised. If the specified name does not match the name of an existing capture process, then an error is raised. If NULL, then the outbound server is created without a capture process.

Table 239-5 (Cont.) ADD_OUTBOUND Procedure Parameters

Parameter	Description
start_scn	A valid system change number (SCN) for the database from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive.
start_time	A valid time from which the capture process starts capturing changes. If the capture_name parameter is NULL, then this parameter is ignored. If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed. The start_scn and start_time parameters are mutually exclusive.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.
lcrid_version	The LCRID version for captured LCRs, either 1 or 2. If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher. If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower. If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.

- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

> **Note:**
>
> An empty array includes one `NULL` entry.

239.4.5 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
```

```
  source_database         IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
  and_condition           IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 239-6 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 239-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 239-6 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number

is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.6 ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

> **Note:**
>
> If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name             IN   VARCHAR2,
   streams_type            IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   queue_name              IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   source_root_name        IN  VARCHAR2  DEFAULT NULL,
```

```
   source_container_name  IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
   schema_name             IN   VARCHAR2,
   streams_type            IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   queue_name              IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   source_root_name        IN  VARCHAR2  DEFAULT NULL,
   source_container_name   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-7 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.

Table 239-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

Table 239-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.

and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:
	`(system_condition) AND (and_condition)`
	The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:
	`:lcr.get_tag() = HEXTORAW(''02'')`
	The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.
	Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.
	See Also: Logical Change Record TYPEs

Table 239-7 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.7 ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One column_list parameter is type VARCHAR2 and the other column_list parameter is type DBMS_UTILITY.LNAME_ARRAY. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

> **Note:**
>
> This procedure does not add rules to the outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN DBMS_UTILITY.LNAME_ARRAY,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   table_name       IN VARCHAR2,
   condition        IN VARCHAR2  DEFAULT NULL,
   column_list      IN VARCHAR2  DEFAULT NULL,
   keep             IN BOOLEAN   DEFAULT TRUE,
   source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-8 ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.
`table_name`	The name of the table specified as `[schema_name.]object_name`. For example, you can specify `hr.employees`. If the schema is not specified, then the current user is the default. If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database. The specified table cannot have any LOB, `LONG`, or `LONG RAW` columns currently or in the future.
`condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` If `NULL`, then the procedure raises an error. **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 239-8 (Cont.) ADD_SUBSET_OUTBOUND_RULES Procedure Parameters

Parameter	Description
column_list	The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the keep parameter. The columns can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL. To include or exclude all of the columns in a table, specify each column in the table in the list or array. If NULL, then the procedure raises an error.
keep	If TRUE, then the columns specified in the column_list parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the condition parameter are streamed to the outbound server's client application. If FALSE, then the columns specified in the column_list parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application. **See Also:** "Usage Notes"
source_database	The global name of the container where the specified table_names and schema_names are located. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.

Usage Notes

When the keep parameter is set to TRUE, this procedure creates a keep columns declarative rule-based transformation for the columns listed in column_list.

When the keep parameter is set to FALSE, this procedure creates a delete column declarative rule-based transformation for each column listed in column_list.

> **See Also:**
>
> *Oracle Database XStream Guide* for information about declarative rule-based transformations

239.4.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
   delete_rule_name          OUT  VARCHAR2,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 239-9 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, `LONG`, `LONG RAW`, or `XMLType` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 239-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.

Table 239-9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the

propagation are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

> **Note:**
>
> Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

239.4.9 ADD_SUBSET_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an

outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name              IN   VARCHAR2,
   dml_condition           IN   VARCHAR2,
   streams_type            IN   VARCHAR2 DEFAULT 'apply',
   streams_name            IN   VARCHAR2 DEFAULT NULL,
   queue_name              IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr      IN   BOOLEAN  DEFAULT FALSE,
   source_database         IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name        OUT  VARCHAR2,
   update_rule_name        OUT  VARCHAR2,
   delete_rule_name        OUT  VARCHAR2,
   source_root_name        IN  VARCHAR2  DEFAULT NULL,
   source_container_name   IN  VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
   table_name              IN   VARCHAR2,
   dml_condition           IN   VARCHAR2,
   streams_type            IN   VARCHAR2 DEFAULT 'apply',
   streams_name            IN   VARCHAR2 DEFAULT NULL,
   queue_name              IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr      IN   BOOLEAN  DEFAULT FALSE,
   source_database         IN   VARCHAR2 DEFAULT NULL,
   source_root_name        IN  VARCHAR2  DEFAULT NULL,
   source_container_name   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-10 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, `LONG`, `LONG RAW`, or `XMLType` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.
`streams_type`	The type of XStream client: • Specify `capture` for a capture process. • Specify `apply` for an apply process.

Table 239-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_tagged_lcr	If TRUE, then the XStream client performs its action regardless of the tag: • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an XStream client performs its action only when the tag is NULL: • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.

Table 239-10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

> **Note:**
>
> Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

239.4.10 ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 239-11 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 239-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 239-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 239-11 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. • If NULL, then the procedure does not change the queue to queue property of the propagation.

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is

used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.11 ADD_TABLE_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.

  This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name          OUT  VARCHAR2,
   ddl_rule_name          OUT  VARCHAR2,
   inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
   and_condition          IN   VARCHAR2  DEFAULT NULL,
   source_root_name       IN  VARCHAR2   DEFAULT NULL,
   source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
   table_name             IN   VARCHAR2,
   streams_type           IN   VARCHAR2,
   streams_name           IN   VARCHAR2  DEFAULT NULL,
   queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml            IN   BOOLEAN   DEFAULT TRUE,
   include_ddl            IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
   source_database        IN   VARCHAR2  DEFAULT NULL,
```

```
  inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
  and_condition          IN   VARCHAR2  DEFAULT NULL,
  source_root_name       IN  VARCHAR2   DEFAULT NULL,
  source_container_name  IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 239-12 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Replication does not validate the existence of the table.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify apply for an apply process.
streams_name	The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: • If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. • If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

Table 239-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag: • A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. • An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is NULL: • A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. • An LCR is considered for apply by an apply process only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

Table 239-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Logical Change Record TYPEs

Table 239-12 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

See Also:

- "Operational Notes"
- "Security Model"

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

239.4.12 ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
   server_name IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-13 ALTER_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.
apply_user	The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply user is not changed. See "CREATE_INBOUND Procedure" for information about the required privileges for an apply user.
comment	An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

239.4.13 ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the CREATE_OUTBOUND procedure in this package.
- The queue used by the capture process was created by the CREATE_OUTBOUND procedure.

To check whether this procedure can alter the outbound server's capture process, query the CAPTURE_NAME column in the ALL_XSTREAM_OUTBOUND view. When the name of the capture process appears in the CAPTURE_NAME column of this view, the ALTER_OUTBOUND procedure can manage the capture process's rules or change the capture user for the capture process. When the CAPTURE_NAME column of this view is NULL, the ALTER_OUTBOUND procedure cannot manage the capture process.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

> **Note:**
>
> Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the start_scn and start_time parameters are included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names          IN DBMS_UTILITY.UNCL_ARRAY,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHR2    DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
   inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
   start_scn             IN NUMBER     DEFAULT NULL,
   start_time            IN TIMESTAMP  DEFAULT NULL,
   include_dml           IN BOOLEAN    DEFAULT TRUE,
   include_ddl           IN BOOLEAN    DEFAULT FALSE,
   source_database       IN VARCHAR2   DEFAULT NULL,
   source_container_name IN VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
   server_name           IN VARCHAR2,
   table_names           IN VARCHAR2   DEFAULT NULL,
   schema_names          IN VARCHAR2   DEFAULT NULL,
   add                   IN BOOLEAN    DEFAULT TRUE,
   capture_user          IN VARCHAR2   DEFAULT NULL,
   connect_user          IN VARCHAR2   DEFAULT NULL,
   comment               IN VARCHAR2   DEFAULT NULL,
   inclusion_rule        IN BOOLEAN    DEFAULT TRUE,
   start_scn             IN NUMBER     DEFAULT NULL,
   start_time            IN TIMESTAMP  DEFAULT NULL,
   include_dml           IN BOOLEAN    DEFAULT TRUE,
   include_ddl           IN BOOLEAN    DEFAULT FALSE,
   source_database       IN VARCHAR2   DEFAULT NULL,
   source_container_name IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 239-14 ALTER_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.
`table_names`	The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the `add` parameter. The tables can be specified in the following ways: • Comma-delimited list of type `VARCHAR2`. • A PL/SQL associative array of type `DBMS_UTILITY.UNCL_ARRAY`, where each element is the name of a table. Specify the first table in position 1. The last position must be `NULL`. Each table should be specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter

Table 239-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
schema_names	The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
add	If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter. If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If NULL, then the capture user is not changed. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a capture user. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user. Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS. If NULL, then the connect user is not changed. If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.

Table 239-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
comment	An optional comment associated with the outbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.
inclusion_rule	If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application. If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration. If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application. If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration.
start_scn	A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process. If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted. An error is returned if an invalid SCN is specified. If NULL and the start_time parameter is NULL, then the start SCN is not changed. If NULL and the start_time parameter is non-NULL, then the start SCN is changed to match the specified start time. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL.

Table 239-14 (Cont.) ALTER_OUTBOUND Procedure Parameters

Parameter	Description
start_time	A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process. If a valid time is specified, then the capture process captures changes from the specified time when it is restarted. An error is returned if an invalid time is specified. If NULL and the start_scn parameter is NULL, then the start time is not changed. If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN. The start_scn and start_time parameters are mutually exclusive. **Note:** If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_database	The global name of the container where the specified table_names and schema_names are located. If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

> **Note:**
>
> An empty array includes one `NULL` entry.

239.4.14 CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

> **Note:**
>
> A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
   server_name IN VARCHAR2,
   queue_name  IN VARCHAR2,
   apply_user  IN VARCHAR2  DEFAULT NULL,
   comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-15 CREATE_INBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the inbound server being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The `server_name` setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.

Table 239-15 (Cont.) CREATE_INBOUND Procedure Parameters

Parameter	Description
queue_name	The name of the local queue used by the inbound server, specified as [*schema_name.*]*queue_name*. If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it. For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default. **Note:** An inbound server's queue is used only to store error transactions.
apply_user	The apply user. If NULL, then the current user is the default. The client application must attach to the inbound server as the apply user. The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user: • The necessary privileges to perform DML and DDL changes on the apply objects • EXECUTE privilege on the rule sets used by the inbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set • EXECUTE privilege on all apply handler procedures You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the apply user for an inbound server is dropped using DROP USER . . . CASCADE, then the inbound server is also dropped automatically.
comment	An optional comment associated with the inbound server.

Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the DBMS_XSTREAM_ADM and DBMS_RULE_ADM packages.

In a CDB, you can execute the CREATE_INBOUND procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

> **See Also:**
>
> *Oracle Database XStream Guide*

239.4.15 CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

> **Note:**
>
> - A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
> - If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
> - This procedure automatically generates a name for the queue that it creates.
> - This procedure enables both the capture process and outbound server that it creates.
> - Starting with Oracle Database 11*g* Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN DBMS_UTILITY.UNCL_ARRAY,
   schema_names           IN DBMS_UTILITY.UNCL_ARRAY,
```

```
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
   include_dml            IN BOOLEAN   DEFAULT TRUE,
   include_ddl            IN BOOLEAN   DEFAULT FALSE,
   source_root_name       IN VARCHAR2  DEFAULT NULL,
   source_container_name  IN VARCHAR2  DEFAULT NULL,
   lcrid_version          IN NUMBER    DEFAULT NULL);

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
   server_name            IN VARCHAR2,
   source_database        IN VARCHAR2  DEFAULT NULL,
   table_names            IN VARCHAR2  DEFAULT NULL,
   schema_names           IN VARCHAR2  DEFAULT NULL,
   capture_user           IN VARCHAR2  DEFAULT NULL,
   connect_user           IN VARCHAR2  DEFAULT NULL,
   comment                IN VARCHAR2  DEFAULT NULL,
   capture_name           IN VARCHAR2  DEFAULT NULL,
   include_dml            IN BOOLEAN   DEFAULT TRUE,
   include_ddl            IN BOOLEAN   DEFAULT FALSE,
   source_root_name       IN VARCHAR2  DEFAULT NULL,
   source_container_name  IN VARCHAR2  DEFAULT NULL,
   lcrid_version          IN NUMBER    DEFAULT NULL);
```

Parameters

Table 239-16 CREATE_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. **Note:** The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.
source_database	The global name of the source database. The source database is where the changes to be captured originated. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See *Oracle Database XStream Guide* for instructions. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.

Table 239-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
table_names	The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [*schema_name.*]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. **See Also:** "Usage Notes" for more information about this parameter
schema_names	The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways: • Comma-delimited list of type VARCHAR2. • A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. **Note:** This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (*schema_name.table_name*). **See Also:** "Usage Notes" for more information about this parameter
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. In addition, ensure that the capture user has the following privileges: • EXECUTE privilege on the rule sets used by the capture process • EXECUTE privilege on all rule-based transformation functions used in the positive rule set You can grant these privileges directly to the apply user, or you can grant them through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.

Table 239-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
connect_user	The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user. If NULL, then the current user is the default. The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. In addition to the privileges granted by this procedure, grant the following privileges to the connect user: • EXECUTE privilege on the rule sets used by the outbound server • EXECUTE privilege on all rule-based transformation functions used in the rule set You can grant these privileges directly to the connect user, or you can grant them through roles. In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.
comment	An optional comment associated with the outbound server.
capture_name	The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised. If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name. If NULL, then the system creates a new capture process with a system-generated name. **Note:** The capture process name cannot be altered after the capture process is created.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 239-16 (Cont.) CREATE_OUTBOUND Procedure Parameters

Parameter	Description
source_root_name	The global name of the root in the source CDB. For example, mycdb.example.com. If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. **Note:** This parameter only applies to a CDB.
source_container_name	The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See *Oracle Database XStream Guide* for more information about setting this parameter in a CDB. **Note:** This parameter only applies to a CDB.
lcrid_version	The LCRID version for captured LCRs, either 1 or 2. If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher. If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower. If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrid_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrid_version is set to 1 internally.

Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the

schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

> **Note:**
>
> An empty array includes one NULL entry.

239.4.16 DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> - The DELETE_COLUMN procedure supports the same data types supported by Oracle Replication capture processes.
> - The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
> - Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> - *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
> - KEEP_COLUMNS Procedure

Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
   rule_name      IN  VARCHAR2,
   table_name     IN  VARCHAR2,
   column_name    IN  VARCHAR2,
   value_type     IN  VARCHAR2   DEFAULT '*',
   step_number    IN  NUMBER     DEFAULT 0,
   operation      IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 239-17 DELETE_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table from which the column is deleted in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.

table_name	column_name	step_number	Result
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

239.4.17 DROP_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

> **See Also:**
>
> "CREATE_INBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 239-18 DROP_INBOUND Procedure Parameters

Parameter	Description
server_name	The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.

239.4.18 DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

> **See Also:**
>
> - "ADD_OUTBOUND Procedure"
> - "CREATE_OUTBOUND Procedure"

Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(
   server_name IN VARCHAR2);
```

Parameters

Table 239-19 DROP_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.

239.4.19 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling

- Capture process parallelism

Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
   enable IN BOOLEAN  TRUE);
```

Parameters

Table 239-20 ENABLE_GG_XSTREAM_FOR_STREAMS Procedure Parameters

Parameter	Description
`enable`	If `TRUE`, then enable XStream performance optimizations for Oracle Replication components. If `FALSE`, then disable XStream performance optimizations for Oracle Replication components.

Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays `XStream Streams`:
  - `ALL_APPLY`
  - `DBA_APPLY`
  - `ALL_CAPTURE`
  - `DBA_CAPTURE`
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

See Also:

- IS_GG_XSTREAM_FOR_STREAMS Function
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream"*

239.4.20 GET_MESSAGE_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

See Also:

SET_MESSAGE_TRACKING Procedure

Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

239.4.21 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

> **See Also:**
>
> "SET_TAG Procedure"

Syntax

```
DBMS_XSTREAM_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_XSTREAM_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

239.4.22 IS_GG_XSTREAM_FOR_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components.

> **See Also:**
>
> "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"

Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

239.4.23 KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- DELETE_COLUMN Procedure

Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_list   IN  VARCHAR2,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_XSTREAM_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
   value_type    IN  VARCHAR2 DEFAULT '*',
```

```
  step_number    IN  NUMBER DEFAULT 0,
  operation      IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 239-21 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/ column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.

table_name	column_list/ column_table	step_number	Result
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified column_list/ column_table and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified column_list/ column_table for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified table_name and column_list/column_table for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified table_name, column_list/column_table, and step_number for the specified rule.

239.4.24 MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.

- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

>
> SPLIT_STREAMS Procedure

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-22 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: • The queue specified in the queue_name parameter does not exist. • The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: • script_name • script_directory_object

Table 239-22 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

239.4.25 MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the

MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure
- SPLIT_STREAMS Procedure

Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name IN VARCHAR2,
   propagation_name        IN VARCHAR2 DEFAULT NULL,
   queue_name              IN VARCHAR2 DEFAULT NULL,
   merge_threshold         IN NUMBER,
   schedule_name           IN VARCHAR2 DEFAULT NULL,
   merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 239-23 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: • The queue specified in the queue_name parameter does not exist. • The queue specified in the queue_name parameter exists but is not used by a capture process.

