| Column                 | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                 |
|------------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONNECTION_POOL        | VARCHAR2 (128) |      | Name of the connection pool                                                                                                                                                                                                                                                                                                 |
| STATUS                 | VARCHAR2 (16)  |      | Status of the pool: <ul style="list-style-type: none"><li>• ACTIVE</li><li>• INACTIVE</li></ul>                                                                                                                                                                                                                             |
| MINSIZE                | NUMBER         |      | Minimum number of pooled servers that are always running in the pool                                                                                                                                                                                                                                                        |
| MAXSIZE                | NUMBER         |      | Maximum number of pooled servers in the pool                                                                                                                                                                                                                                                                                |
| INCRSIZE               | NUMBER         |      | Number of pooled servers by which the pool is incremented if servers are unavailable when a client application request is received                                                                                                                                                                                          |
| SESSION_CACHED_CURSORS | NUMBER         |      | Number of session cursors to cache in each pooled server                                                                                                                                                                                                                                                                    |
| INACTIVITY_TIMEOUT     | NUMBER         |      | Maximum time (in seconds) that the pooled server can stay idle in the pool. After this time, the server is terminated.                                                                                                                                                                                                      |
| MAX_THINK_TIME         | NUMBER         |      | Maximum time of inactivity (in seconds) for a client after obtaining a pooled server from the pool. After obtaining a pooled server from the pool, if the client application does not issue a database call for the time specified by this column, then the pooled server is freed and the client connection is terminated. |
| MAX_USE_SESSION        | NUMBER         |      | Number of times a pooled server can be taken and released to the pool                                                                                                                                                                                                                                                       |
| MAX_LIFETIME_SESSION   | NUMBER         |      | Time (in seconds) for a pooled server to live in the pool                                                                                                                                                                                                                                                                   |
| NUM_CBROK              | NUMBER         |      | Number of connection brokers spawned per instance                                                                                                                                                                                                                                                                           |
| MAXCONN_CBROK          | NUMBER         |      | Maximum number of connections per connection broker                                                                                                                                                                                                                                                                         |

| Column             | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_TXN_THINK_TIME | NUMBER   |      | Maximum time of inactivity (in seconds) for a client after it obtains a pooled server from the pool and starts a transaction. If the client application does not issue a database call for the time specified by MAX_TXN_THINK_TIME while in a transaction, the pooled server is freed, the transaction is rolled back, and the client connection is terminated. The default value is 0, which means MAX_THINK_TIME applies for all connections, irrespective of transactions being open or not in those connections. Care should be taken while setting the two parameters MAX_THINK_TIME and MAX_TXN_THINK_TIME to higher values, as it would mean the servers are not released to the pool for a longer time, even if clients are not responding for any reason, thereby making other users wait unnecessarily. |
| CON_ID             | NUMBER   |      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                   |

## 5.263 DBA\_CPU\_USAGE\_STATISTICS

DBA\_CPU\_USAGE\_STATISTICS displays database CPU usage statistics.

| Column           | Datatype      | NULL     | Description                         |
|------------------|---------------|----------|-------------------------------------|
| DBID             | NUMBER        | NOT NULL | Database ID                         |
| VERSION          | VARCHAR2 (17) | NOT NULL | Database version                    |
| TIMESTAMP        | DATE          | NOT NULL | Time at which the CPU usage changed |
| CPU_COUNT        | NUMBER        |          | CPU count of the database           |
| CPU_CORE_COUNT   | NUMBER        |          | CPU core count of the database      |
| CPU_SOCKET_COUNT | NUMBER        |          | CPU socket count of the database    |

## 5.264 DBA\_CQ\_NOTIFICATION\_QUERIES

DBA\_CQ\_NOTIFICATION\_QUERIES describes the registered queries for all CQ notifications in the database.

### Related View

USER\_CQ\_NOTIFICATION\_QUERIES describes the registered queries for the CQ notifications owned by the current user. This view does not display the USERNAME column.

| Column    | Datatype      | NULL | Description                                       |
|-----------|---------------|------|---------------------------------------------------|
| QUERYID   | NUMBER        |      | ID of the query                                   |
| QUERYTEXT | CLOB          |      | Text of the query                                 |
| REGID     | NUMBER        |      | Registration ID that the query is registered with |
| USERNAME  | VARCHAR2 (31) |      | Name of the user who registered the query         |

### See Also:

"USER\_CQ\_NOTIFICATION\_QUERIES"

## 5.265 DBA\_CREDENTIALS

DBA\_CREDENTIALS lists all credentials in the database. Its columns are the same as those in ALL\_CREDENTIALS.

### See Also:

"ALL\_CREDENTIALS"

## 5.266 DBA\_CUBE\_ATTR\_VISIBILITY

DBA\_CUBE\_ATTR\_VISIBILITY describes all OLAP attributes visible for the dimensions, hierarchies, and levels in the database. Its columns are the same as those in ALL\_CUBE\_ATTR\_VISIBILITY.

### See Also:

"ALL\_CUBE\_ATTR\_VISIBILITY"

## 5.267 DBA\_CUBE\_ATTRIBUTES

DBA\_CUBE\_ATTRIBUTES describes the attributes for all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_ATTRIBUTES.

**See Also:**

["ALL\\_CUBE\\_ATTRIBUTES"](#)

## 5.268 DBA\_CUBE\_BUILD\_PROCESSES

DBA\_CUBE\_BUILD\_PROCESSES describes all OLAP build processes and maintenance scripts in the database. Its columns are the same as those in ALL\_CUBE\_BUILD\_PROCESSES.

**See Also:**

["ALL\\_CUBE\\_BUILD\\_PROCESSES"](#)

## 5.269 DBA\_CUBE\_CALCULATED\_MEMBERS

DBA\_CUBE\_CALCULATED\_MEMBERS describes the calculated members for all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_CALCULATED\_MEMBERS.

**See Also:**

["ALL\\_CUBE\\_CALCULATED\\_MEMBERS"](#)

## 5.270 DBA\_CUBE\_DIM\_LEVELS

DBA\_CUBE\_DIM\_LEVELS describes all OLAP dimension levels in the database. Its columns are the same as those in ALL\_CUBE\_DIM\_LEVELS.

**See Also:**

["ALL\\_CUBE\\_DIM\\_LEVELS"](#)

## 5.271 DBA\_CUBE\_DIM\_MODELS

DBA\_CUBE\_DIM\_MODELS describes the models for all OLAP dimensions in the database. Its columns are the same as those in ALL\_CUBE\_DIM\_MODELS.

**See Also:**

["ALL\\_CUBE\\_DIM\\_MODELS"](#)

## 5.272 DBA\_CUBE\_DIM\_VIEW\_COLUMNS

DBA\_CUBE\_DIM\_VIEW\_COLUMNS describes the columns of the relational views of all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_DIM\_VIEW\_COLUMNS.

**See Also:**

["ALL\\_CUBE\\_DIM\\_VIEW\\_COLUMNS"](#)

## 5.273 DBA\_CUBE\_DIM\_VIEWS

DBA\_CUBE\_DIM\_VIEWS describes the relational views of all OLAP dimensions in the database. Its columns are the same as those in ALL\_CUBE\_DIM\_VIEWS.

**See Also:**

["ALL\\_CUBE\\_DIM\\_VIEWS"](#)

## 5.274 DBA\_CUBE\_DIMENSIONALITY

DBA\_CUBE\_DIMENSIONALITY describes the dimension order for all OLAP cubes in the database. Its columns are the same as those in ALL\_CUBE\_DIMENSIONALITY.

**See Also:**

["ALL\\_CUBE\\_DIMENSIONALITY"](#)

## 5.275 DBA\_CUBE\_DIMENSIONS

DBA\_CUBE\_DIMENSIONS describes all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_DIMENSIONS.

**See Also:**

["ALL\\_CUBE\\_DIMENSIONS"](#)

## 5.276 DBA\_CUBE\_HIER\_LEVELS

DBA\_CUBE\_HIER\_LEVELS describes the hierarchy levels for all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_HIER\_LEVELS.

**See Also:**

["ALL\\_CUBE\\_HIER\\_LEVELS"](#)

## 5.277 DBA\_CUBE\_HIER\_VIEW\_COLUMNS

DBA\_CUBE\_HIER\_VIEW\_COLUMNS describes the columns of the relational hierarchy views of all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_HIER\_VIEW\_COLUMNS.

**See Also:**

["ALL\\_CUBE\\_HIER\\_VIEW\\_COLUMNS"](#)

## 5.278 DBA\_CUBE\_HIER\_VIEWS

DBA\_CUBE\_HIER\_VIEWS describes the hierarchies for all OLAP cube dimensions in the database. Its columns are the same as those in ALL\_CUBE\_HIER\_VIEWS.

**See Also:**

["ALL\\_CUBE\\_HIER\\_VIEWS"](#)

## 5.279 DBA\_CUBE\_HIERARCHIES

DBA\_CUBE\_HIERARCHIES describes all OLAP dimension hierarchies in the database. Its columns are the same as those in ALL\_CUBE\_HIERARCHIES.

See Also:

"ALL\_CUBE\_HIERARCHIES"

## 5.280 DBA\_CUBE\_MEASURES

DBA\_CUBE\_MEASURES describes the measures for all OLAP cubes in the database. Its columns are the same as those in ALL\_CUBE\_MEASURES.

See Also:

"ALL\_CUBE\_MEASURES"

## 5.281 DBA\_CUBE\_NAMED\_BUILD\_SPECS

DBA\_CUBE\_NAMED\_BUILD\_SPECS describes the OLAP cube named build specifications in the database. Its columns are the same as those in ALL\_CUBE\_NAMED\_BUILD\_SPECS.

See Also:

"ALL\_CUBE\_NAMED\_BUILD\_SPECS"

## 5.282 DBA\_CUBE\_SUB\_PARTITION\_LEVELS

DBA\_CUBE\_SUB\_PARTITION\_LEVELS describes the OLAP secondary partition levels in the database. Its columns are the same as those in ALL\_CUBE\_SUB\_PARTITION\_LEVELS.

See Also:

"ALL\_CUBE\_SUB\_PARTITION\_LEVELS"

## 5.283 DBA\_CUBE\_VIEW\_COLUMNS

DBA\_CUBE\_VIEW\_COLUMNS describes the columns of relational views of all OLAP cubes in the database. Its columns are the same as those in ALL\_CUBE\_VIEW\_COLUMNS.

### See Also:

"ALL\_CUBE\_VIEW\_COLUMNS"

## 5.284 DBA\_CUBE\_VIEWS

DBA\_CUBE\_VIEWS describes the relational views of all OLAP cubes in the database. Its columns are the same as those in ALL\_CUBE\_VIEWS.

### See Also:

"ALL\_CUBE\_VIEWS"

## 5.285 DBA\_CUBES

DBA\_CUBES describes all OLAP cubes in the database. Its columns are the same as those in ALL\_CUBES.

### See Also:

"ALL\_CUBES"

## 5.286 DBA\_DATA\_FILES

DBA\_DATA\_FILES describes database files.

### Note:

When you query the DBA\_DATA\_FILES data dictionary view, Oracle must have access to all tablespaces and their data files if the requested information is not already available in the dictionary. If the tablespaces are encrypted, then you must open the Oracle wallet (keystore) before you can query DBA\_DATA\_FILES. You can use the ADMINISTER KEY MANAGEMENT SET KEYSTORE OPEN statement to open the keystore.

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 5.287 DBA\_DATAPUMP\_JOBS

DBA\_DATAPUMP\_JOBS identifies all active Data Pump jobs in the database, regardless of their state, on an instance (or on all instances for Real Application Clusters). It also show all Data Pump control job tables not currently associated with an active job.

### Related View

USER\_DATAPUMP\_JOBS displays the Data Pump jobs owned by the current user. This view does not display the OWNER\_NAME column.

| Column            | Datatype       | NULL | Description                                                                  |
|-------------------|----------------|------|------------------------------------------------------------------------------|
| OWNER_NAME        | VARCHAR2 (128) |      | User that initiated the job                                                  |
| JOB_NAME          | VARCHAR2 (128) |      | User-supplied name for the job (or the default name generated by the server) |
| OPERATION         | VARCHAR2 (128) |      | Type of job                                                                  |
| JOB_MODE          | VARCHAR2 (128) |      | Mode of job                                                                  |
| STATE             | VARCHAR2 (128) |      | Current job state                                                            |
| DEGREE            | NUMBER         |      | Number of worker processes performing the operation                          |
| ATTACHED_SESSIONS | NUMBER         |      | Number of sessions attached to the job                                       |
| DATAPUMP_SESSIONS | NUMBER         |      | Number of Data Pump sessions participating in the job                        |

## 5.288 DBA\_DATAPUMP\_SESSIONS

DBA\_DATAPUMP\_SESSIONS identifies the user sessions that are attached to a Data Pump job. The information in this view is useful for determining why a stopped Data Pump operation has not gone away.

| Column     | Datatype       | NULL | Description                 |
|------------|----------------|------|-----------------------------|
| OWNER_NAME | VARCHAR2 (128) |      | User that initiated the job |

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_NAME     | VARCHAR2 (128) |      | User-supplied name for the job (or the default name generated by the server)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INSTANCE_ID  | NUMBER         |      | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SADDR        | RAW (4   8)    |      | Address of the session attached to the job. Can be used with V\$SESSION view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SESSION_TYPE | VARCHAR2 (14)  |      | Data Pump session type: <ul style="list-style-type: none"> <li>• DBMS_DATAPUMP - Data Pump interface process (one for each active instantiation of DBMS_DATAPUMP.OPEN and DBMS_DATAPUMP.ATTACH per job.)</li> <li>• MASTER - Data Pump control job process (one per job)</li> <li>• WORKER - worker process (1 to <i>n</i> per job, depending on degree of parallelism)</li> <li>• EXTERNAL TABLE - external table data access process (1 to <i>n</i>, depending on degree of parallelism, for jobs that use external tables as the data access method for some tables)</li> <li>• OTHER</li> </ul> |

## 5.289 DBA\_DB\_LINK\_SOURCES

DBA\_DB\_LINK\_SOURCES identifies all unique source databases that opened database links to the local database.

By default, only a DBA has access to this view. However, a DBA can grant access to this view to others.

This view is based on a persistent table that resides in the same system tablespace that is used by Database Auditing.

In a multitenant container database (CDB) environment, for every DBA\_ view, there is a corresponding CDB\_ view that contains data for all the pluggable databases (PDBs) in the CDB. A query on the CDB\_DB\_LINK\_SOURCES view done in the CDB\$ROOT container will show sources of all the database links recorded in all PDBs. A query on the corresponding DBA\_DB\_LINK\_SOURCES view done in a PDB show information corresponding to that PDB only (that is, where that specific PDB was the target of an inbound database link).

Note that the CDB\_ views would only show data from PDBs that are open at the time the query is issued. Therefore, when you are diagnosing sources of database links, Oracle recommends that you keep open any or all PDBs that might contain useful information for the diagnosis.

| Column    | Datatype | NULL     | Description                                         |
|-----------|----------|----------|-----------------------------------------------------|
| SOURCE_ID | NUMBER   | NOT NULL | Unique ID that identifies an incoming database link |

| Column           | Datatype       | NULL     | Description                                                                                                                                                                    |
|------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_NAME          | VARCHAR2 (256) | NOT NULL | Global name of the source database                                                                                                                                             |
| DBID             | NUMBER         | NOT NULL | Database identifier of the source database. Maps to the DBID of the source database in V\$DATABASE.                                                                            |
| DB_UNIQUE_NAME   | VARCHAR2 (256) |          | Unique database name of the source database. Maps to the DB_UNIQUE_NAME of the source database in V\$DATABASE. Null for source databases that do not provide this information. |
| HOST_NAME        | VARCHAR2 (256) |          | Resolved host name. Null if not available.                                                                                                                                     |
| IP_ADDRESS       | VARCHAR2 (128) |          | IP address of source machine. Null if not available.                                                                                                                           |
| PROTOCOL         | VARCHAR2 (64)  |          | One of supported protocols such as ipc, sdp, tcp, or tcps. Null if not available.                                                                                              |
| USERNAME         | VARCHAR2 (128) | NOT NULL | Oracle username of the user who logged into the local database. Maps to the USERNAME column in V\$SESSION.                                                                     |
| USER#            | NUMBER         | NOT NULL | Oracle user id of the user who logged into the local database. Maps to the USER# column in V\$SESSION.                                                                         |
| FIRST_LOGON_TIME | TIMESTAMP (6)  | NOT NULL | The timestamp of the first connection on this database link in UTC                                                                                                             |
| LAST_LOGON_TIME  | TIMESTAMP (6)  |          | The timestamp of the last connection on this database link in UTC                                                                                                              |
| LOGON_COUNT      | NUMBER         |          | Number of times connection has been established through this database link                                                                                                     |

**See Also:**

- "V\$DATABASE"
- "V\$SESSION"
- "DBA\_EXTERNAL\_SCN\_ACTIVITY"
- "DBA\_DB\_LINKS"

## 5.290 DBA\_DB\_LINKS

DBA\_DB\_LINKS describes all database links in the database. Its columns are the same as those in ALL\_DB\_LINKS.

**See Also:**

- "ALL\_DB\_LINKS"
- "DBA\_DB\_LINK\_SOURCES"
- "DBA\_EXTERNAL\_SCN\_ACTIVITY"

## 5.291 DBA\_DBFS\_HS

DBA\_DBFS\_HS shows all Database File System (DBFS) hierarchical stores.

### Related View

USER\_DBFS\_HS shows all Database File System hierarchical stores owned by the current user. This view does not display the STOREOWNER column.

| Column     | Datatype       | NULL | Description    |
|------------|----------------|------|----------------|
| STORENAME  | VARCHAR2 (256) |      | Name of store  |
| STOREOWNER | VARCHAR2 (64)  |      | Owner of store |

**See Also:**

"USER\_DBFS\_HS"

## 5.292 DBA\_DBFS\_HS\_COMMANDS

DBA\_DBFS\_HS\_COMMANDS shows all the registered store commands for all Database File System (DBFS) hierarchical stores.

### Related View

USER\_DBFS\_HS\_COMMANDS shows all the registered store commands for all DBFS hierarchical stores owned by current user. This view does not display the STOREOWNER column.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                   |
|--------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STORENAME    | VARCHAR2 (256) |      | Name of store                                                                                                                                                                                                 |
| STOREOWNER   | VARCHAR2 (64)  |      | Owner of store                                                                                                                                                                                                |
| STORECOMMAND | VARCHAR2 (512) |      | Store command                                                                                                                                                                                                 |
| STOREFLAGS   | NUMBER         |      | Valid values are: <ul style="list-style-type: none"><li>• 1 - Indicates that the command is sent to the device before put</li><li>• 2 - Indicates that the command is sent to the device before get</li></ul> |

**See Also:**

"USER\_DBFS\_HS\_COMMANDS"

## 5.293 DBA\_DBFS\_HS\_FIXED\_PROPERTIES

DBA\_DBFS\_HS\_FIXED\_PROPERTIES shows non-modifiable properties of all Database File System (DBFS) hierarchical stores.

### Related View

USER\_DBFS\_HS\_FIXED\_PROPERTIES shows non-modifiable properties of all DBFS hierarchical stores owned by current user. This view does not display the STORE\_OWNER column.

| Column      | Datatype       | NULL     | Description    |
|-------------|----------------|----------|----------------|
| STORE_NAME  | VARCHAR2 (128) | NOT NULL | Name of store  |
| STORE_OWNER | VARCHAR2 (128) | NOT NULL | Owner of store |
| PROP_NAME   | VARCHAR2 (256) | NOT NULL | Property name  |
| PROP_VALUE  | VARCHAR2 (256) | NOT NULL | Property value |

### See Also:

"USER\_DBFS\_HS\_FIXED\_PROPERTIES"

## 5.294 DBA\_DBFS\_HS\_PROPERTIES

DBA\_DBFS\_HS\_PROPERTIES shows modifiable properties of all Database File System (DBFS) hierarchical stores.

### Related View

USER\_DBFS\_HS\_PROPERTIES shows modifiable properties of all DBFS hierarchical stores owned by current user. This view does not display the STOREOWNER column.

| Column        | Datatype       | NULL | Description    |
|---------------|----------------|------|----------------|
| STORENAME     | VARCHAR2 (256) |      | Name of store  |
| STOREOWNER    | VARCHAR2 (64)  |      | Owner of store |
| PROPERTYNAME  | VARCHAR2 (256) |      | Property name  |
| PROPERTYVALUE | VARCHAR2 (256) |      | Property value |

### See Also:

"USER\_DBFS\_HS\_PROPERTIES"

## 5.295 DBA\_DDL\_LOCKS

DBA\_DDL\_LOCKS lists all DDL locks held in the database and all outstanding requests for a DDL lock.

| Column         | Datatype        | NULL | Description                                                                                                                                                                                                                             |
|----------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID     | NUMBER          |      | Session identifier                                                                                                                                                                                                                      |
| OWNER          | VARCHAR2 (128)  |      | Owner of the lock                                                                                                                                                                                                                       |
| NAME           | VARCHAR2 (1000) |      | Name of the lock                                                                                                                                                                                                                        |
| TYPE           | VARCHAR2 (40)   |      | Lock type: <ul style="list-style-type: none"><li>• Cursor</li><li>• Table/Procedure/Type</li><li>• Body</li><li>• Trigger</li><li>• Index</li><li>• Cluster</li><li>• Java Source</li><li>• Java Resource</li><li>• Java Data</li></ul> |
| MODE_HELD      | VARCHAR2 (9)    |      | Lock mode: <ul style="list-style-type: none"><li>• None</li><li>• Null</li><li>• Share</li><li>• Exclusive</li></ul>                                                                                                                    |
| MODE_REQUESTED | VARCHAR2 (9)    |      | Lock request type: <ul style="list-style-type: none"><li>• None</li><li>• Null</li><li>• Share</li><li>• Exclusive</li></ul>                                                                                                            |

### See Also:

*Oracle Database Concepts* for more information about DDL locks

## 5.296 DBA\_DDL\_REGS

DBA\_DDL\_REGS displays all DDL notification registrations in the database.

### Related View

USER\_DDL\_REGS displays DDL notification registrations that apply to tables owned by the current user. This view does not display the USERNAME column.

| Column   | Datatype       | NULL     | Description              |
|----------|----------------|----------|--------------------------|
| USERNAME | VARCHAR2 (128) | NOT NULL | Registration owner       |
| REG_ID   | NUMBER         | NOT NULL | Internal registration ID |

| Column           | Datatype       | NULL | Description                                                                                                                         |
|------------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------|
| TYPE             | VARCHAR2 (8)   |      | Registration type. Possible values: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• SCHEMA</li> <li>• DATABASE</li> </ul> |
| NAME             | VARCHAR2 (257) |      | Name of the registered table, schema, or database                                                                                   |
| CLIENT_ID        | VARCHAR2 (64)  |      | User-specified client ID                                                                                                            |
| INCLUDE_TRUNCATE | VARCHAR2 (3)   |      | Indicates whether notifications are generated for TRUNCATE operations (YES) or not (NO)                                             |
| INCLUDE_PMOP     | VARCHAR2 (3)   |      | Indicates whether notifications are generated for partition maintenance operations (YES) or not (NO)                                |

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"[USER\\_DDL\\_REGS](#)"

## 5.297 DBA\_DEPENDENCIES

DBA\_DEPENDENCIES describes all dependencies in the database between procedures, packages, functions, package bodies, and triggers, including dependencies on views created without any database links. Its columns are the same as those in ALL\_DEPENDENCIES.

**See Also:**

"[ALL\\_DEPENDENCIES](#)"

## 5.298 DBA\_DIGEST\_VERIFIERS

DBA\_DIGEST\_VERIFIERS enables the database administrator to check which users have Digest verifiers stored on disk and the type of hashing algorithm used for the verifiers.

| Column               | Datatype       | NULL | Description                                   |
|----------------------|----------------|------|-----------------------------------------------|
| USERNAME             | VARCHAR2 (128) |      | Name of the user                              |
| HAS_DIGEST_VERIFIERS | VARCHAR2 (3)   |      | YES if a Digest verifier exists, NO otherwise |

| Column      | Datatype | NULL | Description                                                                                                                                                           |
|-------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIGEST_TYPE | CHAR(3)  |      | The type of hashing algorithm used for the Digest verifier. For instance, MD5 for users with MD5 Digest verifiers. If no Digest verifier exists, this column is NULL. |

## 5.299 DBA\_DIM\_ATTRIBUTES

DBA\_DIM\_ATTRIBUTES describes the relationships between dimension levels and functionally dependent columns in the database. The level columns and the dependent column must be in the same table. This view's columns are the same as those in ALL\_DIM\_ATTRIBUTES.

**See Also:**

"ALL\_DIM\_ATTRIBUTES"

## 5.300 DBA\_DIM\_CHILD\_OF

DBA\_DIM\_CHILD\_OF describes a hierarchical relationship of 1 to  $n$  between all the pairs of levels in the dimensions in the database. Its columns are the same as those in ALL\_DIM\_CHILD\_OF.

**See Also:**

"ALL\_DIM\_CHILD\_OF"

## 5.301 DBA\_DIM\_HIERARCHIES

DBA\_DIM\_HIERARCHIES describes all the dimension hierarchies in the database. Its columns are the same as those in ALL\_DIM\_HIERARCHIES.

**See Also:**

"ALL\_DIM\_HIERARCHIES"

## 5.302 DBA\_DIM\_JOIN\_KEY

DBA\_DIM\_JOIN\_KEY describes all joins in the database between two dimension tables. The join is always specified between a parent dimension level column and a child column. This view's columns are the same as those in ALL\_DIM\_JOIN\_KEY.

**See Also:**

["ALL\\_DIM\\_JOIN\\_KEY"](#)

## 5.303 DBA\_DIM\_LEVEL\_KEY

DBA\_DIM\_LEVEL\_KEY describes the columns of all dimension levels in the database. This view's columns are the same as those in ALL\_DIM\_LEVEL\_KEY.

**See Also:**

["ALL\\_DIM\\_LEVEL\\_KEY"](#)

## 5.304 DBA\_DIM\_LEVELS

DBA\_DIM\_LEVELS describes all dimension levels in the database. All columns of a dimension level must come from the same relation. This view's columns are the same as those in ALL\_DIM\_LEVELS.

**See Also:**

["ALL\\_DIM\\_LEVELS"](#)

## 5.305 DBA\_DIMENSIONS

DBA\_DIMENSIONS represents dimension objects. Its columns are the same as those in ALL\_DIMENSIONS.

**See Also:**

["ALL\\_DIMENSIONS"](#)

## 5.306 DBA\_DIRECTORIES

DBA\_DIRECTORIES describes all directory objects in the database. Its columns are the same as those in ALL\_DIRECTORIES.

**See Also:**

"ALL\_DIRECTORIES"

## 5.307 DBA\_DISCOVERY\_SOURCE

DBA\_DISCOVERY\_SOURCE describes sensitive data discovery import information.

| Column      | Datatype       | NULL | Description                                                                                                                                                                 |
|-------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE_NAME | VARCHAR2 (128) |      | The name of the discovery source. In the case of Application Data Model (ADM), this is the ADM instance name.                                                               |
| SOURCE_TYPE | VARCHAR2 (6)   |      | The type of the source: <ul style="list-style-type: none"><li>• ADM: import from ADM</li><li>• CUSTOM: custom import</li><li>• DB: discovered within the database</li></ul> |
| CTIME       | TIMESTAMP (6)  |      | The last time sensitive data was imported from this source                                                                                                                  |

**See Also:**

*Oracle Database Security Guide* for more information about transparent sensitive data protection

## 5.308 DBA\_DML\_LOCKS

DBA\_DML\_LOCKS lists all DML locks held in the database and all outstanding requests for a DML lock.

| Column     | Datatype       | NULL     | Description                           |
|------------|----------------|----------|---------------------------------------|
| SESSION_ID | NUMBER         |          | Session holding or acquiring the lock |
| OWNER      | VARCHAR2 (128) | NOT NULL | Owner of the lock                     |
| NAME       | VARCHAR2 (128) | NOT NULL | Name of the lock                      |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                        |
|-----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MODE_HELD       | VARCHAR2 (13) |      | The type of lock held. The values are: <ul style="list-style-type: none"> <li>ROWS_S (SS): row share lock</li> <li>ROW-X (SX): row exclusive lock</li> <li>SHARE (S): share lock</li> <li>S/ROW-X (SSX): exclusive lock</li> <li>NONE: lock requested but not yet obtained</li> </ul>              |
| MODE_REQUESTED  | VARCHAR2 (13) |      | Lock request type. The values are: <ul style="list-style-type: none"> <li>ROWS_S (SS): row share lock</li> <li>ROW-X (SX): row exclusive lock</li> <li>SHARE (S): share lock</li> <li>S/ROW-X (SSX): exclusive lock</li> <li>NONE: Lock identifier obtained; lock not held or requested</li> </ul> |
| LAST_CONVERT    | NUMBER        |      | Time since current mode was granted                                                                                                                                                                                                                                                                |
| BLOCKING_OTHERS | VARCHAR2 (40) |      | Blocking others                                                                                                                                                                                                                                                                                    |

## 5.309 DBA\_DMT\_FREE\_SPACE

DBA\_DMT\_FREE\_SPACE describes the free extents in all dictionary managed tablespaces in the database.

| Column        | Datatype | NULL     | Description                                               |
|---------------|----------|----------|-----------------------------------------------------------|
| TABLESPACE_ID | NUMBER   | NOT NULL | Identifier number of the tablespace containing the extent |
| FILE_ID       | NUMBER   | NOT NULL | File identifier number of the file containing the extent  |
| BLOCK_ID      | NUMBER   | NOT NULL | Starting block number of the extent                       |
| BLOCKS        | NUMBER   | NOT NULL | Size of the extent (in Oracle blocks)                     |

## 5.310 DBA\_DMT\_USED\_EXTENTS

DBA\_DMT\_USED\_EXTENTS describes the extents comprising the segments in all dictionary managed tablespaces in the database.

| Column         | Datatype | NULL     | Description                                               |
|----------------|----------|----------|-----------------------------------------------------------|
| SEGMENT_FILEID | NUMBER   | NOT NULL | File number of the segment header of the extent           |
| SEGMENT_BLOCK  | NUMBER   | NOT NULL | Block number of the segment header of the extent          |
| TABLESPACE_ID  | NUMBER   | NOT NULL | Identifier number of the tablespace containing the extent |
| EXTENT_ID      | NUMBER   | NOT NULL | Extent number in the segment                              |

| Column | Datatype | NULL     | Description                                              |
|--------|----------|----------|----------------------------------------------------------|
| FILEID | NUMBER   | NOT NULL | File identifier number of the file containing the extent |
| BLOCK  | NUMBER   | NOT NULL | Starting block number of the extent                      |
| LENGTH | NUMBER   | NOT NULL | Number of blocks in the extent                           |

## 5.311 DBA\_DOMAIN\_COLS

DBA\_DOMAIN\_COLS describes columns of all data use case domains in the database. Its columns are the same as those in ALL\_DOMAIN\_COLS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_DOMAIN\_COLS"

## 5.312 DBA\_DOMAIN\_CONSTRAINTS

DBA\_DOMAIN\_CONSTRAINTS describes constraint definitions on all data use case domains in the database. Its columns are the same as those in ALL\_DOMAIN\_CONSTRAINTS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_DOMAIN\_CONSTRAINTS"

## 5.313 DBA\_DOMAINS

DBA\_DOMAINS describes all data use case domains in the database. Its columns are the same as those in ALL\_DOMAINS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_DOMAINS"

## 5.314 DBA\_EDITION\_COMMENTS

DBA\_EDITION\_COMMENTS describes the comments on all editions in the database. Its columns are the same as those in ALL\_EDITION\_COMMENTS.

### See Also:

"ALL\_EDITION\_COMMENTS"

## 5.315 DBA\_EDITIONED\_TYPES

DBA\_EDITIONED\_TYPES lists all types that are editioned by default for every user in the database.

### Related View

USER\_EDITIONED\_TYPES lists the types that are editioned by default for the current user. This view does not display the SCHEMA column.

| Column      | Datatype       | NULL     | Description                                     |
|-------------|----------------|----------|-------------------------------------------------|
| SCHEMA      | VARCHAR2 (128) | NOT NULL | Schema in which the object types is editionable |
| OBJECT_TYPE | VARCHAR2 (23)  |          | Object type that is editionable                 |

### See Also:

"USER\_EDITIONED\_TYPES"

## 5.316 DBA\_EDITIONING\_VIEW\_COLS

DBA\_EDITIONING\_VIEW\_COLS describes the relationship between the columns of all editioning views in the database and the table columns to which they map. Its columns are the same as those in ALL\_EDITIONING\_VIEW\_COLS.

**See Also:**

["ALL\\_EDITIONING\\_VIEW\\_COLS"](#)

## 5.317 DBA\_EDITIONING\_VIEW\_COLS\_AE

DBA\_EDITIONING\_VIEW\_COLS\_AE describes the relationship between the columns of all editioning views (across all editions) in the database and the table columns to which they map. Its columns are the same as those in ALL\_EDITIONING\_VIEW\_COLS\_AE.

**See Also:**

["ALL\\_EDITIONING\\_VIEW\\_COLS\\_AE"](#)

## 5.318 DBA\_EDITIONING\_VIEWS

DBA\_EDITIONING\_VIEWS describes all editioning views in the database. Its columns are the same as those in ALL\_EDITIONING\_VIEWS.

**See Also:**

["ALL\\_EDITIONING\\_VIEWS"](#)

## 5.319 DBA\_EDITIONING\_VIEWS\_AE

DBA\_EDITIONING\_VIEWS\_AE describes all editioning views (across all editions) in the database. Its columns are the same as those in ALL\_EDITIONING\_VIEWS\_AE.

**See Also:**

["ALL\\_EDITIONING\\_VIEWS\\_AE"](#)

## 5.320 DBA\_EDITIONS

DBA\_EDITIONS describes all editions in the database. Its columns are the same as those in ALL\_EDITIONS.