Table 239-23 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

239.4.26 PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

> **Note:**
>
> A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2,
   source_root_name    IN  VARCHAR2);
```

Parameters

Table 239-24 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
`source_database`	In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `.NET`, then the procedure specifies `DBS1.NET` automatically.
`source_object_name`	The name of the object specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`source_object_type`	Type of the object. Currently, `TABLE` is the only possible object type.
`source_root_name`	The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `EXAMPLE.COM`, then the procedure specifies `DBS1.EXAMPLE.COM` automatically. If the `source_root_name` parameter is `NULL`, then the global name of the local root is the default. **Note:** This parameter only applies to a CDB.

Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

> **Note:**
>
> These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

239.4.27 RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-`NULL` values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and

DBA_RECOVERABLE_SCRIPT_ERRORS, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

Run the RECOVER_OPERATION procedure at the database that contains the capture process.

Note:

To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

See Also:

- "SPLIT_STREAMS Procedure"
- "MERGE_STREAMS Procedure"
- "MERGE_STREAMS_JOB Procedure"

Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 239-25 RECOVER_OPERATION Procedure Parameters

Parameter	Description
script_id	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.

Table 239-25 (Cont.) RECOVER_OPERATION Procedure Parameters

Parameter	Description
operation_mode	If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.

239.4.28 REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the XStream clients that are using the queue.

> **Note:**
>
> The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
   queue_name                IN  VARCHAR2,
   cascade                   IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 239-26 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any XStream clients that use the queue. If FALSE, then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no XStream clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

239.4.29 REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

> **Note:**
>
> If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the DBMS_RULE_ADM.DROP_RULE procedure. If you use the DBMS_RULE_ADM.DROP_RULE procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 239-27 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule to remove, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set. For example, to specify a rule in the hr schema named prop_rule1, enter hr.prop_rule1. If the schema is not specified, then the current user is the default.
streams_type	The type of XStream client: • Specify capture for a capture process. • Specify propagation for a propagation. • Specify apply for an apply process.
streams_name	The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner. If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.
drop_unused_rule	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
inclusion_rule	If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.

239.4.30 REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD_SUBSET_OUTBOUND_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
   FROM ALL_XSTREAM_RULES
   WHERE SUBSETTING_OPERATION IS NOT NULL;
```

Note:

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

See Also:

"ADD_SUBSET_OUTBOUND_RULES Procedure"

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
   server_name      IN VARCHAR2,
   insert_rule_name IN VARCHAR2,
   update_rule_name IN VARCHAR2,
   delete_rule_name IN VARCHAR2);
```

239.4.31 REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
   container IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-28 REMOVE_XSTREAM_CONFIGURATION Procedure Parameters

Parameter	Description
container	If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB. If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to a CDB.

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT_TABLE_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package

- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT_SCHEMA_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT_GLOBAL_INSTANTIATION procedure in the DBMS_CAPTURE_ADM package
- Drops propagations that were created using either the DBMS_XSTREAM_ADM package or the DBMS_PROPAGATION_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS_AQADM package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the SET_MESSAGE_NOTIFICATION procedure in the DBMS_XSTREAM_ADM package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the DBMS_XSTREAM_ADM package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the DBMS_RULE_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

> **Note:**
>
> Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

> **Note:**
>
> - Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
> - This procedure commits multiple times.

239.4.32 RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> - The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
> - Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*',
```

```
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 239-29 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

239.4.33 RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
   rule_name         IN  VARCHAR2,
   from_schema_name  IN  VARCHAR2,
   to_schema_name    IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 239-30 RENAME_SCHEMA Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[schema_name.]rule_name`. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_schema_name`	The name of the schema to be renamed in each row LCR that satisfies the rule.
`to_schema_name`	The new name of the schema in each row LCR that satisfies the rule.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is `NULL`:

from_schema_name	to_schema_name	step_number	Result
`NULL`	`NULL`	`NULL`	Remove all rename schema transformations for the specified rule.
`NULL`	`NULL`	non-`NULL`	Remove all rename schema transformations with the specified `step_number` for the specified rule.

from_schema_name	to_schema_name	step_number	Result
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

239.4.34 RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

> **Note:**
>
> Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

> **See Also:**
>
> *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
   rule_name         IN  VARCHAR2,
   from_table_name   IN  VARCHAR2,
   to_table_name     IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 239-31 RENAME_TABLE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[schema_name.]rule_name`. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_table_name`	The name of the table to be renamed in each row LCR that satisfies the rule, specified as `[schema_name.]object_name`. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`to_table_name`	The new name of the table in each row LCR that satisfies the rule, specified as `[schema_name.]object_name`. For example, `humres.staff`. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Database XStream Guide* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

from_table_name	to_table_name	step_number	Result
`NULL`	`NULL`	`NULL`	Remove all rename table transformations for the specified rule.

from_table_name	to_table_name	step_number	Result
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

239.4.35 SET_MESSAGE_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

> **Note:**
>
> The tracking label set by this procedure does not track non-LCR messages.

> **See Also:**
>
> KAWGET_MESSAGE_TRACKING

Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

Parameters

Table 239-32 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
`tracking_label`	The label used to track the LCRs produced by the session. Set this parameter to `NULL` to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
`actions`	When `DBMS_XSTREAM_ADM.ACTION_MEMORY` is specified, the LCRs are tracked in memory. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

239.4.36 SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER(
   streams_name    IN  VARCHAR2,
   streams_type    IN  VARCHAR2,
   parameter       IN  VARCHAR2,
   value           IN  VARCHAR2  DEFAULT NULL,
   no_wait         IN  BOOLEAN   DEFAULT FALSE,
   source_database IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-33 SET_PARAMETER Procedure Parameters

Parameter	Description
`streams_type`	The type of XStream client: • Specify `capture` for a capture process. • Specify `apply` for an outbound server or inbound server.
`streams_name`	The name of the capture process, outbound server, or inbound server. Do not specify an owner.

Table 239-33 (Cont.) SET_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the parameter you are setting. See "Capture Process Parameters" for information about capture process parameters. See "Apply Component Parameters" for information about outbound server and inbound server parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.
no_wait	If TRUE, then the parameter is set immediately. If FALSE, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to TRUE speeds up each call. However, if the process is currently running, you must set this parameter to FALSE in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to TRUE for the last call to the procedure, the running process might not detect the parameter changes.
source_database	If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then the parameter is set in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters: • include_objects capture parameter • excludetag capture or apply parameter • excludetrans capture or apply parameter • excludeuser capture or apply parameter • excludeuserid capture or apply parameter • getreplicates capture or apply parameter • getapplops capture or apply parameter

239.4.37 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 239-34 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

> **See Also:**
>
> BUILD Procedure

239.4.38 SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 239-35 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference*for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10*g* release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10*g* release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

> **Note:**
>
> If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

239.4.39 SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note:

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure"
- "MERGE_STREAMS_JOB Procedure"

Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
   propagation_name          IN      VARCHAR2,
   cloned_propagation_name   IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name         IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name       IN      VARCHAR2  DEFAULT NULL,
   perform_actions           IN      BOOLEAN   DEFAULT TRUE,
   script_name               IN      VARCHAR2  DEFAULT NULL,
   script_directory_object   IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold      IN      NUMBER    DEFAULT NULL,
   schedule_name             IN OUT  VARCHAR2,
   merge_job_name            IN OUT  VARCHAR2);
```

Parameters

Table 239-36 SPLIT_STREAMS Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: • script_name • script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 239-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$XSTREAM_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name.*]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.

Table 239-36 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name.*]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

Oracle Database Administrator's Guide for information about Oracle Scheduler

239.4.40 START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
   server_name      IN  VARCHAR2);
```

Parameters

Table 239-37 START_OUTBOUND Procedure Parameters

Parameter	Description
server_name	The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.

239.4.41 STOP_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
   server_name  IN  VARCHAR2,
   force        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 239-38 STOP_OUTBOUND Procedure Parameters

Parameter	Description
`server_name`	The name of the outbound server being stopped. A `NULL` specification is not allowed. Do not specify an owner.
`force`	If `TRUE`, then the procedure stops the outbound server and its capture process as soon as possible. If `FALSE`, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the `force` parameter and the setting specified for the `commit_serialization` apply component parameter.

240
XSTREAM_CAPTURE

The `XSTREAM_CAPTURE` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- Overview
- Security Model

240.1 XSTREAM_CAPTURE Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

240.2 XSTREAM_CAPTURE Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `XSTREAM_CAPTURE` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

240.3 Summary of XSTREAM_CAPTURE Subprograms

This table lists the `XSTREAM_CAPTURE` subprograms and briefly describes them.

Table 240-1 XSTREAM_CAPTURE Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure	Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure	Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure	Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges

Table 240-1 (Cont.) XSTREAM_CAPTURE Package Subprograms

Subprogram	Description
REVOKE_REMOTE_ADMIN_ACCESS Procedure	Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link

> **Note:**
>
> All subprograms commit unless specified otherwise.

240.3.1 XSTREAM_APPLY Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

> **See Also:**
>
> "XSTREAM_APPLY Procedure"

Syntax

```
XSTREAM_CAPTURE.XSTREAM_APPLY(
   grantee                    IN  VARCHAR2,
   privilege_type             IN  VARCHAR2  DEFAULT '*',
   grant_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_grants                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                  IN  VARCHAR2  DEFAULT NULL,
   directory_name             IN  VARCHAR2  DEFAULT NULL
   grant_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                  IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 240-2 XSTREAM_APPLY Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted

Table 240-2 (Cont.) XSTREAM_APPLY Procedure Parameters

Parameter	Description
privilege_type	Specify one of the following values: • CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes. • APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.
do_grants	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
grant_optional_privileges	A comma-separated list of optional privileges to grant to the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges

Table 240-2 (Cont.) XSTREAM_APPLY Procedure Parameters

Parameter	Description
container	If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root. If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_TRANSFORM
  - DBMS_XSTREAM_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

  This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

> **Note:**
>
> – To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
>
> – This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

> **See Also:**
>
> – "GRANT_REMOTE_ADMIN_ACCESS Procedure"
>
> – *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

240.3.2 GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 240-3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The

XStream administrator at a downstream capture database administers the source database using this connection.

> **Note:**
>
> The `XSTREAM_APPLY` procedure in this package runs this procedure.

> **See Also:**
>
> "XSTREAM_APPLY Procedure"

240.3.3 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
XSTREAM_CAPTURE.REVOKE_ADMIN_PRIVILEGE(
   grantee                     IN  VARCHAR2,
   privilege_type              IN  VARCHAR2  DEFAULT '*',
   revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
   do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
   file_name                   IN  VARCHAR2  DEFAULT NULL,
   directory_name              IN  VARCHAR2  DEFAULT NULL
   revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
   container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 240-4 *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

Parameter	Description
`grantee`	The user from whom privileges are revoked
`privilege_type`	Specify one of the following values: • `CAPTURE` Specifying `CAPTURE` revokes the minimum privileges required by the user to administer capture processes. • `APPLY` Specifying `APPLY` revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes. • `*` Specifying `*` revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.

Table 240-4 (Cont.) *REVOKE_ADMIN_PRIVILEGE Procedure Parameters*

Parameter	Description
revoke_select_privileges	If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.
revoke_optional_privileges	A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges
container	If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. **Note:** This parameter only applies to CDBs.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the XSTREAM_APPLY procedure in this package.

> **Note:**
>
> To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

> **See Also:**
>
> - "XSTREAM_APPLY Procedure"
> - *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

240.3.4 REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

> **Note:**
>
> The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

> **See Also:**
>
> "REVOKE_ADMIN_PRIVILEGE Procedure"

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 240-5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
`grantee`	The user for whom access from a remote XStream administrator is disabled. If a row for the grantee exists in the `DBA_XSTREAM_ADMINISTRATOR` data dictionary view, then the procedure updates the `ACCESS_FROM_REMOTE` column for the grantee to `NO`. If, after this update, both the `LOCAL_PRIVILEGES` column and the `ACCESS_FROM_REMOTE` column are `NO` for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the `DBA_XSTREAM_ADMINISTRATOR` data dictionary view, then the procedure does not update the view and does not raise an error.

241
DEBUG_EXTPROC

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms

241.1 DEBUG_EXTPROC Security Model

Your Oracle account must have EXECUTE privileges on the package and CREATE LIBRARY privileges.

241.2 DEBUG_EXTPROC Operational Notes

These operational notes apply to DEBUG_EXTPROC.

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

> **Note:**
>
> These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.

- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

241.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

241.4 Summary of DEBUG_EXTPROC Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

Table 241-1 DEBUG_EXTPROC Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure	Starts up the extproc agent process in the session

241.4.1 STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

242
HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Deprecated Subprograms
- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTF Subprograms

242.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10*g*.

> **Note:**
>
> Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Related Topics

- ESCAPE_URL Function
  This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

242.2 HTF Operational Notes

These operational notes apply to the `HTF` package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.`PRINT` function. It then prints its parameters to the generated Web page.

242.3 Rules and Limits

If you use values of the LONG datatype in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` datatype in the function.

242.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
   HTP.P (HTF.HTMLOPEN); -- generates <HTML>
   HTP.P (HTF.HEADOPEN); -- generates <HEAD>
   HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
   HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
   HTP.P (HTF.BODYOPEN); -- generates <BODY>
   HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
   HTP.P (HTF.BODYCLOSE); -- generates </BODY>
   HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

242.5 Summary of Tags

This list summarizes the HTML tags generated by the `HTF` package.

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate `<HTML>` and `</HTML>`

HEADOPEN Function, HEADCLOSE Function - generate `<HEAD>` and `</HEAD>`

BODYOPEN Function, BODYCLOSE Function - generate `<BODY>` and `</BODY>`

Comment Tag

COMMENT Function - generates <!-- and -->

http://www.w3.org.BASE Function - generates `<BASE>`

LINKREL Function - generates `<LINK>` with the `REL` attribute

LINKREV Function - generates <LINK> with the REV attribute

TITLE Function - generates <TITLE>

META Function - generates <META>

SCRIPT Function - generates <SCRIPT>

STYLE Function - generates <STYLE>

ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>

PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>

ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>

DLISTOPEN Function, DLISTCLOSE Function- generate <DL> and </DL>

DLISTTERM Function - generates <DT>

DLISTDEF Function - generates <DD>

DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>

LISTHEADER Function - generates <LH>

LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>

MENULISTOPEN Function - generate <MENU> and </MENU>

LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>

FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Function - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates <INPUT TYPE="PASSWORD">

FORMRADIO Function - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate <SELECT> and </SELECT>

FORMSELECTOPTION Function - generates <OPTION>

FORMTEXT Function - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Function - generate <TEXTAREA>

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Function - generates <INPUT TYPE="RESET">

FORMSUBMIT Function - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate <TABLE> and </TABLE>

TABLECAPTION Function - generates <CAPTION>

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>

TABLEHEADER Function - generates <TH>

TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>

IMG Function, IMG2 Function - generate <IMG>

ANCHOR Function, ANCHOR2 Function - generate <A>

MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)

PARA Function, PARAGRAPH Function - generate <P>

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Function - generates <DIV>

NL Function, BR Function - generate

NOBR Function - generates <NOBR>

WBR Function - generates <WBR>

PLAINTEXT Function - generates <PLAINTEXT>

ADDRESS Function - generates <ADDRESS>

MAILTO Function - generates <A> with the MAILTO attribute

AREA Function - generates <AREA>

BGSOUND Function - generates <BGSOUND>

Character Formatting Tags

BASEFONT Function - generates <BASEFONT>

BIG Function - generates <BIG>

BOLD Function - generates <B>

CENTER Function - generates <CENTER> and </CENTER>

CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>

CITE Function - generates <CITE>

CODE Function - generates <CODE>

DFN Function - generates <DFN>

EM Function, EMPHASIS Function - generate <EM>

FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>

ITALIC Function - generates <I>

KBD Function, KEYBOARD Function - generate <KBD> and </KBD>

S Function - generates <S>

SAMPLE Function - generates <SAMP>

SMALL Function - generates <SMALL>

STRIKE Function - generates <STRIKE>

STRONG Function - generates <STRONG>

SUB Function - generates <SUB>

SUP Function - generates <SUP>

TELETYPE Function - generates <TT>

UNDERLINE Function - generates <U>

VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>

FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

242.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

Table 242-1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Function	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function	Generates the <AREA> tag, which defines a client-side image map
BASE Function	Generates the <BASE> tag which records the URL of the document
BASEFONT Function	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Function	Generates the tag which begins a new line of text
CENTER Function	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Function	Generates the comment tags <!-- ctext -->
DFN Function	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function	Generates the <DIR> which starts a directory list section

Table 242-1 (Cont.) HTF Package Subprograms

Subprogram	Description
DIV Function	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function	Generates the </DL> tag which ends a definition list
DLISTDEF Function	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function	Generates the <DL> tag which starts a definition list
DLISTTERM Function	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Function	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Function	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Function	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMPASSWORD Function	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function	Generates the </SELECT> tag which marks the beginning of a Select form element

Table 242-1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMSELECTOPTION Function	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Function	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function	Creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program
ITALIC Function	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font

Table 242-1 (Cont.) HTF Package Subprograms

Subprogram	Description
KEYBOARD Function	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function	Generates the <LI> tag, which indicates a list item
MAILTO Function	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function	Generates the <MENU> tag which begins a list that presents one line for each item
META Function	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Function	Generates the tag which begins a new line of text
NOBR Function	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Function	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Function	Generates the <OL> tag which marks the beginning of an ordered list
PARA Function	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function	Adds attributes to the <P> tag
PARAM Function	Generates the <PARAM> tag which specifies parameter values for Java applets

Table 242-1 (Cont.) HTF Package Subprograms

Subprogram	Description
PLAINTEXT Function	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions	Generates the specified parameter as a string
S Function	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Function	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function	Generates the <TR> tag which marks the beginning of a new row in an HTML table

Table 242-1 (Cont.) HTF Package Subprograms

Subprogram	Description
TELETYPE Function	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Function	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Function	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

242.6.1 ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 242-2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

242.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 242-3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

242.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 242-4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

242.6.4 APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using APPLETOPEN Function

Syntax

```
HTF.APPLETCLOSE
 RETURN VARCHAR2;
```

242.6.5 APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Function which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.