### See Also:

- ["ALL\\_EDITIONS"](#)
- *Oracle Database Development Guide* for more information about editions

## 5.321 DBA\_ENABLED\_AGGREGATIONS

DBA\_ENABLED\_AGGREGATIONS displays information about enabled on-demand statistic aggregation.

| Column           | Datatype      | NULL | Description                                                                                                                                                     |
|------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGGREGATION_TYPE | VARCHAR2 (21) |      | Type of the aggregation: <ul style="list-style-type: none"><li>• CLIENT_ID</li><li>• SERVICE</li><li>• SERVICE_MODULE</li><li>• SERVICE_MODULE_ACTION</li></ul> |
| PRIMARY_ID       | VARCHAR2 (64) |      | Primary qualifier (specific client identifier or service name)                                                                                                  |
| QUALIFIER_ID1    | VARCHAR2 (48) |      | Secondary qualifier (specific module name)                                                                                                                      |
| QUALIFIER_ID2    | VARCHAR2 (32) |      | Additional qualifier (specific action name)                                                                                                                     |

## 5.322 DBA\_ENABLED\_TRACES

DBA\_ENABLED\_TRACES displays information about enabled SQL traces.

| Column        | Datatype      | NULL | Description                                                                                                                                                                  |
|---------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRACE_TYPE    | VARCHAR2 (21) |      | Type of the trace: <ul style="list-style-type: none"><li>• CLIENT_ID</li><li>• SERVICE</li><li>• SERVICE_MODULE</li><li>• SERVICE_MODULE_ACTION</li><li>• DATABASE</li></ul> |
| PRIMARY_ID    | VARCHAR2 (64) |      | Primary qualifier (specific client identifier or service name)                                                                                                               |
| QUALIFIER_ID1 | VARCHAR2 (64) |      | Secondary qualifier (specific module name)                                                                                                                                   |
| QUALIFIER_ID2 | VARCHAR2 (64) |      | Additional qualifier (specific action name)                                                                                                                                  |
| WAITS         | VARCHAR2 (5)  |      | Indicates whether waits are traced (TRUE) or not (FALSE)                                                                                                                     |

| Column        | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BINDS         | VARCHAR2 (5)  |      | Indicates whether binds are traced ( <b>TRUE</b> ) or not ( <b>FALSE</b> )                                                                                                                                                                                                                                                                                                                                      |
| PLAN_STATS    | VARCHAR2 (10) |      | Indicates whether cursor execution statistics are traced. Possible values include: <ul style="list-style-type: none"> <li><b>ALL_EXEC</b>: Execution statistics are dumped at each cursor execution</li> <li><b>NEVER</b>: Execution statistics are never dumped</li> <li><b>FIRST_EXEC</b>: Execution statistics are dumped during the first execution of the cursor. This is the default behavior.</li> </ul> |
| INSTANCE_NAME | VARCHAR2 (16) |      | Instance name for tracing restricted to named instances                                                                                                                                                                                                                                                                                                                                                         |

**See Also:**

*Oracle Database PL/SQL Packages and Types Reference* for more information about the **DBMS\_MONITOR** package

## 5.323 DBA\_ENCRYPTED\_COLUMNS

**DBA\_ENCRYPTED\_COLUMNS** maintains encryption algorithm information for all encrypted columns in the database. Its columns are the same as those in **ALL\_ENCRYPTED\_COLUMNS**.

**See Also:**

["ALL\\_ENCRYPTED\\_COLUMNS"](#)

## 5.324 DBA\_EPG\_DAD\_AUTHORIZATION

**DBA\_EPG\_DAD\_AUTHORIZATION** describes the DADs that are authorized to use different user's privileges.

**Related View**

**USER\_EPG\_DAD\_AUTHORIZATION** describes the DADs that are authorized to use the user's privileges. This view does not display the **USERNAME** column.

| Column   | Datatype       | NULL     | Description                                                    |
|----------|----------------|----------|----------------------------------------------------------------|
| DAD_NAME | VARCHAR2 (64)  | NOT NULL | Name of DAD                                                    |
| USERNAME | VARCHAR2 (128) | NOT NULL | Name of the user whose privileges the DAD is authorized to use |

**See Also:**

["USER\\_EPG\\_DAD\\_AUTHORIZATION"](#)

## 5.325 DBA\_ERROR\_TRANSLATIONS

DBA\_ERROR\_TRANSLATIONS describes all error translations in the database. Its columns are the same as those in ALL\_ERROR\_TRANSLATIONS.

**See Also:**

["ALL\\_ERROR\\_TRANSLATIONS"](#)

## 5.326 DBA\_ERRORS

DBA\_ERRORS describes the current errors on all stored objects in the database. Its columns are the same as those in ALL\_ERRORS.

**See Also:**

["ALL\\_ERRORS"](#)

## 5.327 DBA\_ERRORS\_AE

DBA\_ERRORS\_AE describes the current errors on all stored objects (across all editions) in the database. Its columns are the same as those in ALL\_ERRORS\_AE.

**See Also:**

["ALL\\_ERRORS\\_AE"](#)

## 5.328 DBA\_EVALUATION\_CONTEXT\_TABLES

DBA\_EVALUATION\_CONTEXT\_TABLES describes the tables in all rule evaluation contexts in the database. Its columns are the same as those in ALL\_EVALUATION\_CONTEXT\_TABLES.

**See Also:**

["ALL\\_EVALUATION\\_CONTEXT\\_TABLES"](#)

## 5.329 DBA\_EVALUATION\_CONTEXT\_VARS

DBA\_EVALUATION\_CONTEXT\_VARS describes the variables in all rule evaluation contexts in the database. Its columns are the same as those in ALL\_EVALUATION\_CONTEXT\_VARS.

**See Also:**

"ALL\_EVALUATION\_CONTEXT\_VARS"

## 5.330 DBA\_EVALUATION\_CONTEXTS

DBA\_EVALUATION\_CONTEXTS describes all rule evaluation contexts in the database. Its columns are the same as those in ALL\_EVALUATION\_CONTEXTS.

**See Also:**

"ALL\_EVALUATION\_CONTEXTS"

## 5.331 DBA\_EXP\_FILES

DBA\_EXP\_FILES describes export files.

| Column      | Datatype      | NULL     | Description                                               |
|-------------|---------------|----------|-----------------------------------------------------------|
| EXP_VERSION | NUMBER(3)     | NOT NULL | Version number of the export session                      |
| EXP_TYPE    | VARCHAR2(11)  |          | Type of export file: complete, cumulative, or incremental |
| FILE_NAME   | VARCHAR2(100) | NOT NULL | Name of the export file                                   |
| USER_NAME   | VARCHAR2(128) | NOT NULL | Name of user who executed export                          |
| TIMESTAMP   | DATE          | NOT NULL | Timestamp of the export session                           |

## 5.332 DBA\_EXP\_OBJECTS

DBA\_EXP\_OBJECTS describes objects that have been incrementally exported.

| Column         | Datatype      | NULL     | Description                          |
|----------------|---------------|----------|--------------------------------------|
| OWNER          | VARCHAR2(128) | NOT NULL | Owner of exported object             |
| OBJECT_NAME    | VARCHAR2(128) | NOT NULL | Name of exported object              |
| OBJECT_TYPE    | VARCHAR2(13)  |          | Type of exported object              |
| CUMULATIVE     | DATE          |          | Timestamp of last cumulative export  |
| INCREMENTAL    | DATE          | NOT NULL | Timestamp of last incremental export |
| EXPORT_VERSION | NUMBER(3)     | NOT NULL | The ID of the export session         |

## 5.333 DBA\_EXP\_VERSION

DBA\_EXP\_VERSION displays the version number of the last export session.

| Column      | Datatype  | NULL     | Description                               |
|-------------|-----------|----------|-------------------------------------------|
| EXP_VERSION | NUMBER(3) | NOT NULL | Version number of the last export session |

## 5.334 DBA\_EXPRESSION\_STATISTICS

DBA\_EXPRESSION\_STATISTICS provides expression usage tracking statistics for all the tables in the database. Its columns are the same as those in ALL\_EXPRESSION\_STATISTICS.

**See Also:**

["ALL\\_EXPRESSION\\_STATISTICS"](#)

## 5.335 DBA\_EXTENTS

DBA\_EXTENTS describes the extents comprising the segments in all tablespaces in the database.

Note that if a data file (or entire tablespace) is offline in a locally managed tablespace, you will not see any extent information. If an object has extents in an online file of the tablespace, you will see extent information about the offline data file. However, if the object is entirely in the offline file, a query of this view will not return any records.

### Related View

USER\_EXTENTS describes the extents comprising the segments owned by the current user's objects. This view does not display the OWNER, FILE\_ID, BLOCK\_ID, or RELATIVE\_FNO columns.

| Column          | Datatype      | NULL | Description                                                    |
|-----------------|---------------|------|----------------------------------------------------------------|
| OWNER           | VARCHAR2(128) |      | Owner of the segment associated with the extent                |
| SEGMENT_NAME    | VARCHAR2(128) |      | Name of the segment associated with the extent                 |
| PARTITION_NAME  | VARCHAR2(128) |      | Object Partition Name (Set to NULL for nonpartitioned objects) |
| SEGMENT_TYPE    | VARCHAR2(18)  |      | Type of the segment: INDEX PARTITION, TABLE PARTITION          |
| TABLESPACE_NAME | VARCHAR2(30)  |      | Name of the tablespace containing the extent                   |
| EXTENT_ID       | NUMBER        |      | Extent number in the segment                                   |
| FILE_ID         | NUMBER        |      | Absolute file number of the data file containing the extent    |
| BLOCK_ID        | NUMBER        |      | Starting block number of the extent                            |
| BYTES           | NUMBER        |      | Size of the extent in bytes                                    |
| BLOCKS          | NUMBER        |      | Size of the extent in Oracle blocks                            |

| Column       | Datatype | NULL | Description                                    |
|--------------|----------|------|------------------------------------------------|
| RELATIVE_FNO | NUMBER   |      | Relative file number of the first extent block |

 **See Also:**  
"USER\_EXTENTS"

## 5.336 DBA\_EXTERNAL\_LOCATIONS

DBA\_EXTERNAL\_LOCATIONS describes the locations (data sources) of all external tables in the database. Its columns are the same as those in ALL\_EXTERNAL\_LOCATIONS.

 **See Also:**  
"ALL\_EXTERNAL\_LOCATIONS"

## 5.337 DBA\_EXTERNAL\_SCN\_ACTIVITY

DBA\_EXTERNAL\_SCN\_ACTIVITY works in conjunction with the DBA\_DB\_LINK\_SOURCES and DBA\_DB\_LINKS views to determine the source of high SCN activities.

If the SCN is increased by an inbound database link, then you can join the DBA\_EXTERNAL\_SCN\_ACTIVITY view with the DBA\_DB\_LINK\_SOURCES view on the INBOUND\_DB\_LINK\_SOURCE\_ID column to get details of the remote database where the SCN increase originated.

If the SCN is increased by an outbound database link, then the INBOUND\_DB\_LINK\_SOURCE\_ID column will be NULL, but the OUTBOUND\_DB\_LINK\_NAME and OUTBOUND\_DB\_LINK\_OWNER columns can be joined with the DB\_LINK and OWNER columns respectively in the DBA\_DB\_LINKS view to determine the remote database that caused the SCN increase.

If neither of the above cases are true (the INBOUND\_DB\_LINK\_SOURCE\_ID, OUTBOUND\_DB\_LINK\_NAME, and OUTBOUND\_DB\_LINK\_OWNER are all NULL), then the SCN increase resulted from a client connection and not as a result of a database link to or from another database. You can join the SESSION\_ID and SESSION\_SERIAL# columns with the SID and SERIAL# columns in V\$SESSION to get the client session details.

In a multitenant container database (CDB) environment, for every DBA\_ view, there is a corresponding CDB\_ view that contains data for all the pluggable databases (PDBs) in the CDB.

As the SCN is a property of the CDB (and not a PDB), a DBA interested in understanding large SCN jumps will likely find the CDB\_EXTERNAL\_SCN\_ACTIVITY view more useful for diagnosing SCN jumps on a CDB. Querying the CDB\_EXTERNAL\_SCN\_ACTIVITY view from CDB\$ROOT ensures that external SCN jumps occurring on all PDBs are looked at and noticed. On the other hand, a query on the corresponding DBA\_EXTERNAL\_SCN\_ACTIVITY view, or a query on the CDB\_EXTERNAL\_SCN\_ACTIVITY view done from a PDB would only show data for that PDB (that

is, details regarding any external activity that occurred on that specific PDB that resulted in large SCN jumps).

Note that the CDB\_ views would only show data from PDBs that are open at the time the query is issued. Therefore, when you are diagnosing sources of external SCN activities, Oracle recommends that you keep open any or all PDBs that might contain useful information for the diagnosis.

| Column                    | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPERATION_TIMESTAMP       | TIMESTAMP (6)  | NOT NULL | Timestamp when SCN was received in UTC                                                                                                                                                                                                                                                                                                                                                                                      |
| SESSION_ID                | NUMBER         | NOT NULL | Session identifier of the local session that created this entry. Maps to V\$SESSION.SID and to V\$ACTIVE_SESSION_HISTORY.SESSION_ID.                                                                                                                                                                                                                                                                                        |
| SESSION_SERIAL#           | NUMBER         | NOT NULL | Session serial number of the local session that created this entry. Maps to V\$SESSION.SERIAL# and to V\$ACTIVE_SESSION_HISTORY.SESSION_SERIAL#.                                                                                                                                                                                                                                                                            |
| AUDIT_SESSIONID           | NUMBER         |          | Session identifier that can be joined with DBA_AUDIT_TRAIL.SESSIONID or UNIFIED_AUDIT_TRAIL.SESSIONID (depending on which kind of auditing is enabled). Null if auditing is not enabled.                                                                                                                                                                                                                                    |
| USERNAME                  | VARCHAR2 (128) | NOT NULL | Oracle username of the user who logged into the local database. Maps to V\$SESSION.USERNAME.                                                                                                                                                                                                                                                                                                                                |
| INBOUND_DB_LINK_SOURCE_ID | NUMBER         |          | If the SCN was bumped by an inbound database link, then this is the inbound database link identified by the DBA_DB_LINK_SOURCES.SOURCE_ID database link.<br>If the SCN was not increased by an inbound database link, then this value is null.                                                                                                                                                                              |
| OUTBOUND_DB_LINK_NAME     | VARCHAR2 (128) |          | If the SCN was bumped by an outbound database link, then this is the outbound database link identified by the DBA_DB_LINKS.DB_LINK database link.<br>Using this column and the OUTBOUND_DB_LINK_OWNER column, you can determine the source of the SCN increase for outbound links.<br>If the SCN was not increased by an outbound database link, then this value is null.                                                   |
| OUTBOUND_DB_LINK_OWNER    | VARCHAR2 (128) |          | If the SCN was bumped by an outbound database link, then this is the owner of the outbound database link identified by DBA_DB_LINKS.OWNER.<br>Using this column and the OUTBOUND_DB_LINK_NAME column, you can determine the source of the SCN increase for outbound links.<br>If the SCN was not increased by an outbound database link, then this value is null.                                                           |
| RESULT                    | VARCHAR2 (64)  | NOT NULL | The following SCN activities are captured: <ul style="list-style-type: none"> <li>REJECTED_HIGH_SCN - SCN rejection due to unreasonable value</li> <li>REJECTED_HIGH_DELTA - SCN rejection due to unreasonable rate of growth</li> <li>ACCEPTED - SCN accepted with warning</li> </ul> Regular SCN activities which do not result in errors or warnings are not captured. SCN errors and warnings also appear in alert.log. |

| Column         | Datatype | NULL     | Description                                                                                                                                          |
|----------------|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXTERNAL_SCN   | NUMBER   | NOT NULL | The external SCN received from an inbound database link, an outbound database link, or a client                                                      |
| SCN_ADJUSTMENT | NUMBER   | NOT NULL | For ACCEPTED SCNs in the RESULT column, how much the local SCN was increased.<br>For REJECTED SCNs in the RESULT column, the attempted SCN increase. |

## 5.338 DBA\_EXTERNAL\_TABLES

DBA\_EXTERNAL\_TABLES describes all external tables in the database. Its columns are the same as those in ALL\_EXTERNAL\_TABLES.

 See Also:

"ALL\_EXTERNAL\_TABLES"

## 5.339 DBA\_FEATURE\_USAGE\_STATISTICS

DBA\_FEATURE\_USAGE\_STATISTICS displays information about database feature usage statistics.

| Column          | Datatype      | NULL     | Description                                                                                 |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------|
| DBID            | NUMBER        | NOT NULL | Database identifier of the database being tracked                                           |
| NAME            | VARCHAR2 (64) | NOT NULL | Name of the feature                                                                         |
| VERSION         | VARCHAR2 (17) | NOT NULL | Database version in which the feature was tracked                                           |
| DETECTED_USAGES | NUMBER        | NOT NULL | Number of times the system has detected usage for the feature                               |
| TOTAL_SAMPLES   | NUMBER        | NOT NULL | Number of times the system has woken up and checked for feature usage                       |
| CURRENTLY_USED  | VARCHAR2 (5)  |          | Indicates whether usage was detected the last time the system checked (TRUE) or not (FALSE) |

| Column                | Datatype       | NULL | Description                                                         |
|-----------------------|----------------|------|---------------------------------------------------------------------|
| FIRST_USAGE_DATE      | DATE           |      | First sample time the system detected usage of the feature          |
| LAST_USAGE_DATE       | DATE           |      | Last sample time the system detected usage of the feature           |
| AUX_COUNT             | NUMBER         |      | This column stores feature-specific usage data in number format.    |
| FEATURE_INFO          | CLOB           |      | This column stores feature-specific usage data in character format. |
| LAST_SAMPLE_DATE      | DATE           |      | The last time the system checked for usage                          |
| LAST_SAMPLE_PERIOD    | NUMBER         |      | Amount of time (in seconds) between the last two usage sample times |
| SAMPLE_INTERVAL       | NUMBER         |      | Sample interval                                                     |
| DESCRIPTION           | VARCHAR2 (128) |      | Description of the feature and usage detection logic                |
| LAST_FEAT_SAMPLE_DATE | DATE           |      | The last time the system checked for usage of the feature           |

**Note:**

Use the following SQL query to list the database features and their descriptions in alphabetical order:

```
SELECT name, description FROM dba_feature_usage_statistics
ORDER BY name;
```

## 5.340 DBA\_FGA\_AUDIT\_TRAIL

DBA\_FGA\_AUDIT\_TRAIL displays all audit records for fine-grained auditing.

**Note:**

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column     | Datatype       | NULL     | Description                                                        |
|------------|----------------|----------|--------------------------------------------------------------------|
| SESSION_ID | NUMBER         | NOT NULL | Session id of the query                                            |
| TIMESTAMP  | DATE           |          | Date and time of the query in the local database session time zone |
| DB_USER    | VARCHAR2 (128) |          | Database username who executed the query                           |
| OS_USER    | VARCHAR2 (255) |          | Operating system username who executed the query                   |
| USERHOST   | VARCHAR2 (128) |          | Client host machine name                                           |

| Column             | Datatype                     | NULL | Description                                                                                                                                                                                                           |
|--------------------|------------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_ID          | VARCHAR2 (128)               |      | Client identifier in each Oracle session                                                                                                                                                                              |
| ECONTEXT_ID        | VARCHAR2 (64)                |      | Application execution context identifier                                                                                                                                                                              |
| EXT_NAME           | VARCHAR2 (4000)              |      | External name                                                                                                                                                                                                         |
| OBJECT_SCHEMA      | VARCHAR2 (128)               |      | Owner of the table or view                                                                                                                                                                                            |
| OBJECT_NAME        | VARCHAR2 (128)               |      | Name of the table or view                                                                                                                                                                                             |
| POLICY_NAME        | VARCHAR2 (128)               |      | Name of the Fine-Grained Auditing Policy                                                                                                                                                                              |
| SCN                | NUMBER                       |      | System change number (SCN) of the query                                                                                                                                                                               |
| SQL_TEXT           | NVARCHAR2 (2000)             |      | SQL text of the query                                                                                                                                                                                                 |
| SQL_BIND           | NVARCHAR2 (2000)             |      | Bind variable data of the query                                                                                                                                                                                       |
| COMMENT\$TEXT      | VARCHAR2 (4000)              |      | Comments                                                                                                                                                                                                              |
| STATEMENT_TYPE     | VARCHAR2 (7)                 |      | Statement type of the query: <ul style="list-style-type: none"> <li>• SELECT</li> <li>• INSERT</li> <li>• UPDATE</li> <li>• DELETE</li> </ul>                                                                         |
| EXTENDED_TIMESTAMP | TIMESTAMP (6) WITH TIME ZONE |      | Timestamp of the query in UTC (Coordinated Universal Time) time zone                                                                                                                                                  |
| PROXY_SESSIONID    | NUMBER                       |      | Proxy session serial number, if an enterprise user has logged in through the proxy mechanism                                                                                                                          |
| GLOBAL_UID         | VARCHAR2 (32)                |      | Global user identifier for the user, if the user has logged in as an enterprise user                                                                                                                                  |
| INSTANCE_NUMBER    | NUMBER                       |      | Instance number as specified by the <code>INSTANCE_NUMBER</code> initialization parameter                                                                                                                             |
| OS_PROCESS         | VARCHAR2 (16)                |      | Operating System process identifier of the Oracle process                                                                                                                                                             |
| TRANSACTIONID      | RAW (8)                      |      | Transaction identifier of the transaction in which the object is accessed or modified                                                                                                                                 |
| STATEMENTID        | NUMBER                       |      | Numeric ID for each statement run (a statement may cause many actions)                                                                                                                                                |
| ENTRYID            | NUMBER                       |      | Numeric ID for each audit trail entry in the session                                                                                                                                                                  |
| OBJ_EDITION_NAME   | VARCHAR2 (128)               |      | Name of the edition containing the audited object                                                                                                                                                                     |
| DBID               | NUMBER                       |      | Database identifier of the audited database                                                                                                                                                                           |
| RLS_INFO           | CLOB                         |      | Stores virtual private database (VPD) policy names and predicates separated by delimiter.<br><br>To format the output into individual rows, use the <code>DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA</code> function. |
| CURRENT_USER       | VARCHAR2 (128)               |      | Effective user for the statement execution                                                                                                                                                                            |

**Note:**

The `SQL_BIND` and `SQL_TEXT` columns are populated only if the policy has been created with the `AUDIT_TRAIL` parameter set to `db, extended`.

**See Also:**

*Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_FGA` function.

## 5.341 DBA\_FLASHBACK\_ARCHIVE

`DBA_FLASHBACK_ARCHIVE` describes all flashback archives available in the database.

### Related View

`USER_FLASHBACK_ARCHIVE` describes the flashback archives available to the current user.

| Column                 | Datatype       | NULL     | Description                                                                                                   |
|------------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------|
| OWNER_NAME             | VARCHAR2 (255) |          | Name of the creator of the flashback archive                                                                  |
| FLASHBACK_ARCHIVE_NAME | VARCHAR2 (255) | NOT NULL | Name of the flashback archive                                                                                 |
| FLASHBACK_ARCHIVE#     | NUMBER         | NOT NULL | Number of the flashback archive                                                                               |
| RETENTION_IN_DAYS      | NUMBER         | NOT NULL | Maximum duration (in days) for which data is retained in the flashback archive                                |
| CREATE_TIME            | TIMESTAMP (9)  |          | Time at which the flashback archive was created                                                               |
| LAST_PURGE_TIME        | TIMESTAMP (9)  |          | Time at which the data in the flashback archive was last purged by the system                                 |
| STATUS                 | VARCHAR2 (7)   |          | Indicates whether the flashback archive is a default flashback archive for the system (DEFAULT) or not (NULL) |

**See Also:**

`"USER_FLASHBACK_ARCHIVE"`

## 5.342 DBA\_FLASHBACK\_ARCHIVE\_TABLES

`DBA_FLASHBACK_ARCHIVE_TABLES` displays information about all tables in the database that are enabled for Flashback Archive.

### Related View

`USER_FLASHBACK_ARCHIVE_TABLES` displays information about the tables owned by the current user that are enabled for Flashback Archive.

| Column                 | Datatype       | NULL     | Description                                           |
|------------------------|----------------|----------|-------------------------------------------------------|
| TABLE_NAME             | VARCHAR2 (128) | NOT NULL | Name of the table enabled for Flashback Archive       |
| OWNER_NAME             | VARCHAR2 (128) | NOT NULL | Owner name of the table enabled for Flashback Archive |
| FLASHBACK_ARCHIVE_NAME | VARCHAR2 (255) | NOT NULL | Name of the flashback archive                         |

| Column             | Datatype      | NULL | Description                                                                   |
|--------------------|---------------|------|-------------------------------------------------------------------------------|
| ARCHIVE_TABLE_NAME | VARCHAR2 (53) |      | Name of the archive table containing the historical data for the user table   |
| STATUS             | VARCHAR2 (13) |      | Status of whether flashback archive is enabled or being disabled on the table |

**See Also:**["USER\\_FLASHBACK\\_ARCHIVE\\_TABLES"](#)

## 5.343 DBA\_FLASHBACK\_ARCHIVE\_TS

DBA\_FLASHBACK\_ARCHIVE\_TS describes all tablespaces in the flashback archives available in the database.

| Column                 | Datatype       | NULL     | Description                                                                                                           |
|------------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------|
| FLASHBACK_ARCHIVE_NAME | VARCHAR2 (255) | NOT NULL | Name of the flashback archive                                                                                         |
| FLASHBACK_ARCHIVE#     | NUMBER         | NOT NULL | Number of the flashback archive                                                                                       |
| TABLESPACE_NAME        | VARCHAR2 (30)  | NOT NULL | Name of a tablespace in the flashback archive                                                                         |
| QUOTA_IN_MB            | VARCHAR2 (40)  |          | Maximum space (in MB) that can be used for Flashback Archive from the tablespace; NULL indicates no Quota restriction |

## 5.344 DBA\_FLASHBACK\_TXN\_REPORT

DBA\_FLASHBACK\_TXN\_REPORT displays information about all compensating transactions that have been committed in the database.

Each row in this view is associated with one compensating transaction.

### Related View

USER\_FLASHBACK\_TXN\_REPORT displays information about the compensating transactions owned by the current user that have been committed in the database. This view does not display the USERNAME column.

| Column                | Datatype       | NULL     | Description                                                                                         |
|-----------------------|----------------|----------|-----------------------------------------------------------------------------------------------------|
| COMPENSATING_XID      | RAW (8)        | NOT NULL | Transaction responsible for backout                                                                 |
| COMPENSATING_TXN_NAME | VARCHAR2 (256) |          | Name of the compensating transaction                                                                |
| COMMIT_TIME           | DATE           |          | Timestamp when the compensating transaction committed                                               |
| XID_REPORT            | CLOB           |          | An XML report describing the details of the transactions backed out by the compensating transaction |
| USERNAME              | VARCHAR2 (128) | NOT NULL | User who is executing the compensating transaction                                                  |

**See Also:**["USER\\_FLASHBACK\\_TXN\\_REPORT"](#)

## 5.345 DBA\_FLASHBACK\_TXN\_STATE

DBA\_FLASHBACK\_TXN\_STATE displays information about the compensating status of all transactions in the database.

For each compensating transaction, there could be multiple rows, where each row provides the dependency relation between the transactions that have been compensated by the compensating transaction.

### Related View

USER\_FLASHBACK\_TXN\_STATE displays information about the compensating status of the transactions owned by the current user. This view does not display the USERNAME column.

| Column           | Datatype       | NULL     | Description                                                                                                                                                          |
|------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPENSATING_XID | RAW (8)        |          | Transaction ID of the compensating transaction                                                                                                                       |
| XID              | RAW (8)        |          | A transaction that has been compensated by the compensating transaction                                                                                              |
| DEPENDENT_XID    | RAW (8)        |          | A dependent transaction of XID<br><b>Note:</b> In the case of BACKOUT_MODE = CASCADE, there must be another row with XID = DEPENDENT_XID of this column.             |
| BACKOUT_MODE     | VARCHAR2 (16)  |          | Mode in which XID was backed out: <ul style="list-style-type: none"><li>• NOCASCADE</li><li>• NOCASCADE_FORCE</li><li>• NONCONFLICT_ONLY</li><li>• CASCADE</li></ul> |
| USERNAME         | VARCHAR2 (128) | NOT NULL | User who is performing the compensating transaction                                                                                                                  |

**See Also:**["USER\\_FLASHBACK\\_TXN\\_STATE"](#)

## 5.346 DBA\_FREE\_SPACE

DBA\_FREE\_SPACE describes the free extents in all tablespaces in the database.

If a data file (or entire tablespace) is offline in a locally managed tablespace, you will not see any extent information. If an object has extents in an online file of the tablespace, you will see extent information about the offline data file. However, if the object is entirely in the offline file, a query of this view will not return any records.

If a data file does not have any free space, you will not see a row for the data file in this view.

**Related View**

USER\_FREE\_SPACE describes the free extents in the tablespaces accessible to the current user.

| Column          | Datatype      | NULL | Description                                                 |
|-----------------|---------------|------|-------------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) |      | Name of the tablespace containing the extent                |
| FILE_ID         | NUMBER        |      | Absolute file number of the data file containing the extent |
| BLOCK_ID        | NUMBER        |      | Starting block number of the extent                         |
| BYTES           | NUMBER        |      | Size of the extent (in bytes)                               |
| BLOCKS          | NUMBER        |      | Size of the extent (in Oracle blocks)                       |
| RELATIVE_FNO    | NUMBER        |      | Relative file number of the file containing the extent      |

**See Also:**["USER\\_FREE\\_SPACE"](#)

## 5.347 DBA\_FREE\_SPACE\_COALESCED

DBA\_FREE\_SPACE\_COALESCED describes statistics on coalesced space in all tablespaces in the database.

| Column                    | Datatype      | NULL | Description                                                    |
|---------------------------|---------------|------|----------------------------------------------------------------|
| TABLESPACE_NAME           | VARCHAR2 (30) |      | Name of the tablespace                                         |
| TOTAL_EXTENTS             | NUMBER        |      | Total number of free extents in the tablespace                 |
| EXTENTS_COALESCED         | NUMBER        |      | Total number of coalesced free extents in the tablespace       |
| PERCENT_EXTENTS_COALESCED | NUMBER        |      | Percentage of coalesced free extents in the tablespace         |
| TOTAL_BYTES               | NUMBER        |      | Total number of free bytes in the tablespace                   |
| BYTES_COALESCED           | NUMBER        |      | Total number of coalesced free bytes in the tablespace         |
| TOTAL_BLOCKS              | NUMBER        |      | Total number of free Oracle blocks in the tablespace           |
| BLOCKS_COALESCED          | NUMBER        |      | Total number of coalesced free Oracle blocks in the tablespace |
| PERCENT_BLOCKS_COALESCED  | NUMBER        |      | Percentage of coalesced free Oracle blocks in the tablespace   |

## 5.348 DBA\_GG\_AUTO\_CDR\_COLUMN\_GROUPS

DBA\_GG\_AUTO\_CDR\_COLUMN\_GROUPS provides details about all of the Oracle GoldenGate automatic conflict detection and resolution (CDR) column groups in the database.

Its columns are the same as those in ALL\_GG\_AUTO\_CDR\_COLUMN\_GROUPS.

**See Also:**

["ALL\\_GG\\_AUTO\\_CDR\\_COLUMN\\_GROUPS"](#)

## 5.349 DBA\_GG\_AUTO\_CDR\_COLUMNS

DBA\_GG\_AUTO\_CDR\_COLUMNS provides details about all of the Oracle GoldenGate automatic conflict detection and resolution (CDR) columns in the database.

Its columns are the same as those in ALL\_GG\_AUTO\_CDR\_COLUMNS.

**See Also:**

["ALL\\_GG\\_AUTO\\_CDR\\_COLUMNS"](#)

## 5.350 DBA\_GG\_AUTO\_CDR\_TABLES

DBA\_GG\_AUTO\_CDR\_TABLES provides details about all the tables configured for Oracle GoldenGate automatic conflict detection and resolution (CDR).

Its columns are the same as those in ALL\_GG\_AUTO\_CDR\_TABLES.

**See Also:**

["ALL\\_GG\\_AUTO\\_CDR\\_TABLES"](#)

## 5.351 DBA\_GG\_INBOUND\_PROGRESS

DBA\_GG\_INBOUND\_PROGRESS displays information about the progress made by all GoldenGate inbound servers in the database. Its columns are the same as those in ALL\_GG\_INBOUND\_PROGRESS.

**See Also:**

["ALL\\_GG\\_INBOUND\\_PROGRESS"](#)

## 5.352 DBA\_GG\_PROC\_OBJECT\_EXCLUSION

DBA\_GG\_PROC\_OBJECT\_EXCLUSION provides details about all tables that should be filtered when operating on given objects.

| Column        | Datatype       | NULL | Description                                    |
|---------------|----------------|------|------------------------------------------------|
| PACKAGE_OWNER | VARCHAR2 (384) |      | Procedure package owner                        |
| PACKAGE_NAME  | VARCHAR2 (384) |      | Procedure package name                         |
| OBJECT_OWNER  | VARCHAR2 (384) |      | Object owner to filter for the given procedure |
| OBJECT_NAME   | VARCHAR2 (384) |      | Object name to filter for the given procedure  |

## 5.353 DBA\_GG\_PROCEDURE\_ANNOTATION

DBA\_GG\_PROCEDURE\_ANNOTATION annotates the position of Owner and Object arguments in procedure calls.

| Column                | Datatype       | NULL     | Description                                                    |
|-----------------------|----------------|----------|----------------------------------------------------------------|
| PACKAGE_OWNER         | VARCHAR2 (384) | NOT NULL | Procedure package owner                                        |
| PACKAGE_NAME          | VARCHAR2 (384) | NOT NULL | Procedure package name                                         |
| PROCEDURE_NAME        | VARCHAR2 (384) | NOT NULL | Procedure name                                                 |
| OBJECT_OWNER_ARGPOS   | NUMBER         | NOT NULL | Object owner name position in argument list, -1 if not present |
| OBJECT_ARGPOS         | NUMBER         | NOT NULL | Object name position in argument list, -1 if not present       |
| MIN_DB_VERSION        | VARCHAR2 (100) |          | Minimum database version for the procedure                     |
| MAX_DB_VERSION        | VARCHAR2 (100) |          | Maximum database version for the procedure                     |
| MIN_REDO_COMPAT_LEVEL | VARCHAR2 (100) |          | Minimum redo compatibility for the procedure                   |
| MAX_REDO_COMPAT_LEVEL | VARCHAR2 (100) |          | Maximum redo compatibility for the procedure                   |
| FLAGS                 | NUMBER         |          | Additional information about procedure arguments               |

## 5.354 DBA\_GG\_SUPPORTED\_PACKAGES

DBA\_GG\_SUPPORTED\_PACKAGES provides details about supported procedure packages for Oracle GoldenGate replication.

| Column                | Datatype       | NULL     | Description                                          |
|-----------------------|----------------|----------|------------------------------------------------------|
| OWNER                 | VARCHAR2 (384) | NOT NULL | Procedure package owner                              |
| NAME                  | VARCHAR2 (384) | NOT NULL | Procedure package name                               |
| FEATURE               | VARCHAR2 (384) | NOT NULL | DBMS feature that the procedure package belongs to   |
| MIN_DB_VERSION        | VARCHAR2 (100) |          | Minimum database version for the supported package   |
| MAX_DB_VERSION        | VARCHAR2 (100) |          | Maximum database version for the supported package   |
| MIN_REDO_COMPAT_LEVEL | VARCHAR2 (100) |          | Minimum redo compatibility for the supported package |
| MAX_REDO_COMPAT_LEVEL | VARCHAR2 (100) |          | Maximum redo compatibility for the supported package |
| SUPPORTED_LEVEL       | VARCHAR2 (100) |          | Supported level of the package                       |

## 5.355 DBA\_GG\_SUPPORTED\_PROCEDURES

DBA\_GG\_SUPPORTED\_PROCEDURES provides details about all procedures that are supported for Oracle GoldenGate replication.

| Column                | Datatype       | NULL | Description                                                                                                                        |
|-----------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                 | VARCHAR2 (128) |      | Procedure package owner                                                                                                            |
| PACKAGE_NAME          | VARCHAR2 (128) |      | Procedure package name                                                                                                             |
| PROCEDURE_NAME        | VARCHAR2 (128) |      | Procedure name                                                                                                                     |
| MIN_DB_VERSION        | VARCHAR2 (100) |      | Minimum database version for the procedure                                                                                         |
| MAX_DB_VERSION        | VARCHAR2 (100) |      | Maximum database version for the procedure                                                                                         |
| MIN_REDO_COMPAT_LEVEL | VARCHAR2 (100) |      | Minimum redo compatibility for the procedure                                                                                       |
| MAX_REDO_COMPAT_LEVEL | VARCHAR2 (100) |      | Maximum redo compatibility for the procedure                                                                                       |
| SUPPORTED_MODE        | VARCHAR2 (100) |      | Supported mode for the procedure: ALWAYS or DBMS_ROLLING                                                                           |
| EXCLUSION_RULE_EXISTS | VARCHAR2 (3)   |      | Specifies whether an exclusion rule exists for the procedure (YES) or not (NO).<br><b>See Also:</b> "DBA_GG_PROC_OBJECT_EXCLUSION" |

## 5.356 DBA\_GLOBAL\_CONTEXT

DBA\_GLOBAL\_CONTEXT displays the definition (name, schema, and package) of all global contexts created in the database.