Table 242-5 (Cont.) APPLETOPEN Function Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

242.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-6 AREA Function Parameters

Parameter	Description
ccords	The value for the `COORDS` attribute.
cshape	The value for the `SHAPE` attribute.
chref	The value for the `HREF` attribute.
cnohref	If the value for this parameter is not `NULL`, the `NOHREF` attribute is added to the tag.
ctarget	The value for the `TARGET` attribute.

Table 242-6 (Cont.) AREA Function Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

242.6.7 BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

242.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (
   nsize    IN    INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 242-8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

242.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

242.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-10 BIG Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

242.6.11 BLOCKQUOTECLOSE Function

This function generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

242.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-11 BLOCKQUOTEOPEN Function Parameters

Parameter	Description
`cnowrap`	If the value for this parameter is not `NULL`, the `NOWRAP` attribute is added to the tag.
`cclear`	The value for the `CLEAR` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

242.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

242.6.14 BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-12 BODYOPEN Function Parameters

Parameter	Description
`cbackground`	The value for the `BACKGROUND` attribute which specifies a graphic file to use for the background of the document.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

242.6.15 BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

242.6.16 BR Function

This function generates the <BR> tag which begins a new line of text.

It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-14 BR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

242.6.17 CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

242.6.18 CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

242.6.19 CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the CENTERCLOSE Function.

Syntax

```
HTF.CENTEROPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

242.6.20 CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-16 CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

242.6.21 CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-17 CODE Function Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

242.6.22 COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

242.6.23 DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

242.6.24 DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

Related Topics

- DIRLISTOPEN Function
  This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

242.6.25 DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

Related Topics

- DIRLISTCLOSE Function
  This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

242.6.26 DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
   calign          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

242.6.27 DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

Related Topics

- DLISTOPEN Function
  This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

242.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

242.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- DLISTCLOSE Function
  This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

242.6.30 DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

242.6.31 EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

242.6.32 EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EM Function.

Syntax

```
HTF.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

242.6.33 ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
     ctext           IN       VARCHAR2);
```

Parameters

Table 242-26 ESCAPE_SC Function Parameters

Parameter	Description
ctext	The text string to convert.

242.6.34 ESCAPE_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

> **Note:**
>
> This procedure, deprecated in Release 10*g*, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the ESCAPE Functionin the UTL_URL package.

The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >
- % to &25

Syntax

```
HTF.ESCAPE_URL(
     p_url           IN       VARCHAR2);
```

Parameters

Table 242-27 ESCAPE_URL Function Parameters

Parameter	Description
p_url	The string to convert.

242.6.35 FONTCLOSE Function

This function generates the</FONT> tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</FONT>

242.6.36 FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

242.6.37 FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
   columnValue          IN       VARCHAR2
   format_numbers       IN       VARCHAR2   DEFAULT NULL
 RETURN VARCHAR2;
```

Parameters

Table 242-29 FORMAT_CELL Function Parameters

Parameter	Description
`columnValue`	The value that needs to be formatted in an HTML table.
`format_numbers`	The format that numeric data is displayed in. If the value of this parameter is not `NULL`, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

Related Topics

- TABLEDATA Function
  This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

242.6.38 FORMCHECKBOX Function

This function generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-30 FORMCHECKBOX Function Parameters

Parameter	Description
`cname`	The value for the `NAME` attribute.

Table 242-30 (Cont.) FORMCHECKBOX Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

242.6.39 FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

242.6.40 FORMFILE Function

This function generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

242.6.41 FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

242.6.42 FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-33 FORMIMAGE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

242.6.43 FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

242.6.44 FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-35 FORMPASSWORD Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

242.6.45 FORMRADIO Function

This function generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-36 FORMRADIO Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

242.6.46 FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
   cvalue          IN       VARCHAR2   DEFAULT 'Reset',
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

242.6.47 FORMSELECTCLOSE Function

This function generates the </SELECT> tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

242.6.48 FORMSELECTOPEN Function

This function generates the <SELECT> tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
  cname        IN    VARCHAR2,
  cprompt      IN    VARCHAR2   DEFAULT NULL,
  nsize        IN    INTEGER    DEFAULT NULL,
  cattributes  IN    VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

242.6.49 FORMSELECTOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue           IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-39 FORMSELECTOPTION Function Parameters

Parameter	Description
`cvalue`	The text for the option
`cvalue`	If the value for this parameter is not `NULL`, the `SELECTED` attribute is added to the tag.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the FORMSELECTOPEN Function.

242.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-40 FORMSUBMIT Function Parameters

Parameter	Description
`cname`	The value for the `NAME` attribute.

Table 242-40 (Cont.) FORMSUBMIT Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

242.6.51 FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-41 FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

242.6.52 FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

242.6.53 FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.

Table 242-43 (Cont.) FORMTEXTAREA2 Function Parameters

Parameter	Description
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

242.6.54 FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element.

You open a text area element by means of eitherFORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

242.6.55 FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

242.6.56 FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
   cname           IN       VARCHAR2,
   nrows           IN       INTEGER,
   ncolumns        IN       INTEGER,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

242.6.57 FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth" MARGINHEIGHT="cmarginheight"
SCROLLING="cscrolling" NORESIZE cattributes>
```

242.6.58 FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

242.6.59 FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-47 FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

242.6.60 HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```
HTF.HEADCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

242.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-48 HEADER Function Parameters

Parameter	Description
nsize	The heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1,'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

242.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

242.6.63 HR Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

242.6.64 HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document.

You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

242.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

242.6.66 IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The IMG2 Function performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTF.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-50 IMG Function Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

242.6.67 IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The IMG Function performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-51 IMG2 Function Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

242.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

242.6.69 ITALIC Function

This function generates the `<I> and </I>` tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-53 ITALIC Function Parameters

Parameter	Description
`ctext`	The text to be rendered in italics.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

242.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-54 KBD Function Parameters

Parameter	Description
`ctext`	The text to be rendered in monospace.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

242.6.71 KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-55 KEYBOARD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

242.6.72 LINE Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.

Table 242-56 (Cont.) LINE Function Parameters

Parameter	Description
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

242.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

242.6.74 LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

242.6.75 LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

242.6.76 LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

242.6.77 LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

242.6.78 LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

242.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

242.6.80 MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

242.6.81 MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-62 MAPOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

242.6.82 MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

242.6.83 MENULISTOPEN Function

This function generates the <MENU> tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Function.The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

242.6.84 META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

242.6.85 NL Function

This function generates the <BR> tag which begins a new line of text.

It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

242.6.86 NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
ctext         IN         VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-65 NOBR Function Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

242.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

242.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

242.6.89 OLISTCLOSE Function

This function generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

242.6.90 OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

242.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

242.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- PARA Function
  This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

242.6.93 PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname           IN       VARCHAR2
   cvalue          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

242.6.94 PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

242.6.95 PRECLOSE Function

This function generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

242.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwidth          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-70 PREOPEN Function Parameters

Parameter	Description
`cclear`	The value for the `CLEAR` attribute.
`cwidth`	The value for the `WIDTH` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

242.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the `\n` newline character.

The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRINT (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRINT (
```

```
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 242-71 PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

242.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRN (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRN (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 242-72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

242.6.99 S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

242.6.100 SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

242.6.101 SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

242.6.102 SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

242.6.103 STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Function.

Syntax

```
STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-77 STRIKE Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

242.6.104 STRONG Function

This function generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTF.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-78 STRONG Function Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

242.6.105 STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page.

You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
   cstyle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-79 STYLE Function Parameters

Parameter	Description
cstyle	The style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

242.6.106 SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

242.6.107 SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

242.6.108 TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
```

```
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

242.6.109 TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Function.

Syntax

```
HTF.TABLECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

242.6.110 TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

242.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

242.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-85 TABLEOPEN Function Parameters

Parameter	Description
`border`	The value for the `BORDER` attribute.
`calign`	The value for the `ALIGN` attribute.
`cnowrap`	If the value of this parameter is not `NULL`, the `NOWRAP` attribute is added to the tag.
`cclear`	The value for the `CLEAR` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

242.6.113 TABLEROWCLOSE Function

This function generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

242.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cvalign         IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-86 TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

242.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
   ctext           IN       VARCHAR2,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-87 TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.

Table 242-87 (Cont.) TELETYPE Function Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

242.6.116 TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
   ctitle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 242-88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

242.6.117 ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

242.6.118 ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-89 ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

242.6.119 UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
   ctext           IN       VARCHAR2,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.

Table 242-90 (Cont.) UNDERLINE Function Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

242.6.120 VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 242-91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

242.6.121 WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
  RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```

243
HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- Operational Notes
- Rules and Limits
- Examples
- Summary of Tags
- Summary of HTP Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

243.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.`PRINT` procedure. It then prints its parameters to the generated Web page.

243.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as `HTP.PRINT`, `HTP.PRN`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` datatype in the procedure.

243.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

243.4 HTP Summary of Tags

`HTP` tags can be grouped by type, to make understanding them easier.

HTML, HEAD, and BODY Tags

HTMLOPEN Procedure, HTMLCLOSE Procedure - generate `<HTML>` and `</HTML>`

HEADOPEN Procedure, HEADCLOSE Procedure - generate `<HEAD>` and `</HEAD>`

BODYOPEN Procedure, BODYCLOSE Procedure - generate `<BODY>` and `</BODY>`

Comment Tag

COMMENT Procedure - generates <!-- and -->

Tags in the <HEAD> Area

BASE Procedure - generates `<BASE>`

LINKREL Procedure - generates `<LINK>` with the `REL` attribute

LINKREV Procedure - generates `<LINK>` with the `REV` attribute

TITLE Procedure - generates `<TITLE>`

META Procedure - generates `<META>`

SCRIPT Procedure - generates `<SCRIPT>`

STYLE Procedure - generates `<STYLE>`

ISINDEX Procedure - generates `<ISINDEX>`

Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate `<APPLET>` and `</APPLET>`

PARAM Procedure - generates `<PARAM>`

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate `<OL>` and `</OL>`

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate `<UL>` and `</UL>`

DLISTOPEN Procedure, DLISTCLOSE Procedure- generate `<DL>` and `</DL>`

DLISTTERM Procedure - generates `<DT>`

DLISTDEF Procedure - generates `<DD>`

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate `<DIR>` and `</DIR>`

LISTHEADER Procedure - generates `<LH>`

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate `<LISTING>` and `</LISTING>`

MENULISTOPEN Procedure - generate `<MENU>` and `</MENU>`

LISTITEM Procedure - generates `<LI>`

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate `<FORM>` and `</FORM>`

FORMCHECKBOX Procedure - generates `<INPUT TYPE="CHECKBOX">`

FORMHIDDEN Procedure - generates `<INPUT TYPE="HIDDEN">`

FORMIMAGE Procedure - generates `<INPUT TYPE="IMAGE">`

FORMPASSWORD Procedure - generates `<INPUT TYPE="PASSWORD">`

FORMRADIO Procedure - generates `<INPUT TYPE="RADIO">`

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate `<SELECT>` and `</SELECT>`

FORMSELECTOPTION Procedure - generates `<OPTION>`

FORMTEXT Procedure - generates `<INPUT TYPE="TEXT">`

FORMTEXTAREA Procedure - generate `<TEXTAREA>`

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate `<TEXTAREA>` and `</TEXTAREA>`

FORMRESET Procedure - generates `<INPUT TYPE="RESET">`

FORMSUBMIT Procedure - generates `<INPUT TYPE="SUBMIT">`

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate `<TABLE>` and `</TABLE>`

TABLECAPTION Procedure - generates <CAPTION>

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>

TABLEHEADER Procedure - generates <TH>

TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>

IMG Procedure, IMG2 Procedure - generate <IMG>

ANCHOR Procedure, ANCHOR2 Procedure - generate <A>

MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)

PARA Procedure, PARAGRAPH Procedure - generate <P>

PRN Procedures, PRINT Procedures - generate any text that is passed in

PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Procedure - generates <DIV>

NL Procedure, BR Procedure - generate

NOBR Procedure - generates <NOBR>

WBR Procedure - generates <WBR>

PLAINTEXT Procedure - generates <PLAINTEXT>

ADDRESS Procedure - generates <ADDRESS>

MAILTO Procedure - generates <A> with the MAILTO attribute

AREA Procedure - generates <AREA>

BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>

BIG Procedure - generates <BIG>

BOLD Procedure - generates <B>

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate <EM>

FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates <STRONG>

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

243.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

Table 243-1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure	Closes the applet invocation with the </APPLET> tag

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
APPLETOPEN Procedure	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Procedure	Generates the tag which begins a new line of text
CENTER Procedure	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Procedure	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Procedure	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure	Generates procedure generates the comment tags <!-- ctext -->
DFN Procedure	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure	Generates the <DIR> which starts a directory list section
DIV Procedure	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Procedure	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure	Generates the <DT> tag which defines a term in a definition list <DL>

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
EM Procedure	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Procedure	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Procedure	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Procedure	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMTEXTAREACLOSE Procedure	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure	Generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Procedure	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Procedure	Creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program
ITALIC Procedure	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
LISTINGCLOSE Procedure	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure	Generates the <LI> tag, which indicates a list item
MAILTO Procedure	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure	Generates the <MENU> tag which begins a list that presents one line for each item
META Procedure	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure	Generates the tag which begins a new line of text
NOBR Procedure	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Procedure	Generates the <OL> tag which marks the beginning of an ordered list
PARA Procedure	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure	Adds attributes to the <P> tag
PARAM Procedure	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures	Generates the specified parameter as a string

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
PS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Procedure	Generates the <UL> tag which marks the beginning of an unordered list

Table 243-1 (Cont.) HTP Package Subprograms

Subprogram	Description
UNDERLINE Procedure	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

243.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

243.5.2 ANCHOR Procedure

Like the ANCHOR2 procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-3 ANCHOR Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

243.5.3 ANCHOR2 Procedure

Like the ANCHOR procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the ANCHOR procedure is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.

Table 243-4 (Cont.) ANCHOR2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

243.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

243.5.5 APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-5 APPLETOPEN Procedure Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

243.5.6 AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-6 AREA Procedure Parameters

Parameter	Description
`ccords`	The the value for the `COORDS` attribute.
`cshape`	The value for the `SHAPE` attribute.
`chref`	The value for the `HREF` attribute.
`cnohref`	If the value for this parameter is not `NULL`, the `NOHREF` attribute is added to the tag.
`ctarget`	The value for the `TARGET` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

243.5.7 BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-7 BASE Procedure Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

243.5.8 BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
   nsize    IN    INTEGER);
```

Parameters

Table 243-8 BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

243.5.9 BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

243.5.10 BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-10 BIG Procedure Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

243.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

243.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
`cnowrap`	If the value for this parameter is not `NULL`, the `NOWRAP` attribute is added to the tag.
`cclear`	The value for the `CLEAR` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

243.5.13 BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

243.5.14 BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```
HTP.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-12 BODYOPEN Procedure Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

243.5.15 BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-13 BOLD Procedure Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

243.5.16 BR Procedure

This procedure generates the <BR> tag which begins a new line of text.

It performs the same operation as the NL Procedure.

Syntax

```
HTP.BR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-14 BR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

243.5.17 CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
   ctext           IN       VARCHAR2);
```

Parameters

Table 243-15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

243.5.18 CENTERCLOSE Procedure

This procedure generates the </CENTER> tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

243.5.19 CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

243.5.20 CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

243.5.21 CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-17 CODE Procedure Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

243.5.22 COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext          IN       VARCHAR2);
```

Parameters

Table 243-18 COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

243.5.23 DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (
   ctext          IN       VARCHAR2);
```

Parameters

Table 243-19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

243.5.24 DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

Related Topics

- DIRLISTOPEN Procedure
  This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

243.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

Related Topics

- DIRLISTCLOSE Procedure
  This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

243.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-20 DIV Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

243.5.27 DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
</DL>
```

Related Topics

- DLISTOPEN Procedure
  This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

243.5.28 DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-21 DLISTDEF Procedure Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

243.5.29 DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-22 DLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

Related Topics

- DLISTCLOSE Procedure
  This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

243.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
   ctext           IN       VARCHAR2   DEFAULT NULL,
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-23 DLISTTERM Procedure Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.

Table 243-23 (Cont.) DLISTTERM Procedure Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

243.5.31 EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EMPHASIS Procedure.

Syntax

```
HTP.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-24 EM Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

243.5.32 EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the EM Procedure.

Syntax

```
HTP.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-25 EMPHASIS Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

243.5.33 ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```
HTP.ESCAPE_SC(
     ctext           IN       VARCHAR2);
```

Parameters

Table 243-26 ESCAPE_SC Procedure Parameters

Parameter	Description
ctext	The text string to convert.

243.5.34 FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

243.5.35 FONTOPEN Procedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-27 FONTOPEN Procedure Parameters

Parameter	Description
`ccolor`	The value for the `COLOR` attribute.
`cface`	The value for the `FACE` attribute
`csize`	The value for the `SIZE` attribute
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

243.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
   cname           IN       VARCHAR2,
   cvalue          IN       VARCHAR2   DEFAULT 'ON',
   cchecked        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-28 FORMCHECKBOX Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

243.5.37 FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

243.5.38 FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-29 FORMOPEN Procedure Parameters

Parameter	Description
curl	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

243.5.39 FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-30 FORMFILE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

243.5.40 FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

243.5.41 FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-32 FORMIMAGE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

243.5.42 FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-33 FORMPASSWORD Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

243.5.43 FORMRADIO Procedure

This procedure generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-34 FORMRADIO Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

243.5.44 FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-35 FORMRESET Procedure Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

243.5.45 FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

243.5.46 FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
```

```
<OPTION>Gretzky
</SELECT>
```

243.5.47 FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
   cvalue          IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.

243.5.48 FORMSUBMIT Procedure

This procedure generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
   cname           IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-38 FORMSUBMIT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

243.5.49 FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-39 FORMTEXT Procedure Parameters

Parameter	Description
`cname`	The value for the `NAME` attribute.
`csize`	The value for the `SIZE` attribute.
`cmaxlength`	The value for the `MAXLENGTH` attribute.
`cvalue`	The value for the `VALUE` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

243.5.50 FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign       , IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

243.5.51 FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

243.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

243.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
`cname`	The value for the `NAME` attribute.
`nrows`	The value for the `ROWS` attribute.This is an integer.
`ncolumns`	The value for the `COLS` attribute.This is an integer.
`calign`	The value for the `ALIGN` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

243.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

243.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth" MARGINHEIGHT="cmarginheight"
SCROLLING="cscrolling" NORESIZE cattributes>
```

243.5.56 FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section.

You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

243.5.57 FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section.

You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-45 FRAMESETOPEN Procedure Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

243.5.58 HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

243.5.59 HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-46 HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.

Table 243-46 (Cont.) HEADER Procedure Parameters

Parameter	Description
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```

243.5.60 HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

243.5.61 HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-47 HR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

243.5.62 HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document.

You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

243.5.63 HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document.

You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

243.5.64 IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page.

The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-48 IMG Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

243.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

```
HTP.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2  DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-49 IMG2 Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.

Table 243-49 (Cont.) IMG2 Procedure Parameters

Parameter	Description
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

243.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
   cprompt         IN       VARCHAR2    DEFAULT NULL,
   curl            IN       VARCHAR2    DEFAULT NULL);
```

Parameters

Table 243-50 ISINDEX Procedure Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

243.5.67 ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
   ctext           IN       VARCHAR2,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

243.5.68 KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

243.5.69 KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-53 KEYBOARD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

243.5.70 LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-54 LINE Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

243.5.71 LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

243.5.72 LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

243.5.73 LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

243.5.74 LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

243.5.75 LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

243.5.76 LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

243.5.77 MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

243.5.78 MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

243.5.79 MAPOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-60 MAPOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

243.5.80 MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item.

To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

243.5.81 MENULISTOPEN Procedure

This procedure generates the <MENU> tag which begins a list that presents one line for each item.

To end a list of this kind, use the MENULISTCLOSE Procedure.The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

243.5.82 META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2);
```

Parameters

Table 243-61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

243.5.83 NL Procedure

This procedure generates the <BR> tag which begins a new line of text.

It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

243.5.84 NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
ctext        IN        VARCHAR2);
```

Parameters

Table 243-63 NOBR Procedure Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

243.5.85 NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

243.5.86 NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

243.5.87 OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

243.5.88 OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-64 OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

243.5.89 PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

243.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-65 PARAGRAPH Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.

Table 243-65 (Cont.) PARAGRAPH Procedure Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

Related Topics

- PARA Procedure
  This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

243.5.91 PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 243-66 PARAM Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

243.5.92 PLAINTEXT Procedure

This procedure generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-67 PLAINTEXT Procedure Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

243.5.93 PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

243.5.94 PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-68 PREOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.

Table 243-68 (Cont.) PREOPEN Procedure Parameters

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

243.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character.

The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
   cbuf      IN       VARCHAR2);

HTP.PRINT (
   dbuf      IN       DATE);

HTP.PRINT (
   nbuf      IN       NUMBER);
```

Parameters

Table 243-69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

243.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 243-70 PRINTS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).

243.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (
   cbuf       IN       VARCHAR2);

HTP.PRN (
   dbuf       IN       DATE);

HTP.PRN (
   nbuf       IN       NUMBER);
```

Parameters

Table 243-71 PRN Procedure Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

243.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to `<`
- > to `>`
- " to `"`
- & to `&`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 243-72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes for the HTF implementation).

243.5.99 S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-73 S Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

243.5.100 SAMPLE Procedure

This procedure generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-74 SAMPLE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

243.5.101 SCRIPT Procedure

This procedure generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-75 SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

243.5.102 SMALL Procedure

This procedure generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-76 SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

243.5.103 STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-77 STRIKE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

243.5.104 STRONG Procedure

This procedure generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

Syntax

```
HTP.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-78 STRONG Procedure Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

243.5.105 STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page.

You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
   cstyle          IN       VARCHAR2);
```

Parameters

Table 243-79 STYLE Procedure Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

243.5.106 SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(
   ctext           IN       VARCHAR2,
   calign          in       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

243.5.107 SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

243.5.108 TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

243.5.109 TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

243.5.110 TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-83 TABLEDATA Procedure Parameters

Parameter	Description
`cvalue`	The data for the cell in the table.
`calign`	The value for the `ALIGN` attribute.
`cdp`	The value for the `DP` attribute.
`cnowrap`	If the value of this parameter is not `NULL`, the `NOWRAP` attribute is added to the tag.
`ccolspan`	The value for the `COLSPAN` attribute.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

243.5.111 TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

243.5.112 TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
   cborder         IN       VARCHAR2   DEFAULT NULL
   calign          IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-85 TABLEOPEN Procedure Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

243.5.113 TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

243.5.114 TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-86 TABLEROWOPEN Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

243.5.115 TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-87 TELETYPE Procedure Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

243.5.116 TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(
   ctitle          IN       VARCHAR2);
```

Parameters

Table 243-88 TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

243.5.117 ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

243.5.118 ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.

Table 243-89 (Cont.) ULISTOPEN Procedure Parameters

Parameter	Description
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

243.5.119 UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

243.5.120 VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 243-91 VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

243.5.121 WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

244
OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the `PL/SQL Gateway` cache to improve the performance of PL/SQL Web applications.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Constants
- Summary of OWA_CACHE Subprograms

244.1 OWA_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

244.2 Summary of OWA_CACHE Subprograms

This table lists the OWA_CACHE subprograms and briefly describes them.

Table 244-1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure	Disables the cache for this particular request
GET_ETAG Function	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure	Sets up the headers for a surrogate-control header for Web cache

244.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

244.2.2 GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
  RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise `NULL`.

244.2.3 GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('`USER`' or '`SYSTEM`') for cache hit, otherwise `NULL`.

244.2.4 SET_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag         IN       VARCHAR2,
   p_level        IN       VARCHAR2);
```

Parameters

Table 244-2 *SET_CACHE Procedure Parameters*

Parameter	Description
`p_etag`	The `etag` associated with this content
`p_level`	The caching level ('`USER`' or '`SYSTEM`').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

244.2.5 SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
   p_expires      IN       NUMBER,
   p_level        IN       VARCHAR2);
```

Parameters

Table 244-3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

244.2.6 SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

VALUE_ERROR is thrown if If the etag was not passed in

244.2.7 SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
   p_value         IN       VARCHAR2);
```

Parameters

Table 244-4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

245
OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Overview
- Types
- Rules and Limits
- Summary of OWA_COOKIE Subprograms

245.1 OWA_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

245.2 OWA_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
   name           VARCHAR2(4000),
   vals           vc_arr,
   num_vals       INTEGER);
```

245.3 OWA_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

245.4 Summary of OWA_COOKIE Subprograms

This table lists the `OWA_COOKIE` subprograms and briefly describes them.

Table 245-1 *OWA_COOKIE Package Subprograms*

Subprogram	Description
GET Function	Gets the value of the specified cookie
GET_ALL Procedure	Gets all cookie name-value pairs
REMOVE Procedure	Removes the specified cookie
SEND procedure	Generates a "Set-Cookie" line in the HTTP header

245.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a `OWA_COOKIE.COOKIE DATA TYPE` .

Syntax

```
OWA_COOKIE.GET(
    name            IN       VARCHAR2)
  RETURN COOKIE;
```

Parameters

Table 245-2 GET Function Parameters

Parameter	Description
name	The name of the cookie.

Return Values

`OWA_COOKIE.COOKIE DATA TYPE.`

245.4.2 GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
   names           OUT      vc_arr,
   vals            OUT      vc_arr,
   num_vals        OUT      INTEGER);
```

Parameters

Table 245-3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

245.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
   name           IN       VARCHAR2,
   val            IN       VARCHAR2,
   path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 245-4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

245.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
   name           in       varchar2,
   value          in       varchar2,
   expires        in       date       DEFAULT NULL,
   path           in       varchar2   DEFAULT NULL,
   domain         in       varchar2   DEFAULT NULL,
   secure         in       varchar2   DEFAULT NULL);
```

Parameters

Table 245-5 SEND Procedure Parameters

Parameter	Description
`name`	The name of the cookie.
`value`	The value of the cookie.
`expires`	The date at which the cookie will expire
`path`	The value for the path field.
`domain`	The value for the domain field.
`secure`	If the value of this parameter is not `NULL`, the "secure" field is added to the line.

246
OWA_CUSTOM

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Constants
- Summary of OWA_CUSTOM Subprograms

246.1 OWA_CUSTOM Constants

OWA_CUSTOM defines several constants to use when specifying parameter values.

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

246.2 Summary of OWA_CUSTOM Subprograms

The AUTHORIZE function is the only subprogram in the OWA_CUSTOM package.

Table 246-1 *OWA_CUSTOM Package Subprograms*

Subprogram	Description
AUTHORIZE Function	Provides a Global PLSQL Agent Authorization callback function

246.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
  RETURN BOOLEAN;
```

247
OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- Overview
- Types
- Variables
- Examples
- Summary of OWA_IMAGE Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

247.1 OWA_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

247.2 OWA_IMAGE Types

This datatype (`point`) contain the `X` and `Y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

247.3 OWA_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

247.4 OWA_IMAGE Examples

This example shows use of `OWA_IMAGE`.

```
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```

247.5 Summary of OWA_IMAGE Subprograms

This table lists the OWA_IMAGE subprograms and briefly describes them.

Table 247-1 *OWA_IMAGE Package Subprograms*

Subprogram	Description
GET_X Function	Gets the X value of a point type
GET_Y Function	Gets the Y value of a point type

247.5.1 GET_X Function

This function returns the `X` coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
   p        IN        point)
 RETURN INTEGER;

OWA_IMAGE.GET_X(
   p        IN        point)
 RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 247-2 GET_X Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

247.5.2 GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER;

OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 247-3 GET_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

248
OWA_OPT_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- Overview
- Types
- Summary of OWA_OPT_LOCK Subprograms

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

248.1 OWA_OPT_LOCK Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

248.2 OWA_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR DATA TYPE`.

248.3 Summary of OWA_OPT_LOCK Subprograms

This table lists the `OWA_OPT_LOCK` subprograms and briefly describes them.

Table 248-1 OWA_OPT_LOCK Package Subprograms

Subprogram	Description
CHECKSUM Functions	Returns the checksum value
GET_ROWID Function	Returns the ROWID value
STORE_VALUES Procedure	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function	Verifies the stored values against modified values

248.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER PARALLEL_ENABLE DETERMINISTIC;

OWA_OPT_LOCK.CHECKSUM(
   p_owner       IN      VARCHAR2,
   p_tname       IN       VARCHAR2,
   p_rowid       IN       ROWID)
  RETURN NUMBER;
```

Parameters

Table 248-2 CHECKSUM Function Parameters

Parameter	Description
`p_buff`	The nstring where you want to calculate the `checksum`.
`p_owner`	The owner of the table.
`p_tname`	The table name.
`p_rowid`	The row in `p_tname` where you want to calculate the `checksum` value. Use the GET_ROWID Function to convert `VCARRAY` values to proper rowids.

248.3.2 GET_ROWID Function

This function returns the `ROWID` datatype from the specified `OWA_OPT_LOCK.VCARRAY DATA TYPE`.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID;

OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID PARALLEL_ENABLE DETERMINISTIC;
```

Parameters

Table 248-3 GET_ROWID Function Parameters

Parameter	Description
`p_old_values`	This parameter is usually passed in from an HTML form.

248.3.3 STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
   p_owner        IN       VARCHAR2,
   p_tname        IN       VARCHAR2,
   p_rowid        IN       ROWID);
```

Parameters

Table 248-4 STORE_VALUES Procedure Parameters

Parameter	Description
`p_owner`	The owner of the table.
`p_tname`	The name of the table.
`p_rowid`	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "*old*_p_tname", where `p_tname` is the name of the table. The value of the element is the owner name.

- One hidden form element is created for the table name. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

248.3.4 VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the STORE_VALUES Procedure.

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
 RETURN BOOLEAN;
```

Parameters

Table 248-5 *VERIFY_VALUES Function Parameters*

Parameter	Description
p_old_values	A PL/SQL table containing the following information: • p_old_values(1) specifies the owner of the table. • p_old_values(2) specifies the table. • p_old_values(3) specifies the rowid of the row to verify. The remaining indexes contain values for the columns in the table. Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.

Return Values

TRUE if no other update has been performed, otherwise FALSE.

249
OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

> **See Also:**
>
> For more information about implementation of this package, see the following:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Types
- Operational Notes
- Summary of OWA_PATTERN Subprograms

249.1 OWA_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

249.2 OWA_PATTERN Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards
- Quantifiers

- Flags

249.2.1 OWA_PATTERN Wildcards

Wildcard tokens match something other than themselves.

Table 249-1 ***Wildcard tokens recognized by OWA_PATTERN package***

Token	Description
^	Matches newline or the beginning of the target
$	Matches newline or the end of the target
\n	Matches newline
.	Matches any character except newline
\t	Matches tab
\d	Matches digits [0-9]
\D	Matches non-digits [not 0-9]
\w	Matches word characters (0-9, a-z, A-Z, or _)
\W	Matches non-word characters (not 0-9, a-z, A-Z, or _)
\s	Matches whitespace characters (blank, tab, or newline).
\S	Matches non-whitespace characters (not blank, tab, or newline)
\b	Matches "word" boundaries (between \w and \W)
\x<HEX>	Matches the value in the current character set of the two hexadecimal digits
\<OCT>	Matches the value in the current character set of the two or three octal digits
\	Followed by any character not covered by another case matches that character
&	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures .

249.2.2 OWA_PATTERN Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

Table 249-2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly *n* occurrences
(n,}	At least *n* occurrences
{n,m}	At least *n*, but not more than *m*, occurrences

249.2.3 OWA_PATTERN Flags

In addition to targets and regular expressions, the `OWA_PATTERN` functions and procedures use flags to affect how they are interpreted.

Table 249-3 Flags

Flag	Description
`i`	This indicates a case-insensitive search.
`g`	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

249.3 Summary of OWA_PATTERN Subprograms

This table lists the OWA_PATTERN subprograms and briefly describes them.

Table 249-4 OWA_PATTERN Package Subprograms

Subprogram	Description
AMATCH Function	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure	Generates a pattern datatype from a `VARCHAR2` type
MATCH Function	Determines if a string contains the specified pattern

249.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

> **Note:**
>
> If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            in       varchar2
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            IN OUT   PATTERN
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 249-5 AMATCH Function Parameters

Parameter	Description
`line`	The text to search in.
from_loc	The location (in number of characters) in `line` where the search is to begin.
`pat`	The string to match. It can contain regular expressions. This can be either a `VARCHAR2` or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the `OWA_TEXT.VC_ARR DATA TYPE` PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns `0`.

249.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
   line           IN OUT    VARCHAR2,
   from_str       IN        VARCHAR2,
   to_str         IN        VARCHAR2,
   flags          IN        VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   line           IN OUT   VARCHAR2,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);

owa_pattern.change(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 249-6 CHANGE Procedure Parameters

Parameter	Description
`line`	The text to search in. The output value of this parameter is the altered string.
mline	The text to search in. This is a `owa_text.multi_line datatype`. The output value of this parameter is the altered string.
`from_str`	The regular expression to replace.
to_str	The substitution pattern.
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "`i`" is specified, the search is case-insensitive. If "`g`" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "`Cats in`". It then replaces this string with "& red". The ampersand character "`&`" indicates "`Cats in`" because that is what matched the regular expression. Thus, this procedure replaces the string "`Cats in pajamas`" with "`Cats in red`" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
   BEGIN
       theline := 'what is the goal?';
       num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
       HTP.PRINT(num_found); -- num_found is 1
       HTP.PRINT(theline); -- theline is 'what is the idea?'
   END;
/
SHOW ERRORS
```

249.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an `OWA_PATTERN.PATTERN DATA TYPE`.

Syntax

```
OWA_PATTERN.GETPAT(
   arg      IN          VARCHAR2,
   pat      IN OUT      pattern);
```

Parameters

Table 249-7 GETPAT Procedure Parameters

Parameter	Description
`arg`	The string to convert.
pat	the `OWA_PATTERN.PATTERN DATA TYPE` initialized with `arg`.

249.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
```

```
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   mline          IN       owa_text.multi_line,
   pat            IN       VARCHAR2,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   mline          IN       owa_text.multi_line,
   pat            IN OUT   pattern,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 249-8 MATCH Function Parameters

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a owa_text.multi_line datatype..
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext  VARCHAR2(256);
pat       VARCHAR2(256);

sometext    := 'what is the goal?'
pat         := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
   THEN
      HTP.PRINT('Match found');
   ELSE
     HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create AN OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.
- If the line is a string and not a multi_line, you can add an optional output parameter called backrefs. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.

250
OWA_SEC

The `OWA_SEC` package provides an interface for custom authentication.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Operational Notes
- Summary of OWA_SEC Subprograms

250.1 OWA_SEC Operational Notes

Parameters that have default values are optional.

250.2 Summary of OWA_SEC Subprograms

This table lists the OWA_SEC subprograms in alphabetical order and briefly describes them.

Table 250-1 *OWA_SEC Package Subprograms*

Subprogram	Description
GET_CLIENT_HOSTNAME Function	Returns the client's hostname
GET_CLIENT_IP Function	Returns the client's IP address
GET_PASSWORD Function	Returns the password that the user entered
GET_USER_ID Function	Returns the username that the user entered
SET_AUTHORIZATION Procedure	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure	Defines the realm that the page is in

250.2.1 GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
 RETURN VARCHAR2;
```

Return Values

The hostname.

250.2.2 GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
  RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address datatype` is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the owa_util.ip_address datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

250.2.3 GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
  RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

250.2.4 GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID
  RETURN VARCHAR2;
```

Return Values

The username.