This view is a subset of DBA\_CONTEXT, which describes all contexts, including global contexts.

| Column    | Datatype       | NULL     | Description                                                            |
|-----------|----------------|----------|------------------------------------------------------------------------|
| NAMESPACE | VARCHAR2 (128) | NOT NULL | Name of the context namespace                                          |
| SCHEMA    | VARCHAR2 (128) | NOT NULL | Schema of the package that administers the globally accessible context |
| PACKAGE   | VARCHAR2 (128) | NOT NULL | Package that administers the globally accessible context               |

### See Also:

- "DBA\_CONTEXT"
- *Oracle Database Security Guide* for more information about using global application contexts
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_SESSION.SET\_CONTEXT procedure

## 5.357 DBA\_GOLDENGATE\_INBOUND

DBA\_GOLDENGATE\_INBOUND displays information about all GoldenGate inbound servers in the database. Its columns are the same as those in ALL\_GOLDENGATE\_INBOUND.

**See Also:**

["ALL\\_GOLDENGATE\\_INBOUND"](#)

## 5.358 DBA\_GOLDENGATE\_NOT\_UNIQUE

DBA\_GOLDENGATE\_NOT\_UNIQUE displays all tables that have no primary and no non-null unique indexes.

Most of the tables displayed by this view are supported because their columns contain enough information to be maintained by Oracle GoldenGate. Some tables, however, cannot be supported because their columns do not contain the necessary information. Unsupported tables usually contain a column defined using an unsupported data type.

| Column     | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER      | VARCHAR2 (128) |      | Schema name of the non-unique table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TABLE_NAME | VARCHAR2 (128) |      | Table name of the non-unique table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| BAD_COLUMN | VARCHAR2 (1)   |      | Indicates that the table has a column not useful in the where clause. Possible values: <ul style="list-style-type: none"><li>• <b>Y</b> - Table column is defined using an unbounded data type, such as <b>LONG</b> or <b>BLOB</b>. If two rows in the table match except in their LOB columns, then the table cannot be maintained properly. Log apply services will attempt to maintain these tables, but you must ensure the application does not allow uniqueness only in the unbounded columns.</li><li>• <b>N</b> - Enough column information is present to maintain the table in Oracle GoldenGate but the log transport services and log apply services would run more efficiently if you added a primary key. You should consider adding a disabled <b>RELY</b> constraint to these tables.</li></ul> |

## 5.359 DBA\_GOLDENGATE\_PRIVILEGES

DBA\_GOLDENGATE\_PRIVILEGES displays details about Oracle GoldenGate privileges. Its columns are the same as those in ALL\_GOLDENGATE\_PRIVILEGES.

**See Also:**

["ALL\\_GOLDENGATE\\_PRIVILEGES"](#)

## 5.360 DBA\_GOLDENGATE\_RULES

DBA\_GOLDENGATE\_RULES displays information about all GoldenGate server rules in the database. Its columns are the same as those in ALL\_GOLDENGATE\_RULES.

**See Also:**

"ALL\_GOLDENGATE\_RULES"

## 5.361 DBA\_GOLDENGATE\_SUPPORT\_MODE

DBA\_GOLDENGATE\_SUPPORT\_MODE displays information about the level of Oracle GoldenGate capture process support for the tables in the database.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER        | VARCHAR2 (128) |      | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_NAME  | VARCHAR2 (128) |      | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SUPPORT_MODE | VARCHAR2 (6)   |      | Capture process support level for the table: <ul style="list-style-type: none"><li>• <b>FULL</b> - A capture process can capture changes made to all of the columns in the table</li><li>• <b>ID KEY</b> - A capture process can capture changes made to the key columns and any other columns in the table supported by the capture process, except for LOB, LONG, LONG RAW, and XMLType columns.</li><li>• <b>INTERNAL</b> - A capture process cannot capture changes made to any columns in the table because the table is secondary to a user-created table and is updated implicitly when changes are made to the user-created table. Such tables include mapping tables for index-organized tables, storage tables for nested tables, materialized view logs, secondary objects associated with domain indexes, and temporary tables.</li><li>• <b>PLSQL</b> - A capture process can capture changes made to the table as long as Procedural Supplemental Logging is enabled on the source database. Such tables include hierarchy-enabled tables, AQ queue tables, and tables containing columns of type MDSYS.SDO_TOPO_GEOMETRY, MDSYS.SDO_GEORASTER, or MDSYS.SDO_RDF_TRIPLE_S.</li><li>• <b>NONE</b> - A capture process cannot capture changes made to any columns in the table because the table is not supported for replication.</li></ul> |

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPLANATION | VARCHAR2 (4000) |      | Reason the table does not have <code>FULL</code> capture process support<br>This column is populated only when both of the following conditions are met: <ul style="list-style-type: none"> <li>The value of the <code>COMPATIBLE</code> initialization parameter is <code>20.0</code> or higher</li> <li>The value of the <code>SUPPORT_MODE</code> column is <code>ID KEY</code>, <code>INTERNAL</code>, <code>PLSQL</code>, or <code>NONE</code></li> </ul> |

## 5.362 DBA\_HANG\_MANAGER\_PARAMETERS

`DBA_HANG_MANAGER_PARAMETERS` shows the available user-tunable Blocker Resolver parameters and their values.

### Note:

This view is deprecated. Oracle recommends that you instead use the `DBA_BLOCKER_RESOLVER_PARAMETERS` view.

### See Also:

"[DBA\\_BLOCKER\\_RESOLVER\\_PARAMETERS](#)"

## 5.363 DBA\_HEAT\_MAP\_SEG\_HISTOGRAM

`DBA_HEAT_MAP_SEG_HISTOGRAM` displays segment access information for all segments. Its columns are the same as those in `ALL_HEAT_MAP_SEG_HISTOGRAM`.

### See Also:

"[ALL\\_HEAT\\_MAP\\_SEG\\_HISTOGRAM](#)"

## 5.364 DBA\_HEAT\_MAP\_SEGMENT

`DBA_HEAT_MAP_SEGMENT` displays the latest segment access time for all segments. Its columns are the same as those in `ALL_HEAT_MAP_SEGMENT`.

### See Also:

"[ALL\\_HEAT\\_MAP\\_SEGMENT](#)"

## 5.365 DBA\_HEATMAP\_TOP\_OBJECTS

DBA\_HEATMAP\_TOP\_OBJECTS displays heat map information for the top 10000 objects by default.

If the database contains fewer than 10000 objects, then fewer than 10000 objects are returned by the view.

| Column          | Datatype       | NULL | Description                                           |
|-----------------|----------------|------|-------------------------------------------------------|
| OWNER           | VARCHAR2 (128) |      | Object owner                                          |
| OBJECT_NAME     | VARCHAR2 (128) |      | Object name                                           |
| OBJECT_TYPE     | VARCHAR2 (18)  |      | Object type                                           |
| TABLESPACE_NAME | VARCHAR2 (30)  |      | Tablespace name                                       |
| SEGMENT_COUNT   | NUMBER         |      | Segments in the tablespace                            |
| OBJECT_SIZE     | NUMBER         |      | Size of the object in MB                              |
| MIN_WRITETIME   | DATE           |      | Oldest modification time for a set of blocks          |
| MAX_WRITETIME   | DATE           |      | Latest modification time for a set of blocks          |
| AVG_WRITETIME   | DATE           |      | Average of the modification times for a set of blocks |
| MIN_READTIME    | DATE           |      | Oldest read time for a set of blocks                  |
| MAX_READTIME    | DATE           |      | Latest read time for a set of blocks                  |
| AVG_READTIME    | DATE           |      | Average of the read times for a set of blocks         |
| MIN_FTSTIME     | DATE           |      | Minimum full table scan time of the object            |
| MAX_FTSTIME     | DATE           |      | Maximum full table scan time of the object            |
| AVG_FTSTIME     | DATE           |      | Average full table scan time of the object            |
| MIN_LOOKUPTIME  | DATE           |      | Minimum lookup time of the object                     |
| MAX_LOOKUPTIME  | DATE           |      | Maximum lookup time of the object                     |
| AVG_LOOKUPTIME  | DATE           |      | Average lookup time of the object                     |

## 5.366 DBA\_HEATMAP\_TOP\_TABLESPACES

DBA\_HEATMAP\_TOP\_TABLESPACES displays heat map information for the top 100 tablespaces.

| Column          | Datatype       | NULL | Description                                            |
|-----------------|----------------|------|--------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (128) |      | Tablespace name                                        |
| SEGMENT_COUNT   | NUMBER         |      | Segments in the tablespace                             |
| ALLOCATED_BYTES | NUMBER         |      | Total bytes allocated to the objects in the tablespace |
| MIN_WRITETIME   | DATE           |      | Minimum write time of objects tracked                  |
| MAX_WRITETIME   | DATE           |      | Maximum write time of objects tracked                  |
| AVG_WRITETIME   | DATE           |      | Average write time of objects tracked                  |
| MIN_READTIME    | DATE           |      | Minimum read time of objects tracked                   |
| MAX_READTIME    | DATE           |      | Maximum read time of objects tracked                   |
| AVG_READTIME    | DATE           |      | Average read time of objects tracked                   |
| MIN_FTSTIME     | DATE           |      | Minimum full table scan time of objects tracked        |

| Column         | Datatype | NULL | Description                                     |
|----------------|----------|------|-------------------------------------------------|
| MAX_FTSTIME    | DATE     |      | Maximum full table scan time of objects tracked |
| AVG_FTSTIME    | DATE     |      | Average full table scan time of objects tracked |
| MIN_LOOKUPTIME | DATE     |      | Minimum lookup time of objects tracked          |
| MAX_LOOKUPTIME | DATE     |      | Maximum lookup time of objects tracked          |
| AVG_LOOKUPTIME | DATE     |      | Average lookup time of objects tracked          |

## 5.367 DBA\_HIER\_CLASS

DBA\_HIER\_CLASS describes the classifications of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_CLASS.

**See Also:**

["ALL\\_HIER\\_CLASS"](#)

## 5.368 DBA\_HIER\_CLASS\_AE

DBA\_HIER\_CLASS\_AE describes the classifications of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_CLASS\_AE.

**See Also:**

["ALL\\_HIER\\_CLASS\\_AE"](#)

## 5.369 DBA\_HIER\_COLUMNS

DBA\_HIER\_COLUMNS describes the columns of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_COLUMNS.

**See Also:**

["ALL\\_HIER\\_COLUMNS"](#)

## 5.370 DBA\_HIER\_COLUMNS\_AE

DBA\_HIER\_COLUMNS\_AE describes the columns of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_COLUMNS\_AE.

**See Also:**

"ALL\_HIER\_COLUMNS\_AE"

## 5.371 DBA\_HIER\_HIER\_ATTR\_CLASS

DBA\_HIER\_HIER\_ATTR\_CLASS describes the classifications of the hierarchical attributes of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_HIER\_ATTR\_CLASS.

**See Also:**

"ALL\_HIER\_HIER\_ATTR\_CLASS"

## 5.372 DBA\_HIER\_HIER\_ATTR\_CLASS\_AE

DBA\_HIER\_HIER\_ATTR\_CLASS\_AE describes the classifications of the hierarchical attributes of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_HIER\_ATTR\_CLASS\_AE.

**See Also:**

"ALL\_HIER\_HIER\_ATTR\_CLASS\_AE"

## 5.373 DBA\_HIER\_HIER\_ATTRIBUTES

DBA\_HIER\_HIER\_ATTRIBUTES describes the hierarchical attributes of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_HIER\_ATTRIBUTES.

**See Also:**

"ALL\_HIER\_HIER\_ATTRIBUTES"

## 5.374 DBA\_HIER\_HIER\_ATTRIBUTES\_AE

DBA\_HIER\_HIER\_ATTRIBUTES\_AE describes the hierarchical attributes of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_HIER\_ATTRIBUTES\_AE.

**See Also:**

["ALL\\_HIER\\_HIER\\_ATTRIBUTES\\_AE"](#)

## 5.375 DBA\_HIER\_JOIN\_PATHS

DBA\_HIER\_JOIN\_PATHS describes the join paths for all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_JOIN\_PATHS.

**See Also:**

["ALL\\_HIER\\_JOIN\\_PATHS"](#)

## 5.376 DBA\_HIER\_JOIN\_PATHS\_AE

DBA\_HIER\_JOIN\_PATHS\_AE describes the join paths for all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_JOIN\_PATHS\_AE.

**See Also:**

["ALL\\_HIER\\_JOIN\\_PATHS\\_AE"](#)

## 5.377 DBA\_HIER\_LEVEL\_ID\_ATTRS

DBA\_HIER\_LEVEL\_ID\_ATTRS describes the attributes that uniquely identify members of the levels of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_LEVEL\_ID\_ATTRS.

**See Also:**

["ALL\\_HIER\\_LEVEL\\_ID\\_ATTRS"](#)

## 5.378 DBA\_HIER\_LEVEL\_ID\_ATTRS\_AE

DBA\_HIER\_LEVEL\_ID\_ATTRS\_AE describes the attributes that uniquely identify members of the levels of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_LEVEL\_ID\_ATTRS\_AE.

**See Also:**

["ALL\\_HIER\\_LEVEL\\_ID\\_ATTRS\\_AE"](#)

## 5.379 DBA\_HIER\_LEVELS

DBA\_HIER\_LEVELS describes the levels of all hierarchies in the database. Its columns are the same as those in ALL\_HIER\_LEVELS.

**See Also:**

["ALL\\_HIER\\_LEVELS"](#)

## 5.380 DBA\_HIER\_LEVELS\_AE

DBA\_HIER\_LEVELS\_AE describes the levels of all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIER\_LEVELS\_AE.

**See Also:**

["ALL\\_HIER\\_LEVELS\\_AE"](#)

## 5.381 DBA\_HIERARCHIES

DBA\_HIERARCHIES describes all hierarchies in the database. Its columns are the same as those in ALL\_HIERARCHIES.

**See Also:**

["ALL\\_HIERARCHIES"](#)

## 5.382 DBA\_HIERARCHIES\_AE

DBA\_HIERARCHIES\_AE describes all hierarchies (across all editions) in the database. Its columns are the same as those in ALL\_HIERARCHIES\_AE.

**See Also:**

"ALL\_HIERARCHIES\_AE"

## 5.383 DBA\_HIGH\_WATER\_MARK\_STATISTICS

DBA\_HIGH\_WATER\_MARK\_STATISTICS displays information about database high-watermark statistics.

| Column      | Datatype       | NULL     | Description                                                                    |
|-------------|----------------|----------|--------------------------------------------------------------------------------|
| DBID        | NUMBER         | NOT NULL | Identifier of the database for which the high-watermark statistics are tracked |
| NAME        | VARCHAR2 (64)  | NOT NULL | Name of the high-watermark statistic (see <a href="#">Table 5-1</a> )          |
| VERSION     | VARCHAR2 (17)  | NOT NULL | Database version in which the high watermarks were tracked                     |
| HIGHWATER   | NUMBER         |          | Highest value of the statistic seen at sampling time                           |
| LAST_VALUE  | NUMBER         |          | Value of the statistic at the last sample time                                 |
| DESCRIPTION | VARCHAR2 (128) |          | Description of the high-watermark statistics (see <a href="#">Table 5-1</a> )  |

**Table 5-1 DBA\_HIGH\_WATER\_MARK\_STATISTICS Statistics**

| Name              | Description                                                |
|-------------------|------------------------------------------------------------|
| ACTIVE_SESSIONS   | Maximum Number of Active Sessions seen in the system       |
| CPU_COUNT         | Maximum Number of CPUs                                     |
| DATAFILES         | Maximum Number of Datafiles                                |
| DB_SIZE           | Maximum Size of the Database (Bytes)                       |
| EXADATA_DISKS     | Number of physical disks                                   |
| INSTANCES         | Oracle Database instances                                  |
| PART_INDEXES      | Maximum Number of Partitions belonging to an User Index    |
| PART_TABLES       | Maximum Number of Partitions belonging to an User Table    |
| QUERY_LENGTH      | Maximum Query Length                                       |
| SEGMENT_SIZE      | Size of Largest Segment (Bytes)                            |
| SESSIONS          | Maximum Number of Concurrent Sessions seen in the database |
| SQL_NCHAR_COLUMNS | Maximum Number of SQL NCHAR Columns                        |
| TABLESPACES       | Maximum Number of Tablespaces                              |
| USER_INDEXES      | Number of User Indexes                                     |
| USER_MV           | Maximum Number of Materialized Views (User)                |

**Table 5-1 (Cont.) DBA\_HIGH\_WATER\_MARK\_STATISTICS Statistics**

| Name        | Description           |
|-------------|-----------------------|
| USER_TABLES | Number of User Tables |

## 5.384 DBA\_HIST\_ACTIVE\_SESS\_HISTORY

DBA\_HIST\_ACTIVE\_SESS\_HISTORY displays the history of the contents of the in-memory active session history of recent system activity.

DBA\_HIST\_ACTIVE\_SESS\_HISTORY contains snapshots of V\$ACTIVE\_SESSION\_HISTORY. See ["V\\$ACTIVE\\_SESSION\\_HISTORY"](#) for further interpretation details for many of these columns (except SNAP\_ID, DBID, and INSTANCE\_NUMBER).

### Note:

If you want to perform a join with the snapshots view, use the DBA\_HIST\_ASH\_SNAPSHOT view instead of the DBA\_HIST\_SNAPSHOT view.

| Column           | Datatype     | NULL     | Description                                                                                        |
|------------------|--------------|----------|----------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER       | NOT NULL | Unique snapshot ID                                                                                 |
| DBID             | NUMBER       | NOT NULL | Database ID for the snapshot                                                                       |
| INSTANCE_NUMBER  | NUMBER       | NOT NULL | Instance number for the snapshot                                                                   |
| SAMPLE_ID        | NUMBER       | NOT NULL | ID of the sample                                                                                   |
| SAMPLE_TIME      | TIMESTAMP(3) | NOT NULL | Time of the sample                                                                                 |
| SAMPLE_TIME_UTC  | TIMESTAMP(3) |          | SAMPLE_TIME in UTC                                                                                 |
| USECS_PER_ROW    | NUMBER       |          | Time in microseconds since the last active session history sample                                  |
| SESSION_ID       | NUMBER       | NOT NULL | Session identifier                                                                                 |
| SESSION_SERIAL#  | NUMBER       |          | Session serial number (used to uniquely identify a session's objects)                              |
| SESSION_TYPE     | VARCHAR2(10) |          | Session type: <ul style="list-style-type: none"> <li>• FOREGROUND</li> <li>• BACKGROUND</li> </ul> |
| FLAGS            | NUMBER       |          | Reserved for future use                                                                            |
| USER_ID          | NUMBER       |          | Oracle user identifier                                                                             |
| SQL_ID           | VARCHAR2(13) |          | SQL identifier of the SQL statement that is currently being executed                               |
| IS_SQLID_CURRENT | VARCHAR2(1)  |          | Indicates whether the SQL identifier in the SQL_ID column is being executed (Y) or not (N)         |
| SQL_CHILD_NUMBER | NUMBER       |          | Child number of the SQL statement that is currently being executed                                 |
| SQL_OPCODE       | NUMBER       |          | Indicates what phase of operation the SQL statement is in                                          |
| SQL_OPNAME       | VARCHAR2(64) |          | SQL command name                                                                                   |

| Column                     | Datatype      | NULL | Description                                                                                                                                                                                                              |
|----------------------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FORCE_MATCHING_SIGNATURE   | NUMBER        |      | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>                                                                                                                               |
| TOP_LEVEL_SQL_ID           | VARCHAR2 (13) |      | SQL identifier of the top level SQL statement                                                                                                                                                                            |
| TOP_LEVEL_SQL_OPCODE       | NUMBER        |      | Indicates what phase of operation the top level SQL statement was in                                                                                                                                                     |
| SQL_PLAN_HASH_VALUE        | NUMBER        |      | Numerical representation of the SQL plan for the cursor                                                                                                                                                                  |
| SQL_FULL_PLAN_HASH_VALUE   | NUMBER        |      | Numerical representation of the complete SQL plan for the cursor being executed by this session                                                                                                                          |
| SQL_ADAPTIVE_PLAN_RESOLVED | NUMBER        |      | Indicates whether the SQL plan of the sampled database session is a resolved adaptive plan or not                                                                                                                        |
| SQL_PLAN_LINE_ID           | NUMBER        |      | SQL plan line ID                                                                                                                                                                                                         |
| SQL_PLAN_OPERATION         | VARCHAR2 (64) |      | Plan operation name                                                                                                                                                                                                      |
| SQL_PLAN_OPTIONS           | VARCHAR2 (64) |      | Plan operation options                                                                                                                                                                                                   |
| SQL_EXEC_ID                | NUMBER        |      | SQL execution identifier                                                                                                                                                                                                 |
| SQL_EXEC_START             | DATE          |      | Time when the execution of the SQL started                                                                                                                                                                               |
| PLSQL_ENTRY_OBJECT_ID      | NUMBER        |      | Object ID of the top-most PL/SQL subprogram on the stack (or NULL if there is no PL/SQL subprogram on the stack)                                                                                                         |
| PLSQL_ENTRY_SUBPROGRAM_ID  | NUMBER        |      | Subprogram ID of the top-most PL/SQL subprogram on the stack (or NULL if there is no PL/SQL subprogram on the stack)                                                                                                     |
| PLSQL_OBJECT_ID            | NUMBER        |      | Object ID of the currently executing PL/SQL subprogram (or NULL if executing SQL)                                                                                                                                        |
| PLSQL_SUBPROGRAM_ID        | NUMBER        |      | Subprogram ID of the currently executing PL/SQL object (or NULL if executing SQL)                                                                                                                                        |
| QC_INSTANCE_ID             | NUMBER        |      | Query coordinator instance ID                                                                                                                                                                                            |
| QC_SESSION_ID              | NUMBER        |      | Query coordinator session ID                                                                                                                                                                                             |
| QC_SESSION_SERIAL#         | NUMBER        |      | Query coordinator session serial number                                                                                                                                                                                  |
| PX_FLAGS                   | NUMBER        |      | Reserved for internal use                                                                                                                                                                                                |
| EVENT                      | VARCHAR2 (64) |      | If <code>SESSION_STATE</code> = <code>WAITING</code> , then the event for which the session was waiting at the time of sampling.<br>If <code>SESSION_STATE</code> = <code>ON CPU</code> , then this column will be NULL. |
| EVENT_ID                   | NUMBER        |      | Identifier of the resource or event for which the session is waiting or for which the session last waited                                                                                                                |
| SEQ#                       | NUMBER        |      | Sequence number that uniquely identifies the wait (incremented for each wait)                                                                                                                                            |
| P1TEXT                     | VARCHAR2 (64) |      | Text of first additional parameter                                                                                                                                                                                       |
| P1                         | NUMBER        |      | First additional parameter                                                                                                                                                                                               |
| P2TEXT                     | VARCHAR2 (64) |      | Text of second additional parameter                                                                                                                                                                                      |
| P2                         | NUMBER        |      | Second additional parameter                                                                                                                                                                                              |
| P3TEXT                     | VARCHAR2 (64) |      | Text of third additional parameter                                                                                                                                                                                       |
| P3                         | NUMBER        |      | Third additional parameter                                                                                                                                                                                               |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                |
|--------------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAIT_CLASS               | VARCHAR2 (64) |      | Wait class name of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the <code>EVENT</code> column. Maps to <code>V\$SESSION.WAIT_CLASS</code> .                                                   |
| WAIT_CLASS_ID            | NUMBER        |      | Wait class identifier of the event for which the session was waiting at the time of sampling. Interpretation is similar to that of the <code>EVENT</code> column. Maps to <code>V\$SESSION.WAIT_CLASS_ID</code> .                                          |
| WAIT_TIME                | NUMBER        |      | Total wait time (in microseconds) for the event for which the session last waited (0 if currently waiting)                                                                                                                                                 |
| SESSION_STATE            | VARCHAR2 (7)  |      | Session state: <ul style="list-style-type: none"> <li>• WAITING</li> <li>• ON CPU</li> </ul>                                                                                                                                                               |
| TIME_WAITED              | NUMBER        |      | Time that the current session actually spent waiting for the event (in microseconds). This column is set for waits that were in progress at the time the sample was taken.                                                                                 |
| BLOCKING_SESSION_STATUS  | VARCHAR2 (11) |      | Status of the blocking session: <ul style="list-style-type: none"> <li>• VALID</li> <li>• NO HOLDER</li> <li>• GLOBAL</li> <li>• NOT IN WAIT</li> <li>• UNKNOWN</li> </ul>                                                                                 |
| BLOCKING_SESSION         | NUMBER        |      | Session identifier of the blocking session. Populated only when the session was waiting for enqueues or a "buffer busy" wait. Maps to <code>V\$SESSION.BLOCKING_SESSION</code> .                                                                           |
| BLOCKING_SESSION_SERIAL# | NUMBER        |      | Serial number of the blocking session                                                                                                                                                                                                                      |
| BLOCKING_INST_ID         | NUMBER        |      | Instance number of the blocker shown in <code>BLOCKING_SESSION</code>                                                                                                                                                                                      |
| BLOCKING_HANGCHAIN_INFO  | VARCHAR2 (1)  |      | Indicates whether the information about <code>BLOCKING_SESSION</code> comes from the hang chain (Y) or not (N)                                                                                                                                             |
| CURRENT_OBJ#             | NUMBER        |      | Object ID of the object that the session is currently referencing. This information is only available if the session was waiting for Application, Cluster, Concurrency, and User I/O wait events. Maps to <code>V\$SESSION.ROW_WAIT_OBJ#</code> .          |
| CURRENT_FILE#            | NUMBER        |      | File number of the file containing the block that the session is currently referencing. This information is only available if the session was waiting for Cluster, Concurrency, and User I/O wait events. Maps to <code>V\$SESSION.ROW_WAIT_FILE#</code> . |
| CURRENT_BLOCK#           | NUMBER        |      | ID of the block that the session is currently referencing                                                                                                                                                                                                  |
| CURRENT_ROW#             | NUMBER        |      | Row identifier that the session is referencing                                                                                                                                                                                                             |
| TOP_LEVEL_CALL#          | NUMBER        |      | Oracle top level call number                                                                                                                                                                                                                               |
| TOP_LEVEL_CALL_NAME      | VARCHAR2 (64) |      | Oracle top level call name                                                                                                                                                                                                                                 |
| CONSUMER_GROUP_ID        | NUMBER        |      | Consumer group ID                                                                                                                                                                                                                                          |

| Column                   | Datatype     | NULL | Description                                                                                                                                                              |
|--------------------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XID                      | RAW (8)      |      | Transaction ID that the session was working on at the time of sampling. V\$SESSION does not contain this information.                                                    |
| REMOTE_INSTANCE#         | NUMBER       |      | Remote instance identifier that will serve the block that this session is waiting for. This information is only available if the session was waiting for cluster events. |
| TIME_MODEL               | NUMBER       |      | Time model information                                                                                                                                                   |
| IN_CONNECTION_MGMT       | VARCHAR2 (1) |      | Indicates whether the session was doing connection management at the time of sampling (Y) or not (N)                                                                     |
| IN_PARSE                 | VARCHAR2 (1) |      | Indicates whether the session was parsing at the time of sampling (Y) or not (N)                                                                                         |
| IN_HARD_PARSE            | VARCHAR2 (1) |      | Indicates whether the session was hard parsing at the time of sampling (Y) or not (N)                                                                                    |
| IN_SQL_EXECUTION         | VARCHAR2 (1) |      | Indicates whether the session was executing SQL statements at the time of sampling (Y) or not (N)                                                                        |
| IN_PLSQL_EXECUTION       | VARCHAR2 (1) |      | Indicates whether the session was executing PL/SQL at the time of sampling (Y) or not (N)                                                                                |
| IN_PLSQL_RPC             | VARCHAR2 (1) |      | Indicates whether the session was executing inbound PL/SQL RPC calls at the time of sampling (Y) or not (N)                                                              |
| IN_PLSQL_COMPILATION     | VARCHAR2 (1) |      | Indicates whether the session was compiling PL/SQL at the time of sampling (Y) or not (N)                                                                                |
| IN_JAVA_EXECUTION        | VARCHAR2 (1) |      | Indicates whether the session was executing Java at the time of sampling (Y) or not (N)                                                                                  |
| IN_BIND                  | VARCHAR2 (1) |      | Indicates whether the session was doing bind operations at the time of sampling (Y) or not (N)                                                                           |
| IN_CURSOR_CLOSE          | VARCHAR2 (1) |      | Indicates whether the session was closing a cursor at the time of sampling (Y) or not (N)                                                                                |
| IN_SEQUENCE_LOAD         | VARCHAR2 (1) |      | Indicates whether the session is loading in sequence (in sequence load code) (Y) or not (N)                                                                              |
| IN_INMEMORY_QUERY        | VARCHAR2 (1) |      | Indicates whether the session was querying the In-Memory Column Store (IM column store) at the time of sampling (Y) or not (N)                                           |
| IN_INMEMORY_POPULATE     | VARCHAR2 (1) |      | Indicates whether the session was populating the IM column store at the time of sampling (Y) or not (N)                                                                  |
| IN_INMEMORY_PREPOPULATE  | VARCHAR2 (1) |      | Indicates whether the session was prepopulating the IM column store at the time of sampling (Y) or not (N)                                                               |
| IN_INMEMORY_REPOPULATE   | VARCHAR2 (1) |      | Indicates whether the session was repopulating the IM column store at the time of sampling (Y) or not (N)                                                                |
| IN_INMEMORY_TREPOPULATE  | VARCHAR2 (1) |      | Indicates whether the session was trickle repopulating the IM column store at the time of sampling (Y) or not (N)                                                        |
| IN_TABLESPACE_ENCRYPTION | VARCHAR2 (1) |      | Indicates whether encryption or decryption of a tablespace occurred at the time of sampling (Y) or not (N)                                                               |
| CAPTURE_OVERHEAD         | VARCHAR2 (1) |      | Indicates whether the session is executing capture code (Y) or not (N)                                                                                                   |
| REPLAY_OVERHEAD          | VARCHAR2 (1) |      | Indicates whether the session is executing replay code (Y) or not (N)                                                                                                    |

| Column                      | Datatype      | NULL | Description                                                                                                                                                             |
|-----------------------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_CAPTURED                 | VARCHAR2 (1)  |      | Indicates whether the session is being captured (Y) or not (N)                                                                                                          |
| IS_REPLAYED                 | VARCHAR2 (1)  |      | Indicates whether the session is being replayed (Y) or not (N)                                                                                                          |
| IS_REPLAY_SYNC_TOKEN_HOLDER | VARCHAR2 (1)  |      | Indicates whether the session is holding a synchronization token (Y) or not (N) during workload replay                                                                  |
| SPID                        | VARCHAR2 (24) |      | Operating system process identifier                                                                                                                                     |
| STID                        | VARCHAR2 (24) |      | Operating system thread identifier                                                                                                                                      |
| SERVICE_HASH                | NUMBER        |      | Hash that identifies the Service                                                                                                                                        |
| PROGRAM                     | VARCHAR2 (84) |      | Name of the operating system program                                                                                                                                    |
| MODULE                      | VARCHAR2 (64) |      | Name of the currently executing module as set by the DBMS_APPLICATION_INFO.SET_MODULE procedure                                                                         |
| ACTION                      | VARCHAR2 (64) |      | Name of the currently executing action as set by the DBMS_APPLICATION_INFO.SET_ACTION procedure                                                                         |
| CLIENT_ID                   | VARCHAR2 (64) |      | Client identifier of the session                                                                                                                                        |
| CLIENT_INFO                 | VARCHAR2 (64) |      | Client information for the session                                                                                                                                      |
| MACHINE                     | VARCHAR2 (64) |      | Client's operating system machine name                                                                                                                                  |
| PORT                        | NUMBER        |      | Client port number                                                                                                                                                      |
| ECID                        | VARCHAR2 (64) |      | Execution context identifier (sent by Application Server)                                                                                                               |
| DBREPLAY_FILE_ID            | NUMBER        |      | If the session is being captured or replayed, then DBREPLAY_FILE_ID is the file ID for the workload capture or workload replay; otherwise it is NULL.                   |
| DBREPLAY_CALL_COUNTER       | NUMBER        |      | If the session is being captured or replayed, then DBREPLAY_CALL_COUNTER is the call counter of the user call that is being captured or replayed; otherwise it is NULL. |
| TM_DELTA_TIME               | NUMBER        |      | Time interval (in microseconds) over which TM_DELTA_CPU_TIME and TM_DELTA_DB_TIME are accumulated                                                                       |
| TM_DELTA_CPU_TIME           | NUMBER        |      | Amount of time this session spent on CPU over the last TM_DELTA_TIME microseconds                                                                                       |
| TM_DELTA_DB_TIME            | NUMBER        |      | Amount of time spent by this session in database calls over the last TM_DELTA_TIME microseconds                                                                         |
| DELTA_TIME                  | NUMBER        |      | Time interval (in microseconds) since the last time this session was sampled or created, over which the next five statistics are accumulated                            |
| DELTA_READ_IO_REQUESTS      | NUMBER        |      | Number of read I/O requests made by this session over the last DELTA_TIME microseconds                                                                                  |
| DELTA_WRITE_IO_REQUESTS     | NUMBER        |      | Number of write I/O requests made by this session over the last DELTA_TIME microseconds                                                                                 |
| DELTA_READ_IO_BYTES         | NUMBER        |      | Number of I/O bytes read by this session over the last DELTA_TIME microseconds                                                                                          |
| DELTA_WRITE_IO_BYTES        | NUMBER        |      | Number of I/O bytes written by this session over the last DELTA_TIME microseconds                                                                                       |

| Column                      | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELTA_INTERCONNECT_IO_BYTES | NUMBER        |      | Number of I/O bytes sent over the I/O interconnect over the last <code>DELTA_TIME</code> microseconds                                                                                                                                                                                                                                                                                                                                                      |
| PGA_ALLOCATED               | NUMBER        |      | Amount of PGA memory (in bytes) consumed by this session at the time this sample was taken                                                                                                                                                                                                                                                                                                                                                                 |
| TEMP_SPACE_ALLOCATED        | NUMBER        |      | Amount of TEMP memory (in bytes) consumed by this session at the time this sample was taken                                                                                                                                                                                                                                                                                                                                                                |
| DBOP_NAME                   | VARCHAR2 (64) |      | Database operation name. If the type is SQL, the <code>DBOP_NAME</code> will be NULL.                                                                                                                                                                                                                                                                                                                                                                      |
| DBOP_EXEC_ID                | NUMBER        |      | Database operation execution identifier for the current execution. If the type is SQL, the <code>DBOP_EXEC_ID</code> will be NULL.                                                                                                                                                                                                                                                                                                                         |
| CON_DBID                    | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                      | NUMBER        |      | The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.385 DBA\_HIST\_APPLY\_SUMMARY