250.2.5 SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN       INTEGER);
```

Parameters

Table 250-2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description

`scheme`	The authorization scheme. It is one of the following schemes for `SET_AUTHORIZATION`:
	• `OWA_SEC.NO_CHECK` - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.
	• `OWA_SEC.GLOBAL` - Defines an authorize function that is called for all users and all procedures. This is the `OWA_CUSTOM`.AUTHORIZE Function in the "`sys`" schema.
	• `OWA_SEC.PER_PACKAGE` - Define an `authorize` function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.`AUTHORIZE` function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous `authorize` function in the user's schema is called.
	• `OWA_SEC.CUSTOM` - Implements different authorize functions for each user. The function `OWA_CUSTOM`.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an `OWA_CUSTOM`.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.
	The custom `authorize` function has the following signature:
	`FUNCTION AUTHORIZE`
	`  RETURN BOOLEAN;`
	If the function returns `TRUE`, authentication succeeded. If it returns `FALSE`, authentication failed. If the `authorize` function is not defined, the Gateway returns an error and fails.

Related Topics

- OWA_CUSTOM
  The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

250.2.6 SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
   realm      IN      VARCHAR2);
```

Parameters

Table 250-3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

251
OWA_TEXT

The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Types
- Summary of OWA_TEXT Subprograms

251.1 OWA_OPT_LOCK Types

There are three OWA_OPT_LOCK lock types.

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

251.1.1 MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

```
TYPE multi_line IS RECORD (
   rows           vc_arr,
   num_rows       INTEGER,
   partial_row    BOOLEAN);
```

251.1.2 ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
   rows           int_arr,
   num_rows       INTEGER);

int_arr IS DEFINED AS:

TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

251.1.3 VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics

- MULTI_LINE DATA TYPE
  This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

251.2 Summary of OWA_TEXT Subprograms

This table lists the `OWA_TEXT` subprograms and briefly describes them.

Table 251-1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure	Adds text to an existing `multi_line` type
NEW_ROW_LIST Function and Procedure	Creates a new `row_list`
PRINT_MULTI Procedure	Prints out the contents of a `multi_list`
PRINT_ROW_LIST Procedure	Prints out the contents of a `row_list`
STREAM2MULTI Procedure	Converts a varchar2 to a `multi_line` type

251.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi_Line Data Type

Syntax

```
OWA_TEXT.ADD2MULTI(
   stream          IN       VARCHAR2,
   mline           IN OUT   multi_line,
```

continue IN BOOLEAN DEFAULT TRUE);

Parameters

Table 251-2 ADD2MULTI Procedure Parameters

Parameter	Description
`stream`	The text to add.
`mline`	The `OWA_TEXT.MULTI_LINE DATA TYPE`. The output of this parameter contains *stream*.
`continue`	If `TRUE`, the procedure appends *stream* within the previous final row (assuming it is less than 32K). If `FALSE`, the procedure places *stream* in a new row.

251.2.2 NEW_ROW_LIST Function and Procedure

This function or procedure creates a new `OWA_TEX.ROW_LIST DATA TYPE`.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

Table 251-3 *NEW_ROW_LIST Procedure Parameters*

Parameter	Description
`rlist`	This is an output parameter containing the new `row_list` datatype

Return Values

The function version returns the new `row_list` datatype.

251.2.3 PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_MULTI(
   mline       IN       multi_line);
```

Parameters

Table 251-4 PRINT_MULTI Procedure Parameters

Parameter	Description
`mline`	The multi_line datatype to print.

Return Values

The contents of the `multi_line`.

Related Topics

- PRINT Procedures
  These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- PRN Procedures
  These procedures generate the specified parameter as a string.

251.2.4 PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
   rlist       IN       multi_line);
```

Parameters

Table 251-5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
`rlist`	The row_list datatype to print.

Return Values

The contents of the `row_list`.

Related Topics

- PRINT Procedures
  These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- PRN Procedures
  These procedures generate the specified parameter as a string.

251.2.5 STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

Syntax

```
OWA_TEXT.STREAM2MULTI(
   stream          IN       VARCHAR2
   mline           OUT      multi_line);
```

Parameters

Table 251-6 STREAM2MULTI Procedure Parameters

Parameter	Description
`stream`	The string to convert.
`mline`	The stream in `OWA_TEXT.MULTI_LINE DATA TYPE` format

252
OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

> **See Also:**
>
> For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Overview
- Types
- Summary of OWA_UTIL Subprograms

252.1 OWA_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

252.2 OWA_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- DATETYPE Datatype
- IDENT_ARR Datatype
- IP_ADDRESS Datatype

252.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

Related Topics

- TODATE Function
  This function converts the DATETYPE Datatype to the standard Oracle `DATE` type.
- CHOOSE_DATE Procedure
  This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

252.2.2 IDENT_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

252.2.3 IP_ADDRESS Datatype

This datatype is used by the GET_CLIENT_IP Function in the OWA_SEC package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Related Topics

- GET_CLIENT_IP Function
  This function returns the IP address of the client.
- OWA_SEC
  The `OWA_SEC` package provides an interface for custom authentication.

252.3 Summary of OWA_UTIL Subprograms

This table lists the `OWA_UTIL` subprograms and briefly describes them.

Table 252-1 ***OWA_UTIL Package Subprograms***

Subprogram	Description
BIND_VARIABLES Function	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures	Prints a calendar
CELLSPRINT Procedures	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function	Returns the full virtual path for the PL/SQL Gateway
GET_PROCEDURE Function	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure	Closes the HTTP header
LISTPRINT Procedure	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure	Generates the Location line in the HTTP header
SHOWPAGE Procedure	Prints a page generated by the HTP and HTF packages in SQL*Plus

Table 252-1 (Cont.) *OWA_UTIL Package Subprograms*

Subprogram	Description
SHOWSOURCE Procedure	Prints the source for the specified subprogram
SIGNATURE procedure	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure	Generates the Status line in the HTTP header
TABLEPRINT Function	Prints the data from a table in the database as an HTML table
TODATE Function	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure	Returns information on the caller of the procedure.

252.3.1 BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
   theQuery       IN       VARCHAR2   DEFAULT NULL,
   bv1Name        IN       VARCHAR2   DEFAULT NULL,
   bv1Value       IN       VARCHAR2   DEFAULT NULL,
   bv2Name        IN       VARCHAR2   DEFAULT NULL,
   bv2Value       IN       VARCHAR2   DEFAULT NULL,
   bv3Name        IN       VARCHAR2   DEFAULT NULL,
   bv3Value       IN       VARCHAR2   DEFAULT NULL,
        ...
   bv25Name       IN       VARCHAR2   DEFAULT NULL,
   bv25Value      IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 252-2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

252.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.CALENDARPRINT(
   p_query        IN       VARCHAR2,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
   p_cursor       IN       INTEGER,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');
```

Parameters

Table 252-3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

252.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the " HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT(
   p_colCnt          IN    INTEGER,
   p_resultTbl       IN    vc_arr,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  iN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER      DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN,
   p_reccnt          OUT   NUMBER);
```

Parameters

Table 252-4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

252.3.4 CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
   p_name         IN       VARCHAR2,
   p_date         IN       DATE       DEFAULT SYSDATE);
```

Parameters

Table 252-5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.

- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE datatype.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
     ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
     ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
     ...
<OPTION value="2002">2002
</SELECT>
```

252.3.5 GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
   param_name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 252-6 GET_CGI_ENV Function Parameters

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

252.3.6 GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

252.3.7 GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

252.3.8 HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

252.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
   p_theQuery     IN       VARCHAR2,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
   p_theCursor    IN    INTEGER,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 252-7 LISTPRINT Procedure Parameters

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
     ...
</SELECT>
```

252.3.10 MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
   ccontent_type    IN       VARCHAR2   DEFAULT 'text/html',
   bclose_header    IN       BOOLEAN    DEFAULT TRUE,
   ccharset         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 252-8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate

Table 252-8 (Cont.) MIME_HEADER Procedure Parameters

Parameter	Description
bclose_header	Whether or not to close the HTTP header. If `TRUE`, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use.The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

252.3.11 PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

252.3.12 REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(
   curl           IN       VARCHAR2
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 252-9 REDIRECT_URL Procedure Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

252.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

252.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
   cname      IN     VARCHAR2);
```

Parameters

Table 252-10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

252.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
   cname        IN        VARCHAR2);
```

Parameters

Table 252-11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

252.3.16 STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
   nstatus        IN       INTEGER,
   creason        IN       VARCHAR2   DEFAULT NULL,
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 252-12 STATUS_LINE Procedure Parameters

Parameter	Description
`nstatus`	The status code.
`creason`	The string for the status code.
`bclose_header`	Whether or not to close the HTTP header. If `TRUE`, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

252.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
   ctable         IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL,
   ntable_type    IN       INTEGER    DEFAULT HTML_TABLE,
   ccolumns       IN       VARCHAR2   DEFAULT '*',
   cclauses       IN    VARCHAR2   DEFAULT NULL,
   ccol_aliases   IN       VARCHAR2   DEFAULT NULL,
   nrow_min       IN       NUMBER     DEFAULT 0,
   nrow_max       IN       NUMBER     DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 252-13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: • HTML_TABLE CONSTANT INTEGER := 1; • PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

```
http://myhost:7777/pls/hr/showemps
```

returns to the following to the client:

```
<PRE>
---------------------------------------------------------------
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
---------------------------------------------------------------
| 7369| SMITH  | CLERK    | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499| ALLEN  | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521| WARD   | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566| JONES  | MANAGER | 7839 | 02-APR-81 | 2975 |     | 20 |
```

```
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |     | 30 |
| 7782| CLARK  | MANAGER | 7839 | 09-JUN-81 | 2450 |     | 10 |
| 7788| SCOTT  | ANALYST | 7566 | 09-DEC-82 | 3000 |     | 20 |
| 7839| KING   | PRESIDENT |    | 17-NOV-81 | 5000 |     | 10 |
| 7844| TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0   | 30 |
| 7876| ADAMS  | CLERK   | 7788 | 12-JAN-83 | 1100 |     | 20 |
| 7900| JAMES  | CLERK   | 7698 | 03-DEC-81 | 950  |     | 30 |
| 7902| FORD   | ANALYST | 7566 | 03-DEC-81 | 3000 |     | 20 |
| 7934| MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |     | 10 |
-----------------------------------------------------------------
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showemps_10
```

would return the following to the client:

```
<PRE>
-------------------------------------
| Employee Number |Name    | Salary |
-------------------------------------
| 7782            | CLARK  | 2450   |
| 7839            | KING   | 5000   |
| 7934            | MILLER | 1300   |
-------------------------------------
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
```

```
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

252.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle `DATE` type.

Syntax

```
OWA_UTIL.TODATE(
   p_dateArray      IN     dateType)
 RETURN DATE;
```

Parameters

Table 252-14 TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

Related Topics

- DATETYPE Datatype
  The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

252.3.19 WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
   owner          OUT      VARCHAR2,
   name           OUT      VARCHAR2,
   lineno         OUT      NUMBER,
   caller_t       OUT      VARCHAR2);
```

Parameters

Table 252-15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
`owner`	The owner of the program unit.
`name`	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is `NULL`.
`lineno`	The line number within the program unit where the call was made.
`caller_t`	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

253
SDO_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

254
SDO_CSW_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*..

255
SDO_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in the *Oracle Spatial and Graph Developer's Guide*.

256
SDO_GEOM

The SDO_GEOM package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the *Oracle Spatial and Graph Developer's Guide*.

257
SDO_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

258
SDO_GEOR_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

259
SDO_GEOR_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the SDO_GEOR_AGGR package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

260
SDO_GEOR_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

261
SDO_GEOR_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

262
SDO_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

263
SDO_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

264
SDO_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

265
SDO_NFE

The SDO_NFE package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see SDO_NFE in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

266
SDO_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

267
SDO_PC_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

268
SDO_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

269
SDO_TIN_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

270
SDO_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

271
SDO_TOPO_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

272
SDO_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

273
SDO_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

274
SDO_WFS_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

275
SDO_WFS_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

276
SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

277
SEM_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

278
SEM_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

279
SEM_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

280
SEM_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

281
UTL_CALL_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- Overview
- Security Model
- UTL_CALL_STACK Operational Notes
- UTL_CALL_STACK Exceptions
- Data Structures
- Summary of UTL_CALL_STACK Subprograms

> **See Also:**
>
> - *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
> - *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

281.1 UTL_CALL_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

281.2 UTL_CALL_STACK Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list onlys shows program unit C.

281.3 UTL_CALL_STACK Operational Notes

Certain operational notes apply to `UTL_CALL_STACK`.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- `UTL_CALL_STACK` is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using `UTL_CALL_STACK`.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through `UTL_CALL_STACK`.

281.4 UTL_CALL_STACK Exceptions

This table lists the exceptions raised by `UTL_CALL_STACK`.

Table 281-1 Exceptions Raised by UTL_CALL_STACK

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

281.5 UTL_CALL_STACK Data Structures

The `UTL_CALL_STACK` package defines a `VARRAY` type, `UNIT_QUALIFIED_NAME`.

VARRAY Type

- UNIT_QUALIFIED_NAME

281.5.1 UNIT_QUALIFIED_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
  BEGIN
```

```
  ...
END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be `"__anonymous_block"`

281.6 Summary of UTL_CALL_STACK Subprograms

This table lists the subprograms in the `UTL_CALL_STACK` package.

Table 281-2 UTL_CALL_STACK Package Subprograms

Subprogram	Description
BACKTRACE_DEPTH Function	Returns the number of backtrace items in the backtrace
BACKTRACE_LINE Function	Returns the line number of the unit at the specified backtrace depth
BACKTRACE_UNIT Function	Returns the name of the unit at the specified backtrace depth
CURRENT_EDITION Function	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
CONCATENATE_SUBPROGRAM Function	Returns a concatenated form of a unit-qualified name
DYNAMIC_DEPTH Function	Returns the number of subprograms on the call stack
ERROR_DEPTH Function	Returns the number of errors on the error stack
ERROR_MSG Function	Returns the error message of the error at the specified error depth
ERROR_NUMBER Function	Returns the error number of the error at the specified error depth
LEXICAL_DEPTH Function	Returns the lexical nesting level of the subprogram at the specified dynamic depth
OWNER Function	Returns the owner name of the unit of the subprogram at the specified dynamic depth
UNIT_LINE Function	Returns the line number of the unit of the subprogram at the specified dynamic depth
SUBPROGRAM Function	Returns the unit-qualified name of the subprogram at the specified dynamic depth

281.6.1 BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

281.6.2 BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (
   backtrace_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 281-3 *BACKTRACE_LINE Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The line number of the unit at the specified backtrace depth

281.6.3 BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
   backtrace_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 281-4 *BACKTRACE_UNIT Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

Return Values

The name of the unit at the specified backtrace depth

281.6.4 CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (
   dynamic_depth     IN     PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 281-5 *CURRENT_EDITION Function Parameters*

Parameter	Description
dynamic_depth	Depth in the error stack

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

281.6.5 CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (
   qualified_name    IN    UNIT_QUALIFIED_NAME)
 RETURN VARCHAR2;
```

Parameters

Table 281-6 *CONCATENATE_SUBPROGRAM Function Parameters*

Parameter	Description
qualified_name	A unit-qualified name

Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`

281.6.6 DYNAMIC_DEPTH Function

This function returns the number of subprograms on the call stack.

Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of subprograms on the call stack

281.6.7 ERROR_DEPTH Function

This function returns the number of errors on the error stack.

Syntax

```
UTL_CALL_STACK.ERROR_DEPTH
 RETURN PLS_INTEGER;
```

Return Values

The number of errors on the error stack

281.6.8 ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_MSG (
   error_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 281-7 *ERROR_MSG Function Parameters*

Parameter	Description
error_depth	Depth in the error stack

Return Values

The error message of the error at the specified error depth.

281.6.9 ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (
   error_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 281-8 *ERROR_NUMBER Function Parameters*

Parameter	Description
error_depth	Depth in the call stack

Return Values

The error number of the error at the specified error depth

281.6.10 LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 281-9 *LEXICAL_DEPTH Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

281.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.OWNER (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN VARCHAR2;
```

Parameters

Table 281-10 *OWNER Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

281.6.12 UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.UNIT_LINE (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN PLS_INTEGER;
```

Parameters

Table 281-11 *UNIT_LINE Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

The line number of the unit of the subprogram at the specified dynamic depth

281.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
   dynamic_depth    IN    PLS_INTEGER)
 RETURN UNIT_QUALIFIED_NAME;
```

Parameters

Table 281-12 *SUBPROGRAM Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

282
UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms

282.1 Summary of UTL_COLL Subprograms

The UTL_COLL package has one subprogram, the IS_LOCATOR function.

Table 282-1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function	Determines whether a collection item is actually a locator or not

282.1.1 IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
   coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

Table 282-2 *IS_LOCATOR Function Parameters*

Parameter	Description
coln	Nested table or varray item.

Return Values

Table 282-3 IS_LOCATOR Function Return Values

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno  number,
  ph   list_t );
/

CREATE TABLE phone_book OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

283
UTL_COMPRESS

The UTL_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- Constants
- Exceptions
- Operational Notes
- Summary of UTL_COMPRESS Subprograms

283.1 UTL_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE   CONSTANT  PLS_INTEGER := 5;
```

283.2 UTL_COMPRESS Exceptions

This table describes exceptions raised by UTL_COMPRESS subprograms.

Table 283-1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

283.3 UTL_COMPRESS Operational Notes

Certain operational notes apply to UTL_COMPRESS.

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.
- A BFILE passed into LZ_COMPRESS* or lZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.