`DBA_HIST_APPLY_SUMMARY` displays historical statistics information about each apply process for Oracle GoldenGate, and Oracle XStream. This view is intended for use with Automatic Workload Repository (AWR).

| Column                         | Datatype       | NULL     | Description                                                                |
|--------------------------------|----------------|----------|----------------------------------------------------------------------------|
| SNAP_ID                        | NUMBER         | NOT NULL | Unique snapshot ID                                                         |
| DBID                           | NUMBER         | NOT NULL | Database ID for the snapshot                                               |
| INSTANCE_NUMBER                | NUMBER         | NOT NULL | Instance number for the snapshot                                           |
| APPLY_NAME                     | VARCHAR2 (128) | NOT NULL | Name of the apply process                                                  |
| STARTUP_TIME                   | DATE           | NOT NULL | The time that the apply process was last started                           |
| READER_TOTAL_MESSAGES_DEQUEUED | NUMBER         |          | Total number of messages dequeued since the apply process was last started |

| Column                        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READER_LAG                    | NUMBER         |          | For captured messages, the delay (in seconds) between the creation of the last message and it being received by the apply process. For user enqueued messages, the delay between the message being enqueued in the local database and being received by the apply process.                             |
| COORD_TOTAL_RECEIVED          | NUMBER         |          | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                              |
| COORD_TOTAL_APPLIED           | NUMBER         |          | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                     |
| COORD_TOTAL_ROLLBACKS         | NUMBER         |          | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                             |
| COORD_TOTAL_WAIT_DEPS         | NUMBER         |          | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                         |
| COORD_TOTAL_WAIT_CMTS         | NUMBER         |          | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                   |
| COORD_LWM_LAG                 | NUMBER         |          | For captured messages, the delay (in seconds) between the creation of the message corresponding to the low watermark and it being applied by the apply process. For user enqueued messages, the delay between the message being enqueued in the local database and being applied by the apply process. |
| SERVER_TOTAL_MESSAGES_APPLIED | NUMBER         |          | Total number of messages applied by all the apply servers since the apply process was last started                                                                                                                                                                                                     |
| SERVER_ELAPSED_DEQUEUE_TIME   | NUMBER         |          | Time elapsed (in hundredths of a second) dequeuing messages by all the apply servers since the apply process was last started                                                                                                                                                                          |
| SERVER_ELAPSED_APPLY_TIME     | NUMBER         |          | Time elapsed (in hundredths of a second) applying messages by all the apply servers since the apply process was last started                                                                                                                                                                           |
| CON_DBID                      | NUMBER         |          | The database ID of the PDB                                                                                                                                                                                                                                                                             |
| REPLICAT_NAME                 | VARCHAR2 (128) |          | The name of the replicat group created from GGSCI using GoldenGate                                                                                                                                                                                                                                     |
| UNASSIGNED_COMPLETE_TXN       | NUMBER         |          | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                       |
| TOTAL_LCRS_RETRIED            | NUMBER         |          | Total number of LCRs retried by this server                                                                                                                                                                                                                                                            |
| TOTAL_TRANSACTIONS_RETRIED    | NUMBER         |          | Total transactions retried by this server                                                                                                                                                                                                                                                              |
| TOTAL_ERRORS                  | NUMBER         |          | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                           |
| SESSION_MODULE                | VARCHAR2 (64)  | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>• XStream</li> <li>• GoldenGate</li> </ul>                                                                                                                                                                                        |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.386 DBA\_HIST\_ASH\_SNAPSHOT

DBA\_HIST\_ASH\_SNAPSHOT provides the list of snapshots that contains Active Session History (ASH) data.

This view differs from DBA\_HIST\_SNAPSHOT in that it provides snapshots which had errors flushing some Automatic Workload Repository (AWR) tables, but for which ASH data may be successfully flushed (DBA\_HIST\_SNAPSHOT filters out snapshots which had errors flushing AWR tables).

| Column              | Datatype                        | NULL     | Description                                                                                                                                                                                                                                                                                       |

## 5.387 DBA\_HIST\_BASELINE

DBA\_HIST\_BASELINE displays information on baselines taken in the system.

For each baseline, this view displays the complete time range and whether the baseline is the default baseline.

| Column             | Datatype      | NULL | Description                                                                                                                                                                                                                                                                       |
|--------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID               | NUMBER        |      | Database ID                                                                                                                                                                                                                                                                       |
| BASELINE_ID        | NUMBER        |      | Internal ID for the baseline                                                                                                                                                                                                                                                      |
| BASELINE_NAME      | VARCHAR2 (64) |      | User-specified name for the baseline                                                                                                                                                                                                                                              |
| BASELINE_TYPE      | VARCHAR2 (13) |      | <p>The baseline type, as follows:</p> <p>STATIC - baselines that are created manually by the user</p> <p>MOVING WINDOW - baselines that have dynamic start and end snapshot IDs</p> <p>GENERATED - baselines that are automatically generated by the system, using a template</p> |
| START_SNAP_ID      | NUMBER        |      | Start snapshot ID for the baseline                                                                                                                                                                                                                                                |
| START_SNAP_TIME    | TIMESTAMP (3) |      | Time associated with the start snapshot ID                                                                                                                                                                                                                                        |
| END_SNAP_ID        | NUMBER        |      | End snapshot ID for the baseline                                                                                                                                                                                                                                                  |
| END_SNAP_TIME      | TIMESTAMP (3) |      | Time associated with the end snapshot ID                                                                                                                                                                                                                                          |
| MOVING_WINDOW_SIZE | NUMBER        |      | <p>If BASELINE_TYPE is MOVING WINDOW, this field is the size of the moving window in number of days.</p> <p>If NULL, then the window size is the value of the AWR retention setting.</p>                                                                                          |
| CREATION_TIME      | DATE          |      | Time the baseline was created                                                                                                                                                                                                                                                     |
| EXPIRATION         | NUMBER        |      | How long to keep the baseline, in number of days. A NULL value means that the baseline will be kept forever.                                                                                                                                                                      |
| TEMPLATE_NAME      | VARCHAR2 (64) |      | Name of the template that created this baseline, if any.                                                                                                                                                                                                                          |

| Column             | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_TIME_COMPUTED | DATE     |      | Last time that statistics were computed on the baseline.                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID             | NUMBER   |      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.388 DBA\_HIST\_BASELINE\_DETAILS

DBA\_HIST\_BASELINE\_DETAILS displays details about the baseline.

| Column             | Datatype      | NULL | Description                                                                                                                                                                                                                                                    |
|--------------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| BASLINE_NAME       | VARCHAR2 (64) |      | User-specified name for the baseline                                                                                                                                                                                                                           |
| BASLINE_TYPE       | VARCHAR2 (13) |      | The baseline type, as follows:<br>STATIC - baselines that are created manually by the user<br>MOVING WINDOW - baselines that have dynamic start and end snapshot IDs<br>GENERATED - baselines that are automatically generated by the system, using a template |
| START_SNAP_ID      | NUMBER        |      | Start snapshot ID for the baseline                                                                                                                                                                                                                             |
| START_SNAP_TIME    | TIMESTAMP (3) |      | Start snapshot time for the baseline                                                                                                                                                                                                                           |
| END_SNAP_ID        | NUMBER        |      | End snapshot ID for the baseline                                                                                                                                                                                                                               |
| END_SNAP_TIME      | TIMESTAMP (3) |      | End snapshot time for the baseline                                                                                                                                                                                                                             |
| SHUTDOWN           | VARCHAR2 (3)  |      | Whether or not there is a database startup or shutdown in this interval (YES, NO, or NULL).                                                                                                                                                                    |
| ERROR_COUNT        | NUMBER        |      | Number of errors in the snapshots in the baseline snapshot range                                                                                                                                                                                               |
| PCT_TOTAL_TIME     | NUMBER        |      | Amount of time captured in snapshots, divided by the total possible time for this baseline                                                                                                                                                                     |
| LAST_TIME_COMPUTED | DATE          |      | Last time that statistics were computed on the baseline                                                                                                                                                                                                        |
| MOVING_WINDOW_SIZE | NUMBER        |      | If BASELINE_TYPE is MOVING WINDOW, this field is the size of the moving window in number of days.<br>If NULL, then the window size is the value of the AWR retention setting.                                                                                  |
| CREATION_TIME      | DATE          |      | Time the baseline was created                                                                                                                                                                                                                                  |

| Column        | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPIRATION    | NUMBER        |      | How long to keep the baseline, in number of days. A value of NULL indicates that the baseline will be kept forever.                                                                                                                                                                                                                                                                                                                             |
| TEMPLATE_NAME | VARCHAR2 (64) |      | Name of the template that created this baseline, if any.                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID        | NUMBER        |      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.389 DBA\_HIST\_BASELINE\_METADATA

DBA\_HIST\_BASELINE\_METADATA displays metadata information for the baseline.

| Column             | Datatype      | NULL     | Description                                                                                                                                                                                                                                                    |
|--------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.390 DBA\_HIST\_BASELINE\_TEMPLATE

DBA\_HIST\_BASELINE\_TEMPLATE displays the templates used by the system for baseline generation.

The system uses this information to determine which baselines should be automatically created or removed.

| Column              | Datatype       | NULL     | Description                                                                                                                                                                                                                                   |
|---------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID                | NUMBER         | NOT NULL | Database ID                                                                                                                                                                                                                                   |
| TEMPLATE_ID         | NUMBER         | NOT NULL | Internal ID for the template                                                                                                                                                                                                                  |
| TEMPLATE_NAME       | VARCHAR2 (128) | NOT NULL | Name of the template                                                                                                                                                                                                                          |
| TEMPLATE_TYPE       | VARCHAR2 (9)   | NOT NULL | <p>Type of the template, as follows:</p> <p>SINGLE - one time period</p> <p>REPEATING - maintain a time period</p>                                                                                                                            |
| BASLINE_NAME_PREFIX | VARCHAR2 (128) | NOT NULL | <p>Name to use for the baselines that are created:</p> <p>For a template type of SINGLE, the BASLINE_NAME_PREFIX is the name that will be used.</p> <p>For a template type of REPEATING, the BASLINE_NAME will be the prefix to the name.</p> |
| START_TIME          | DATE           | NOT NULL | <p>For a template type of SINGLE, this is the start time for future baselines</p> <p>For a template type of REPEATING, this is the effective start time that baselines should start being generated.</p>                                      |
| END_TIME            | DATE           | NOT NULL | <p>For a template type of SINGLE, this is the end time for future baselines.</p> <p>For a template type of REPEATING, this is the effective end time that baselines should stop being generated.</p>                                          |
| DAY_OF_WEEK         | VARCHAR2 (9)   |          | <p>For a template type of REPEATING, this indicates the day of the week to create the baseline: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY, ALL.</p>                                                                      |
| HOURL_IN_DAY        | NUMBER         |          | <p>For a template type of REPEATING, a value from 0 - 23 to indicate the hour of the day to create the baseline for.</p>                                                                                                                      |
| DURATION            | NUMBER         |          | <p>For a template type of REPEATING, the length of time for the baseline to be created.</p>                                                                                                                                                   |
| EXPIRATION          | NUMBER         |          | How long to keep the baseline, in number of days                                                                                                                                                                                              |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPEAT_INTERVAL | VARCHAR2 (128) |      | String that represents the time repeating information in the format used by the DBMS_SCHEDULER package                                                                                                                                                                                                                                                                                                                                      |
| LAST_GENERATED  | DATE           |      | Last time a baseline was generated for this template                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER         |      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 5.391 DBA\_HIST\_BG\_EVENT\_SUMMARY

DBA\_HIST\_BG\_EVENT\_SUMMARY displays the historical summary background event activity.

This view contains snapshots from V\$SESSION\_EVENT.

| Column            | Datatype      | NULL     | Description                                                 |
|-------------------|---------------|----------|-------------------------------------------------------------|
| SNAP_ID           | NUMBER        | NOT NULL | Unique snapshot ID                                          |
| DBID              | NUMBER        | NOT NULL | Database ID for the snapshot                                |
| INSTANCE_NUMBER   | NUMBER        | NOT NULL | Instance number for the snapshot                            |
| EVENT_ID          | NUMBER        | NOT NULL | Identifier of the wait event                                |
| EVENT_NAME        | VARCHAR2 (64) | NOT NULL | Name of the wait event                                      |
| WAIT_CLASS_ID     | NUMBER        |          | Identifier of the class of the wait event                   |
| WAIT_CLASS        | VARCHAR2 (64) |          | Name of the class of the wait event                         |
| TOTAL_WAITS       | NUMBER        |          | Total number of waits for the event                         |
| TOTAL_TIMEOUTS    | NUMBER        |          | Total number of timeouts for the event                      |
| TIME_WAITED_MICRO | NUMBER        |          | Total amount of time waited for the event (in microseconds) |
| CON_DBID          | NUMBER        |          | The database ID of the PDB for the sampled session          |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| DEQUEUE_CPU_TIME             | NUMBER        |      | Total CPU time for dequeue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_ENQUEUE_TIME            | TIMESTAMP (3) |      | Last message enqueue time                                                                                                                                                                                                                                                                                                                                                                                                                     |
| LAST_DEQUEUE_TIME            | TIMESTAMP (3) |      | Last message dequeue time                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_DBID                     | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                       | NUMBER        |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.394 DBA\_HIST\_BUFFERED\_SUBSCRIBERS

DBA\_HIST\_BUFFERED\_SUBSCRIBERS displays historical information about the subscribers for all buffered queues in the instance.

| Column             | Datatype        | NULL     | Description                                     |
|--------------------|-----------------|----------|-------------------------------------------------|
| SNAP_ID            | NUMBER          | NOT NULL | Unique snapshot ID                              |
| DBID               | NUMBER          | NOT NULL | Database ID for the snapshot                    |
| INSTANCE_NUMBER    | NUMBER          | NOT NULL | Instance number for the snapshot                |
| QUEUE_SCHEMA       | VARCHAR2 (128)  | NOT NULL | Owner of the queue                              |
| QUEUE_NAME         | VARCHAR2 (128)  | NOT NULL | Name of the queue                               |
| SUBSCRIBER_ID      | NUMBER          | NOT NULL | Internal subscriber number (for identification) |
| SUBSCRIBER_NAME    | VARCHAR2 (128)  |          | Name of the subscriber                          |
| SUBSCRIBER_ADDRESS | VARCHAR2 (1024) |          | Address of the subscribing agent                |

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUBSCRIBER_TYPE      | VARCHAR2 (128) |          | Type of subscriber: <ul style="list-style-type: none"> <li>• PROXY - Proxy subscriber</li> <li>• SUBSCRIBOR</li> </ul>                                                                                                                                                                                                                                                                                                                              |
| STARTUP_TIME         | DATE           | NOT NULL | Startup time of the instance                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_BROWSED_SEQ     | NUMBER         |          | Sequence number of the most recently browsed message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_READER view)                                                                                                                                                                                                                                                                                                  |
| LAST_BROWSED_NUM     | NUMBER         |          | Internal Message number for the most recently browsed message for the subscriber                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_DEQUEUED_SEQ    | NUMBER         |          | Sequence number of the most recently dequeued message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_COORDINATOR view)                                                                                                                                                                                                                                                                                            |

| CON_DBID             | NUMBER         |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID               | NUMBER         |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.395 DBA\_HIST\_CAPTURE

DBA\_HIST\_CAPTURE displays historical statistics information about each capture process for Oracle GoldenGate, and XStream capture operations.

This view is intended for use with Automatic Workload Repository (AWR).

| Column                  | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| TOTAL_MESSAGES_CAPTURED | NUMBER         |          | Total changes captured since the capture process was last started                                                                                                                                                                                                                                                                                                                                                                                     |
| TOTAL_MESSAGES_ENQUEUED | NUMBER         |          | Total number of messages enqueued since the capture process was last started                                                                                                                                                                                                                                                                                                                                                                          |
| ELAPSED_RULE_TIME       | NUMBER         |          | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started                                                                                                                                                                                                                                                                                                                                                  |
| ELAPSED_ENQUEUE_TIME    | NUMBER         |          | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started                                                                                                                                                                                                                                                                                                                                               |
| ELAPSED_REDO_WAIT_TIME  | NUMBER         |          | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state since the capture process was last started.                                                                                                                                                                                                                                                                                                       |
| ELAPSED_PAUSE_TIME      | NUMBER         |          | Elapsed pause time (in hundredths of a second) spent by the capture process since the capture process was last restarted                                                                                                                                                                                                                                                                                                                              |
| CON_DBID                | NUMBER         |          | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                            |
| EXTRACT_NAME            | VARCHAR2 (128) |          | Name of the extract process, if applicable                                                                                                                                                                                                                                                                                                                                                                                                            |
| BYTES_REDO_MINED        | NUMBER         |          | The total amount of redo data mined (in bytes) since the capture process last started                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES_SENT              | NUMBER         |          | Total number of bytes sent by the capture process to the extract process since the last time the extract process attached to the capture process                                                                                                                                                                                                                                                                                                      |
| SESSION_MODULE          | VARCHAR2 (64)  | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>• XStream</li> <li>• GoldenGate</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                  | NUMBER         |          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.396 DBA\_HIST\_CHANNEL\_WAITS

DBA\_HIST\_CHANNEL\_WAITS display the amount of messages broadcast on KSR and KSXR channels as well as the total time taken for the broadcast to complete.

KSR channels are local to an instance, that is, only processes within an instance subscribed to the channel can receive the message. KSXR channels allow messages to be broadcast across instances. The messages broadcast and the total time to broadcast are cumulative from the start of the instance. Channels with high overall average wait times could indicate potential problems with a subscriber on that channel which can lead to poor scaled performance.

| Column             | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID            | NUMBER        |      | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DBID               | NUMBER        |      | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE_NUMBER    | NUMBER        |      | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                              |
| CHANNEL            | VARCHAR2 (64) |      | The name of the KSR or KSXR channel                                                                                                                                                                                                                                                                                                                                                                                                           |
| MESSAGES_PUBLISHED | NUMBER        |      | The cumulative count of messages published on the channel (from instance startup)                                                                                                                                                                                                                                                                                                                                                             |
| WAIT_COUNT         | NUMBER        |      | The total number of times a publisher has waited for a broadcast to complete. This metric is only pertinent for asynchronous broadcasts where the broadcast can be dispatched and publisher can wait for completion at a later point of time. A high wait count along with increased wait time can indicate a potential performance bottleneck.                                                                                               |
| WAIT_TIME_USEC     | NUMBER        |      | The cumulative amount of time in microseconds that publishers have waited for message broadcast to complete. Average time for broadcast on a channel can be computed by dividing WAIT_TIME_USEC by WAIT_COUNT. A high average time can indicate a potential performance bottleneck.                                                                                                                                                           |
| CON_DBID           | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID             | NUMBER        |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.397 DBA\_HIST\_CLUSTER\_INTERCON

DBA\_HIST\_CLUSTER\_INTERCON displays information about the devices used by the instance to access the interconnect (that is, communicate with other instances).

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER | NUMBER         | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NAME            | VARCHAR2 (256) | NOT NULL | Operating system name of the device                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IP_ADDRESS      | VARCHAR2 (64)  | NOT NULL | IP address of the device                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IS_PUBLIC       | VARCHAR2 (3)   |          | Indicates whether the device is a public interface (YES) or a private interface (NO)<br><br>Public interfaces can be listened to by outside applications, which may be a security problem. Oracle recommends using private interfaces for interconnect.                                                                                                                                                                                                |
| SOURCE          | VARCHAR2 (31)  |          | Describes the type of device                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_DBID        | NUMBER         |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID          | NUMBER         |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.398 DBA\_HIST\_COLORED\_SQL

DBA\_HIST\_COLORED\_SQL displays the SQL IDs that have been marked for AWR SQL capture.

If a SQL statement is colored using the DBMS\_WORKLOAD\_REPOSITORY.ADD\_COLORED\_SQL procedure, then AWR will always capture the SQL statistics for the colored SQL ID. A SQL statement can be removed from coloring using the DBMS\_WORKLOAD\_REPOSITORY.REMOVE\_COLORED\_SQL procedure.

| Column      | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID        | NUMBER        | NOT NULL | Database ID                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SQL_ID      | VARCHAR2 (13) | NOT NULL | SQL ID of colored SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CREATE_TIME | DATE          | NOT NULL | Time the SQL ID was colored                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 5.405 DBA\_HIST\_CR\_BLOCK\_SERVER

DBA\_HIST\_CR\_BLOCK\_SERVER displays historical statistics on the Global Cache Service processes (LMS) used in cache fusion.

This view contains snapshots of V\$CR\_BLOCK\_SERVER.

| Column                 | Datatype | NULL     | Description                                                                                                                                                               |

| ZERO_RESULTS           | NUMBER   |          | Number of requests for which changes were rolled out of the block returned to the requesting instance. Only zero-XID transactions can use the block.                      |
| DISK_READ_RESULTS      | NUMBER   |          | Number of requests for which the requesting instance had to read the requested block from disk                                                                            |
| FAIL_RESULTS           | NUMBER   |          | Number of requests that failed; the requesting transaction must reissue the request                                                                                       |
| FAIRNESS_DOWN_CONVERTS | NUMBER   |          | Number of times an instance receiving a request has down-converted an X lock on a block because it was not modifying the block                                            |
| FLUSHES                | NUMBER   |          | Number of times the log has been flushed by an LMS process                                                                                                                |
| FLUSHES                | NUMBER   |          | Number of times the log has been flushed by an LMS process                                                                                                                |
| BUILDS                 | NUMBER   |          | Number of requests for which the server had to fabricate a CR block                                                                                                       |

| Column      | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LIGHT_WORKS | NUMBER   |      | Number of times the light-work rule was evoked. This rule prevents the LMS processes from going to disk while responding to CR requests for data, undo, or undo segment header blocks. This rule can prevent the LMS process from completing its response to the CR request.                                                                                                                                                                  |
| ERRORS      | NUMBER   |      | Number of times an error was signalled by an LMS process                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_DBID    | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID      | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.406 DBA\_HIST\_CURRENT\_BLOCK\_SERVER

DBA\_HIST\_CURRENT\_BLOCK\_SERVER displays historical statistics on the Global Cache Service processes (LMS) used in cache fusion.

This view contains snapshots of V\$CURRENT\_BLOCK\_SERVER.

| Column          | Datatype | NULL     | Description                                      |
|-----------------|----------|----------|--------------------------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID                               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot                     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot                 |
| PIN0            | NUMBER   |          | Pins taking less than 100 microseconds           |
| PIN1            | NUMBER   |          | Pins taking 100 microseconds to 1 millisecond    |
| PIN10           | NUMBER   |          | Pins taking 1 to 10 milliseconds                 |
| PIN100          | NUMBER   |          | Pins taking 10 to 100 milliseconds               |
| PIN1000         | NUMBER   |          | Pins taking 100 to 1000 milliseconds             |
| PIN10000        | NUMBER   |          | Pins taking 1000 to 10000 milliseconds           |
| PINOVER         | NUMBER   |          | Pins taking more than 10000 milliseconds         |
| FLUSH0          | NUMBER   |          | Flushes taking less than 100 microseconds        |
| FLUSH1          | NUMBER   |          | Flushes taking 100 microseconds to 1 millisecond |
| FLUSH10         | NUMBER   |          | Flushes taking 1 to 10 milliseconds              |

| Column     | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FLUSH100   | NUMBER   |      | Flushes taking 10 to 100 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                            |
| FLUSH1000  | NUMBER   |      | Flushes taking 100 to 1000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                          |
| FLUSH10000 | NUMBER   |      | Flushes taking 1000 to 10000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                        |
| FLUSHOVER  | NUMBER   |      | Flushes taking more than 10000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_DBID   | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID     | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. ## 5.410 DBA\_HIST\_DISPATCHER

DBA\_HIST\_DISPATCHER displays historical information for each dispatcher process present at the time of the snapshot.

This view contains snapshots of information from V\$DISPATCHER and V\$QUEUE.

| Column             | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                            |

| VALUE           | NUMBER        |      | Statistic value                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_DBID        | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID          | NUMBER        |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 5.412 DBA\_HIST\_DYN\_REMASTER\_STATS

DBA\_HIST\_DYN\_REMASTER\_STATS displays historical statistical information about the dynamic remastering process.

All times are given in hundredths of a second, except where otherwise noted, and total values reflect what has been collected since instance startup. This view contains snapshots of V\$DYNAMIC\_REMASTER\_STATS.

| Column              | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                               |

## 5.413 DBA\_HIST\_ENQUEUE\_STAT

DBA\_HIST\_ENQUEUE\_STAT displays historical statistics on the number of enqueue (lock) requests for each type of lock.

This view contains snapshots of V\$ENQUEUE\_STATISTICS.

| Column          | Datatype      | NULL     | Description                                                                                |
|-----------------|---------------|----------|--------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                         |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                               |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                           |
| EQ_TYPE         | VARCHAR2 (2)  | NOT NULL | Type of enqueue requested                                                                  |
| REQ_REASON      | VARCHAR2 (64) | NOT NULL | Reason for the enqueue request                                                             |
| TOTAL_REQ#      | NUMBER        |          | Total number of enqueue requests or enqueue conversions for this type of enqueue           |
| TOTAL_WAIT#     | NUMBER        |          | Total number of times an enqueue request or conversion resulted in a wait                  |
| SUCC_REQ#       | NUMBER        |          | Number of times an enqueue request or conversion was granted                               |
| FAILED_REQ#     | NUMBER        |          | Number of times an enqueue request or conversion failed                                    |
| CUM_WAIT_TIME   | NUMBER        |          | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion |
| EVENT#          | NUMBER        |          | Event number                                                                               |

## 5.418 DBA\_HIST\_IC\_CLIENT\_STATS

`DBA_HIST_IC_CLIENT_STATS` displays information about the usage of an interconnect device by the instance.

The information is divided into several areas of the Oracle Database, each identified by the `NAME` value.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |

| Column         | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2 (9) | NOT NULL | Identifies the area of the Oracle Database: <ul style="list-style-type: none"> <li>ipq - Parallel query communications</li> <li>d1m - Database lock management</li> <li>cache - Global cache communications</li> </ul> All other values are internal to Oracle and are not expected to have high usage.                                                                                                                         |
| BYTES_SENT     | NUMBER       |          | Number of bytes sent by the instance since instance startup for the software area identified by NAME. This information is aggregated across all devices used by the instance.                                                                                                                                                                                                                                                   |
| BYTES_RECEIVED | NUMBER       |          | Number of bytes received by the instance since instance startup for the software area identified by NAME. This information is aggregated across all devices used by the instance.                                                                                                                                                                                                                                               |
| CON_DBID       | NUMBER       |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID         | NUMBER       |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 5.419 DBA\_HIST\_IC\_DEVICE\_STATS

DBA\_HIST\_IC\_DEVICE\_STATS displays operating system information about the usage of interconnect devices by the machine.

This usage contains Oracle usage but is not limited to it. The quality of the information depends on the operating system.

| Column           | Datatype       | NULL     | Description                                                                |
|------------------|----------------|----------|----------------------------------------------------------------------------|
| SNAP_ID          | NUMBER         | NOT NULL | Unique snapshot ID                                                         |
| DBID             | NUMBER         | NOT NULL | Database ID for the snapshot                                               |
| INSTANCE_NUMBER  | NUMBER         | NOT NULL | Instance number for the snapshot                                           |
| IF_NAME          | VARCHAR2 (256) | NOT NULL | Name of the device (same as NAME in DBA_HIST_CLUSTER_INTERCON)             |
| IP_ADDR          | VARCHAR2 (64)  | NOT NULL | IP address of the device (same as IP_ADDRESS in DBA_HIST_CLUSTER_INTERCON) |
| NET_MASK         | VARCHAR2 (16)  |          | Network mask                                                               |
| FLAGS            | VARCHAR2 (32)  |          | Flags                                                                      |
| MTU              | NUMBER         |          | Maximum transmission unit                                                  |
| BYTES_RECEIVED   | NUMBER         |          | Number of bytes received since operating system start time                 |
| PACKETS_RECEIVED | NUMBER         |          | Number of packets received since operating system start time               |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECEIVE_ERRORS    | NUMBER   |      | Number of receive errors since operating system start time                                                                                                                                                                                                                                                                                                                                                                                       |
| RECEIVE_DROPPED   | NUMBER   |      | Number of receive messages that were dropped                                                                                                                                                                                                                                                                                                                                                                                                     |
| RECEIVE_BUF_OR    | NUMBER   |      | Number of receive buffer overruns experienced                                                                                                                                                                                                                                                                                                                                                                                                    |
| RECEIVE_FRAME_ERR | NUMBER   |      | Number of receive errors due to frame error                                                                                                                                                                                                                                                                                                                                                                                                      |
| BYTES_SENT        | NUMBER   |      | Number of bytes sent since operating system start time                                                                                                                                                                                                                                                                                                                                                                                           |
| PACKETS_SENT      | NUMBER   |      | Number of packets sent since operating system start time                                                                                                                                                                                                                                                                                                                                                                                         |
| SEND_ERRORS       | NUMBER   |      | Number of send errors since operating system start time                                                                                                                                                                                                                                                                                                                                                                                          |
| SENDS_DROPPED     | NUMBER   |      | Number of send messages that were dropped                                                                                                                                                                                                                                                                                                                                                                                                        |
| SEND_BUF_OR       | NUMBER   |      | Number of send buffer overruns experienced                                                                                                                                                                                                                                                                                                                                                                                                       |
| SEND_CARRIER_LOST | NUMBER   |      | Number of send errors due to carrier lost                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_DBID          | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID            | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.420 DBA\_HIST\_IM\_SEG\_STAT

DBA\_HIST\_IM\_SEG\_STAT displays information about historical in-memory segment statistics.

| Column                 | Datatype | NULL     | Description                                                                                                  |
|------------------------|----------|----------|--------------------------------------------------------------------------------------------------------------|
| SNAP_ID                | NUMBER   | NOT NULL | Unique snapshot ID                                                                                           |
| DBID                   | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                 |
| INSTANCE_NUMBER        | NUMBER   | NOT NULL | Instance number for the snapshot                                                                             |
| TS#                    | NUMBER   | NOT NULL | Tablespace number                                                                                            |
| OBJ#                   | NUMBER   | NOT NULL | Dictionary object number                                                                                     |
| DATAOBJ#               | NUMBER   | NOT NULL | Data object number                                                                                           |
| MEMBYTES               | NUMBER   |          | Size of in-memory version of the segment in bytes                                                            |
| SCANS                  | NUMBER   |          | Count of segment statistics                                                                                  |
| SCANS_DELTA            | NUMBER   |          | Delta values for in-memory scans                                                                             |
| DB_BLOCK_CHANGES       | NUMBER   |          | The total number of changes that were part of an update or delete operation that were made to segment blocks |
| DB_BLOCK_CHANGES_DELTA | NUMBER   |          | Delta value for database block changes                                                                       |
| POPULATE_CUS           | NUMBER   |          | Count of compression units (CUs) populated per segment                                                       |

| Column               | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POPULATE_CUS_DELTA   | NUMBER   |      | Delta value for compression unit (CU) populate operations                                                                                                                                                                                                                                                                                                                                                                                        |
| REPOPULATE_CUS       | NUMBER   |      | Count of CUs repopulated per segment                                                                                                                                                                                                                                                                                                                                                                                                             |
| REPOPULATE_CUS_DELTA | NUMBER   |      | Delta value for compression unit (CU) repopulate operations                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_DBID             | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID               | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.421 DBA\_HIST\_IM\_SEG\_STAT\_OBJ

DBA\_HIST\_IM\_SEG\_STAT\_OBJ displays information about object metadata for historical in-memory segments.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| OBJECT_TYPE     | VARCHAR2 (128) |          | Type of the object                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TABLESPACE_NAME | VARCHAR2 (128) |          | Tablespace name for the object                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_DBID        | NUMBER         |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER         |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.422 DBA\_HIST\_INST\_CACHE\_TRANSFER

DBA\_HIST\_INST\_CACHE\_TRANSFER displays the historical statistics on the cache blocks transferred among instances.