- The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.

283.4 Summary of UTL_COMPRESS Subprograms

This table lists the `UTL_COMPRESS` subprograms and briefly describes them.

Table 283-2 *UTL_COMPRESS Package Subprograms*

Subprogram	Description
ISOPEN Function	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure	Adds a piece of compressed data
LZ_COMPRESS_CLOSE	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure	Closes and finishes the piecewise uncompress

283.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(
   handle in binary_integer)
 RETURN BOOLEAN;
```

Parameters

Table 283-3 ISOPEN Function Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.

Return Values

`TRUE` if the given piecewise handle is opened, otherwise `FALSE`.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
   UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
   UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

283.4.2 LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a `RAW` as input, compress it and return the compressed `RAW` result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
   src       IN           RAW,
   quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN RAW;
```

This function accept a `BLOB` as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src       IN           BLOB,
  quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN            BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN            BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary `BLOB` for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   quality IN            BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   dst     IN OUT NOCOPY BLOB,
   quality IN            BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 283-4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- quality is an optional compression tuning value. It allows the UTL_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

283.4.3 LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB,
   src    IN             RAW);
```

Parameters

Table 283-5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

Exceptions

- invalid_handle - out of range invalid or unopened handle.
- invalid_argument - NULL handle, src, dst, or invalid dst.

283.4.4 LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB);
```

Parameters

Table 283-6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle, dst, or invalid dst.

283.4.5 LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
   dst       IN OUT NOCOPY BLOB,
   quality   IN            BINARY_INTEGER DEFAULT 6)
 RETURN BINARY_INTEGER;
```

Parameters

Table 283-7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. • Valid values are the range 1..9, with a default value of 6. • 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL dst or invalid quality specified.

Usage Notes

Close the opened handle with LZ_COMPRESS_CLOSE

- once the piecewise compress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

283.4.6 LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  RAW)
  RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB)
  RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB,
   dst  IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BFILE,
   dst  IN OUT NOCOPY BLOB);
```

Parameters

Table 283-8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

283.4.7 LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
   handle  IN          BINARY_INTEGER,
   dst     OUT NOCOPY  RAW);
```

Parameters

Table 283-9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

Exceptions

- no_data_found - finished uncompress.
- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.

283.4.8 LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
   src  IN  BLOB)
  RETURN BINARY_INTEGER;
```

Parameters

Table 283-10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

283.4.9 LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
   handle  IN   BINARY_INTEGER);
```

Parameters

Table 283-11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - `NULL` handle.

284
UTL_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms

284.1 Summary of UTL_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

Table 284-1 ***UTL_ENCODE Package Subprograms***

Subprogram	Description
BASE64_DECODE Function	Reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value
BASE64_ENCODE Function	Encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string
MIMEHEADER_DECODE Function	Decodes a string from mime header format
MIMEHEADER_ENCODE Function	Encodes a string into mime header format
QUOTED_PRINTABLE_DECODE Function	Reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string
QUOTED_PRINTABLE_ENCODE Function	Reads the `RAW` input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function	Decodes a character set sensitive text string
TEXT_ENCODE Function	Encodes a character set sensitive text string
UUDECODE Function	Reads the `RAW` uuencode format input string and decodes it to the corresponding `RAW` string
UUENCODE Function	Reads the `RAW` input string and encodes it to the corresponding uuencode format string

284.1.1 BASE64_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 284-2 BASE64_DECODE Function Parameters

Parameter	Description
`r`	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 284-3 BASE64_DECODE Function Return Values

Return	Description
`RAW`	Contains the decoded string

284.1.2 BASE64_ENCODE Function

This function encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 284-4 BASE64_ENCODE Function Parameters

Parameter	Description
`r`	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 284-5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

284.1.3 MIMEHEADER_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The `<encoded text>` is encapsulated in mime header tags which give the `MIMEHEADER_DECODE` function information about how to decode the string. The mime header metadata tags are stripped from the input string and the `<encoded text>` is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the `<encoding>` metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a `VARCHAR2` string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
   buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
  RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 284-6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 284-7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

284.1.4 MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 284-8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 284-9 MIMEHEADER_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

284.1.5 QUOTED_PRINTABLE_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 284-10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
`r`	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 284-11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
`RAW`	The decoded string

284.1.6 QUOTED_PRINTABLE_ENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

Table 284-12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 284-13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

284.1.7 TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each `encoding` parameter. If `NULL`, quoted-printable is selected as a default decoding format. If `encode_charset` is not `NULL`, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 284-14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`.

Return Values

Table 284-15 TEXT_DECODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
     'Here is some text',
      WE8ISO8859P1,
      UTL_ENCODE.BASE64);
```

284.1.8 TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL.

The text is encoded to either base64 or quoted-printable format, as specified by the encoding parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 284-16 TEXT_ENCODE Function Parameters

Parameter	Description
buf	The text data.
encode_charset	The target character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL

Return Values

Table 284-17 TEXT_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
   'Here is some text',
   'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

284.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "UUENCODE Function" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 284-18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 284-19 UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

284.1.10 UUENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized `RAW` values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
   r          IN RAW,
   type       IN PLS_INTEGER DEFAULT 1,
   filename   IN VARCHAR2 DEFAULT NULL,
   permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 284-20 UUENCODE Function Parameters

Parameter	Description
`r`	`RAW` string
`type`	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of `1`. (default) header_piece ...middle_piece ...end_piece
`filename`	Optional `varchar2` parameter containing the uuencode filename; the default is `uuencode.txt`
`permission`	Optional `varchar2` parameter containing the permission mode; the default is `0` (a text string zero).

Return Values

Table 284-21 UUENCODE Function Return Values

Return	Description
`RAW`	Contains the uuencode format string

285
UTL_FILE

With the UTL_FILE package, PL/SQL programs can read and write operating system text files. UTL_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Exceptions
- Examples
- Data Structures
- Summary of UTL_FILE Subprograms

285.1 UTL_FILE Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in the operating system directory described by USER_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

> **Note:**
>
> Use the CREATE DIRECTORY feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

> **WARNING:**
>
> The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.

285.2 UTL_FILE Operational Notes

Keep these notes in mind when using UTL_FILE.

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators.

UTL_FILE expects that files opened by UTL_FILE.FOPEN in text mode are encoded in the database character set. It expects that files opened by UTL_FILE.FOPEN_NCHAR in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should therefore be the same as the database character set.

285.3 UTL_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

> **Note:**
>
> The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

285.4 UTL_FILE Exceptions

This table describes exceptions raised by UTL_FILE subprograms.

Table 285-1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: • ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or • ABSOLUTE_OFFSET < 0, or • Either offset caused a seek past the end of the file

Table 285-1 (Cont.) UTL_FILE Package Exceptions

Exception Name	Description
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

285.5 UTL_FILE Examples

These two examples show use of the procedure.

Example 1

> **Note:**
>
> The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user'';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults to
1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1);
  UTL_FILE.FCLOSE(F1);
END;
```

285.6 UTL_FILE Data Structures

The `UTL_FILE` package defines a RECORD type.

Record Types

- FILETYPE Record Type

285.6.1 FILETYPE Record Type

The contents of `FILE_TYPE` are private to the `UTL_FILE` package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
   id          BINARY_INTEGER,
   datatype    BINARY_INTEGER,
   byte_mode   BOOLEAN);
```

Fields

Table 285-2 FILE_TYPE Fields

Field	Description
`id`	A numeric value indicating the internal file handle number
`datatype`	Indicates whether the file is a `CHAR` file, `Nchar` file or other (binary)
`byte_mode`	Indicates whether the file was open as a binary file, or as a text file

> **Caution:**
>
> Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have inderterminate outcomes.

285.7 Summary of UTL_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

Table 285-3 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure	Closes a file
FCLOSE_ALL Procedure	Closes all open file handles
FCOPY Procedure	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure	Physically writes all pending output to a file
FGETATTR Procedure	Reads and returns the attributes of a disk file
FGETPOS Function	Returns the current relative offset position within a file, in bytes
FOPEN Function	Opens a file for input or output
FOPEN_NCHAR Function	Opens a file in Unicode for input or output
FREMOVE Procedure	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure	Renames an existing file to a new name, similar to the UNIX `mv` function
FSEEK Procedure	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure	Reads text from an open file
GET_LINE_NCHAR Procedure	Reads text in Unicode from an open file
GET_RAW Procedure	Reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function	Determines if a file handle refers to an open file
NEW_LINE Procedure	Writes one or more operating system-specific line terminators to a file
PUT Procedure	Writes a string to a file
PUT_LINE Procedure	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure	Writes a Unicode line to a file
PUT_NCHAR Procedure	Writes a Unicode string to a file
PUTF Procedure	A `PUT` procedure with formatting
PUTF_NCHAR Procedure	A `PUT_NCHAR` procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Procedure	Accepts as input a `RAW` data value and writes the value to the output buffer

285.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
   file IN OUT FILE_TYPE);
```

Parameters

Table 285-4 FCLOSE Procedure Parameters

Parameter	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call

Usage Notes

If there is buffered data yet to be written when `FCLOSE` runs, then you may receive a `WRITE_ERROR` exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

285.7.2 FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

> **Note:**
>
> `FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

```
WRITE_ERROR
```

285.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
   src_location    IN VARCHAR2,
   src_filename    IN VARCHAR2,
   dest_location   IN VARCHAR2,
   dest_filename   IN VARCHAR2,
   start_line      IN BINARY_INTEGER DEFAULT 1,
   end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 285-5 FCOPY Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be copied
`dest_location`	Destination directory where the destination file is created
`dest_filename`	Destination file created from the source file
`start_line`	Line number at which to begin copying. The default is `1` for the first line
`end_line`	Line number at which to stop copying. The default is `NULL`, signifying end of file

Exceptions

`INVALID_FILENAME`

`INVALID_PATH`

`INVALID_OPERATION`

`INVALID_OFFSET`

`READ_ERROR`

`WRITE_ERROR`

285.7.4 FFLUSH Procedure

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
   file  IN FILE_TYPE);
```

Parameters

Table 285-6 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Exceptions

INVALID_FILENAME

INVALID_MAXLINESIZE

INVALID_OPERATION

WRITE_ERROR

285.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   fexists      OUT BOOLEAN,
   file_length  OUT NUMBER,
   block_size   OUT BINARY_INTEGER);
```

Parameters

Table 285-7 FGETATTR Procedure Parameters

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

Exceptions

INVALID_PATH

INVALID_FILENAME

INVALID_OPERATION

READ_ERROR

ACCESS_DENIED

285.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (
   file IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

Parameters

Table 285-8 FGETPOS Parameters

Parameters	Description
file	Directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

285.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also FOPEN_NCHAR Function.

Syntax

```
UTL_FILE.FOPEN (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
  RETURN FILE_TYPE;
```

Parameters

Table 285-9 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: • r -- read text • w -- write text • a -- append text • rb -- read byte mode • wb -- write byte mode • ab -- append byte mode If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 285-10 FOPEN Function Return Values

Return	Description
FILE_TYPE	Handle to open file

Exceptions

INVALID_MAXILINESIZE

INVALID_MODE

INVALID_OPERATION

INVALID_PATH

INVALID_FILENAME

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

285.7.8 FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 285-11 FOPEN_NCHAR Function Parameters

Parameter	Description
`location`	Directory location of file
`filename`	File name (including extension)
`open_mode`	Open mode (`r`,`w`,`a`,`rb`,`wb`,`ab`)
`max_linesize`	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

Return Values

`FOPEN_NCHAR` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

Table 285-12 FOPEN_NCHAR Function Return Values

Return	Description
`FILE_TYPE`	Handle to open file

Exceptions

`INVALID_MAXILINESIZE`

`INVALID_MODE`

`INVALID_OPERATION`

```
INVALID_PATH
```

285.7.9 FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (
   location IN VARCHAR2,
   filename IN VARCHAR2);
```

Parameters

Table 285-13 FREMOVE Procedure Parameters

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

Exceptions

```
ACCESS_DENIED

DELETE_FAILED

INVALID_FILENAME

INVALID_OPERATION

INVALID_PATH
```

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

285.7.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

Syntax

```
UTL_FILE.FRENAME (
   src_location      IN   VARCHAR2,
   src_filename      IN   VARCHAR2,
   dest_location     IN   VARCHAR2,
   dest_filename     IN   VARCHAR2,
   overwrite         IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 285-14 FRENAME Procedure Parameters

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be renamed
dest_location	Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
dest_filename	New name of the file
overwrite	Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.

Exceptions

ACCESS_DENIED

INVALID_FILENAME

INVALID_PATH

RENAME_FAILED

285.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
   file             IN OUT  UTL_FILE.FILE_TYPE,
   absolute_offset  IN      PL_INTEGER DEFAULT NULL,
   relative_offset  IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 285-15 FSEEK Procedure Parameters

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

Exceptions

INVALID_FILEHANDLE

INVALID_OFFSET

INVALID_OPERATION

READ_ERROR

Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If relative_offset, the procedure seeks forward. If relative_offset > 0, or backward, if relative_offset < 0, the procedure seeks through the file by the number of relative_offset bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an INVALID_OFFSET error is raised.
- If absolute_offset, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

285.7.12 GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the len parameter. It cannot exceed the max_linesize specified in FOPEN.

Syntax

```
UTL_FILE.GET_LINE (
   file        IN  FILE_TYPE,
   buffer      OUT VARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 285-16 GET_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call. The file must be open for reading (mode r); otherwise an INVALID_OPERATION exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

NO_DATA_FOUND

READ_ERROR

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure".

285.7.13 GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also GET_LINE Procedure

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
   file        IN  FILE_TYPE,
   buffer      OUT NVARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 285-17 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. The file must be open for reading (mode `r`). If the file is opened by `FOPEN` instead of `FOPEN_NCHAR`, a `CHARSETMISMATCH` exception is raised.
`buffer`	Data buffer to receive the line read from the file
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, Oracle supplies the value of max_linesize.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

285.7.14 GET_RAW Procedure

This procedure reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read. `UTL_FILE.GET_RAW` ignores line terminators.

Syntax

```
UTL_FILE.GET_RAW (
   file       IN            UTL_FILE.FILE_TYPE,
   buffer     OUT NOCOPY    RAW,
   len        IN            PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 285-18 GET_RAW Procedure Parameters

Parameters	Description
`file`	File handle
`buffer`	`RAW` data
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, `len` is assumed to be the maximum length of `RAW`.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`LENGTH_MISMATCH`

`NO_DATA_FOUND`

`READ_ERROR`

Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
      h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
      Buf   RAW(32767);
      Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
      LOOP
        BEGIN
          Utl_File.Get_Raw(h, Buf, Amnt);
          -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
      END LOOP;
      UTL_FILE.FCLOSE (h);
    END;
```

285.7.15 IS_OPEN Function

This function tests a file handle to see if it identifies an open file.

`IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (
   file  IN FILE_TYPE)
  RETURN BOOLEAN;
```

Parameters

Table 285-19 IS_OPEN Function Parameters

Parameter	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call

Return Values

`TRUE` or `FALSE`

Exceptions

`INVALID_FILEHANDLE`

285.7.16 NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from `PUT` because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
   file     IN FILE_TYPE,
   lines    IN BINARY_INTEGER := 1);
```

Parameters

Table 285-20 NEW_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call
`lines`	Number of line terminators to be written to the file

Exceptions

`INVALID_FILEHANDLE`

INVALID_OPERATION

WRITE_ERROR

285.7.17 PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure".

Syntax

```
UTL_FILE.PUT (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2);
```

Parameters

Table 285-21 PUT Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

285.7.18 PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure".

Syntax

```
UTL_FILE.PUT_LINE (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 285-22 PUT_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call
`buffer`	Text buffer that contains the lines to be written to the file
`autoflush`	Flushes the buffer to disk after the `WRITE`

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

285.7.19 PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
   file    IN FILE_TYPE,
   buffer  IN NVARCHAR2);
```

Parameters

Table 285-23 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. The file must be open for writing.

Table 285-23 (Cont.) PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
buffer	Text buffer that contains the lines to be written to the file

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

285.7.20 PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

Syntax

```
UTL_FILE.PUT_NCHAR (
   file      IN FILE_TYPE,
   buffer    IN NVARCHAR2);
```

Parameters

Table 285-24 PUT_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

```
WRITE_ERROR
```

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

Related Topics

- PUT Procedure
  `PUT` writes the text string stored in the buffer parameter to the open file identified by the file handle.

285.7.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf`().

Syntax

```
UTL_FILE.PUTF (
   file    IN FILE_TYPE,
   format  IN VARCHAR2,
   [arg1   IN VARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 285-25 PUTF Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call
`format`	Format string that can contain text as well as the formatting characters `\n` and `%s`
`arg1..arg5`	From one to five operational argument strings. Argument strings are substituted, in order, for the `%s` formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each `%s` for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
`%s`	Substitute this sequence with the string value of the next argument in the argument list.
`\n`	Substitute with the appropriate platform-specific line terminator.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
                my_world,
                'greetings for all earthlings');
```

If there are more `%s` formatters in the format parameter than there are arguments, then an empty string is substituted for each `%s` for which there is no matching argument.

Related Topics

- PUTF_NCHAR Procedure
  This procedure is a formatted version of a PUT_NCHAR Procedure.

285.7.22 PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure.

Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
   file    IN FILE_TYPE,
   format  IN NVARCHAR2,
   [arg1   IN NVARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 285-26 PUTF_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Exceptions

INVALID_FILEHANDLE

INVALID_OPERATION

WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

Related Topics

- PUT_NCHAR Procedure
  This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

285.7.23 PUT_RAW Procedure

This procedure accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
   file          IN    UTL_FILE.FILE_TYPE,
   buffer        IN    RAW,
   autoflush     IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 285-27 PUT_RAW Procedure Parameters

Parameters	Description
`file`	File handle
`buffer`	The `RAW` data written to the buffer
`autoflush`	If `TRUE`, then performs a flush after writing the value to the output buffer; default is `FALSE`.

Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

286
UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet which can be created by `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Exceptions
- Examples
- Data Structures
- Operations
- Subprogram Groups
- Summary of UTL_HTTP Subprograms

> **See Also:**
>
> - UTL_URL
> - UTL_SMTP
> - *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

286.1 UTL_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

286.2 UTL_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

> **Note:**
>
> For more information about managing fine-grained access, see *Oracle Database Security Guide*

286.3 UTL_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- Table 286-1
- Table 286-2
- Table 286-3

Table 286-1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
`HTTP_VERSION_1_0`	`VARCHAR2(10)`	`'HTTP/1.0'`	Denotes HTTP version 1.0 that can be used in the function `BEGIN_REQUEST`.
`HTTP_VERSION_1_1`	`VARCHAR2(10)`	`'HTTP/1.1'`	Denotes HTTP version 1.1 that can be used in the function `BEGIN_REQUEST`.

Table 286-2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
`DEFAULT_HTTP_PORT`	`PLS_INTEGER`	`80`	The default TCP/IP port (80) at which a Web server or proxy server listens
`DEFAULT_HTTPS_PORT`	`PLS_INTEGER`	`443`	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 286-3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.
HTTP_NON_AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent- driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.

Table 286-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIME_OUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined `Content-Length`.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.

Table 286-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_REQUEST_ENTITY_TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

286.4 UTL_HTTP Exceptions

Exceptions indicate that the UTL_HTTP package encountered issues.

The following table lists these exceptions . By default, `UTL_HTTP` raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

Table 286-4 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when detailed_exception is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when detailed_exception is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when detailed_exception is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when detailed_exception is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

> **Note:**
>
> The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

286.5 UTL_HTTP Examples

These five examples demonstrate how to use `UTL_HTTP`.

- General Usage
- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

286.5.1 UTL_HTTP General Usage

This is an general example of `UTL_HTTP` usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  LOOP
    UTL_HTTP.READ_LINE(resp, value, TRUE);
    DBMS_OUTPUT.PUT_LINE(value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    UTL_HTTP.END_RESPONSE(resp);
END;
```

286.5.2 UTL_HTTP Retrieving HTTP Response Headers

This example shows how `UTL_HTTP` retrieves HTTP response headers.

```
SET SERVEROUTPUT ON SIZE 40000
```

```
DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  name  VARCHAR2(256);
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
  DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

286.5.3 UTL_HTTP Handling HTTP Authentication

This code sample indicates how `UTL_HTTP` handles HTTP authentication.

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                      username IN VARCHAR2 DEFAULT NULL,
                                      password IN VARCHAR2 DEFAULT NULL,
                                      realm    IN VARCHAR2 DEFAULT NULL) AS
  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  name      VARCHAR2(256);
  value     VARCHAR2(256);
BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen.
Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
    DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
    DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
     for the proxy server.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
    DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
    DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
     for the Web page.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
```

```
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

286.5.4 UTL_HTTP Handling HTTP Digest Authentication

This code sample indicates how `UTL_HTTP` handles HTTP digest authentication.

```
declare
  url varchar2(32767);
  q utl_http.req;
  p utl_http.resp;
  pstatus pls_integer;
   begin
    url := 'http://slc10tzv.us.oracle.com:3000/digest.html';
    q := utl_http.begin_request(url);
    utl_http.set_authentication(q,
                                username => 'utlhttp_user',
                                password => 'welcome',
                                scheme   => 'Digest');
    p := utl_http.get_response(q);
    pstatus := p.status_code;

  -- status code returned from get_response should be 200
  dbms_output.put_line('-- response status: ' || p.status_code);
  utl_http.end_response(p);
  utl_http.end_request(q);
EXCEPTION WHEN OTHERS THEN
  utl_http.end_request(q);
end;
/
-- response status: 200"
```

286.5.5 UTL_HTTP Retrieving and Restoring Cookies

This example show how UTL_HTTP can be used to retrieve and restore cookies.

```
CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  my_session_id  PLS_INTEGER;
  secure         VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
```

```
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  cookie         UTL_HTTP.COOKIE;
  i              PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name     := r.name;
    cookie.value    := r.value;
    cookie.domain   := r.domain;
    cookie.expire   := r.expire;
    cookie.path     := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

286.5.6 UTL_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how `UTL_HTTP` creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```
SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req             UTL_HTTP.REQ;
  resp            UTL_HTTP.RESP;
  data            VARCHAR2(1024);

BEGIN
```

```
  -- Create a request context with its wallet and cookie table
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
                       wallet_path          => 'file:/oracle/wallets/test/wallet',
                       wallet_password      => '******',
                       enable_cookies       => TRUE,
                       max_cookies          => 300,
                       max_cookies_per_site => 20);

  -- Make a HTTP request using the private wallet and cookie
  -- table in the request context
  req := UTL_HTTP.BEGIN_REQUEST(
           url             => url,
           request_context => request_context);
  resp := UTL_HTTP.GET_RESPONSE(req);

  BEGIN
    LOOP
       UTL_HTTP.READ_TEXT(resp, data);
       DBMS_OUTPUT.PUT(data);
    END LOOP;
  EXCEPTION
      WHEN UTL_HTTP.END_OF_BODY THEN
         UTL_HTTP.END_RESPONSE(resp);
  END;

  -- Destroy the request context
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
  DISPLAY_PAGE('https://www.example.com/');
END;
/
```

286.5.7 UTL_HTTP Using a Proxy Server

This example shows using a proxy server for an Oracle Database connection.

The `UTL_HTTP.REQUEST` procedure uses the proxy server host name and the port number to access the HTTPS URL from within the Oracle Database.

```
SELECT UTL_HTTP.REQUEST('<URL>', '<proxy_hostname>:<proxy_port_number>',
'<wallet_directory>', '<wallet_password>') FROM DUAL;
```

> **Note:**
>
> By default, the `UTL_HTTP.REQUEST` procedure enables you to omit or set the "proxy" argument as `NULL`.

286.6 UTL_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- REQ Type
- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type
- REQUEST_CONTEXT_KEY Type

286.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
   url           VARCHAR2(32767),
   method        VARCHAR2(64),
   http_version  VARCHAR2(64));
```

Parameters

Table 286-5 REQ Type Parameters

Parameter	Description
`url`	The URL of the HTTP request. It is set after the request is created by `BEGIN_REQUEST`.
`method`	The method to be performed on the resource identified by the URL. It is set after the request is created by `BEGIN_REQUEST`.
`http_version`	The HTTP protocol version used to send the request. It is set after the request is created by `BEGIN_REQUEST`.

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

286.6.2 REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, UTL_HTTP allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

286.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
   status_code    PLS_INTEGER,
   reason_phrase  VARCHAR2(256),
   http_version   VARCHAR2(64));
```

Parameters

Table 286-6 RESP Type Parameters

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

286.6.4 COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
   name  VARCHAR2(256),
```

```
  value  VARCHAR2(1024),
  domain  VARCHAR2(256),
  expire  TIMESTAMP WITH TIME ZONE,
  path  VARCHAR2(1024),
  secure  BOOLEAN,
  version  PLS_INTEGER,
  comment  VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 286-7 shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

Table 286-7 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
`name`	The name of the HTTP cookie
`value`	The value of the cookie
`domain`	The domain for which the cookie is valid
`expire`	The time by which the cookie will expire
`path`	The subset of URLs to which the cookie applies
`secure`	Should the cookie be returned to the Web server using secured means only.
`version`	The version of the HTTP cookie specification the cookie conforms. This field is `NULL` for Netscape cookies.
`comment`	The comment that describes the intended use of the cookie. This field is `NULL` for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies".

286.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields

are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `SSL` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
   host  VARCHAR2(256),
   port  PLS_INTEGER,
   proxy_host  VARCHAR2(256),
   proxy_port  PLS_INTEGER,
   ssl  BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

286.7 UTL_HTTP Operations

These topics provide information about how `UTL_HTTP` makes HTTP requests from SQL and PL/SQL.

- Operational Flow
- Simple HTTP Fetches
- HTTP Requests
- HTTP Responses
- HTTP Persistent Connections
- Error Conditions
- Session Settings
- Request Context
- External Password Store

286.7.1 UTL_HTTP Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 286-1 Flow of the Core UTL_HTTP Package

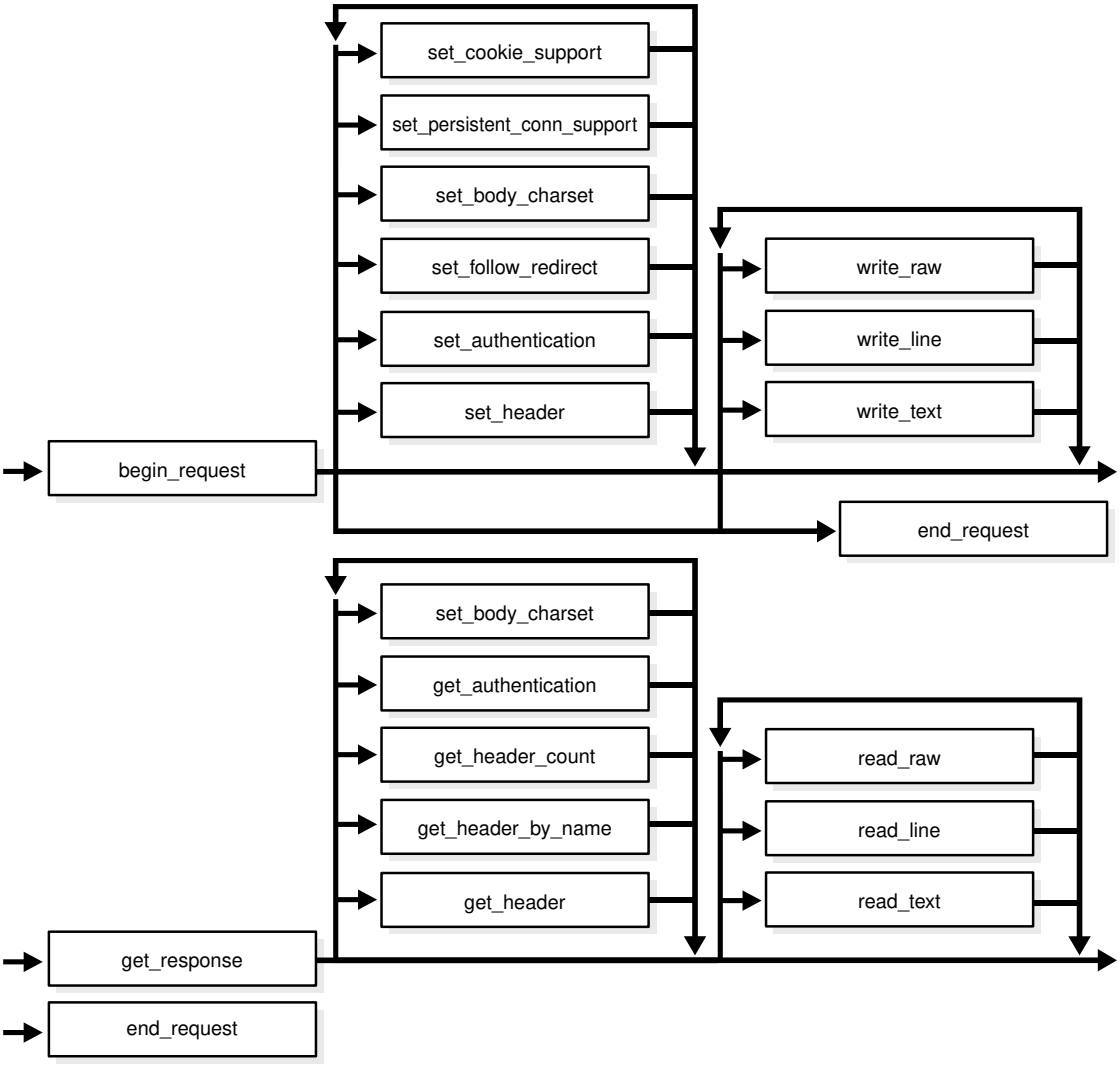

illustration: arpls006
release: 9
caption: The flow of the core UTL_HTTP Package API
date: 9/5/01
platform: pc

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET_COOKIE_COUNT
  - GET_COOKIES
  - ADD_COOKIES
  - CLEAR_COOKIES
- Persistent connections
  - GET_PERSISTENT_CONN_COUNT
  - GET_PERSISTENT_CONNS
  - CLOSE_PERSISTENT_CONN
  - CLOSE_PERSISTENT_CONNS
- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

> **Note:**
>
> Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

286.7.2 UTL_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

> **Note:**
>
> `UTL_HTTP` can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the `UTL_HTTP` package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

> **See Also:**
>
> Simple HTTP Fetches in a Single Call Subprograms

286.7.3 UTL_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-

connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

> **See Also:**
>
> HTTP Requests Subprograms

286.7.4 UTL_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

> **See Also:**
>
> HTTP Responses Subprograms

286.7.5 UTL_HTTP HTTP Cookies

The `UTL_HTTP` package provides subprograms to manipulate HTTP cookies.

> **See Also:**
>
> HTTP Cookies Subprograms

286.7.6 UTL_HTTP HTTP Persistent Connections

The `UTL_HTTP` package provides subprograms to manipulate persistent connections.

> **See Also:**
>
> HTTP Persistent Connections Subprograms

286.7.7 UTL_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

> **See Also:**
>
> Error Conditions Subprograms

286.7.8 UTL_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

> **See Also:**
>
> Session Settings Subprograms

286.7.9 UTL_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

> **See Also:**
>
> HTTP Requests Subprograms

286.7.10 UTL_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

> **See Also:**
>
> SET_AUTHENTICATION_FROM_WALLET Procedure

286.8 UTL_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms

286.8.1 UTL_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 286-8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

286.8.2 UTL_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

Table 286-9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests

Table 286-9 (Cont.) UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the `UTL_HTTP` package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the `UTL_HTTP` package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function
SET_PERSISTENT_CONN_SUPPORT Procedure	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

286.8.3 UTL_HTTP HTTP Requests Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Requests.

Table 286-10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function	Begins a new HTTP request.`UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

Table 286-10 (Cont.) UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`)
WRITE_RAW Procedure	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure	Writes some text data in the HTTP request body

286.8.4 UTL_HTTP HTTP Request Contexts Subprograms

`UTL_HTTP` HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the `UTL_HTTP` HTTP Request Contexts.

Table 286-11 UTL_HTTP Subprograms—HTTP Request Contexts

Subprogram	Description
CREATE_REQUEST_CONTEXT Function	Creates a request context in `UTL_HTTP` for a wallet and a cookie table
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in `UTL_HTTP`

286.8.5 UTL_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of `UTL_HTTP`.

Table 286-12 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure	Returns the n^{th} HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header

Table 286-12 (Cont.) UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header

286.8.6 UTL_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

Table 286-13 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure	Add the cookies either to a request context or to the `UTL_HTTP` package's session state
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state
GET_COOKIE_COUNT Function	Returns the number of cookies maintained either in a request context or in the `UTL_HTTP` package's session states
GET_COOKIES Function	Returns all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

286.8.7 UTL_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

Table 286-14 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session
CLOSE_PERSISTENT_CONNS Procedure	Closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session
GET_PERSISTENT_CONN_COUNT Function	Returns the number of network connections currently kept persistent by the `UTL_HTTP` package to the Web servers
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers

286.8.8 UTL_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of `UTL_HTTP` .

Table 286-15 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function	Retrieves the detailed SQLERRM of the last exception raised

286.9 Summary of UTL_HTTP Subprograms

This table lists the `UTL_HTTP` subprograms and briefly describes them.