This view contains snapshots of V\$INSTANCE\_CACHE\_TRANSFER.

| Column             | Datatype      | NULL     | Description                                                                                                                                                   |

| ACTUAL_REDO_BLKs               | NUMBER   |          | Current actual number of redo blocks required for recovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TARGET_REDO_BLKs               | NUMBER   |          | Current target number of redo blocks that must be processed for recovery. This value is the minimum value of the following 3 columns, and identifies which of the 3 user-defined limits determines checkpointing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LOG_FILE_SIZE_REDO_BLKs        | NUMBER   |          | Maximum number of redo blocks required to guarantee that a log switch does not occur before the checkpoint completes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LOG_CHKPT_TIMEOUT_REDO_BLKs    | NUMBER   |          | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_TIMEOUT parameter. The value displayed is not meaningful unless LOG_CHECKPOINT_TIMEOUT has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOG_CHKPT_INTERVAL_REDO_BLKs   | NUMBER   |          | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_INTERVAL parameter. The value displayed is not meaningful unless LOG_CHECKPOINT_INTERVAL has been set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FAST_START_IO_TARGET_REDO_BLKs | NUMBER   |          | This column is obsolete and maintained for backward compatibility. The value of this column is always null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TARGET_MTTR                    | NUMBER   |          | Effective MTTR (mean time to recover) target value in seconds. The TARGET_MTTR value is calculated based on the value of the FAST_START_MTTR_TARGET parameter (the TARGET_MTTR value is used internally), and is usually an approximation of the parameter's value. However, if the FAST_START_MTTR_TARGET parameter value is very small (for example, one second), or very large (for example, 3600 seconds), then the calculation will produce a target value dictated by system limitations.<br><br>In such cases, the TARGET_MTTR value will be the shortest calculated time, or the longest calculated time that recovery is expected to take. If FAST_START_MTTR_TARGET is not specified, then the value of this field is the current estimated MTTR. |
| ESTIMATED_MTTR                 | NUMBER   |          | Current estimated mean time to recover (MTTR) based on the number of dirty buffers and log blocks (0 if FAST_START_MTTR_TARGET is not specified). This value tells you how long you can expect recovery to take based on the work the system is doing right now.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CKPT_BLOCK_WRITES              | NUMBER   |          | Number of blocks written by checkpoint writes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OPTIMAL_LOGFILE_SIZE           | NUMBER   |          | Redo log file size (in megabytes) that is considered optimal based on the current setting of FAST_START_MTTR_TARGET. It is recommended that all online redo logs be configured to be at least this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Column                        | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_CLUSTER_AVAILABLE_TIME   | NUMBER   |      | Estimated time (in seconds) that the cluster would become partially available should the instance fail. This column is only meaningful in an Oracle Real Application Clusters (Oracle RAC) environment. In a non-Oracle RAC environment, the value of this column is null.                                                                                                                                                                                 |
| WRITES_MTTR                   | NUMBER   |      | Number of writes driven by the <code>FAST_START_MTTR_TARGET</code> parameter                                                                                                                                                                                                                                                                                                                                                                               |
| WRITES_LOGFILE_SIZE           | NUMBER   |      | Number of writes driven by the smallest redo log file size                                                                                                                                                                                                                                                                                                                                                                                                 |
| WRITES_LOG_CHECKPOINT_SECONDS | NUMBER   |      | Number of writes driven by the <code>LOG_CHECKPOINT_INTERVAL</code> parameter or the <code>LOG_CHECKPOINT_TIMEOUT</code> parameter                                                                                                                                                                                                                                                                                                                         |
| WRITES_OTHER_SETTINGS         | NUMBER   |      | Number of writes driven by other reasons (such as the deprecated <code>FAST_START_IO_TARGET</code> parameter)                                                                                                                                                                                                                                                                                                                                              |
| WRITES_AUTOTUNE               | NUMBER   |      | Number of writes due to auto-tune checkpointing                                                                                                                                                                                                                                                                                                                                                                                                            |
| WRITES_FULL_THREAD_CKPT       | NUMBER   |      | Number of writes due to full thread checkpoints                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_DBID                      | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                        | NUMBER   |      | The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.424 DBA\_HIST\_INTERCONNECT\_PINGS

`DBA_HIST_INTERCONNECT_PINGS` displays information about measured latency of interconnect messages (round-trip) from instance to instance.

In Oracle Database 11g and later releases, the `PING` process assesses the latencies associated with communications for each pair of instances.

Every few seconds, the process in one instance (`INSTANCE_NUMBER` value) sends two messages to each instance (`TARGET_INSTANCE` value). One message has a size of 500 bytes and the other has a size of 8 KB. The message is received by the `PING` process on the target instance and is immediately acknowledged. The time for the round-trip is measured and collected.

| Column          | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TARGET_INSTANCE | NUMBER   | NOT NULL | Target instance number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CNT_500B        | NUMBER   |          | Number of pings of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER)                                                                                                                                                                                                                                                                                                             |
| WAIT_500B       | NUMBER   |          | Sum of round-trip times for messages of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). Dividing by CNT_500B gives the average latency.                                                                                                                                                                                                                                       |
| WAITSQ_500B     | NUMBER   |          | Sum of squares (divided by 1000) of round-trip times for messages of size 500 bytes from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). When used with CNT_500B and WAIT_500B, the standard deviation of the latency can be calculated.                                                                                                                                                          |
| CNT_8K          | NUMBER   |          | Number of pings of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER)                                                                                                                                                                                                                                                                                                                  |
| WAIT_8K         | NUMBER   |          | Sum of round-trip times for messages of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). Dividing by CNT_8K gives the average latency.                                                                                                                                                                                                                                              |
| WAITSQ_8K       | NUMBER   |          | Sum of squares (divided by 1000) of round-trip times for messages of size 8 KB from INSTANCE_NUMBER to TARGET_INSTANCE since the startup of the source instance (INSTANCE_NUMBER). When used with CNT_8K and WAIT_8K, the standard deviation of the latency can be calculated.                                                                                                                                                                   |
| CON_DBID        | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER   |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 5.425 DBA\_HIST\_IOSTAT\_DETAIL

DBA\_HIST\_IOSTAT\_DETAIL displays I/O statistics aggregated by combination of file type and function (component).

This view contains snapshots of V\$IOSTAT\_FILE and V\$IOSTAT\_FUNCTION.

| Column                | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 5.426 DBA\_HIST\_IOSTAT\_FILETYPE

DBA\_HIST\_IOSTAT\_FILETYPE displays historical I/O statistics by file type.

This view contains snapshots of V\$IOSTAT\_FILE.

| Column                  | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| SNAP_ID                     | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DBID                        | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                 |
| INSTANCE_NUMBER             | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                             |
| JAVA_POOL_SIZE_FOR_ESTIMATE | NUMBER   | NOT NULL | Java pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                               |
| JAVA_POOL_SIZE_FACTOR       | NUMBER   |          | Size factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                                       |
| ESTD_LC_SIZE                | NUMBER   |          | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                  |
| ESTD_LC_MEMORY_OBJECTS      | NUMBER   |          | Estimated number of library cache memory objects in the Java pool of the specified size                                                                                                                                                                                                                                                                                                                                                      |
| ESTD_LC_TIME_SAVED          | NUMBER   |          | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a Java pool of the specified size. This is the time that would have been spent in reloading the required objects in the Java pool had they been aged out due to insufficient amount of available free memory.                                                                                                                          |
| ESTD_LC_TIME_SAVED_FACTOR   | NUMBER   |          | Estimated parse time saved factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                 |
| ESTD_LC_LOAD_TIME           | NUMBER   |          | Estimated elapsed time (in seconds) for parsing in a Java pool of the specified size.                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_LC_LOAD_TIME_FACTOR    | NUMBER   |          | Estimated load time factor with respect to the current Java pool size                                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_LC_MEMORY_OBJECT_HITS  | NUMBER   |          | Estimated number of times a library cache memory object was found in a Java pool of the specified size                                                                                                                                                                                                                                                                                                                                       |
| CON_DBID                    | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                      | NUMBER   |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## Static Data Dictionary Views: DBA\_HIST\_LATCH to DBA\_STORED\_SETTINGS

This chapter contains the static data dictionary views `DBA_HIST_LATCH` through `DBA_STORED_SETTINGS`.

### 6.1 DBA\_HIST\_LATCH

`DBA_HIST_LATCH` displays historical aggregate latch statistics for both parent and child latches, grouped by latch name.

This view contains snapshots of `V$LATCH`.

| Column                            | Datatype      | NULL     | Description                                                                                                                                                                                  |
|-----------------------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SNAP_ID</code>              | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                           |
| <code>DBID</code>                 | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                 |

## 6.2 DBA\_HIST\_LATCH\_CHILDREN

DBA\_HIST\_LATCH\_CHILDREN displays historical statistics about child latches.

This view includes all columns of DBA\_HIST\_LATCH plus the CHILD# column. Note that child latches have the same parent if their LATCH# columns match each other. This view contains snapshots of V\$LATCH\_CHILDREN.

| Column           | Datatype      | NULL     | Description                                                                                                |
|------------------|---------------|----------|------------------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER        | NOT NULL | Unique snapshot ID                                                                                         |
| DBID             | NUMBER        | NOT NULL | Database ID for the snapshot                                                                               |
| INSTANCE_NUMBER  | NUMBER        | NOT NULL | Instance number for the snapshot                                                                           |
| LATCH_HASH       | NUMBER        | NOT NULL | Latch hash                                                                                                 |
| LATCH_NAME       | VARCHAR2 (64) | NOT NULL | Latch name                                                                                                 |
| CHILD#           | NUMBER        | NOT NULL | Child latch number (unique only to each parent latch)                                                      |
| GETS             | NUMBER        |          | Number of times the latch was requested in willing-to-wait mode                                            |
| MISSES           | NUMBER        |          | Number of times the latch was requested in willing-to-wait mode and the requester had to wait              |
| SLEEPS           | NUMBER        |          | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch |
| IMMEDIATE_GETS   | NUMBER        |          | Number of times a latch was requested in no-wait mode                                                      |
| IMMEDIATE_MISSES | NUMBER        |          | Number of times a no-wait latch request did not succeed (that is, missed)                                  |
| SPIN_GETS        | NUMBER        |          | Number of willing-to-wait latch requests which missed the first try but succeeded while spinning           |

| Column               | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 6.3 DBA\_HIST\_LATCH\_MISSES\_SUMMARY

DBA\_HIST\_LATCH\_MISSES\_SUMMARY displays historical summary statistics about missed attempts to acquire a latch.

This view contains snapshots of V\$LATCH\_MISSES.

| Column          | Datatype      | NULL     | Description                                                  |
|-----------------|---------------|----------|--------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                           |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                 |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                             |
| PARENT_NAME     | VARCHAR2 (50) | NOT NULL | Latch name of a parent latch                                 |
| WHERE_IN_CODE   | VARCHAR2 (64) | NOT NULL | Location that attempted to acquire the latch                 |
| NWFAIL_COUNT    | NUMBER        |          | Number of times that no-wait acquisition of the latch failed |
| SLEEP_COUNT     | NUMBER        |          | Number of times that acquisition attempts caused sleeps      |
| WTR_SLP_COUNT   | NUMBER        |          | Number of times a waiter slept                               |
| CON_DBID        | NUMBER        |          | The database ID of the PDB for the sampled session           |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 6.5 DBA\_HIST\_LATCH\_PARENT

DBA\_HIST\_LATCH\_PARENT displays historical statistics about parent latches.

This view contains snapshots of V\$LATCH\_PARENT.

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |

| STATUS          | VARCHAR2 (16) |          | Log status: <ul style="list-style-type: none"> <li>• <b>UNUSED</b> - Online redo log has never been written to. This is the state of a redo log that was just added, or just after a RESETLOGS, when it is not the current redo log.</li> <li>• <b>CURRENT</b> - Current redo log. This implies that the redo log is active. The redo log could be open or closed.</li> <li>• <b>ACTIVE</b> - Log is active but is not the current log. It is needed for crash recovery. It may be in use for block recovery. It may or may not be archived.</li> <li>• <b>CLEARING</b> - Log is being re-created as an empty log after an ALTER DATABASE CLEAR LOGFILE statement. After the log is cleared, the status changes to UNUSED.</li> <li>• <b>CLEARING_CURRENT</b> - Current log is being cleared of a closed thread. The log can stay in this status if there is some failure in the switch such as an I/O error writing the new log header.</li> <li>• <b>INACTIVE</b> - Log is no longer needed for instance recovery. It may be in use for media recovery. It may or may not be archived.</li> <li>• <b>INVALIDATED</b> - Archived the current redo log without a log switch.</li> </ul> |
| FIRST_CHANGE#   | NUMBER        |          | Lowest system change number (SCN) in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 6.10 DBA\_HIST\_MEMORY\_TARGET\_ADVICE

DBA\_HIST\_MEMORY\_TARGET\_ADVICE displays memory target advice history.

This view contains snapshots of V\$MEMORY\_TARGET\_ADVICE.

| Column             | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                 |
|--------------------|----------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID            | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                          |
| DBID               | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER    | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                            |
| MEMORY_SIZE        | NUMBER   | NOT NULL | If the MEMORY_SIZE_FACTOR column has a value of 1, then this column shows the current size of memory, as set by the MEMORY_TARGET initialization parameter.<br>If the value of the MEMORY_SIZE_FACTOR column is less than or greater than 1, then this column shows a proposed memory size. |
| MEMORY_SIZE_FACTOR | NUMBER   |          | A multiplier for the current memory size. Possible values are 0.25, 0.5, 0.75, 1, 1.5, 1.75 and 2. This multiplier times the current memory size equals the value of the MEMORY_SIZE column.                                                                                                |
| ESTD_DB_TIME       | NUMBER   |          | For current memory size (MEMORY_SIZE_FACTOR = 1), the amount of database time required to complete the current workload. For a proposed memory size, the estimated amount of database time that would be required if the MEMORY_TARGET parameter were changed to the proposed size.         |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_DB_TIME_FACTOR | NUMBER   |      | For a proposed memory size, ratio of estimated database time to current database time                                                                                                                                                                                                                                                                                                                                                                |
| VERSION             | NUMBER   |      | Version number of this recommendation                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_DBID            | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID              | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.12 DBA\_HIST\_MTTR\_TARGET\_ADVICE

DBA\_HIST\_MTTR\_TARGET\_ADVICE displays historical predictions of the number of physical I/O requests for the MTTR corresponding to each row.

The data also includes a physical I/O factor, which is the ratio of the number of estimated I/O requests to the number of I/O requests actually performed by the current MTTR setting during the measurement interval. This view contains snapshots of V\$MTTR\_TARGET\_ADVICE.

| Column                   | Datatype     | NULL     | Description                                                                                                                                                                                  |
|--------------------------|--------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                  | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                           |
| DBID                     | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                 |

## 6.19 DBA\_HIST\_PARAMETER\_NAME

DBA\_HIST\_PARAMETER\_NAME displays information about the parameter names captured in the workload repository.

This view is used with the DBA\_HIST\_PARAMETER view.

| Column         | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 6.20 DBA\_HIST\_PDB\_IN\_SNAP

DBA\_HIST\_PDB\_IN\_SNAP captures a list of open pluggable databases (PDBs) at the time of the Automatic Workload Repository (AWR) snapshot. This view can be used with other DBA\_HIST\_ views to construct the number of opened PDBs at the time of the snapshot.

| Column          | Datatype                    | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| INSTANCE_NUMBER | NUMBER                      | NOT NULL | Instance number of the instance that took this snapshot                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID        | NUMBER                      |          | DBID of an open PDB at the time of the snapshot                                                                                                                                                                                                                                                                                                                                                                                                 |
| FLAG            | NUMBER                      |          | Flag field in capture properties of the PDB. Not used at this time.                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID          | NUMBER                      |          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| OPEN_TIME_TZ    | TIMESTAMP(3) WITH TIME ZONE |          | Time the PDB was last opened                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 6.21 DBA\_HIST\_PDB\_INSTANCE

DBA\_HIST\_PDB\_INSTANCE displays the pluggable databases (PDBs) and instances in the Workload Repository.

| Column          | Datatype      | NULL     | Description                                        |
|-----------------|---------------|----------|----------------------------------------------------|
| DBID            | NUMBER        | NOT NULL | Database ID                                        |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number                                    |
| STARTUP_TIME    | TIMESTAMP(3)  | NOT NULL | Startup time of the instance                       |
| CON_DBID        | NUMBER        | NOT NULL | The database ID of the PDB for the sampled session |
| OPEN_TIME       | TIMESTAMP(3)  | NOT NULL | Time the PDB was last opened                       |
| OPEN_MODE       | VARCHAR2(16)  |          | Open mode of the database                          |
| PDB_NAME        | VARCHAR2(128) |          | PDB name                                           |

| Column          | Datatype                    | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|-----------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID          | NUMBER                      |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SNAP_ID         | NUMBER                      |      | The unique snapshot identifier of the snapshot that flushed the corresponding row                                                                                                                                                                                                                                                                                                                                                                |
| STARTUP_TIME_TZ | TIMESTAMP(3) WITH TIME ZONE |      | Startup time of the instance                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OPEN_TIME_TZ    | TIMESTAMP(3) WITH TIME ZONE |      | Time the PDB was last opened                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 6.22 DBA\_HIST\_PERSISTENT\_QMN\_CACHE

DBA\_HIST\_PERSISTENT\_QMN\_CACHE displays the historical summary background queue table activity.

This view contains snapshots from V\$PERSISTENT\_QMN\_CACHE.

| Column              | Datatype     | NULL     | Description                                                                    |
|---------------------|--------------|----------|--------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER       | NOT NULL | Unique snapshot ID                                                             |
| DBID                | NUMBER       | NOT NULL | Database ID for the snapshot                                                   |
| INSTANCE_NUMBER     | NUMBER       | NOT NULL | Instance number for the snapshot                                               |
| QUEUE_TABLE_ID      | NUMBER       | NOT NULL | Queue table object ID                                                          |
| TYPE                | VARCHAR2(32) |          | Type of the queue table's queue monitor cache                                  |
| STATUS              | NUMBER       |          | Status of the queue table's queue monitor cache                                |
| NEXT_SERVICE_TIME   | TIMESTAMP(3) |          | Time when the queue table should be serviced by QMON servers                   |
| WINDOW_END_TIME     | TIMESTAMP(3) |          | Time manager activity period for non-owner queue table operations              |
| TOTAL_RUNS          | NUMBER       |          | Total number of times this queue table is served                               |
| TOTAL_LATENCY       | NUMBER       |          | Cumulative latency in serving the queue table (in hundredths of a second)      |
| TOTAL_ELAPSED_TIME  | NUMBER       |          | Total time spent in processing this queue table (in seconds)                   |
| TOTAL_CPU_TIME      | NUMBER       |          | Cumulative CPU time for serving the queue table (in hundredths of a second)    |
| TMGR_ROWS_PROCESSED | NUMBER       |          | Number of time manager entries processed                                       |
| TMGR_ELAPSED_TIME   | NUMBER       |          | Cumulative time for time management activities (in hundredths of a second)     |
| TMGR_CPU_TIME       | NUMBER       |          | Cumulative CPU time for time management activities (in hundredths of a second) |

| Column                         | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 6.23 DBA\_HIST\_PERSISTENT\_QUEUES

DBA\_HIST\_PERSISTENT\_QUEUES displays Oracle Database AQ persistent queues historical statistics information.

This view contains snapshots of V\$PERSISTENT\_QUEUES.

| Column  | Datatype | NULL     | Description                  |
|---------|----------|----------|------------------------------|
| SNAP_ID | NUMBER   | NOT NULL | Unique snapshot ID           |
| DBID    | NUMBER   | NOT NULL | Database ID for the snapshot |

| Column                       | Datatype       | NULL     | Description                                                                                                                                                                            |
|------------------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.25 DBA\_HIST\_PGA\_TARGET\_ADVICE

DBA\_HIST\_PGA\_TARGET\_ADVICE displays historical predictions of how the cache hit percentage and over allocation count statistics displayed by the V\$PGASTAT performance view would be impacted if the value of the PGA\_AGGREGATE\_TARGET parameter is changed.

This view contains snapshots of V\$PGA\_TARGET\_ADVICE.

| Column                  | Datatype     | NULL     | Description                                                                                                             |
|-------------------------|--------------|----------|-------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                      |
| DBID                    | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                            |
| INSTANCE_NUMBER         | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                        |
| PGA_TARGET_FOR_ESTIMATE | NUMBER       | NOT NULL | Value of PGA_AGGREGATE_TARGET for the prediction (in bytes)                                                             |
| PGA_TARGET_FACTOR       | NUMBER       |          | PGA_TARGET_FOR_ESTIMATE / the current value of the PGA_AGGREGATE_TARGET parameter                                       |
| ADVICE_STATUS           | VARCHAR2 (3) |          | Indicates whether the advice is enabled (ON) or disabled (OFF) depending on the value of the STATISTICS_LEVEL parameter |
| BYTES_PROCESSED         | NUMBER       |          | Total bytes processed by all the work areas considered by this advice (in bytes)                                        |
| ESTD_TIME               | NUMBER       |          | Time (in seconds) required to process the bytes                                                                         |

| Column                        | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_EXTRA_BYTES_RW           | NUMBER   |      | Estimated number of extra bytes which would be read or written if PGA_AGGREGATE_TARGET was set to the value of the PGA_TARGET_FOR_ESTIMATE column. This number is derived from the estimated number and size of work areas which would run in one-pass (or multi-pass) for that value of PGA_AGGREGATE_TARGET.                                                                                                                                |
| ESTD_PGA_CACHE_HIT_PERCENTAGE | NUMBER   |      | Estimated value of the cache hit percentage statistic when PGA_AGGREGATE_TARGET equals PGA_TARGET_FOR_ESTIMATE. This column is derived from the above two columns and is equal to $\text{BYTES\_PROCESSED} / (\text{BYTES\_PROCESSED} + \text{ESTD\_EXTRA\_BYTES\_RW})$                                                                                                                                                                       |
| ESTD_OVERALLOC_COUNT          | NUMBER   |      | Estimated number of PGA memory over-allocations if the value of PGA_AGGREGATE_TARGET is set to PGA_TARGET_FOR_ESTIMATE. A nonzero value means that PGA_TARGET_FOR_ESTIMATE is not large enough to run the work area workload. Hence, PGA_AGGREGATE_TARGET should not be set to PGA_TARGET_FOR_ESTIMATE since Oracle will not be able to honor that target.                                                                                    |
| CON_DBID                      | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                        | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.29 DBA\_HIST\_PROCESS\_MEM\_SUMMARY

DBA\_HIST\_PROCESS\_MEM\_SUMMARY displays historical information about dynamic PGA memory usage by named component categories for each process.

| Column          | Datatype | NULL     | Description                      |
|-----------------|----------|----------|----------------------------------|
| SNAP_ID         | NUMBER   | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER   | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER   | NOT NULL | Instance number for the snapshot |

| Column            | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CATEGORY          | VARCHAR2 (15) | NOT NULL | Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories                                                                                               |
| IS_INSTANCE_WIDE  | NUMBER        |          | This column shows whether the process memory detail is for only this container or for the whole instance. If the value is 1, the detail is for the whole instance. Any other value is the container ID for the container to which the detail pertains, as seen in the CON_ID column.                                                                                                                                            |
| NUM_PROCESSES     | NUMBER        |          | Number of processes                                                                                                                                                                                                                                                                                                                                                                                                             |
| NON_ZERO_ALLOCS   | NUMBER        |          | Number of processes with nonzero allocations                                                                                                                                                                                                                                                                                                                                                                                    |
| USED_TOTAL        | NUMBER        |          | Bytes of PGA memory used by the process for the category                                                                                                                                                                                                                                                                                                                                                                        |
| ALLOCATED_TOTAL   | NUMBER        |          | Total number of bytes of PGA memory allocated by the process for the category.                                                                                                                                                                                                                                                                                                                                                  |
| ALLOCATED_AVG     | NUMBER        |          | Average number of bytes of PGA memory allocated by the process for the category                                                                                                                                                                                                                                                                                                                                                 |
| ALLOCATED_STDDEV  | NUMBER        |          | Standard deviation of the number of bytes of PGA memory allocated by the process for the category                                                                                                                                                                                                                                                                                                                               |
| ALLOCATED_MAX     | NUMBER        |          | Maximum bytes of PGA memory ever allocated by the process for the category                                                                                                                                                                                                                                                                                                                                                      |
| MAX_ALLOCATED_MAX | NUMBER        |          | Maximum bytes of PGA memory that can be allocated by the process for the category                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID          | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID            | NUMBER        |          | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 6.30 DBA\_HIST\_PROCESS\_WAITTIME

DBA\_HIST\_PROCESS\_WAITTIME displays CPU and wait time by process types.

| Column          | Datatype     | NULL     | Description                      |
|-----------------|--------------|----------|----------------------------------|
| SNAP_ID         | NUMBER       | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER       | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER       | NOT NULL | Instance number for the snapshot |
| PROCESS_TYPE    | VARCHAR2 (5) | NOT NULL | Process type                     |

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION     | VARCHAR2 (64) | NOT NULL | Process description                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WAIT_CLASS_TYPE | VARCHAR2 (64) | NOT NULL | Type of wait class                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VALUE           | NUMBER        |          | Wait time or CPU used time in milliseconds                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_DBID        | NUMBER        |          | The database ID of the PDB for the process                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID          | NUMBER        |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.31 DBA\_HIST\_RECOVERY\_PROGRESS

DBA\_HIST\_RECOVERY\_PROGRESS displays database recovery progress information for an instance.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| TIMESTAMP | DATE          |      | Timestamp of the last redo record applied                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID  | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID    | NUMBER        |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root.</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.32 DBA\_HIST\_REPLICATION\_TBL\_STATS

DBA\_HIST\_REPLICATION\_TBL\_STATS displays replication table statistics for Oracle GoldenGate and XStream sessions. This view is intended for use with Automatic Workload Repository (AWR).

| Column            | Datatype       | NULL     | Description                                                                                                 |
|-------------------|----------------|----------|-------------------------------------------------------------------------------------------------------------|
| SNAP_ID           | NUMBER         | NOT NULL | Unique snapshot ID                                                                                          |
| DBID              | NUMBER         | NOT NULL | Database ID for the snapshot                                                                                |
| INSTANCE_NUMBER   | NUMBER         | NOT NULL | Instance number for the snapshot                                                                            |
| APPLY_NAME        | VARCHAR2 (128) | NOT NULL | Name of the apply process                                                                                   |
| TABLE_NAME        | VARCHAR2 (128) | NOT NULL | Name of the table                                                                                           |
| TABLE_OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the table                                                                                          |
| SESSION_MODULE    | VARCHAR2 (64)  | NOT NULL | Session module. Valid values: <ul style="list-style-type: none"> <li>XStream</li> <li>GoldenGate</li> </ul> |
| TOTAL_INSERTS     | NUMBER         |          | Number of insert operations on this table processed by this apply server                                    |
| TOTAL_UPDATES     | NUMBER         |          | Number of update operations on this table processed by this apply server                                    |
| TOTAL_DELETES     | NUMBER         |          | Number of delete operations on this table processed by this apply server                                    |
| CDR_SUCCESSFUL    | NUMBER         |          | Number of successfully resolved conflicts                                                                   |
| CDR_FAILED        | NUMBER         |          | Number of conflicts that could not be resolved due to an error during resolution                            |
| REPERR_CNT        | NUMBER         |          | The total number of errors for the replication operation                                                    |
| HANDLE_COLLISIONS | NUMBER         |          | Number of collisions on this table handled by this apply server                                             |
| CON_DBID          | NUMBER         |          | The database ID of the PDB for the sampled session                                                          |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.33 DBA\_HIST\_REPLICATION\_TXN\_STATS

DBA\_HIST\_REPLICATION\_TXN\_STATS displays replication transaction statistics for Oracle GoldenGate and XStream sessions.

| Column           | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID          | NUMBER         | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DBID             | NUMBER         | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                     |
| INSTANCE_NUMBER  | NUMBER         | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 6.34 DBA\_HIST\_REPORTS

DBA\_HIST\_REPORTS displays information about XML reports captured into Automatic Workload Repository (AWR).

The reports themselves belong to components such as SQL Monitor, DBOP, and Real-Time ADDM.

Each XML report contains details about some activity of a component. For example, a SQL Monitor report contains a detailed report about a particular execution of a SQL statement, or a Real-Time ADDM report contains system performance data analyzed by Real-Time ADDM.

| Column                  | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER          |      | ID of the first Automatic Workload Repository (AWR) snapshot that will be taken after this report is generated                                                                                                                                                                                                                                                                                                                                         |
| DBID                    | NUMBER          |      | Database ID of the current database for the report                                                                                                                                                                                                                                                                                                                                                                                                     |
| INSTANCE_NUMBER         | NUMBER          |      | Instance number (for an Oracle RAC system)                                                                                                                                                                                                                                                                                                                                                                                                             |
| REPORT_ID               | NUMBER          |      | ID of the captured report                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPONENT_ID            | NUMBER          |      | ID of the component (for example, SQL Monitor) whose report is captured                                                                                                                                                                                                                                                                                                                                                                                |
| SESSION_ID              | NUMBER          |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                                   |
| SESSION_SERIAL#         | NUMBER          |      | Session serial number corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                               |
| PERIOD_START_TIME       | DATE            |      | Time when the activity period started                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 6.35 DBA\_HIST\_REPORTS\_CONTROL

DBA\_HIST\_REPORTS\_CONTROL contains control information about the report capture mechanism that automatically captures XML reports to Automatic Workload Repository (AWR).

Reports are captured automatically for components like SQL Monitor and Real-Time Automatic Database Diagnostic Monitor (Real-Time ADDM).

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID           | NUMBER        |      | Database ID of the current database for the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTION_MODE | VARCHAR2 (12) |      | <p>Mode of execution of automatic report capture.<br/>Possible values:</p> <ul style="list-style-type: none"> <li>REGULAR: Regular per-minute report capture subject to DBTIME budget</li> <li>FULL_CAPTURE: Report capture will be run per minute without the DBTIME budget constraints and is provided to capture a more comprehensive set of reports</li> </ul> <p><b>NOTE:</b> The FULL_CAPTURE mode can be started and ended respectively by executing the START_REPORT_CAPTURE and FINISH_REPORT_CAPTURE APIs in the DBMS_AUTO_REPORT package. At all other times, the execution mode should be REGULAR.</p> |

## 6.36 DBA\_HIST\_REPORTS\_DETAILS

DBA\_HIST\_REPORTS\_DETAILS displays details about each report captured in Automatic Workload Repository (AWR).

Metadata for each report appears in the DBA\_HIST\_REPORTS view while the actual report is available in the DBA\_HIST\_REPORTS\_DETAILS view.

| Column          | Datatype | NULL | Description                                                                                          |
|-----------------|----------|------|------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER   |      | ID of the first AWR snapshot that will be taken after this report is generated                       |
| DBID            | NUMBER   |      | Database ID of the current database for the report                                                   |
| INSTANCE_NUMBER | NUMBER   |      | Instance number (for an Oracle RAC system)                                                           |
| REPORT_ID       | NUMBER   |      | ID of the captured report                                                                            |
| SESSION_ID      | NUMBER   |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports) |
| SESSION_SERIAL# | NUMBER   |      | Session serial number relevant to this report (currently used only for SQL Monitor reports)          |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GENERATION_TIME   | DATE     |      | Time when this report was generated                                                                                                                                                                                                                                                                                                                                                                                                              |
| REPORT_COMPRESSED | BLOB     |      | Actual XML report in compressed form                                                                                                                                                                                                                                                                                                                                                                                                             |
| REPORT            | CLOB     |      | Full uncompressed report                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID          | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID            | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.37 DBA\_HIST\_REPORTS\_TIMEBANDS

DBA\_HIST\_REPORTS\_TIMEBANDS contains bands of time with a new row created every day corresponding to a band of time.

Each band of time represents a period of time, and has a row for every report captured automatically into Automatic Workload Repository (AWR) during that time. If the activity period of a report spans across two bands of time (for example, the activity started before midnight and ended after midnight), then the view contains two rows for that report, with one row for each band of time. The view is partitioned to provide fast access to all reports captured in a given time frame.

| Column                 | Datatype       | NULL | Description                                                             |
|------------------------|----------------|------|-------------------------------------------------------------------------|
| SNAP_ID                | NUMBER         |      | The AWR snapshot id corresponding to the report                         |
| DBID                   | NUMBER         |      | Database ID of the current database for the report                      |
| INSTANCE_NUMBER        | NUMBER         |      | Instance number (for an Oracle RAC system)                              |
| CON_DBID               | NUMBER         |      | CDB ID of the captured report                                           |
| COMPONENT_ID           | NUMBER         |      | ID of the component (for example, SQL Monitor) whose report is captured |
| COMPONENT_NAME         | VARCHAR2 (128) |      | Name of the component whose report is captured                          |
| BAND_START_TIME        | DATE           |      | Starting time of the time band                                          |
| BAND_LENGTH            | NUMBER         |      | Length of time band in days (currently unused)                          |
| REPORT_ID              | NUMBER         |      | ID of the captured report                                               |
| REPORT_GENERATION_TIME | DATE           |      | Time when the report was generated                                      |
| PERIOD_START_TIME      | DATE           |      | Time when the activity period started                                   |
| PERIOD_END_TIME        | DATE           |      | Time when the activity period ended                                     |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY1            | VARCHAR2 (128) |      | Key1 associated with the captured report                                                                                                                                                                                                                                                                                                                                                                                                         |

| SESSION_ID      | NUMBER         |      | ID of the session corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                             |
| SESSION_SERIAL# | NUMBER         |      | Session serial number corresponding to the captured report (currently used only for SQL Monitor reports)                                                                                                                                                                                                                                                                                                                                         |
| CON_ID          | NUMBER         |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.38 DBA\_HIST\_RESOURCE\_LIMIT

DBA\_HIST\_RESOURCE\_LIMIT displays historical information about global resource use for some of the system resource.

This view contains snapshots of V\$RESOURCE\_LIMIT.

If time is of interest, join this view with DBA\_HIST\_SNAPSHOT.END\_INTERVAL\_TIME.

| Column              | Datatype      | NULL     | Description                                                                                                                                              |
|---------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                       |
| DBID                | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                             |
| INSTANCE_NUMBER     | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                         |
| RESOURCE_NAME       | VARCHAR2 (30) | NOT NULL | Name of the resource                                                                                                                                     |
| CURRENT_UTILIZATION | NUMBER        |          | Number of (resources, locks, or processes) currently being used                                                                                          |
| MAX_UTILIZATION     | NUMBER        |          | Maximum consumption of the resource since the last instance start up                                                                                     |
| INITIAL_ALLOCATION  | VARCHAR2 (10) |          | Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation). |
| LIMIT_VALUE         | VARCHAR2 (10) |          | Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).                                 |
| CON_DBID            | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                       |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.39 DBA\_HIST\_ROWCACHE\_SUMMARY

DBA\_HIST\_ROWCACHE\_SUMMARY displays historical summary statistics for data dictionary activity.

This view contains snapshots of V\$ROWCACHE.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|---------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PARAMETER       | VARCHAR2 (32) | NOT NULL | Name of the initialization parameter that determines the number of entries in the data dictionary cache                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_USAGE     | NUMBER        |          | Sum of the total number of entries in the cache                                                                                                                                                                                                                                                                                                                                                                                                      |
| USAGE           | NUMBER        |          | Number of cache entries that contain valid data                                                                                                                                                                                                                                                                                                                                                                                                      |
| GETS            | NUMBER        |          | Total number of requests for information on the data object                                                                                                                                                                                                                                                                                                                                                                                          |
| GETMISSES       | NUMBER        |          | Number of data requests resulting in cache misses                                                                                                                                                                                                                                                                                                                                                                                                    |
| SCANS           | NUMBER        |          | Number of scan requests                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SCANMISSES      | NUMBER        |          | Number of times a scan failed to find the data in the cache                                                                                                                                                                                                                                                                                                                                                                                          |
| SCANCOMPLETES   | NUMBER        |          | For a list of subordinate entries, the number of times the list was scanned completely                                                                                                                                                                                                                                                                                                                                                               |
| MODIFICATIONS   | NUMBER        |          | Number of inserts, updates, and deletions                                                                                                                                                                                                                                                                                                                                                                                                            |
| FLUSHES         | NUMBER        |          | Number of times flushed to disk                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DLM_REQUESTS    | NUMBER        |          | Number of DLM requests                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DLM_CONFLICTS   | NUMBER        |          | Number of DLM conflicts                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DLM_RELEASES    | NUMBER        |          | Number of DLM releases                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID        | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID          | NUMBER        |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.40 DBA\_HIST\_RSRC\_CONSUMER\_GROUP

DBA\_HIST\_RSRC\_CONSUMER\_GROUP displays historical information about Resource Manager consumer groups.

This view contains snapshots of V\$RSRC\_CONS\_GROUP\_HISTORY.

| Column                | Datatype       | NULL     | Description                                                                                                                                                                                             |
|-----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID               | NUMBER         | NOT NULL | Unique snapshot ID                                                                                                                                                                                      |
| DBID                  | NUMBER         | NOT NULL | Database ID for the snapshot                                                                                                                                                                            |
| INSTANCE_NUMBER       | NUMBER         | NOT NULL | Instance number for the snapshot                                                                                                                                                                        |
| SEQUENCE#             | NUMBER         | NOT NULL | A sequential counter that uniquely describes the DBA_HIST_RSRC_PLAN entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                  |
| CONSUMER_GROUP_ID     | NUMBER         | NOT NULL | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                           |
| CONSUMER_GROUP_NAME   | VARCHAR2 (128) | NOT NULL | Name of the consumer group                                                                                                                                                                              |
| REQUESTS              | NUMBER         | NOT NULL | Cumulative number of requests that were executed in the consumer group                                                                                                                                  |
| CPU_WAIT_TIME         | NUMBER         | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.                            |
| CPU_WAITS             | NUMBER         | NOT NULL | Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. |
| CONSUMED_CPU_TIME     | NUMBER         | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)                                                                                                          |
| YIELDS                | NUMBER         | NOT NULL | Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration                                                                         |
| ACTIVE_SESS_LIMIT_HIT | NUMBER         | NOT NULL | Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit                                                                             |
| UNDO_LIMIT_HIT        | NUMBER         | NOT NULL | Number of times that queries in the consumer group were cancelled because the consumer group reached its UNDO_POOL limit                                                                                |

## 6.41 DBA\_HIST\_RSRC\_METRIC

DBA\_HIST\_RSRC\_METRIC displays information about historical Resource Manager metrics for the past hour.

| Column                      | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                 |
|-----------------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                     | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                          |
| DBID                        | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER             | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                            |
| BEGIN_TIME                  | TIMESTAMP(3) | NOT NULL | Begin time of the interval                                                                                                                                                                                                                                                  |
| END_TIME                    | TIMESTAMP(3) | NOT NULL | End time of the interval                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC                | NUMBER       | NOT NULL | Interval size (in hundredths of a second)                                                                                                                                                                                                                                   |
| SEQUENCE#                   | NUMBER       | NOT NULL | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.                                                                                    |
| CONSUMER_GROUP_ID           | NUMBER       | NOT NULL | Consumer group object ID (a unique number, consistent across database shutdowns and startups)                                                                                                                                                                               |
| CPU_CONSUMED_TIME           | NUMBER       | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds                                                                                                                                                                               |
| CPU_WAIT_TIME               | NUMBER       | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| AVG_RUNNING_SESSIONS        | NUMBER       |          | Average number of sessions in the consumer group that are currently running                                                                                                                                                                                                 |
| AVG_WAITING_SESSIONS        | NUMBER       |          | Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                         |
| RUNNING_SESSION_LIMIT       | NUMBER       |          | Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.                                                 |
| AVG_CPU_UTILIZATION         | NUMBER       |          | Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system                                                                                                                                                            |
| IO_REQUESTS                 | NUMBER       | NOT NULL | I/O requests                                                                                                                                                                                                                                                                |
| IO_MEGABYTES                | NUMBER       | NOT NULL | I/O megabytes                                                                                                                                                                                                                                                               |
| IOPS                        | NUMBER       |          | I/O operations per second during the previous minute for this PDB                                                                                                                                                                                                           |
| IOMBPS                      | NUMBER       |          | I/O megabytes per second during the previous minute for this PDB                                                                                                                                                                                                            |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER       |          | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                               |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER       |          | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER       |          | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                         |

| Column                      | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER   |      | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                                       |
| CON_DBID                    | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                      | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.42 DBA\_HIST\_RSRC\_PDB\_METRIC

DBA\_HIST\_RSRC\_PDB\_METRIC displays information about historical Resource Manager metrics for the past hour by PDB.

| Column               | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                 |
|----------------------|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID              | NUMBER       | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                          |
| DBID                 | NUMBER       | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                |
| INSTANCE_NUMBER      | NUMBER       | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                            |
| BEGIN_TIME           | TIMESTAMP(3) | NOT NULL | Begin time of the interval                                                                                                                                                                                                                                                  |
| END_TIME             | TIMESTAMP(3) | NOT NULL | End time of the interval                                                                                                                                                                                                                                                    |
| INTSIZE_CSEC         | NUMBER       | NOT NULL | Interval size (in hundredths of a second)                                                                                                                                                                                                                                   |
| SEQUENCE#            | NUMBER       | NOT NULL | A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.                                                                                               |
| CPU_CONSUMED_TIME    | NUMBER       | NOT NULL | Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds                                                                                                                                                                                          |
| CPU_WAIT_TIME        | NUMBER       | NOT NULL | Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero. |
| AVG_RUNNING_SESSIONS | NUMBER       |          | Average number of sessions in the PDB that are currently running                                                                                                                                                                                                            |
| AVG_WAITING_SESSIONS | NUMBER       |          | Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.                                                                                                    |
| AVG_CPU_UTILIZATION  | NUMBER       |          | Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system                                                                                                                                                                       |
| IOPS                 | NUMBER       |          | I/O operations per second during the previous minute for this PDB                                                                                                                                                                                                           |

| Column                      | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IOMBPS                      | NUMBER   |          | I/O megabytes per second during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                                                         |
| IOPS_THROTTLE_EXEMPT        | NUMBER   |          | <p>Indicates how much of the I/O per second in the current PDB was exempted from throttling.</p> <p>For example, if the value in the IOPS column is 20 I/Os and the value in the IOPS_THROTTLE_EXEMPT column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling.</p> <p>I/O throttling is defined by the MAX_IOPS database initialization parameter.</p>                                                 |
| IOMBPS_THROTTLE_EXEMPT      | NUMBER   |          | <p>Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling.</p> <p>For example, if the value in the IOMBPS column is 200 megabytes and the value in the IOMBPS_THROTTLE_EXEMPT column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling.</p> <p>I/O megabytes per second throttling is defined by the MAX_MBPS database initialization parameter.</p> |
| AVG_IO_THROTTLE             | NUMBER   |          | Average throttle time per I/O operation in milliseconds during the previous minute for this PDB                                                                                                                                                                                                                                                                                                                                          |
| AVG_ACTIVE_PARALLEL_STMTS   | NUMBER   |          | The average number of parallel statements that were running during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                            |
| AVG_QUEUED_PARALLEL_STMTS   | NUMBER   |          | The average number of parallel statements that were queued during the 1-minute metric window                                                                                                                                                                                                                                                                                                                                             |
| AVG_ACTIVE_PARALLEL_SERVERS | NUMBER   |          | The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window                                                                                                                                                                                                                                                                                                      |
| AVG_QUEUED_PARALLEL_SERVERS | NUMBER   |          | The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window                                                                                                                                                                                                                                                                                                               |
| SGA_BYTES                   | NUMBER   | NOT NULL | The current SGA usage for this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                              |
| BUFFER_CACHE_BYTES          | NUMBER   | NOT NULL | The current usage of the buffer cache by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                               |
| SHARED_POOL_BYTES           | NUMBER   | NOT NULL | The current usage of the shared pool by this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                |
| PGA_BYTES                   | NUMBER   | NOT NULL | The current PGA usage for this PDB in bytes                                                                                                                                                                                                                                                                                                                                                                                              |
| PLAN_ID                     | NUMBER   | NOT NULL | Resource Manager plan identifier                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID                    | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                      | NUMBER   |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>   |

| Column                   | Datatype | NULL     | Description                                                |
|--------------------------|----------|----------|------------------------------------------------------------|
| MAX_AVG_RUNNING_SESSIONS | NUMBER   | NOT NULL | Maximum value of AVG_RUNNING_SESSIONS during the last hour |

## 6.43 DBA\_HIST\_RSRC\_PLAN

DBA\_HIST\_RSRC\_PLAN displays historical information about resource plans.

This view contains snapshots of V\$RSRC\_PLAN\_HISTORY.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                         |
|-----------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER         | NOT NULL | Unique snapshot ID                                                                                                                                                                                                  |
| DBID            | NUMBER         | NOT NULL | Database ID for the snapshot                                                                                                                                                                                        |
| INSTANCE_NUMBER | NUMBER         | NOT NULL | Instance number for the snapshot                                                                                                                                                                                    |
| SEQUENCE#       | NUMBER         | NOT NULL | A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.                                                                                                    |
| START_TIME      | DATE           | NOT NULL | Time that the resource plan was enabled                                                                                                                                                                             |
| END_TIME        | DATE           |          | Time that the resource plan was disabled; NULL if the row contains the current resource plan information                                                                                                            |
| PLAN_ID         | NUMBER         | NOT NULL | Resource plan ID; NULL if the Resource Manager was disabled                                                                                                                                                         |
| PLAN_NAME       | VARCHAR2 (128) | NOT NULL | Resource plan name; NULL if the Resource Manager was disabled                                                                                                                                                       |
| CPU_MANAGED     | VARCHAR2 (4)   | NOT NULL | Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF) |

| Column                     | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARALLEL_EXECUTION_MANAGED | VARCHAR2 (4) |      | State of parallel statement queuing: <ul style="list-style-type: none"> <li>• OFF - Parallel statement queuing is disabled</li> <li>• STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes</li> <li>• FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue</li> <li>• FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled.</li> </ul> |
| INSTANCE_CAGING            | VARCHAR2 (4) |      | Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_DBID                   | NUMBER       |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                     | NUMBER       |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                  |

## 6.44 DBA\_HIST\_RULE\_SET

DBA\_HIST\_RULE\_SET displays historical information about rule set statistics.

| Column          | Datatype       | NULL     | Description                      |
|-----------------|----------------|----------|----------------------------------|
| SNAP_ID         | NUMBER         | NOT NULL | Unique snapshot ID               |
| DBID            | NUMBER         | NOT NULL | Database ID for the snapshot     |
| INSTANCE_NUMBER | NUMBER         | NOT NULL | Instance number for the snapshot |
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the rule set            |
| NAME            | VARCHAR2 (128) | NOT NULL | Name of the rule set             |
| STARTUP_TIME    | DATE           | NOT NULL | Startup time of the instance     |

| Column               | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_TIME             | NUMBER   |      | Total CPU time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                                |
| ELAPSED_TIME         | NUMBER   |      | Total elapsed time (in hundredths of a second) spent in evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                            |
| EVALUATIONS          | NUMBER   |      | Number of evaluations on the rule set                                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_FREE_EVALUATIONS | NUMBER   |      | Number of evaluations on the rule set which did not internally issue SQL to evaluate rules                                                                                                                                                                                                                                                                                                                                                    |
| SQL_EXECUTIONS       | NUMBER   |      | Total number of SQL statements executed during evaluation of the rule set                                                                                                                                                                                                                                                                                                                                                                     |
| RELOADS              | NUMBER   |      | Number of times the rule set object was reloaded in shared memory                                                                                                                                                                                                                                                                                                                                                                             |
| CON_DBID             | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.45 DBA\_HIST\_SAGAS

DBA\_HIST\_SAGAS provides a history of all completed sagas in the database. Its columns are the same as those in ALL\_HIST\_SAGAS.

This view displays sagas that were either initiated in the current PDB or joined by participants in the current PDB.

Completed sagas are retained in this view for the length of time specified by the SAGA\_HIST\_RETENTION initialization parameter. The default is 30 days.

### Note:

This view is available starting with Oracle Database 23ai.

## 6.46 DBA\_HIST\_SEG\_STAT

DBA\_HIST\_SEG\_STAT displays historical information about segment-level statistics.

This view captures the top segments based on a set of criteria and captures information from V\$SEGSTAT. The total value is the value of the statistics since instance startup. The delta value is the value of the statistics from the BEGIN\_INTERVAL\_TIME to the END\_INTERVAL\_TIME in the DBA\_HIST\_SNAPSHOT view.

| Column                       | Datatype | NULL     | Description                                             |
|------------------------------|----------|----------|---------------------------------------------------------|
| SNAP_ID                      | NUMBER   | NOT NULL | Unique snapshot ID                                      |
| DBID                         | NUMBER   | NOT NULL | Database ID for the snapshot                            |
| INSTANCE_NUMBER              | NUMBER   | NOT NULL | Instance number for the snapshot                        |
| TS#                          | NUMBER   | NOT NULL | Tablespace number                                       |
| OBJ#                         | NUMBER   | NOT NULL | Dictionary object number                                |
| DATAOBJ#                     | NUMBER   | NOT NULL | Data object number                                      |
| LOGICAL_READS_TOTAL          | NUMBER   |          | Cumulative value for logical reads                      |
| LOGICAL_READS_DELTA          | NUMBER   |          | Delta value for logical reads                           |
| BUFFER_BUSY_WAITS_TOTAL      | NUMBER   |          | Cumulative value for buffer busy waits                  |
| BUFFER_BUSY_WAITS_DELTA      | NUMBER   |          | Delta value for buffer busy waits                       |
| DB_BLOCK_CHANGES_TOTAL       | NUMBER   |          | Cumulative value for db block changes (in blocks)       |
| DB_BLOCK_CHANGES_DELTA       | NUMBER   |          | Delta value for db block changes (in blocks)            |
| PHYSICAL_READS_TOTAL         | NUMBER   |          | Cumulative value for physical reads (in blocks)         |
| PHYSICAL_READS_DELTA         | NUMBER   |          | Delta value for physical reads (in blocks)              |
| PHYSICAL_WRITES_TOTAL        | NUMBER   |          | Cumulative value for physical writes (in blocks)        |
| PHYSICAL_WRITES_DELTA        | NUMBER   |          | Delta value for physical writes (in blocks)             |
| PHYSICAL_READS_DIRECT_TOTAL  | NUMBER   |          | Cumulative value for physical reads direct (in blocks)  |
| PHYSICAL_READS_DIRECT_DELTA  | NUMBER   |          | Delta value for physical reads direct (in blocks)       |
| PHYSICAL_WRITES_DIRECT_TOTAL | NUMBER   |          | Cumulative value for physical writes direct (in blocks) |
| PHYSICAL_WRITES_DIRECT_DELTA | NUMBER   |          | Delta value for physical writes direct (in blocks)      |
| ITL_WAITS_TOTAL              | NUMBER   |          | Cumulative value for ITL waits                          |
| ITL_WAITS_DELTA              | NUMBER   |          | Delta value for ITL waits                               |
| ROW_LOCK_WAITS_TOTAL         | NUMBER   |          | Cumulative value for row lock waits                     |
| ROW_LOCK_WAITS_DELTA         | NUMBER   |          | Delta value for row lock waits                          |
| GC_CR_BLOCKS_SERVED_TOTAL    | NUMBER   |          | Cumulative value for global cache CR blocks served      |
| GC_CR_BLOCKS_SERVED_DELTA    | NUMBER   |          | Delta value for global cache CR blocks served           |
| GC_CU_BLOCKS_SERVED_TOTAL    | NUMBER   |          | Cumulative value for global cache current blocks served |
| GC_CU_BLOCKS_SERVED_DELTA    | NUMBER   |          | Delta value for global cache current blocks served      |

| Column                         | Datatype | NULL | Description                                                                                                                   |
|--------------------------------|----------|------|-------------------------------------------------------------------------------------------------------------------------------|
| GC_BUFFER_BUSY_TOTAL           | NUMBER   |      | Cumulative value for global cache buffer busy                                                                                 |
| GC_BUFFER_BUSY_DELTA           | NUMBER   |      | Delta value for global cache buffer busy                                                                                      |
| GC_CR_BLOCKS_RECEIVED_TOTAL    | NUMBER   |      | Cumulative value for global cache CR blocks received                                                                          |
| GC_CR_BLOCKS_RECEIVED_DELTA    | NUMBER   |      | Delta value for global cache CR blocks received                                                                               |
| GC_CU_BLOCKS_RECEIVED_TOTAL    | NUMBER   |      | Cumulative value for global cache current blocks received                                                                     |
| GC_CU_BLOCKS_RECEIVED_DELTA    | NUMBER   |      | Delta value for global cache current blocks received                                                                          |
| SPACE_USED_TOTAL               | NUMBER   |      | Number of bytes used by user data                                                                                             |
| SPACE_USED_DELTA               | NUMBER   |      | Delta value for space used by user data (in bytes). A negative value indicates the number of bytes deleted in the segment.    |
| SPACE_ALLOCATED_TOTAL          | NUMBER   |      | The number of bytes that are allocated                                                                                        |
| SPACE_ALLOCATED_DELTA          | NUMBER   |      | Delta value for the space allocated (in bytes). A negative value indicates the number of bytes deallocated to the tablespace. |
| TABLE_SCANS_TOTAL              | NUMBER   |      | Cumulative value for table scans                                                                                              |
| TABLE_SCANS_DELTA              | NUMBER   |      | Delta value for table scans                                                                                                   |
| CHAIN_ROW_EXCESS_TOTAL         | NUMBER   |      | Cumulative value of number of chained row pieces that can be eliminated by table reorganization                               |
| CHAIN_ROW_EXCESS_DELTA         | NUMBER   |      | Delta value of number of chained row pieces that can be eliminated by table reorganization                                    |
| PHYSICAL_READ_REQUESTS_TOTAL   | NUMBER   |      | Cumulative value of number of physical read I/O requests issued for the monitored segment                                     |
| PHYSICAL_READ_REQUESTS_DELTA   | NUMBER   |      | Delta value of number of physical read I/O requests issued for the monitored segment                                          |
| PHYSICAL_WRITE_REQUESTS_TOTAL  | NUMBER   |      | Cumulative value of number of physical write I/O requests issued for the monitored segment                                    |
| PHYSICAL_WRITE_REQUESTS_DELTA  | NUMBER   |      | Delta value of number of physical write I/O requests issued for the monitored segment                                         |
| OPTIMIZED_PHYSICAL_READS_TOTAL | NUMBER   |      | Cumulative value of number of physical reads from Database Smart Flash Cache for the monitored segment                        |
| OPTIMIZED_PHYSICAL_READS_DELTA | NUMBER   |      | Delta value of number of physical reads from Database Smart Flash Cache for the monitored segment                             |
| IM_SCANS_TOTAL                 | NUMBER   |      | Count of segment statistics                                                                                                   |
| IM_SCANS_DELTA                 | NUMBER   |      | Delta values for in-memory scans                                                                                              |
| POPULATE_CUS_TOTAL             | NUMBER   |      | Count of compression units (CUs) populated per segment                                                                        |
| POPULATE_CUS_DELTA             | NUMBER   |      | Delta value for compression unit (CU) populate operations                                                                     |
| REPOPULATE_CUS_TOTAL           | NUMBER   |      | Count of CUs repopulated per segment                                                                                          |
| REPOPULATE_CUS_DELTA           | NUMBER   |      | Delta value for compression unit (CU) repopulate operations                                                                   |

| Column                    | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IM_DB_BLOCK_CHANGES_TOTAL | NUMBER   |      | The total number of changes that were part of an update or delete operation that were made to segment blocks                                                                                                                                                                                                                                                                                                                                  |
| IM_DB_BLOCK_CHANGES_DELTA | NUMBER   |      | Delta value for database block changes                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_DBID                  | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                    | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.47 DBA\_HIST\_SEG\_STAT\_OBJ

DBA\_HIST\_SEG\_STAT\_OBJ displays all the names of the segments captured in the workload repository.

This view is used with the DBA\_HIST\_SEG\_STAT view.

| Column          | Datatype       | NULL     | Description                                        |
|-----------------|----------------|----------|----------------------------------------------------|
| DBID            | NUMBER         | NOT NULL | Database ID                                        |
| TS#             | NUMBER         | NOT NULL | Tablespace number                                  |
| OBJ#            | NUMBER         | NOT NULL | Dictionary object number                           |
| DATAOBJ#        | NUMBER         | NOT NULL | Data object number                                 |
| OWNER           | VARCHAR2 (128) | NOT NULL | Owner of the object                                |
| OBJECT_NAME     | VARCHAR2 (128) | NOT NULL | Name of the object                                 |
| SUBOBJECT_NAME  | VARCHAR2 (128) |          | Name of the subobject (for example: partition)     |
| OBJECT_TYPE     | VARCHAR2 (18)  |          | Type of the object for example: table, tablespace) |
| TABLESPACE_NAME | VARCHAR2 (30)  |          | Tablespace Name for the object                     |
| PARTITION_TYPE  | VARCHAR2 (8)   |          | Partition Type, if relevant                        |
| CON_DBID        | NUMBER         |          | The database ID of the PDB for the sampled session |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|----------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. ## 6.49 DBA\_HIST\_SERVICE\_STAT

DBA\_HIST\_SERVICE\_STAT displays the history of important service statistics tracked by the Workload Repository.

The call rate statistics in this view can be used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate.

The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the service name, this view provides historical data on the timing and work done for calls issued for the whole service. This view contains information from V\$SERVICE\_STATS.

| Column            | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Valid values:</p> <ul style="list-style-type: none"> <li>XStream</li> <li>GoldenGate</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER        |          | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.53 DBA\_HIST\_SESSMETRIC\_HISTORY

DBA\_HIST\_SESSMETRIC\_HISTORY displays the history of several important session metrics.

### Note:

This view is populated only if a session metric exceeds a server metric threshold that was configured using the DBMS\_SERVER\_ALERT package.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 6.58 DBA\_HIST\_SHARED\_SERVER\_SUMMARY

DBA\_HIST\_SHARED\_SERVER\_SUMMARY displays historical information for shared servers.

This includes information about shared server activity, the servers, common queues, and dispatcher queues. This view obtains information from V\$SHARED\_SERVER, V\$DISPATCHER, V\$CIRCUIT, and V\$QUEUE, and is aggregated over all servers, dispatchers, queues, and circuits.

| Column              | Datatype | NULL     | Description                                                                                                                                                                                                                  |
|---------------------|----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID             | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                                                           |
| DBID                | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                 |
| INSTANCE_NUMBER     | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                             |
| NUM_SAMPLES         | NUMBER   |          | Total number of samples                                                                                                                                                                                                      |
| SAMPLE_TIME         | NUMBER   |          | Last sample timestamp                                                                                                                                                                                                        |
| SAMPLED_TOTAL_CONN  | NUMBER   |          | Cumulative sum of total number of connections over all samples. To determine the average number of connections between two snapshots, divide the difference in SAMPLED_TOTAL_CONN by the difference in NUM_SAMPLES.          |
| SAMPLED_ACTIVE_CONN | NUMBER   |          | Cumulative sum of active number of connections over all samples. To determine the average number of active connections between two snapshots, divide the difference in SAMPLED_ACTIVE_CONN by the difference in NUM_SAMPLES. |
| SAMPLED_TOTAL_SRV   | NUMBER   |          | Cumulative sum of total number of servers over all samples. To determine the average number of servers between two snapshots, divide the difference in SAMPLED_TOTAL_SRV by the difference in NUM_SAMPLES.                   |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|----------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAMPLED_ACTIVE_SRV  | NUMBER   |      | Cumulative sum of active number of servers over all samples. To determine the average number of active servers between two snapshots, divide the difference in SAMPLED_ACTIVE_SRV by the difference in NUM_SAMPLES.                                                                                                                                                                                                                                |
| SAMPLED_TOTAL_DISP  | NUMBER   |      | Cumulative sum of total number of dispatchers over all samples. To determine the average number of dispatchers between two snapshots, divide the difference in SAMPLED_TOTAL_DISP by the difference in NUM_SAMPLES.                                                                                                                                                                                                                                |
| SAMPLED_ACTIVE_DISP | NUMBER   |      | Cumulative sum of active number of dispatchers over all samples. To determine the average number of active dispatchers between two snapshots, divide the difference in SAMPLED_ACTIVE_DISP by the difference in NUM_SAMPLES.                                                                                                                                                                                                                       |
| SRV_BUSY            | NUMBER   |      | Total shared server busy time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| SRV_IDLE            | NUMBER   |      | Total shared server idle time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                          |
| SRV_IN_NET          | NUMBER   |      | Total shared server incoming network wait time (in hundredths of a second). This includes waits for receives and resets. This time is also included in SRV_BUSY.                                                                                                                                                                                                                                                                                   |
| SRV_OUT_NET         | NUMBER   |      | Total shared server outgoing network wait time (in hundredths of a second). This includes waits for sends and outbound connection requests. This time is also included in SRV_BUSY.                                                                                                                                                                                                                                                                |
| SRV_MESSAGES        | NUMBER   |      | Number of messages processed                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SRV_BYTES           | NUMBER   |      | Total number of bytes in all messages                                                                                                                                                                                                                                                                                                                                                                                                              |
| CQ_WAIT             | NUMBER   |      | Total time that all items in the common queue have waited (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                              |
| CQ_TOTALQ           | NUMBER   |      | Total number of items that have ever been in the common queue                                                                                                                                                                                                                                                                                                                                                                                      |
| DQ_TOTALQ           | NUMBER   |      | Total number of items that have ever been in a dispatcher queue                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_DBID            | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID              | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.61 DBA\_HIST\_SQL\_BIND\_METADATA

DBA\_HIST\_SQL\_BIND\_METADATA displays historical information on metadata for bind variables used by SQL cursors.

| Column       | Datatype      | NULL     | Description                                                                                                                               |
|--------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| DBID         | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                              |
| SQL_ID       | VARCHAR2(13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                  |
| NAME         | VARCHAR2(128) |          | Name of the bind variable                                                                                                                 |
| POSITION     | NUMBER        | NOT NULL | Position of the bind variable in the SQL statement                                                                                        |
| DUP_POSITION | NUMBER        |          | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable |

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATATYPE        | NUMBER        |      | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                                                                                                                                                                                             |
| DATATYPE_STRING | VARCHAR2 (15) |      | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.                                                                                                                                                                      |
| CHARACTER_SID   | NUMBER        |      | National character set identifier                                                                                                                                                                                                                                                                                                                                                                                                             |
| PRECISION       | NUMBER        |      | Precision (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SCALE           | NUMBER        |      | Scale (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MAX_LENGTH      | NUMBER        |      | Maximum bind length                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_DBID        | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID          | NUMBER        |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.62 DBA\_HIST\_SQL\_PLAN

DBA\_HIST\_SQL\_PLAN displays the execution plan information for each child cursor in the workload repository.

This view captures information from V\$SQL\_PLAN and is used with the DBA\_HIST\_SQLSTAT view.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                     |
|-----------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID            | NUMBER         | NOT NULL | Database ID                                                                                                                                                                                                     |
| SQL_ID          | VARCHAR2 (13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                        |
| PLAN_HASH_VALUE | NUMBER         | NOT NULL | Numerical representation of the SQL plan for the cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).   |
| ID              | NUMBER         | NOT NULL | A number assigned to each step in the execution plan                                                                                                                                                            |
| OPERATION       | VARCHAR2 (30)  |          | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                               |
| OPTIONS         | VARCHAR2 (30)  |          | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                              |
| OBJECT_NODE     | VARCHAR2 (128) |          | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed. |
| OBJECT#         | NUMBER         |          | Object number of the table or the index                                                                                                                                                                         |

| Column          | Datatype        | NULL | Description                                                                                                                                                                                                                                                                 |
|-----------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_OWNER    | VARCHAR2 (128)  |      | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                          |
| OBJECT_NAME     | VARCHAR2 (128)  |      | Name of the table or index                                                                                                                                                                                                                                                  |
| OBJECT_ALIAS    | VARCHAR2 (261)  |      | Alias for the object                                                                                                                                                                                                                                                        |
| OBJECT_TYPE     | VARCHAR2 (20)   |      | Type of the object                                                                                                                                                                                                                                                          |
| OPTIMIZER       | VARCHAR2 (20)   |      | Current mode of the optimizer for the first row in the plan (statement line), for example, <code>ALL_ROWS</code> . When the operation is a database access (for example, <code>TABLE ACCESS</code> ), this column indicates whether or not the object is analyzed.          |
| PARENT_ID       | NUMBER          |      | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                               |
| DEPTH           | NUMBER          |      | Depth (or level) of the operation in the tree. It is not necessary to issue a <code>CONNECT BY</code> statement to get the level information, which is generally used to indent the rows from the <code>PLAN_TABLE</code> table. The root operation (statement) is level 0. |
| POSITION        | NUMBER          |      | Order of processing for all operations that have the same <code>PARENT_ID</code>                                                                                                                                                                                            |
| SEARCH_COLUMNS  | NUMBER          |      | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                                                  |
| COST            | NUMBER          |      | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                            |
| CARDINALITY     | NUMBER          |      | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                                                      |
| BYTES           | NUMBER          |      | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                                                     |
| OTHER_TAG       | VARCHAR2 (35)   |      | Describes the contents of the <code>OTHER</code> column. See <code>EXPLAIN PLAN</code> for values.                                                                                                                                                                          |
| PARTITION_START | VARCHAR2 (64)   |      | Start partition of a range of accessed partitions                                                                                                                                                                                                                           |
| PARTITION_STOP  | VARCHAR2 (64)   |      | Stop partition of a range of accessed partitions                                                                                                                                                                                                                            |
| PARTITION_ID    | NUMBER          |      | Step that computes the pair of values of the <code>PARTITION_START</code> and <code>PARTITION_STOP</code> columns                                                                                                                                                           |
| OTHER           | VARCHAR2 (4000) |      | Other information specific to the execution step that users may find useful. See <code>EXPLAIN PLAN</code> for values.                                                                                                                                                      |
| DISTRIBUTION    | VARCHAR2 (20)   |      | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                                             |
| CPU_COST        | NUMBER          |      | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                        |
| IO_COST         | NUMBER          |      | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                        |
| TEMP_SPACE      | NUMBER          |      | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                       |

| Column            | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACCESS_PREDICATES | VARCHAR2 (4000) |      | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FILTER_PREDICATES | VARCHAR2 (4000) |      | Predicates used to filter rows before producing them                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PROJECTION        | VARCHAR2 (4000) |      | Expressions produced by the operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TIME              | NUMBER          |      | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| QBLOCK_NAME       | VARCHAR2 (128)  |      | Name of the query block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| INSTANCE_NUMBER    | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TOTAL_SQL          | NUMBER   | NOT NULL | Total number of SQLs                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_SQL_MEM      | NUMBER   | NOT NULL | Total sharable memory in bytes for SQLs                                                                                                                                                                                                                                                                                                                                                                                                          |
| SINGLE_USE_SQL     | NUMBER   | NOT NULL | Total number of single execution SQLs                                                                                                                                                                                                                                                                                                                                                                                                            |
| SINGLE_USE_SQL_MEM | NUMBER   | NOT NULL | Total sharable memory in bytes for single execution SQLs                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID           | NUMBER   |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID             | NUMBER   |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.64 DBA\_HIST\_SQL\_WORKAREA\_HSTGRM

DBA\_HIST\_SQL\_WORKAREA\_HSTGRM displays the historical cumulative work area execution statistics (cumulated since instance startup) for different work area groups.

This view contains snapshots of V\$SQL\_WORKAREA\_HISTOGRAM.

| Column             | Datatype | NULL     | Description                                                                                                                                                                       |
|--------------------|----------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID            | NUMBER   | NOT NULL | Unique snapshot ID                                                                                                                                                                |
| DBID               | NUMBER   | NOT NULL | Database ID for the snapshot                                                                                                                                                      |
| INSTANCE_NUMBER    | NUMBER   | NOT NULL | Instance number for the snapshot                                                                                                                                                  |
| LOW_OPTIMAL_SIZE   | NUMBER   | NOT NULL | Lower bound for the optimal memory requirement of work areas included in the row (in bytes)                                                                                       |
| HIGH_OPTIMAL_SIZE  | NUMBER   | NOT NULL | Upper bound for the optimal memory requirement of work areas included in the row (in bytes)                                                                                       |
| OPTIMAL_EXECUTIONS | NUMBER   |          | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup  |
| ONEPASS_EXECUTIONS | NUMBER   |          | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup |

| Column                 | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MULTIPASSES_EXECUTIONS | NUMBER   |      | Number of work areas with an optimal memory requirement comprised between <code>LOW_OPTIMAL_SIZE</code> and <code>HIGH_OPTIMAL_SIZE</code> which have been executed in multi-pass mode since instance startup                                                                                                                                                                                                                                              |
| TOTAL_EXECUTIONS       | NUMBER   |      | Sum of <code>OPTIMAL_EXECUTIONS</code> , <code>ONEPASS_EXECUTIONS</code> , and <code>MULTIPASSES_EXECUTIONS</code>                                                                                                                                                                                                                                                                                                                                         |
| CON_DBID               | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                 | NUMBER   |      | The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.65 DBA\_HIST\_SQLBIND

DBA\_HIST\_SQLBIND displays historical information on bind variables used by SQL cursors.