Table 286-16 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure	Add the cookies either to a request context or to the `UTL_HTTP` package's session state	HTTP Cookies Subprograms
BEGIN_REQUEST Function	Begins a new HTTP request. `UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms
CLEAR_COOKIES Procedure	Clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state	HTTP Cookies Subprograms
CLOSE_PERSISTENT_CONN Procedure	Closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session	HTTP Persistent Connections Subprograms
CLOSE_PERSISTENT_CONNS Procedure	Closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session	HTTP Persistent Connections Subprograms
CREATE_REQUEST_CONTEXT Function	Creates a request context in `UTL_HTTP` for a wallet and a cookie table	HTTP Requests Subprograms
DESTROY_REQUEST_CONTEXT Procedure	Destroys a request context in `UTL_HTTP` for a wallet and a cookie table	HTTP Requests Subprograms
END_REQUEST Procedure	Ends the HTTP request	HTTP Requests Subprograms
END_RESPONSE Procedure	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms

Table 286-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_AUTHENTICATION Procedure	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms
GET_BODY_CHARSET Procedure	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms
GET_COOKIE_COUNT Function	Returns the number of cookies currently maintained by the `UTL_HTTP` package set by all Web servers	HTTP Cookies Subprograms
GET_COOKIE_SUPPORT Procedure	Retrieves the current cookie support settings	Session Settings Subprograms
GET_COOKIES Function	Returns all the cookies currently maintained by the `UTL_HTTP` package set by all Web servers	HTTP Cookies Subprograms
GET_DETAILED_EXCP_SUPPORT Procedure	Checks if the `UTL_HTTP` package will raise a detailed exception or not	Session Settings Subprograms
GET_DETAILED_SQLCODE Function	Retrieves the detailed `SQLCODE` of the last exception raised	Error Conditions Subprograms
GET_DETAILED_SQLERRM Function	Retrieves the detailed `SQLERRM` of the last exception raised	Error Conditions Subprograms
GET_FOLLOW_REDIRECT Procedure	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms
GET_HEADER Procedure	Returns the n^{th} HTTP response header name and value returned in the response	HTTP Responses Subprograms
GET_HEADER_BY_NAME Procedure	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms
GET_HEADER_COUNT Function	Returns the number of HTTP response headers returned in the response	HTTP Responses and HTTP Responses Subprograms
GET_PERSISTENT_CONN_COUNT Function	Returns the number of network connections currently kept persistent by the `UTL_HTTP` package to the Web servers	HTTP Persistent Connections Subprograms
GET_HEADER_COUNT Function	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms

Table 286-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_PERSISTENT_CONN_SUPPORT Procedure	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms)	HTTP Persistent Connections Subprograms
GET_PERSISTENT_CONNS Procedure	Returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers	HTTP Persistent Connections Subprograms
GET_PROXY Procedure	Retrieves the current proxy settings	Session Settings Subprograms
GET_RESPONSE Function	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms
GET_RESPONSE_ERROR_CHECK Procedure	Checks if the response error check is set or no	Session Settings Subprograms
GET_TRANSFER_TIMEOUT Procedure	Retrieves the current network transfer timeout value	Session Settings Subprograms
READ_LINE Procedure	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
READ_RAW Procedure	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
READ_TEXT Procedure	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms
REQUEST Function	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms
REQUEST_PIECES Function	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms
SET_AUTHENTICATION Procedure	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms
SET_AUTHENTICATION_FROM_WALLET Procedure	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	HTTP Requests Subprograms

Table 286-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_BODY_CHARSET Procedures	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header	Session Settings Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header	HTTP Requests Subprograms
SET_BODY_CHARSET Procedures	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header	HTTP Responses Subprograms and Session Settings Subprograms
SET_COOKIE_SUPPORT Procedures	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms
SET_DETAILED_EXCP_SUPPORT Procedure	Sets the `UTL_HTTP` package to raise a detailed exception	Session Settings Subprograms
SET_FOLLOW_REDIRECT Procedures	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the `GET_RESPONSE` function	HTTP Requests Subprograms
SET_HEADER Procedure	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function	Session Settings Subprograms
SET_HEADER Procedure	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms
SET_PERSISTENT_CONN_SUPPORT Procedure	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms
SET_PROXY Procedure	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings and Session Settings Subprograms
SET_RESPONSE_ERROR_CHECK Procedure	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error —a status code in the 4xx or 5xx ranges	Session Settings Subprograms

Table 286-16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_TRANSFER_TIMEOUT Procedure	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings and Session Settings Subprograms
SET_WALLET Procedure	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms
WRITE_LINE Procedure	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms
WRITE_RAW Procedure	Writes some binary data in the HTTP request body	HTTP Requests Subprograms
WRITE_TEXT Procedure	Writes some text data in the HTTP request body	HTTP Requests Subprograms

286.9.1 ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.ADD_COOKIES (
   cookies          IN  cookie_table,
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 286-17 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

286.9.2 BEGIN_REQUEST Function

This function begins a new HTTP request. `UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
   url               IN  VARCHAR2,
   method            IN  VARCHAR2 DEFAULT 'GET',
   http_version      IN  VARCHAR2 DEFAULT NULL,
   request_context   IN  request_context_key DEFAULT NULL,
   https_host        IN  VARCHAR2 DEFAULT NULL)
RETURN req;
```

Parameters

Table 286-18 BEGIN_REQUEST Function Parameters

Parameter	Description
`url`	The URL of the HTTP request
`method`	The method performed on the resource identified by the URL
`http_version`	The HTTP protocol version that sends the request. The format of the protocol version is `HTTP/major-version.minor-version`, where `major-version` and `minor-version` are positive numbers. If this parameter is set to `NULL`, `UTL_HTTP` uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is `NULL`.
`request_context`	Request context that holds the private wallet and the cookie table to use in this `HTTP` request. If this parameter is `NULL`, the wallet and cookie table shared in the current database session will be used instead.
`https_host`	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See UTL_URL for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the GET_RESPONSE Function will raise the `PROTOCOL_ERROR` exception.

  A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      =>  req,
                     name   =>  'Content-Type',
                     value  =>  'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      =>   req,
                     name   =>   'Content-Length',
                     value  =>'  <length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      =>   req,
                     data   =>   'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
                     (r     =>   req);
...
```

  The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.
- An Oracle wallet must be set before accessing Web servers over HTTPS. See the SET_WALLET Procedure procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

286.9.3 CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.CLEAR_COOKIES (
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 286-19 CLEAR_COOKIES Procedure Parameters

Parameter	Description
request_context	Request context to clear the cookies. If NULL, the cookies maintained in the UTL_HTTP package's session state will be cleared instead.

286.9.4 CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
   conn  IN connection);
```

Parameters

Table 286-20 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
conn	The HTTP persistent connection to close

286.9.5 CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 286-21 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`host`	The host for which persistent connections are to be closed
`port`	The port number for which persistent connections are to be closed
`proxy_host`	The proxy host for which persistent connections are to be closed
`proxy_port`	The proxy port for which persistent connections are to be closed
`ssl`	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

286.9.6 CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet

and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

> **See Also:**
>
> Request Context and HTTP Request Contexts Subprograms

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path          IN VARCHAR2 DEFAULT NULL,
 wallet_password      IN VARCHAR2 DEFAULT NULL,
 enable_cookies       IN BOOLEAN  DEFAULT TRUE,
 max_cookies          IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

Parameters

Table 286-22 CREATE_REQUEST_CONTEXT Function Parameters

Parameter	Description
`wallet_path`	Directory path that contains the Oracle wallet. The format is `file:`*`directory-path`*
`wallet_password`	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to `NULL`. See the *Oracle Database Enterprise User Security Administrator's Guide* for detailed information about wallets.
`enable_cookies`	Sets whether HTTP requests using this request context should support HTTP cookies or not: `TRUE` to enable the support, `FALSE` to disable it.
`max_cookies`	Sets the maximum total number of cookies that will be maintained in this request context
`max_cookies_per_site`	Sets the maximum number of cookies per each Web site that will be maintained in this request context

Return Values

The request context created.

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
  req              utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
       wallet_path          => 'file:/oracle/wallets/test_wallets',
       wallet_password      => NULL,
       enable_cookies       => TRUE,
       max_cookies          => 300,
       max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
       url                  => 'http://www.example.com/',
       request_context      => request_context);
END;
```

286.9.7 DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in `UTL_HTTP`. A request context cannot be destroyed when it is in use by a HTTP request or response.

> **See Also:**
>
> Request Context and HTTP Request Contexts Subprograms

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
   request_context    request_context_key);
```

Parameters

Table 286-23 DESTROY_REQUEST_CONTEXT Procedure Parameters

Parameter	Description
request_context	Request context to destroy

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(…);
  …
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

286.9.8 END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.END_REQUEST (
   r  IN OUT NOCOPY req);
```

Parameters

Table 286-24 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

286.9.9 END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.END_RESPONSE (
   r  IN OUT NOCOPY resp);
```

Parameters

Table 286-25 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

286.9.10 GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
   r          IN OUT NOCOPY resp,
   scheme     OUT VARCHAR2,
   realm      OUT VARCHAR2,
   for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 286-26 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

286.9.11 GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
   charset  OUT NOCOPY VARCHAR2);
```

Parameters

Table 286-27 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
charset	The default character set of the body of all future HTTP requests

286.9.12 GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
   request_context  IN  request_context_key DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 286-28 GET_COOKIE_COUNT Function Parameters

Parameter	Description
`request_context`	Request context to return the cookie count for. If `NULL`, the cookie count maintained in the `UTL_HTTP` package's session state will be returned instead.

286.9.13 GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
   enable                OUT BOOLEAN,
   max_cookies           OUT PLS_INTEGER,
   max_cookies_per_site  OUT PLS_INTEGER);
```

Parameters

Table 286-29 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`enable`	Indicates whether future HTTP requests should support HTTP cookies (`TRUE`) or not (`FALSE`)
`max_cookies`	Indicates the maximum total number of cookies maintained in the current session

Table 286-29 (Cont.) GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

286.9.14 GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:**
>
> HTTP Cookies and HTTP Cookies Subprograms

Syntax

```
UTL_HTTP.GET_COOKIES (
   cookies          IN  OUT NOCOPY cookie_table,
   request_context  IN             request_context_key DEFAULT NULL);
```

Parameters

Table 286-30 GET_COOKIES Function Parameters

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

286.9.15 GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable  OUT BOOLEAN);
```

Parameters

Table 286-31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

286.9.16 GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

> **See Also:**
>
> Error Conditions andError Conditions Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

286.9.17 GET_DETAILED_SQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

> **See Also:**
>
> Error Conditions and Error Conditions Subprograms

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

286.9.18 GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
   max_redirects  OUT PLS_INTEGER);
```

Parameters

Table 286-32 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

286.9.19 GET_HEADER Procedure

This procedure returns the nth HTTP response header name and value returned in the response.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER (
   r      IN OUT NOCOPY resp,
   n      IN PLS_INTEGER,
   name   OUT NOCOPY VARCHAR2,
   value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 286-33 GET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP response
n	The nth header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

286.9.20 GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 286-34 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

286.9.21 GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
   r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

Table 286-35 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

286.9.22 GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

286.9.23 GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

Table 286-36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` if persistent connection support is enabled; otherwise `FALSE`
`max_conns`	the maximum number of persistent connections maintained in the current session

286.9.24 GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers.

> **See Also:**
>
> HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.get_persistent_conns (
   connections  IN OUT NOCOPY connection_table);
```

Parameters

Table 286-37 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`connections`	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

286.9.25 GET_PROXY Procedure

This procedure retrieves the current proxy settings.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_PROXY (
   proxy             OUT NOCOPY VARCHAR2,
   no_proxy_domains  OUT NOCOPY VARCHAR2);
```

Parameters

Table 286-38 GET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) currently used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy is used for all requests

286.9.26 GET_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_RESPONSE (
   r                      IN OUT NOCOPY req,
   return_info_response   IN BOOLEAN DEFAULT FALSE)
RETURN resp;
```

Parameters

Table 286-39 GET_RESPONSE Function Parameters

Parameter	Description
`r`	The HTTP response

Table 286-39 (Cont.) GET_RESPONSE Function Parameters

Parameter	Description
return_info_response	Return 100 informational response or not. • TRUE means get_response should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned. • FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.

Exceptions

- When detailed-exception is disabled:

  ORA-29273 REQUEST_FAILED - the request fails to execute. Use the GET_DETAILED_EXCP_SUPPORT Procedure and the GET_DETAILED_SQLERRM Function to get the detailed error message.

- When detailed-exception is enabled:

  ORA-29261 BAD_ARGUMENT - some arguments passed are not valid

- When response error check is enabled:

  ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range

  ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the END_REQUEST Procedure.
- If URL redirection occurs, the URL and method fields in the req record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to GET_RESPONSE to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to GET_RESPONSE to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional EXPECT: 100-CONTINUE request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```
DECLARE
 data  VARCHAR2(1024) := '...';
 req   utl_http.req;
 resp  utl_http.resp;
BEGIN
```

```
 req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
 utl_http.set_header(req, 'Content-Length', length(data));
 -- Ask HTTP server to return "100 Continue" response
 utl_http.set_header(req, 'Expect', '100-continue');
 resp := utl_http.get_response(req, TRUE);

 -- Check for and dispose "100 Continue" response
 IF (resp.status_code <> 100) THEN
   utl_http.end_response(resp);
   raise_application_error(20000, 'Request rejected');
 END IF;
 utl_http.end_response(resp);

 -- Now, send the request body
 utl_http.write_text(req, data);

 -- Get the regular response
 resp := utl_http.get_response(req);
 utl_http.read_text(resp, data);

 utl_http.end_response(resp);

END;
```

286.9.27 GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
   enable  OUT BOOLEAN);
```

Parameters

Table 286-40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

286.9.28 GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

> **See Also:**
>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
   timeout  OUT PLS_INTEGER);
```

Parameters

Table 286-41 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

286.9.29 READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_LINE(
   r            IN OUT NOCOPY resp,
   data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
   remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 286-42 READ_LINE Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in text form
remove_crlf	Removes the newline characters if set to `TRUE`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns

all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

286.9.30 READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_RAW(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY RAW,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 286-43 READ_RAW Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in binary form
`len`	The number of bytes of data to read. If `len` is `NULL`, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is `NULL`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

286.9.31 READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:**
>
> HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_TEXT(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 286-44 READ_TEXT Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`len`	The maximum number of characters of data to read. If `len` is NULL, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "`ORA-01482: unsupported character set`" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

286.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:**
>
> Simple HTTP Fetches and Simple HTTP Fetches in a Single Call Subprograms

Syntax

```
UTL_HTTP.REQUEST (
   url              IN VARCHAR2,
   proxy            IN VARCHAR2 DEFAULT NULL,
   wallet_path      IN VARCHAR2 DEFAULT NULL,
   wallet_password  IN VARCHAR2 DEFAULT NULL,
   https_host       IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 286-45 REQUEST Function Parameters

Parameter	Description
`url`	Uniform resource locator
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of `wallet_path` on a PC is, for example, file:`c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets` When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet
`https_host`	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
```

```
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM DUAL;
```

286.9.33 REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:**
>
> Simple HTTP Fetches and Simple HTTP Fetches in a Single Call Subprograms

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
   url             IN VARCHAR2,
   max_pieces      IN NATURAL DEFAULT 32767,
   proxy           IN VARCHAR2 DEFAULT NULL,
   wallet_path     IN VARCHAR2 DEFAULT NULL,
   wallet_password IN VARCHAR2 DEFAULT NULL,
   https_host      IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 286-46 REQUEST_PIECES Function Parameters

Parameter	Description
`url`	Uniform resource locator
`max_pieces`	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that `REQUEST_PIECES` should return. If provided, then that argument should be a positive integer.
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, `file:c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets`. When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet
`https_host`	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

Return Values

`REQUEST_PIECES` returns a PL/SQL table of type `UTL_HTTP.HTML_PIECES`. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by `REQUEST_PIECES` are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the `UTL_URL` package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
   x   UTL_HTTP.HTML_PIECES;
   len PLS_INTEGER;
BEGIN
   x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
   DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
   DBMS_OUTPUT.PUT_LINE('with total length ');
   IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
  ELSE
   len := 0;
   FOR i in 1..x.count LOOP
      len := len + length(x(i));
   END LOOP;
   DBMS_OUTPUT.PUT_LINE(len);
  END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

286.9.34 SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

> **See Also:**
>
> HTTP Requests and HTTP Requests Subprograms

UTL_HTTP Authentication Scheme

The following is the challenge and response work flow:

1. Client sends a HTTP request to the server.
2. The server responds to the client with a 401 (Unauthorized) response status. It also provides information on how to authorize using a WWW-Authenticate response header that contains at least one authentication scheme challenge.

   > **Note:**
   >
   > When server responds with multiple challenges, it will be in the order of preference, starting with the most preferred algorithm followed by the less preferred algorithm.

3. Client authenticates itself with the server by issuing the request that includes an Authorization request header along with the credentials build by using the values from challenge headers, such as algorithm, realm, and nonce.

   > **Note:**
   >
   > UTL_HTTP supports digest SHA-256 algorithm.

Digest Authentication

An authentication scheme is set in the HTTP request header that is authorized by the Web server using the UTL_HTTP.SET_AUTHENTICATION call. Digest is one of the authentication schemes that UTL_HTTP supports. The other authentication schemes are basic, AWS,AWS4, BMC, and AZURE.

The following is the UTL_HTTP request and response flow using the digest authentication scheme:

1. UTL_HTTP.BEGIN_REQUEST- This function sends an HTTP request to the Web server.
2. UTL_HTTP.SET_AUTHENTICATION- This function sets authentication information in the HTTP request header
3. ULT_HTTP.GET_RESPONSE- This function gets the response from the Web server
   a. Server replies “401 Unauthorized” along with the challenge headers.

b. Build digests credentials with values from the challenge headers using the SHA 256 algorithm.

c. Resend request includes an authorization request header with the digest credentials.

d. Server processes request and replies (typically 200-OK).

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
   r         IN OUT NOCOPY req,
   username  IN VARCHAR2,
   password  IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 286-47 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	HTTP request
`username`	Username for the HTTP authentication
`password`	Password for the HTTP authentication
`scheme`	HTTP authentication scheme. Either `Basic` for the HTTP basic or `AWS` for Amazon S3 authentication scheme. Default is basic.
`for_proxy`	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is `FALSE`.

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

286.9.35 SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

> **See Also:**
>
> External Password Store on , and HTTP Requests Subprograms

Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
   r         IN OUT NOCOPY req,
   alias     IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 286-48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
r	The HTTP request
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl         => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
      acl          => 'wallet-acl.xml',
      wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req  UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(…);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  …
END;
```

286.9.36 SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

> **See Also:**
>

> - Session Settings and Session Settings Subprograms

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "`ISO-8859-1`". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY req,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY resp,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 286-49 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
r	The HTTP response.
charset	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.

286.9.37 SET_COOKIE_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

> **See Also:**
>
> - HTTP Requests andHTTP Requests Subprograms
> - Session Settings and Session Settings Subprograms

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
   r       IN OUT NOCOPY REQ,
   enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
   enable       IN BOOLEAN,
   max_cookies  IN PLS_INTEGER DEFAULT 300,
   max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 286-50 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session
max_cookies_per_site	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

286.9.38 SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLEERM` for more detailed information about the error.

>
> Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 286-51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
`enable`	Asks `UTL_HTTP` to raise a detailed exception directly if set to `TRUE`; otherwise `FALSE`

286.9.39 SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the `GET_RESPONSE` function.

> **See Also:**
>
> - HTTP Requests and HTTP Requests Subprograms
> - Session Settings and Session Settings Subprograms

Syntax

Use this procedure to set the maximum number of redirections:

```