This view contains snapshots of V\$SQL\_BIND\_CAPTURE.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                              |
|-----------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER         | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                       |
| DBID            | NUMBER         | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                             |
| INSTANCE_NUMBER | NUMBER         | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                         |
| SQL_ID          | VARCHAR2 (13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                 |
| NAME            | VARCHAR2 (128) |          | Name of the bind variable                                                                                                                                                                                                                                                |
| POSITION        | NUMBER         | NOT NULL | Position of the bind variable in the SQL statement                                                                                                                                                                                                                       |
| DUP_POSITION    | NUMBER         |          | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.                                                                                                                               |
| DATATYPE        | NUMBER         |          | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                        |
| DATATYPE_STRING | VARCHAR2 (15)  |          | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed. |
| CHARACTER_SID   | NUMBER         |          | National character set identifier                                                                                                                                                                                                                                        |

| Column        | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRECISION     | NUMBER          |      | Precision (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SCALE         | NUMBER          |      | Scale (for numeric binds)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_LENGTH    | NUMBER          |      | Maximum bind length                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WAS_CAPTURED  | VARCHAR2 (3)    |      | Indicates whether the bind value was captured (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                  |
| LAST_CAPTURED | DATE            |      | Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.                                                                                                                                                                                                                                                                         |
| VALUE_STRING  | VARCHAR2 (4000) |      | Value of the bind represented as a string                                                                                                                                                                                                                                                                                                                                                                                                                        |
| VALUE_ANYDATA | ANYDATA         |      | Value of the bind represented using the self-descriptive <code>Sys.AnyData</code> data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the <code>DATATYPE</code> column.                                                                                                                                                                                |
| CON_DBID      | NUMBER          |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID        | NUMBER          |      | The ID of the container that <code>CON_DBID</code> identifies. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.66 DBA\_HIST\_SQLCOMMAND\_NAME

DBA\_HIST\_SQLCOMMAND\_NAME displays the mapping between SQL opcodes and names.

| Column       | Datatype      | NULL     | Description                                        |
|--------------|---------------|----------|----------------------------------------------------|
| DBID         | NUMBER        | NOT NULL | Database ID                                        |
| COMMAND_TYPE | NUMBER        | NOT NULL | SQL command number                                 |
| COMMAND_NAME | VARCHAR2 (64) |          | SQL command name                                   |
| CON_DBID     | NUMBER        |          | The database ID of the PDB for the sampled session |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.67 DBA\_HIST\_SQLSTAT

DBA\_HIST\_SQLSTAT displays historical information about SQL statistics.

This view captures the top SQL statements based on a set of criteria and captures the statistics information from V\$SQL. The total value is the value of the statistics since instance startup. The delta value is the value of the statistics from the BEGIN\_INTERVAL\_TIME to the END\_INTERVAL\_TIME in the DBA\_HIST\_SNAPSHOT view.

This view is used with the DBA\_HIST\_OPTIMIZER\_ENV, DBA\_HIST\_SQLTEXT, and DBA\_HIST\_SQL\_PLAN views to provide a complete picture of historical SQL statistics.

| Column                   | Datatype      | NULL     | Description                                                                                                                                                                                                   |
|--------------------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAP_ID                  | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                            |
| DBID                     | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                  |
| INSTANCE_NUMBER          | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                              |
| SQL_ID                   | VARCHAR2 (13) | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                                                                      |
| PLAN_HASH_VALUE          | NUMBER        | NOT NULL | Numerical representation of the SQL plan for the cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). |
| OPTIMIZER_COST           | NUMBER        |          | Cost of the query given by the optimizer                                                                                                                                                                      |
| OPTIMIZER_MODE           | VARCHAR2 (10) |          | Mode under which the SQL statement is executed                                                                                                                                                                |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER        |          | Hash Value for the optimizer environment                                                                                                                                                                      |
| SHARABLE_MEM             | NUMBER        |          | Amount of shared memory used by the child cursor (in bytes)                                                                                                                                                   |
| LOADED_VERSIONS          | NUMBER        |          | Indicates whether the context heap is loaded (1) or not (0)                                                                                                                                                   |
| VERSION_COUNT            | NUMBER        |          | Number of children associated with the cursor                                                                                                                                                                 |
| MODULE                   | VARCHAR2 (64) |          | Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE                                              |
| ACTION                   | VARCHAR2 (64) |          | Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION                                              |
| SQL_PROFILE              | VARCHAR2 (64) |          | Name of the applied SQL Profile                                                                                                                                                                               |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 6.68 DBA\_HIST\_SQLTEXT

DBA\_HIST\_SQLTEXT displays the text of SQL statements belonging to shared SQL cursors captured in the Workload Repository.

This view captures information from V\$SQL and is used with the DBA\_HIST\_SQLSTAT view.

| Column       | Datatype      | NULL     | Description                                              |
|--------------|---------------|----------|----------------------------------------------------------|
| DBID         | NUMBER        | NOT NULL | Database ID                                              |
| SQL_ID       | VARCHAR2 (13) | NOT NULL | SQL identifier of the parent cursor in the library cache |
| SQL_TEXT     | CLOB          |          | Full text for the SQL statement exposed as a CLOB column |
| COMMAND_TYPE | NUMBER        |          | Oracle command type definition                           |
| CON_DBID     | NUMBER        |          | The database ID of the PDB for the sampled session       |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"><li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>1: This value is used for rows containing data that pertain to only the root</li><li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.69 DBA\_HIST\_STAT\_NAME

DBA\_HIST\_STAT\_NAME displays decoded statistic names for the statistics captured in the Workload Repository.

This includes OLAP statistics and OLAP timed events. This view captures information from V\$STATNAME and is used with DBA\_HIST\_SYSSTAT and DBA\_HIST\_SYS\_TIME\_MODEL.

| Column    | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.70 DBA\_HIST\_STREAMS\_APPLY\_SUM

DBA\_HIST\_STREAMS\_APPLY\_SUM displays information about each apply process and its activities.

This view contains a snapshot of V\$STREAMS\_APPLY\_COORDINATOR, V\$STREAMS\_APPLY\_READER, and V\$STREAMS\_APPLY\_SERVER. This view is intended for use with Automatic Workload Repository (AWR).

| Column                         | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                            |

## 6.71 DBA\_HIST\_STREAMS\_CAPTURE

DBA\_HIST\_STREAMS\_CAPTURE displays information about each capture process.

This view is intended for use with Automatic Workload Repository (AWR).

| Column                  | Datatype      | NULL     | Description                                                                                             |
|-------------------------|---------------|----------|---------------------------------------------------------------------------------------------------------|
| SNAP_ID                 | NUMBER        | NOT NULL | Unique snapshot ID                                                                                      |
| DBID                    | NUMBER        | NOT NULL | Database ID for the snapshot                                                                            |
| INSTANCE_NUMBER         | NUMBER        | NOT NULL | Instance number for the snapshot                                                                        |
| CAPTURE_NAME            | VARCHAR2(128) | NOT NULL | Name of the capture process                                                                             |
| STARTUP_TIME            | DATE          | NOT NULL | Time that the capture process was last started                                                          |
| LAG                     | NUMBER        |          | Delay (in seconds) between the creation and capture of the most recently captured message               |
| TOTAL_MESSAGES_CAPTURED | NUMBER        |          | Total changes captured since the capture process was last started                                       |
| TOTAL_MESSAGES_ENQUEUED | NUMBER        |          | Total number of messages enqueued since the capture process was last started                            |
| ELAPSED_RULE_TIME       | NUMBER        |          | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started    |
| ELAPSED_ENQUEUE_TIME    | NUMBER        |          | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started |
| ELAPSED_REDO_WAIT_TIME  | NUMBER        |          | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state     |

| Column             | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_PAUSE_TIME | NUMBER   |      | Elapsed pause time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_DBID           | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID             | NUMBER   |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. ## 6.72 DBA\_HIST\_STREAMS\_POOL\_ADVICE

DBA\_HIST\_STREAMS\_POOL\_ADVICE displays historical information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes.

This view is intended for use with Automatic Workload Repository (AWR).

| Column             | Datatype | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| EXTENT_MANAGEMENT        | VARCHAR2 (30) |          | Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)                                                                                                                                                                                                                                                                                                                                         |
| BLOCK_SIZE               | NUMBER        |          | Block size of the tablespace                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_DBID                 | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER        |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.79 DBA\_HIST\_TABLESPACE\_STAT

DBA\_HIST\_TABLESPACE\_STAT displays tablespace information from the control file.

This view contains snapshots of V\$TABLESPACE and DBA\_TABLESPACES.

| Column          | Datatype      | NULL     | Description                                                                                             |
|-----------------|---------------|----------|---------------------------------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                      |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                                            |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                        |
| TS#             | NUMBER        | NOT NULL | Tablespace number                                                                                       |
| TSNAME          | VARCHAR2 (30) |          | Tablespace name                                                                                         |
| CONTENTS        | VARCHAR2 (9)  |          | Tablespace contents: <ul style="list-style-type: none"> <li>• PERMANENT</li> <li>• TEMPORARY</li> </ul> |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                   | VARCHAR2 (9)  |      | Tablespace status: <ul style="list-style-type: none"> <li>• ONLINE</li> <li>• OFFLINE</li> <li>• READ ONLY</li> </ul>                                                                                                                                                                                                                                                                                                                                  |
| SEGMENT_SPACE_MANAGEMENT | VARCHAR2 (6)  |      | Indicates whether the free and used segment space in the tablespace is managed using free lists (MANUAL) or bitmaps (AUTO)                                                                                                                                                                                                                                                                                                                             |
| EXTENT_MANAGEMENT        | VARCHAR2 (10) |      | Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)                                                                                                                                                                                                                                                                                                                                         |
| IS_BACKUP                | VARCHAR2 (5)  |      | Indicates whether the tablespace is part of a backup                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_DBID                 | NUMBER        |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER        |      | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.85 DBA\_HIST\_UNDOSTAT

DBA\_HIST\_UNDOSTAT displays the history of histograms of statistical data to show how well the system is working.

The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. This view contains snapshots of V\$UNDOSTAT.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| BEGIN_TIME      | DATE          | NOT NULL | Identifies the beginning of the time interval                                                                                                                                                                                                                                                                                                                                                                                                    |
| END_TIME        | DATE          | NOT NULL | Identifies the end of the time interval                                                                                                                                                                                                                                                                                                                                                                                                          |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                     |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                                                                                                                                                                                                                                                                                                                                                                                               |
| UNDOTSN         | NUMBER        | NOT NULL | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                     |
| UNDOBLKS        | NUMBER        |          | Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.                                                                                                                                                                                                                   |
| TXNCOUNT        | NUMBER        |          | Identifies the total number of transactions executed within the period                                                                                                                                                                                                                                                                                                                                                                           |
| MAXQUERYLEN     | NUMBER        |          | Identifies the length of the longest query (in number of seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the UNDO_RETENTION initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/ executed during the period are reflected in the view. |
| MAXQUERYSQLID   | VARCHAR2 (13) |          | SQL identifier of the longest running SQL statement in the period                                                                                                                                                                                                                                                                                                                                                                                |
| MAXCONCURRENCY  | NUMBER        |          | Identifies the highest number of transactions executed concurrently within the period                                                                                                                                                                                                                                                                                                                                                            |
| UNXPSTEALCNT    | NUMBER        |          | Number of attempts to obtain undo space by stealing unexpired extents from other transactions                                                                                                                                                                                                                                                                                                                                                    |
| UNXPBLKRELCNT   | NUMBER        |          | Number of unexpired blocks removed from certain undo segments so they can be used by other transactions                                                                                                                                                                                                                                                                                                                                          |
| UNXPBLKREUCNT   | NUMBER        |          | Number of unexpired undo blocks reused by transactions                                                                                                                                                                                                                                                                                                                                                                                           |
| EXPSTEALCNT     | NUMBER        |          | Number of attempts to steal expired undo blocks from other undo segments                                                                                                                                                                                                                                                                                                                                                                         |
| EXPBLKRELCNT    | NUMBER        |          | Number of expired undo blocks stolen from other undo segments                                                                                                                                                                                                                                                                                                                                                                                    |

| Column              | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPBLKREUCNT        | NUMBER   |      | Number of expired undo blocks reused within the same undo segments                                                                                                                                                                                                                                                                                                                                                                                            |
| SSOLDERRCNT         | NUMBER   |      | Identifies the number of times the error <code>ORA-01555</code> occurred. You can use this statistic to decide whether the <code>UNDO_RETENTION</code> initialization parameter is set properly given the size of the undo tablespace. Increasing the value of <code>UNDO_RETENTION</code> can reduce the occurrence of this error.                                                                                                                           |
| NOSPACEERRCNT       | NUMBER   |      | Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.                                                                                                                                                                                       |
| ACTIVEBLKS          | NUMBER   |      | Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                                        |
| UNEXPIREDBLKS       | NUMBER   |      | Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                                     |
| EXPIREDBLKS         | NUMBER   |      | Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                                       |
| TUNED_UNDORETENTION | NUMBER   |      | System tuned value indicating the period for which undo is being retained<br><br>The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances.                                                                                                                                                                                                          |
| CON_DBID            | NUMBER   |      | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID              | NUMBER   |      | The ID of the container that <code>CON_DBID</code> identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| TIME_WAITED          | NUMBER        | NOT NULL | Time waited during the interval (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| WAIT_COUNT           | NUMBER        | NOT NULL | Number of times waited                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TIME_WAITED_FG       | NUMBER        |          | Time waited (in hundredths of a second), from foreground sessions                                                                                                                                                                                                                                                                                                                                                                                |
| WAIT_COUNT_FG        | NUMBER        |          | Number of times waited, from foreground sessions                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_DBID             | NUMBER        |          | The database ID of the PDB for the sampled session                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID               | NUMBER        |          | The ID of the container that CON_DBID identifies.<br>Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.87 DBA\_HIST\_WAITSTAT

DBA\_HIST\_WAITSTAT displays historical block contention statistics. This view contains snapshots of V\$WAITSTAT.

| Column          | Datatype      | NULL     | Description                                                                      |
|-----------------|---------------|----------|----------------------------------------------------------------------------------|
| SNAP_ID         | NUMBER        | NOT NULL | Unique snapshot ID                                                               |
| DBID            | NUMBER        | NOT NULL | Database ID for the snapshot                                                     |
| INSTANCE_NUMBER | NUMBER        | NOT NULL | Instance number for the snapshot                                                 |
| CLASS           | VARCHAR2 (18) | NOT NULL | Class of the block                                                               |
| WAIT_COUNT      | NUMBER        |          | Number of waits by the OPERATION for this CLASS of block                         |
| TIME            | NUMBER        |          | Sum of all wait times for all the waits by the OPERATION for this CLASS of block |
| CON_DBID        | NUMBER        |          | The database ID of the PDB for the sampled session                               |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container that CON_DBID identifies. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| SRC_DBNAME      | VARCHAR2(128)                   |          | Database name of the non-CDB, CDB, or PDB where the AWR snapshot data was collected                                                                                                                                                                                                                                                                                                                                                                    |
| TABLESPACE_NAME | VARCHAR2(128)                   |          | Name of the tablespace in which AWR snapshot data resides                                                                                                                                                                                                                                                                                                                                                                                              |

## 6.89 DBA\_HIST\_WR\_SETTINGS

DBA\_HIST\_WR\_SETTINGS displays the settings and metadata for the Workload Repository.

| Column        | Datatype     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|--------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOCAL_AWRDBID | NUMBER       | NOT NULL | Database ID of the local database                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VIEW_LOCATION | VARCHAR2 (8) |          | Data source of the DBA_HIST dictionary views.<br>Possible values include: <ul style="list-style-type: none"><li>• AWR_PDB: Views display AWR data stored in the PDB.</li><li>• AWR_ROOT: Views display AWR data stored in the root.</li></ul>                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER       |          | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.90 DBA\_HISTOGRAMS

DBA\_HISTOGRAMS is a synonym for DBA\_TAB\_HISTOGRAMS.

**See Also:**

"DBA\_TAB\_HISTOGRAMS"

## 6.91 DBA\_HIVE\_COLUMNS

DBA\_HIVE\_COLUMNS describes all Hive columns in a Hive metastore. Its columns are the same as those in ALL\_HIVE\_COLUMNS.

**See Also:**

"ALL\_HIVE\_COLUMNS"

## 6.92 DBA\_HIVE\_DATABASES

DBA\_HIVE\_DATABASES describes all the Hive schemas in a Hadoop cluster. Its columns are the same as those in ALL\_HIVE\_DATABASES.

**See Also:**

["ALL\\_HIVE\\_DATABASES"](#)

## 6.93 DBA\_HIVE\_PART\_KEY\_COLUMNS

DBA\_HIVE\_PART\_KEY\_COLUMNS provides information about all Hive table partition columns in the database. Its columns are the same as those in ALL\_HIVE\_PART\_KEY\_COLUMNS.

**See Also:**

["ALL\\_HIVE\\_PART\\_KEY\\_COLUMNS"](#)

## 6.94 DBA\_HIVE\_TAB\_PARTITIONS

DBA\_HIVE\_TAB\_PARTITIONS provides information about all Hive table partitions in the database. Its columns are the same as those in ALL\_HIVE\_TAB\_PARTITIONS.

**See Also:**

["ALL\\_HIVE\\_TAB\\_PARTITIONS"](#)

## 6.95 DBA\_HIVE\_TABLES

DBA\_HIVE\_TABLES provides information about all the Hive tables in the Hive metastore. Its columns are the same as those in ALL\_HIVE\_TABLES.

**See Also:**

["ALL\\_HIVE\\_TABLES"](#)

## 6.96 DBA\_HOST\_ACES

DBA\_HOST\_ACES describes access control entries defined in host access control lists.

### Related View

USER\_HOST\_ACES describes the status of access control entries for the current user to access network hosts through PL/SQL network utility packages. This view does not display the ACE\_ORDER, START\_DATE, END\_DATE, GRANT\_TYPE, INVERTED\_PRINCIPAL, PRINCIPAL, or PRINCIPAL\_TYPE columns.

| Column             | Datatype        | NULL     | Description                                                               |
|--------------------|-----------------|----------|---------------------------------------------------------------------------|
| HOST               | VARCHAR2 (1000) | NOT NULL | Network host                                                              |
| LOWER_PORT         | NUMBER (5)      |          | Lower bound of the port range                                             |
| UPPER_PORT         | NUMBER (5)      |          | Upper bound of the port range                                             |
| ACE_ORDER          | NUMBER          | NOT NULL | Order number of the access control entry                                  |
| START_DATE         | TIMESTAMP (6)   |          | Start date of the access control entry                                    |
| END_DATE           | TIMESTAMP (6)   |          | End date of the access control entry                                      |
| GRANT_TYPE         | VARCHAR2 (5)    |          | Indicates whether the access control entry grants or denies the privilege |
| INVERTED_PRINCIPAL | VARCHAR2 (3)    |          | Indicates whether the principal is inverted or not                        |
| PRINCIPAL          | VARCHAR2 (128)  |          | Principal the privilege is applied to                                     |
| PRINCIPAL_TYPE     | VARCHAR2 (16)   |          | Type of the principal                                                     |
| PRIVILEGE          | VARCHAR2 (128)  |          | Privilege                                                                 |

**See Also:**

["USER\\_HOST\\_ACES"](#)

## 6.97 DBA\_HOST\_ACLS

DBA\_HOST\_ACLS describes access control lists assigned to restrict access to network hosts through PL/SQL network utility packages.

| Column     | Datatype        | NULL     | Description                              |
|------------|-----------------|----------|------------------------------------------|
| HOST       | VARCHAR2 (1000) | NOT NULL | Network host                             |
| LOWER_PORT | NUMBER (5)      |          | Lower bound of the port range            |
| UPPER_PORT | NUMBER (5)      |          | Upper bound of the port range            |
| ACL        | VARCHAR2 (4000) |          | The name of the access control list      |
| ACLID      | RAW (8)         |          | The object ID of the access control list |
| ACL_OWNER  | VARCHAR2 (128)  |          | The owner of the access control list     |

## 6.98 DBA\_IDENTIFIERS

DBA\_IDENTIFIERS displays information about the identifiers in all stored objects in the database. Its columns are the same as those in ALL\_IDENTIFIERS.

### See Also:

"ALL\_IDENTIFIERS"

## 6.99 DBA\_ILMDATAMOVEMENTPOLICIES

DBA\_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy in a database.

### Related View

USER\_ILMDATAMOVEMENTPOLICIES contains information specific to data movement-related attributes of an Automatic Data Optimization policy for a user.

### Note:

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column            | Datatype       | NULL     | Description                                                                                                                                                                                          |
|-------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME       | VARCHAR2 (128) | NOT NULL | The Automatic Data Optimization policy name is autogenerated                                                                                                                                         |
| ACTION_TYPE       | VARCHAR2 (11)  |          | Type of data movement action performed by the Automatic Data Optimization policy: <ul style="list-style-type: none"><li>• ANNOTATE</li><li>• COMPRESSION</li><li>• EVICT</li><li>• STORAGE</li></ul> |
| SCOPE             | VARCHAR2 (7)   |          | Identifies the scope of the Automatic Data Optimization policy: <ul style="list-style-type: none"><li>• ROW</li><li>• GROUP</li><li>• SEGMENT</li></ul>                                              |
| COMPRESSION_LEVEL | VARCHAR2 (30)  |          | Compression level to move selected rows or the entire segment to, for a compression Automatic Data Optimization policy                                                                               |
| TIER_TABLESPACE   | VARCHAR2 (128) |          | Tablespace to move the object to, for a storage Automatic Data Optimization policy                                                                                                                   |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIER_STATUS     | VARCHAR2 (9)   |      | This column is only valid for storage tiering policies, and indicates whether the storage tiering policy was specified with a <code>READ ONLY</code> clause. This column takes <code>READ ONLY</code> as a potential value. In all other cases, it is blank.<br><br>In other words, this column indicates whether the tablespace the object is being moved to will be made <code>READ ONLY</code> after the movement. |
| CONDITION_TYPE  | VARCHAR2 (22)  |      | Column on which the condition for the policy is based. Possible values: <ul style="list-style-type: none"> <li>• <code>LAST ACCESS TIME</code></li> <li>• <code>LAST MODIFICATION TIME</code></li> <li>• <code>CREATION TIME</code></li> <li>• <code>USER DEFINED</code></li> <li>• <code>LOW ACCESS</code></li> </ul>                                                                                                |
| CONDITION_DAYS  | NUMBER         |      | Number of days in the condition for the policy                                                                                                                                                                                                                                                                                                                                                                        |
| CUSTOM_FUNCTION | VARCHAR2 (128) |      | Optional function that evaluates the precondition on the policy                                                                                                                                                                                                                                                                                                                                                       |
| POLICY_SUBTYPE  | VARCHAR2 (10)  |      | Storage tier on which the policy is specified                                                                                                                                                                                                                                                                                                                                                                         |
| ACTION_CLAUSE   | CLOB           |      | Text of the action executed by the policy                                                                                                                                                                                                                                                                                                                                                                             |
| TIER_TO         | VARCHAR2 (10)  |      | Storage tier where the data is placed after the policy is executed                                                                                                                                                                                                                                                                                                                                                    |

| TASK_ID                | NUMBER          |          | Number that uniquely identifies a specific Automatic Data Optimization task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| POLICY_NAME            | VARCHAR2 (128)  | NOT NULL | Name of the Automatic Data Optimization policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_OWNER           | VARCHAR2 (128)  | NOT NULL | Owner of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OBJECT_NAME            | VARCHAR2 (128)  | NOT NULL | Name of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SUBOBJECT_NAME         | VARCHAR2 (128)  |          | Name of the subobject associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OBJECT_TYPE            | VARCHAR2 (18)   |          | Object type. Valid values include TABLE, TABLE PARTITION, and TABLE SUBPARTITION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SELECTED_FOR_EXECUTION | VARCHAR2 (42)   |          | Indicates whether the policy has been selected for execution on the object. If not, the reason for not being selected is listed. Possible values: <ul style="list-style-type: none"> <li>POLICY DISABLED</li> <li>SELECTED FOR EXECUTION</li> <li>POLICY OVERRULED</li> <li>INHERITED POLICY OVERRULED</li> <li>PRECONDITION NOT SATISFIED</li> <li>JOB ALREADY EXISTS</li> <li>NO OPERATION SINCE LAST ILM ACTION</li> <li>TABLE HAS MATERIALIZED VIEW</li> <li>TARGET COMPRESSION NOT HIGHER THAN CURRENT</li> <li>STATISTICS NOT AVAILABLE</li> </ul> The value SELECTED FOR EXECUTION means a job was created for this policy on the object. The other values state the reason why the policy on the object was selected for execution. |
| JOB_NAME               | VARCHAR2 (128)  |          | Name of the job in the case where the policy is selected for execution on this object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| COMMENTS               | VARCHAR2 (4000) |          | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 6.101 DBA\_ILMOBJECTS

DBA\_ILMOBJECTS displays all the Automatic Data Optimization policies and objects in the database.

Many objects inherit policies via their parent objects or because they were created in a particular tablespace. This view provides a mapping between the policies and objects and indicates whether a policy is inherited by an object or is directly specified on it.

#### Related View

USER\_ILMOBJECTS displays all the Automatic Data Optimization policies and objects for a user.

**Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column             | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                           |

| OBJECT_OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                            |
| OBJECT_NAME        | VARCHAR2 (128) | NOT NULL | Name of the object associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                             |
| SUBOBJECT_NAME     | VARCHAR2 (128) |          | Name of the subobject associated with the Automatic Data Optimization policy                                                                                                                                                                                                                                                                          |
| OBJECT_TYPE        | VARCHAR2 (18)  |          | Object type. Valid values include: <ul style="list-style-type: none"> <li>• INDEX</li> <li>• INDEX PARTITION</li> <li>• LOB</li> <li>• LOB PARTITION</li> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTITION</li> </ul> Direct policies on Index, Index Partition, LOB, and LOB Partition are not supported in Oracle Database 12c. |
| INHERITED_FROM     | VARCHAR2 (20)  |          | Indicates if the policy is inherited by the object or subobject, or directly specified on the object or subobject. If the policy is inherited, the level from which the policy is inherited (TABLE, TABLE PARTITION, TABLESPACE) is identified.                                                                                                       |
| TBS_INHERITED_FROM | VARCHAR2 (30)  |          | The tablespace name, if the policy is inherited from a tablespace                                                                                                                                                                                                                                                                                     |
| ENABLED            | VARCHAR2 (7)   |          | Indicates if the Automatic Data Optimization policy is enabled for the object (YES or NO)                                                                                                                                                                                                                                                             |
| DELETED            | VARCHAR2 (7)   |          | Possible values: <ul style="list-style-type: none"> <li>• YES - Indicates that the policy is deleted for any objects that may be added in the future, but is active for those objects that are currently associated with that policy</li> <li>• NO - Indicates that the policy is active</li> </ul>                                                   |

## 6.102 DBA\_ILMPARAMETERS

DBA\_ILMPARAMETERS can be queried to provide information on the Automatic Data Optimization parameters in the database and their values.

**Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column | Datatype       | NULL | Description                                                                                                                             |
|--------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2 (128) |      | Name of the Automatic Data Optimization environment parameter. The value is one of the constants defined in the DBMS_ILM_ADMIN package. |
| VALUE  | NUMBER         |      | Value of the parameter                                                                                                                  |

## 6.103 DBA\_ILMPOLICIES

DBA\_ILMPOLICIES displays details about Automatic Data Optimization policies in the database.

The view contains common details relevant to all types of Automatic Data Optimization policies, not just details relevant to the data movement-related Automatic Data Optimization policies.

**Related View**

USER\_ILMPOLICIES displays details about Automatic Data Optimization policies owned by the user.

**Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                              |
|-------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME | VARCHAR2 (128) |      | The name of the Automatic Data Optimization policy is auto-generated                                                                                                                                                                                     |
| POLICY_TYPE | VARCHAR2 (13)  |      | Type of the policy. Valid values include <code>DATAMOVEMENT</code> .                                                                                                                                                                                     |
| TABLESPACE  | VARCHAR2 (30)  |      | Tablespace name, in the case of a tablespace-level policy                                                                                                                                                                                                |
| ENABLED     | VARCHAR2 (6)   |      | Indicates whether the policy is enabled or not                                                                                                                                                                                                           |
| DELETED     | VARCHAR2 (7)   |      | Possible values: <ul style="list-style-type: none"> <li>• <code>YES</code> - Indicates that the policy associated has been deleted (but shall remain active for this object)</li> <li>• <code>NO</code> - Indicates that the policy is active</li> </ul> |

**Note:**

Automatic Data Optimization policies cannot be set on tables with object types or materialized views.

## 6.104 DBA\_ILMRESULTS

`DBA_ILMRESULTS` displays information on data movement-related Automatic Data Optimization jobs in the database.

### Related View

`USER_ILMRESULTS` displays information on data movement-related Automatic Data Optimization jobs for tasks created by the user.

**Note:**

Automatic Data Optimization is supported in Oracle Database 12c Release 2 multitenant environments.

| Column   | Datatype       | NULL | Description                                                                 |
|----------|----------------|------|-----------------------------------------------------------------------------|
| TASK_ID  | NUMBER         |      | Number that uniquely identifies a specific Automatic Data Optimization task |
| JOB_NAME | VARCHAR2 (128) |      | Name of the Automatic Data Optimization job                                 |

| Column          | Datatype        | NULL | Description                                                                                                                                                                                                                                                                          |
|-----------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB_STATE       | VARCHAR2 (35)   |      | State of the job. Possible values: <ul style="list-style-type: none"> <li>JOB CREATED</li> <li>COMPLETED SUCCESSFULLY</li> <li>FAILED</li> <li>STOPPED</li> <li>JOB CREATION FAILED</li> <li>DEPENDENT OBJECTS BEING REBUILT</li> <li>FAILED TO REBUILD DEPENDENT OBJECTS</li> </ul> |
| START_TIME      | TIMESTAMP (6)   |      | Start time of the Automatic Data Optimization job                                                                                                                                                                                                                                    |
| COMPLETION_TIME | TIMESTAMP (6)   |      | Completion time of the Automatic Data Optimization job                                                                                                                                                                                                                               |
| COMMENTS        | VARCHAR2 (4000) |      | Additional information in cases where the Automatic Data Optimization job execution fails                                                                                                                                                                                            |
| STATISTICS      | CLOB            |      | Job specific statistics, such as space saved via compression. This column is in the form of comma separated name / value pairs, with each pair representing a particular statistic name and value.                                                                                   |

## 6.106 DBA\_IM\_EXPRESSIONS

DBA\_IM\_EXPRESSIONS provides information about the list of expressions (SYS\_IME virtual columns) that are currently enabled for in-memory storage.

Typically, you can query this view after invoking the DBMS\_INMEMORY\_ADMIN.IME\_CAPTURE\_EXPRESSIONS PL/SQL procedure to see the list of hot expressions added to different tables across the database.

Based on this view, you can:

- Populate expressions on a particular table immediately
- Drop certain expressions that are marked for in-memory but not desired by users

### Related View

USER\_IM\_EXPRESSIONS provides information about the list of expressions (SYS\_IME virtual columns) that are currently enabled for in-memory storage in schemas owned by the current user. This view does not display the OWNER column.

| Column         | Datatype       | NULL     | Description                                                            |
|----------------|----------------|----------|------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (129) |          | Table owner                                                            |
| TABLE_NAME     | VARCHAR2 (129) |          | Table name                                                             |
| OBJECT_NUMBER  | NUMBER         |          | Object number of the table                                             |
| COLUMN_NAME    | VARCHAR2 (128) | NOT NULL | Column name of the expression added to the table (with SYS_IME prefix) |
| SQL_EXPRESSION | LONG           |          | SQL representation of the expression                                   |

**See Also:**["USER\\_IM\\_EXPRESSIONS"](#)

## 6.107 DBA\_IMMUTABLE\_ROW\_VERSION\_COLS

DBA\_IMMUTABLE\_ROW\_VERSION\_COLS displays information about row versioned columns in all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_ROW\_VERSION\_COLS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_IMMUTABLE\_ROW\_VERSION\_COLS"

## 6.108 DBA\_IMMUTABLE\_ROW\_VERSION\_HISTORY

DBA\_IMMUTABLE\_ROW\_VERSION\_HISTORY provides a history of row versions in all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_ROW\_VERSION\_HISTORY.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_IMMUTABLE\_ROW\_VERSION\_HISTORY"

## 6.109 DBA\_IMMUTABLE\_TABLE\_COLUMNS

DBA\_IMMUTABLE\_TABLE\_COLUMNS displays information about columns valid in each epoch in all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_TABLE\_COLUMNS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_IMMUTABLE\_TABLE\_COLUMNS"

## 6.110 DBA\_IMMUTABLE\_TABLE\_EPOCHS

DBA\_IMMUTABLE\_TABLE\_EPOCHS displays epoch information for all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_TABLE\_EPOCHS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_IMMUTABLE\_TABLE\_EPOCHS"

## 6.111 DBA\_IMMUTABLE\_TABLES

DBA\_IMMUTABLE\_TABLES describes all immutable tables in the database. Its columns are the same as those in ALL\_IMMUTABLE\_TABLES.

**See Also:**

"ALL\_IMMUTABLE\_TABLES"

## 6.112 DBA\_INCOMPLETE\_SAGAS

DBA\_INCOMPLETE\_SAGAS describes all incomplete sagas in the database. Its columns are the same as those in ALL\_INCOMPLETE\_SAGAS.

This view displays sagas that were either initiated in the current PDB or joined by participants in the current PDB.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_INCOMPLETE\\_SAGAS"](#)

## 6.113 DBA\_IND\_COLUMNS

DBA\_IND\_COLUMNS describes the columns of all the indexes on all tables and clusters in the database. Its columns are the same as those in ALL\_IND\_COLUMNS.

**See Also:**

["ALL\\_IND\\_COLUMNS"](#)

## 6.114 DBA\_IND\_EXPRESSIONS

DBA\_IND\_EXPRESSIONS lists expressions of function-based indexes on all tables and clusters in the database. Its columns are the same as those in ALL\_IND\_EXPRESSIONS.

**See Also:**

["ALL\\_IND\\_EXPRESSIONS"](#)

## 6.115 DBA\_IND\_PARTITIONS

DBA\_IND\_PARTITIONS displays, for each index partition in the database, the partition-level partitioning information, the storage parameters for the partition, and various partition statistics generated by the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_PARTITIONS.

**See Also:**

["ALL\\_IND\\_PARTITIONS"](#)

## 6.116 DBA\_IND\_PENDING\_STATS

DBA\_IND\_PENDING\_STATS describes pending statistics for all tables, partitions, and subpartitions in the database collected using the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_PENDING\_STATS.

### See Also:

"ALL\_IND\_PENDING\_STATS"

## 6.117 DBA\_IND\_STATISTICS

DBA\_IND\_STATISTICS displays optimizer statistics for all indexes in the database collected using the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_STATISTICS.

### See Also:

"ALL\_IND\_STATISTICS"

## 6.118 DBA\_IND\_SUBPARTITIONS

DBA\_IND\_SUBPARTITIONS displays, for each index subpartition in the database, the subpartition-level partitioning information, the storage parameters for the subpartition, and various subpartition statistics generated by the DBMS\_STATS package. Its columns are the same as those in ALL\_IND\_SUBPARTITIONS.

### See Also:

"ALL\_IND\_SUBPARTITIONS"

## 6.119 DBA\_INDEX\_USAGE

DBA\_INDEX\_USAGE displays cumulative statistics for each index.

| Column             | Datatype       | NULL     | Description                                       |
|--------------------|----------------|----------|---------------------------------------------------|
| OBJECT_ID          | NUMBER         | NOT NULL | Object ID for the index                           |
| NAME               | VARCHAR2 (128) | NOT NULL | Index name                                        |
| OWNER              | VARCHAR2 (128) | NOT NULL | Index owner                                       |
| TOTAL_ACCESS_COUNT | NUMBER         |          | Total number of times the index has been accessed |
| TOTAL_EXEC_COUNT   | NUMBER         |          | Total executions the index has participated in    |

| Column                         | Datatype | NULL | Description                                                                                                                                                                                                                                                                           |
|--------------------------------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_ROWS_RETURNED            | NUMBER   |      | Total rows returned by the index.<br>Index usage is categorized into buckets of different ranges. Each bucket has a range of values for access count and rows returned. An entry is placed into a bucket if the rows returned or access counts falls within the range of that bucket. |
| BUCKET_0_ACCESS_COUNT          | NUMBER   |      | The index has not been accessed                                                                                                                                                                                                                                                       |
| BUCKET_1_ACCESS_COUNT          | NUMBER   |      | The index has been accessed once                                                                                                                                                                                                                                                      |
| BUCKET_2_10_ACCESS_COUNT       | NUMBER   |      | The index has been accessed between 2 and 10 times                                                                                                                                                                                                                                    |
| BUCKET_2_10_ROWS_RETURNED      | NUMBER   |      | The index has returned between 2 and 10 rows                                                                                                                                                                                                                                          |
| BUCKET_11_100_ACCESS_COUNT     | NUMBER   |      | The index has been accessed between 11 and 100 times                                                                                                                                                                                                                                  |
| BUCKET_11_100_ROWS_RETURNED    | NUMBER   |      | The index has returned between 11 and 100 rows                                                                                                                                                                                                                                        |
| BUCKET_101_1000_ACCESS_COUNT   | NUMBER   |      | The index has been accessed between 101 and 1000 times                                                                                                                                                                                                                                |
| BUCKET_101_1000_ROWS_RETURNED  | NUMBER   |      | The index has returned between 101 and 1000 rows                                                                                                                                                                                                                                      |
| BUCKET_1000_PLUS_ACCESS_COUNT  | NUMBER   |      | The index has been accessed more than 1000 times                                                                                                                                                                                                                                      |
| BUCKET_1000_PLUS_ROWS_RETURNED | NUMBER   |      | The index has returned more than 1000 rows                                                                                                                                                                                                                                            |
| LAST_USED                      | DATE     |      | Time that the index was last used                                                                                                                                                                                                                                                     |

**See Also:**["V\\$INDEX\\_USAGE\\_INFO"](#)

## 6.120 DBA\_INDEXES

DBA\_INDEXES describes all indexes in the database. To gather statistics for this view, use the DBMS\_STATS package. This view supports parallel partitioned index scans. Its columns are the same as those in ALL\_INDEXES.

**See Also:**["ALL\\_INDEXES"](#)

## 6.121 DBA\_INDEXTYPE\_ARRAYTYPES

DBA\_INDEXTYPE\_ARRAYTYPES displays information about the array types specified by all indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_ARRAYTYPES.

See Also:

["ALL\\_INDEXTYPE\\_ARRAYTYPES"](#)

## 6.122 DBA\_INDEXTYPE\_COMMENTS

DBA\_INDEXTYPE\_COMMENTS displays comments for all user-defined indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_COMMENTS.

See Also:

["ALL\\_INDEXTYPE\\_COMMENTS"](#)

## 6.123 DBA\_INDEXTYPE\_OPERATORS

DBA\_INDEXTYPE\_OPERATORS lists all the operators supported by indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPE\_OPERATORS.

See Also:

["ALL\\_INDEXTYPE\\_OPERATORS"](#)

## 6.124 DBA\_INDEXTYPES

DBA\_INDEXTYPES describes all indextypes in the database. Its columns are the same as those in ALL\_INDEXTYPES.

See Also:

["ALL\\_INDEXTYPES"](#)

## 6.125 DBA\_INMEMORY\_ADVISOR\_RECOMMENDATION

DBA\_INMEMORY\_ADVISOR\_RECOMMENDATION displays In-Memory Advisor recommendations.

In-Memory Advisor simulates various Oracle Database In-Memory sizes and estimates the database time for a reference workload for each size. The results are displayed in this view.

| Column                           | Datatype | NULL | Description                                                                  |
|----------------------------------|----------|------|------------------------------------------------------------------------------|
| TASK_ID                          | NUMBER   |      | In-Memory Advisor task ID                                                    |
| INMEMORY_SIZE                    | NUMBER   |      | Simulated In-Memory size (in bytes)                                          |
| ESTIMATED_DB_TIME_LOW            | NUMBER   |      | Low end of the predicted database time range (in seconds)                    |
| ESTIMATED_DB_TIME_HIGH           | NUMBER   |      | High end of the predicted database time range (in seconds)                   |
| ESTIMATED_DB_TIME_ANALYTICS_LOW  | NUMBER   |      | Low end of the predicted database analytical time range (in seconds)         |
| ESTIMATED_DB_TIME_ANALYTICS_HIGH | NUMBER   |      | High end of the predicted database analytical time range (in seconds)        |
| RECOMMENDED_OBJ_LIST             | CLOB     |      | List of recommended objects for the simulated In-Memory size (INMEMORY_SIZE) |

### Note:

This view is available starting with Oracle Database 23ai.

## 6.126 DBA\_INMEMORY\_AIMTASKDETAILS

DBA\_INMEMORY\_AIMTASKDETAILS displays details for an Automatic In-Memory management task.

| Column         | Datatype       | NULL | Description                                                                          |
|----------------|----------------|------|--------------------------------------------------------------------------------------|
| TASK_ID        | NUMBER         |      | Number that uniquely identifies a specific automatic IM column store management task |
| OBJECT_OWNER   | VARCHAR2 (128) |      | Owner of the object subject to automatic IM column store management task action      |
| OBJECT_NAME    | VARCHAR2 (128) |      | Name of the object subject to automatic IM column store management task action       |
| SUBOBJECT_NAME | VARCHAR2 (128) |      | Name of the subobject subject to automatic IM column store management task action    |
| ACTION         | VARCHAR2 (16)  |      | Action taken on the object                                                           |
| STATE          | VARCHAR2 (10)  |      | Status of the action on the object                                                   |

**See Also:**

*Oracle Database In-Memory Guide* for more information about configuring the Automatic In-Memory feature

## 6.127 DBA\_INMEMORY\_AIMTASKS

DBA\_INMEMORY\_AIMTASKS displays information about Automatic In-Memory management tasks.

| Column        | Datatype      | NULL | Description                                                                          |
|---------------|---------------|------|--------------------------------------------------------------------------------------|
| TASK_ID       | NUMBER        |      | Number that uniquely identifies a specific automatic IM column store management task |
| CREATION_TIME | TIMESTAMP (6) |      | Creation time of the task                                                            |
| STATE         | VARCHAR2 (7)  |      | State of the task                                                                    |

**See Also:**

*Oracle Database In-Memory Guide* for more information about configuring the Automatic In-Memory feature

## 6.128 DBA\_INTERNAL\_TRIGGERS

DBA\_INTERNAL\_TRIGGERS describes internal triggers on all tables in the database. Its columns are the same as those in ALL\_INTERNAL\_TRIGGERS.

**See Also:**

"ALL\_INTERNAL\_TRIGGERS"

## 6.129 DBA\_INVALID\_OBJECTS

DBA\_INVALID\_OBJECTS describes all invalid objects in the database. You can use this view to identify invalid objects before and after a database upgrade.

This view eliminates old versions of object types. It only includes the object type if it is the latest version.

| Column         | Datatype       | NULL | Description                                    |
|----------------|----------------|------|------------------------------------------------|
| OWNER          | VARCHAR2 (128) |      | Owner of the object                            |
| OBJECT_NAME    | VARCHAR2 (128) |      | Name of the object                             |
| SUBOBJECT_NAME | VARCHAR2 (128) |      | Name of the subobject (for example, partition) |
| OBJECT_ID      | NUMBER         |      | Dictionary object number of the object.        |

| Column         | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATA_OBJECT_ID | NUMBER         |      | Dictionary object number of the segment that contains the object.<br><b>Note:</b> OBJECT_ID and DATA_OBJECT_ID display data dictionary metadata. Do not confuse these numbers with the unique 16-byte object identifier ( <i>object ID</i> ) that Oracle Database assigns to row objects in object tables in the system.                                                                                            |
| OBJECT_TYPE    | VARCHAR2 (23)  |      | Type of the object (such as TABLE, INDEX).<br>The current version of the type is shown only if it is invalid. In other words, if prior versions of the type are invalid but the most recent version of the type is valid, it will not be in this list.                                                                                                                                                              |
| CREATED        | DATE           |      | Timestamp for the creation of the object                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_DDL_TIME  | DATE           |      | Timestamp for the last modification of the object and dependent objects resulting from a DDL statement (including grants and revokes)                                                                                                                                                                                                                                                                               |
| TIMESTAMP      | VARCHAR2 (19)  |      | Timestamp for the specification of the object (character data)                                                                                                                                                                                                                                                                                                                                                      |
| STATUS         | VARCHAR2 (7)   |      | Status of the object: <ul style="list-style-type: none"> <li>VALID</li> <li>INVALID</li> <li>N/A</li> </ul>                                                                                                                                                                                                                                                                                                         |
| TEMPORARY      | VARCHAR2 (1)   |      | Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)                                                                                                                                                                                                                                                                               |
| GENERATED      | VARCHAR2 (1)   |      | Indicates whether the name of this object was system-generated (Y) or not (N)                                                                                                                                                                                                                                                                                                                                       |
| SECONDARY      | VARCHAR2 (1)   |      | Indicates whether this is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge (Y) or not (N)                                                                                                                                                                                                                                                                                      |
| NAMESPACE      | NUMBER         |      | Namespace for the object                                                                                                                                                                                                                                                                                                                                                                                            |
| EDITION_NAME   | VARCHAR2 (128) |      | Name of the edition in which the object is actual                                                                                                                                                                                                                                                                                                                                                                   |
| SHARING        | VARCHAR2 (18)  |      | Values: <ul style="list-style-type: none"> <li>DATA LINK - If the object is data-linked or a data link to an object in the root</li> <li>METADATA LINK - If the object is metadata-linked or a metadata link to an object in the root</li> <li>EXTENDED DATA LINK - If the object is extended-data-linked or an extended data link to an object in the root</li> <li>NONE - If none of the above applies</li> </ul> |
| EDITIONABLE    | VARCHAR2 (1)   |      | Values: <ul style="list-style-type: none"> <li>Y - For objects marked EDITIONABLE</li> <li>N - For objects marked NONEDITIONABLE</li> <li>NULL - For objects whose type is not editionable in the database</li> </ul>                                                                                                                                                                                               |

| Column                 | Datatype       | NULL | Description                                                                                                                                                                                                                                             |
|------------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORACLE_MAINTAINED      | VARCHAR2 (1)   |      | Denotes whether the object was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). An object for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script. |
| APPLICATION            | VARCHAR2 (1)   |      | Indicates whether the object is an Application common object (Y) or not (N)                                                                                                                                                                             |
| DEFAULT_COLLATION      | VARCHAR2 (100) |      | Default collation for the object                                                                                                                                                                                                                        |
| DUPLICATED             | VARCHAR2 (1)   |      | Indicates whether this object is duplicated on this shard (Y) or not (N)                                                                                                                                                                                |
| SHARDED                | VARCHAR2 (1)   |      | Indicates whether this object is sharded (Y) or not (N)                                                                                                                                                                                                 |
| IMPORTED_OBJECT        | VARCHAR2 (1)   |      | Indicates whether this object is imported (Y) or not (N)                                                                                                                                                                                                |
| SYNCHRONOUS_DUPLICATED | VARCHAR2 (1)   |      | Indicates whether this object is a synchronous duplicated table (Y) or not (N)                                                                                                                                                                          |
| CREATED_APPID          | NUMBER         |      | ID of the Application that created the object                                                                                                                                                                                                           |
| CREATED_VSNID          | NUMBER         |      | ID of the Application Version that created the object                                                                                                                                                                                                   |
| MODIFIED_APPID         | NUMBER         |      | ID of the Application that last modified the object                                                                                                                                                                                                     |
| MODIFIED_VSNID         | NUMBER         |      | ID of the Application Version that last modified the object                                                                                                                                                                                             |

## 6.130 DBA\_JAVA\_ARGUMENTS

DBA\_JAVA\_ARGUMENTS displays argument information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_ARGUMENTS.

**See Also:**

"ALL\_JAVA\_ARGUMENTS"

## 6.131 DBA\_JAVA\_CLASSES

DBA\_JAVA\_CLASSES displays class level information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_CLASSES.

**See Also:**

"ALL\_JAVA\_CLASSES"

## 6.132 DBA\_JAVA\_COMPILER\_OPTIONS

DBA\_JAVA\_COMPILER\_OPTIONS displays information about all native compiler options in the database. Its columns are the same as those in ALL\_JAVA\_COMPILER\_OPTIONS.

**See Also:**

["ALL\\_JAVA\\_COMPILER\\_OPTIONS"](#)

## 6.133 DBA\_JAVA\_DERIVATIONS

DBA\_JAVA\_DERIVATIONS displays mapping information about Java source objects and their derived Java class objects and Java resource objects for all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_DERIVATIONS.

**See Also:**

["ALL\\_JAVA\\_DERIVATIONS"](#)

## 6.134 DBA\_JAVA\_FIELDS

DBA\_JAVA\_FIELDS displays field information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_FIELDS.

**See Also:**

["ALL\\_JAVA\\_FIELDS"](#)

## 6.135 DBA\_JAVA\_IMPLEMENTES

DBA\_JAVA\_IMPLEMENTES describes interfaces implemented by all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_IMPLEMENTES.

**See Also:**

["ALL\\_JAVA\\_IMPLEMENTES"](#)

## 6.136 DBA\_JAVA\_INNERS

DBA\_JAVA\_INNERS displays information about inner classes referred to by all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_INNERS.

**See Also:**

["ALL\\_JAVA\\_INNERS"](#)

## 6.137 DBA\_JAVA\_LAYOUTS

DBA\_JAVA\_LAYOUTS displays class layout information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_LAYOUTS.

**See Also:**

["ALL\\_JAVA\\_LAYOUTS"](#)

## 6.138 DBA\_JAVA\_METHODS

DBA\_JAVA\_METHODS displays method information about all stored Java classes in the database. Its columns are the same as those in ALL\_JAVA\_METHODS.

**See Also:**

["ALL\\_JAVA\\_METHODS"](#)

## 6.139 DBA\_JAVA\_NCOMPS

DBA\_JAVA\_NCOMPS displays ncomp-related information about all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_NCOMPS.

**See Also:**

["ALL\\_JAVA\\_NCOMPS"](#)

## 6.140 DBA\_JAVA\_POLICY

DBA\_JAVA\_POLICY describes Java security permissions for all users in the database.

### Related View

USER\_JAVA\_POLICY describes Java security permissions for the current user.

| Column      | Datatype        | NULL     | Description                                                                                                                         |
|-------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------|
| KIND        | VARCHAR2 (8)    |          | Indicates whether the permission is a positive (GRANT) or a limitation (RESTRICT)                                                   |
| GRANTEE     | VARCHAR2 (128)  | NOT NULL | Name of the user, schema, or role to which the permission object is assigned                                                        |
| TYPE_SCHEMA | VARCHAR2 (128)  | NOT NULL | Schema in which the permission object is loaded                                                                                     |
| TYPE_NAME   | VARCHAR2 (4000) |          | Permission class type, which is designated by a string containing the full class name, such as, <code>java.io.FilePermission</code> |
| NAME        | VARCHAR2 (4000) |          | Target attribute (name) of the permission object. This name is used when defining the permission.                                   |
| ACTION      | VARCHAR2 (4000) |          | Action attribute for this permission. Many permissions expect a null value if no action is appropriate for the permission.          |
| ENABLED     | VARCHAR2 (8)    |          | Indicates whether the permission is enabled (ENABLED) or disabled (DISABLED)                                                        |
| SEQ         | NUMBER          |          | Sequence number used to identify this row. This number should be supplied when disabling, enabling, or deleting the permission.     |

## 6.141 DBA\_JAVA\_RESOLVERS

DBA\_JAVA\_RESOLVERS displays information about resolvers of all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_RESOLVERS.

**See Also:**

"ALL\_JAVA\_RESOLVERS"

## 6.142 DBA\_JAVA\_THROWS

DBA\_JAVA\_THROWS displays information about exceptions thrown from methods of all Java classes in the database. Its columns are the same as those in ALL\_JAVA\_THROWSa.

**See Also:**

"ALL\_JAVA\_THROWS"

## 6.143 DBA\_JOBS

DBA\_JOBS describes all jobs in the database.

### Related View

USER\_JOBS describes the jobs owned by the current user.

| Column      | Datatype        | NULL     | Description                                                                                                                                                                   |
|-------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOB         | NUMBER          | NOT NULL | Identifier of job. Neither import/export nor repeated executions change this value.                                                                                           |
| LOG_USER    | VARCHAR2 (128)  | NOT NULL | Login user when the job was submitted                                                                                                                                         |
| PRIV_USER   | VARCHAR2 (128)  | NOT NULL | User whose default privileges apply to this job                                                                                                                               |
| SCHEMA_USER | VARCHAR2 (128)  | NOT NULL | Default schema used to parse the job<br>For example, if the SCHEMA_USER is SCOTT and you submit the procedure HIRE_EMP as a job, the Oracle Database looks for SCOTT.HIRE_EMP |
| LAST_DATE   | DATE            |          | Date on which this job last successfully executed                                                                                                                             |
| LAST_SEC    | VARCHAR2 (8)    |          | Same as LAST_DATE. This is when the last successful execution started.                                                                                                        |
| THIS_DATE   | DATE            |          | Date that this job started executing (usually null if not executing)                                                                                                          |
| THIS_SEC    | VARCHAR2 (8)    |          | Same as THIS_DATE. This is when the last successful execution started.                                                                                                        |
| NEXT_DATE   | DATE            | NOT NULL | Date that this job will next be executed                                                                                                                                      |
| NEXT_SEC    | VARCHAR2 (8)    |          | Same as NEXT_DATE. The job becomes due for execution at this time.                                                                                                            |
| TOTAL_TIME  | NUMBER          |          | Total wall clock time spent by the system on this job (in seconds) when it last executed                                                                                      |
| BROKEN      | VARCHAR2 (1)    |          | Y: no attempt is made to run this job<br>N: an attempt is made to run this job                                                                                                |
| INTERVAL    | VARCHAR2 (200)  | NOT NULL | A date function, evaluated at the start of execution, becomes next NEXT_DATE                                                                                                  |
| FAILURES    | NUMBER          |          | Number of times the job has started and failed since its last success                                                                                                         |
| WHAT        | VARCHAR2 (4000) |          | Body of the anonymous PL/SQL block that the job executes                                                                                                                      |

| Column   | Datatype        | NULL | Description                                                                                          |
|----------|-----------------|------|------------------------------------------------------------------------------------------------------|
| NLS_ENV  | VARCHAR2 (4000) |      | Session parameters describing the NLS environment of the job                                         |
| MISC_ENV | RAW (32)        |      | Other session parameters of the session that created the job. The job is run using these parameters. |
| INSTANCE | NUMBER          |      | ID of the instance that can execute or is executing the job. The default is 0.                       |

 **See Also:**

## 6.144 DBA\_JOBS\_RUNNING

DBA\_JOBS\_RUNNING lists all jobs that are currently running in the instance.

| Column    | Datatype     | NULL | Description                                                                      |
|-----------|--------------|------|----------------------------------------------------------------------------------|
| SID       | NUMBER       |      | Identifier of process that is executing the job. See <a href="#">"V\$LOCK"</a> . |
| JOB       | NUMBER       |      | Identifier of job. This job is currently executing.                              |
| FAILURES  | NUMBER       |      | Number of times this job started and failed since its last success.              |
| LAST_DATE | DATE         |      | Date that this job last successfully executed.                                   |
| LAST_SEC  | VARCHAR2 (8) |      | Same as LAST_DATE. This is when the last successful execution started.           |
| THIS_DATE | DATE         |      | Date that this job started executing.                                            |
| THIS_SEC  | VARCHAR2 (8) |      | Same as THIS_DATE. This is when the last successful execution started.           |
| INSTANCE  | NUMBER       |      | Indicates which instance can execute or is executing the job; the default is 0.  |

## 6.145 DBA\_JOIN\_IND\_COLUMNS

DBA\_JOIN\_IND\_COLUMNS describes all join conditions in the database. Its columns are the same as those in ALL\_JOIN\_IND\_COLUMNS.

 **See Also:**  
["ALL\\_JOIN\\_IND\\_COLUMNS"](#)

## 6.146 DBA\_JOINGROUPS

DBA\_JOINGROUPS describes join groups in the database. A join group is a user-created object that consists of two or more columns that can be meaningfully joined. The maximum number of columns that can be included in a join group is 255.

In certain queries, join groups enable the database to eliminate the performance overhead of decompressing and hashing column values. Join groups require an In-Memory column store (IM column store).

### Related View

USER\_JOINGROUPS describes join groups belonging to the user. This view does not display the JOINGROUP\_OWNER column.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOINGROUP_OWNER | VARCHAR2 (128) | NOT NULL | Join group owner. This is the user that created the join group.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| JOINGROUP_NAME  | VARCHAR2 (128) | NOT NULL | This is the user specified name of the join group. The join group name is specified when the join group is created as part of the CREATE INMEMORY JOIN GROUP statement.                                                                                                                                                                                                                                                                                                                                           |
| TABLE_OWNER     | VARCHAR2 (128) | NOT NULL | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TABLE_NAME      | VARCHAR2 (128) | NOT NULL | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COLUMN_NAME     | VARCHAR2 (128) | NOT NULL | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FLAGS           | VARCHAR2 (6)   |          | Possible values: <ul style="list-style-type: none"><li>MASTER: Indicates which column in the join group is mastering the global dictionary. A join group is a group of columns sharing a global dictionary; the global dictionary is associated with one column and the other columns share the same dictionary. The column with which the global dictionary is associated is called the mastering column.</li><li>NULL: Indicates that the column is not mastering the global dictionary.</li></ul>              |
| GD_ADDRESS      | RAW (8)        |          | The memory address of the global dictionary. Ideally, all the columns in one join group should have the same global dictionary address (that is, they share the same global structure). This might not always be the case (for example, a column might be added to a join group after it was populated into memory - in which case its GD_ADDRESS field will be NULL). In such cases, you should force re-populate the tables that are part of the join group and check the views after the repopulates complete. |
| AUTO_CREATED    | VARCHAR2 (3)   |          | Indicates whether the join group was created by Automatic In-Memory (AIM) (YES) or whether the join group was user-created (NO)                                                                                                                                                                                                                                                                                                                                                                                   |
| CREATION_DATE   | DATE           | NOT NULL | Date and time at which the join group was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- *Oracle Database SQL Language Reference* for information about creating a join group using the `CREATE INMEMORY JOIN GROUP` statement

## 6.147 DBA\_JSON\_COLLECTION\_TABLES

`DBA_JSON_COLLECTION_TABLES` describes all JSON collection tables in the database. Its columns are the same as those in `ALL_JSON_COLLECTION_TABLES`.

 **Note:**

This view is available starting with Oracle Database 23ai.

 **See Also:**

["ALL\\_JSON\\_COLLECTION\\_TABLES"](#)

## 6.148 DBA\_JSON\_COLLECTION\_VIEWS

`DBA_JSON_COLLECTION_VIEWS` describes all JSON collection views in the database. Its columns are the same as those in `ALL_JSON_COLLECTION_VIEWS`.

 **Note:**

This view is available starting with Oracle Database 23ai, Release Update 23.6.

 **See Also:**

["ALL\\_JSON\\_COLLECTION\\_VIEWS"](#)

## 6.149 DBA\_JSON\_COLLECTIONS

DBA\_JSON\_COLLECTIONS describes all JSON collections in the database. Its columns are the same as those in ALL\_JSON\_COLLECTIONS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

["ALL\\_JSON\\_COLLECTIONS"](#)

## 6.150 DBA\_JSON\_COLUMNS

DBA\_JSON\_COLUMNS provides information on all JavaScript Object Notation (JSON) columns in the database. Its columns are the same as those in ALL\_JSON\_COLUMNS.

### See Also:

- ["ALL\\_JSON\\_COLUMNS"](#)
- *Oracle Database JSON Developer's Guide* for more information about using JSON with Oracle Database

## 6.151 DBA\_JSON\_DATAGUIDE\_FIELDS

DBA\_JSON\_DATAGUIDE\_FIELDS extracts the path and type information from all the data guides in the database, which are the data guides returned by the DBA\_JSON\_DATAGUIDE view. Its columns are the same as those in ALL\_JSON\_DATAGUIDE\_FIELDS.

### See Also:

["ALL\\_JSON\\_DATAGUIDE\\_FIELDS"](#)

## 6.152 DBA\_JSON\_DATAGUIDES

DBA\_JSON\_DATAGUIDES provides information on all JavaScript Object Notation (JSON) columns in the database that have data guide enabled. Its columns are the same as those in ALL\_JSON\_DATAGUIDES.

### See Also:

"ALL\_JSON\_DATAGUIDES"

## 6.153 DBA\_JSON\_DOMAIN\_SCHEMA\_COLUMNS

DBA\_JSON\_DOMAIN\_SCHEMA\_COLUMNS describes JSON schema constraints on columns of all data use case domains in the database. Its columns are the same as those in ALL\_JSON\_DOMAIN\_SCHEMA\_COLUMNS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_JSON\_DOMAIN\_SCHEMA\_COLUMNS"

## 6.154 DBA\_JSON\_DUALITY\_VIEW\_LINKS

DBA\_JSON\_DUALITY\_VIEW\_LINKS describes the links associated with all JSON-relational duality views in the database. Its columns are the same as those in ALL\_JSON\_DUALITY\_VIEW\_LINKS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_JSON\_DUALITY\_VIEW\_LINKS"

## 6.155 DBA\_JSON\_DUALITY\_VIEW\_TAB\_COLS

DBA\_JSON\_DUALITY\_VIEW\_TAB\_COLS describes the table columns associated with all JSON-relational duality views in the database. Its columns are the same as those in ALL\_JSON\_DUALITY\_VIEW\_TAB\_COLS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_JSON\\_DUALITY\\_VIEW\\_TAB\\_COLS"](#)

## 6.156 DBA\_JSON\_DUALITY\_VIEW\_TABS

DBA\_JSON\_DUALITY\_VIEW\_TABS describes the tables associated with all JSON-relational duality views in the database. Its columns are the same as those in ALL\_JSON\_DUALITY\_VIEW\_TABS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_JSON\\_DUALITY\\_VIEW\\_TABS"](#)

## 6.157 DBA\_JSON\_DUALITY\_VIEWS

DBA\_JSON\_DUALITY\_VIEWS describes all JSON-relational duality views in the database. Its columns are the same as those in ALL\_JSON\_DUALITY\_VIEWS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_JSON\\_DUALITY\\_VIEWS"](#)

## 6.158 DBA\_JSON\_INDEXES

DBA\_JSON\_INDEXES describes all indexes on JSON data in the database. Its columns are the same as those in ALL\_JSON\_INDEXES.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_JSON\\_INDEXES"](#)

## 6.159 DBA\_JSON\_SCHEMA\_COLUMNS

DBA\_JSON\_SCHEMA\_COLUMNS describes JSON schema constraints on columns in all tables in the database. Its columns are the same as those in ALL\_JSON\_SCHEMA\_COLUMNS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_JSON\\_SCHEMA\\_COLUMNS"](#)

## 6.160 DBA\_KAFKA\_APPLICATIONS

DBA\_KAFKA\_APPLICATIONS describes all Oracle SQL Access to Kafka (OSAK) applications in the database.

**Related View**

USER\_KAFKA\_APPLICATIONS describes OSAK applications owned by the current user. This view does not display the OWNER or CLUSTER\_ID columns.

| Column              | Datatype        | NULL     | Description                                                                                                                   |
|---------------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128)  | NOT NULL | Owner of the application                                                                                                      |
| CLUSTER_ID          | VARCHAR2 (40)   | NOT NULL | ID of the OSAK cluster associated with the application                                                                        |
| CLUSTER_NAME        | VARCHAR2 (30)   | NOT NULL | Name of the OSAK cluster associated with the application                                                                      |
| APPLICATION_NAME    | VARCHAR2 (30)   | NOT NULL | Application name (also used as the Kafka group name)                                                                          |
| TOPIC_NAME          | VARCHAR2 (249)  | NOT NULL | Name of the Kafka topic associated with the application                                                                       |
| FORMAT              | VARCHAR2 (4000) |          | Format of the Kafka topic value data: <ul style="list-style-type: none"> <li>• AVRO</li> <li>• DSV</li> <li>• JSON</li> </ul> |
| KEY_FORMAT          | VARCHAR2 (4000) |          | Format of the Kafka topic key data: <ul style="list-style-type: none"> <li>• AVRO</li> <li>• DSV</li> <li>• JSON</li> </ul>   |
| NUM_VIEWS           | NUMBER (38)     | NOT NULL | Number of OSAK views for the application                                                                                      |
| NUM_PARTITIONS      | NUMBER (38)     | NOT NULL | Number of Kafka partitions associated with the OSAK views for the application                                                 |
| NUM_VIEWS_REQUESTED | NUMBER (38)     | NOT NULL | Number of OSAK views requested for the application                                                                            |
| APPLICATION_TYPE    | VARCHAR2 (30)   | NOT NULL | Type of application: <ul style="list-style-type: none"> <li>• LOAD</li> <li>• SEEKABLE</li> <li>• STREAMING</li> </ul>        |
| OPTIONS             | BLOB            | NOT NULL | User-supplied options (excluding AVRO-related schemas)                                                                        |
| AVRO_SCHEMA         | BLOB            |          | User-supplied AVRO schema for the Kafka topic value data                                                                      |
| KEY_AVRO_SCHEMA     | BLOB            |          | Reserved for future use                                                                                                       |

## 6.161 DBA\_KAFKA\_CLUSTERS

DBA\_KAFKA\_CLUSTERS describes the Oracle SQL Access to Kafka (OSAK) clusters for which any database user has READ access.

### Related View

USER\_KAFKA\_CLUSTERS describes the OSAK clusters that are owned by the current user or for which the current user has READ access. This view does not display the OWNER or GRANTEE columns.

| Column              | Datatype        | NULL     | Description                                                                                                                                                               |
|---------------------|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128)  | NOT NULL | Owner of the cluster<br>The value of this column is always SYS.                                                                                                           |
| CLUSTER_ID          | VARCHAR2 (40)   | NOT NULL | System-generated unique cluster ID                                                                                                                                        |
| STATE               | NUMBER (38)     | NOT NULL | Current state of the cluster: <ul style="list-style-type: none"><li>0 - CONNECTED</li><li>1 - MAINTENANCE</li><li>2 - BROKEN</li><li>3 - DEREGISTERED</li></ul>           |
| CLUSTER_NAME        | VARCHAR2 (30)   | NOT NULL | User-supplied name of the cluster                                                                                                                                         |
| BOOTSTRAP_SERVERS   | VARCHAR2 (4000) | NOT NULL | Comma-separated list of bootstrap servers for the cluster<br>Each bootstrap server is represented in the following form: <i>hostname:port</i>                             |
| KAFKA_PROVIDER      | VARCHAR2 (128)  | NOT NULL | Provider of the Kafka cluster software: <ul style="list-style-type: none"><li>APACHE - Apache Kafka</li><li>OSS - Oracle Cloud Infrastructure Streaming Service</li></ul> |
| CONNECTION_TS       | TIMESTAMP (6)   |          | If GRANTEE is currently connected to the cluster, the date and time at which the connection was started; otherwise NULL                                                   |
| CLUSTER_DESCRIPTION | VARCHAR2 (4000) |          | Optional user-supplied description of the Oracle SQL access to the cluster                                                                                                |
| GRANTEE             | VARCHAR2 (128)  |          | User who is granted access to the cluster                                                                                                                                 |

### Note:

This view is available starting with Oracle Database 23ai.

## 6.162 DBA\_KAFKA\_LOAD\_METRICS

DBA\_KAFKA\_LOAD\_METRICS displays metrics for DBMS\_KAFKA.EXECUTE\_LOAD\_APP operations on all tables in the database.

### Related View

USER\_KAFKA\_LOAD\_METRICS displays metrics for DBMS\_KAFKA.EXECUTE\_LOAD\_APP operations on tables owned by the current user. This view does not display the OWNER or CLUSTER\_ID columns.

| Column              | Datatype                     | NULL     | Description                                                                |
|---------------------|------------------------------|----------|----------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128)               | NOT NULL | Owner of the table into which the Kafka data was loaded (TARGET_TABLE)     |
| CLUSTER_ID          | VARCHAR2 (40)                | NOT NULL | ID of the OSAK cluster associated with the EXECUTE_LOAD_APP operation      |
| CLUSTER_NAME        | VARCHAR2 (30)                | NOT NULL | Name of the OSAK cluster associated with the OSAK cluster ID               |
| APPLICATION_NAME    | VARCHAR2 (30)                |          | Application name (also used as the Kafka group name)                       |
| TARGET_TABLE        | VARCHAR2 (128)               | NOT NULL | Name of the table into which the Kafka data was loaded                     |
| TARGET_TABLE_SCHEMA | VARCHAR2 (128)               | NOT NULL | Schema of the table into which the Kafka data was loaded                   |
| INSERTED_ROWS       | NUMBER (38)                  |          | Total number of rows inserted into the table by the load operation         |
| KAFKA_RECORDS       | NUMBER (38)                  |          | Total number of Kafka records fetched for the load operation               |
| STARTED_TIME        | TIMESTAMP (6) WITH TIME ZONE |          | Date and time at which the Kafka data started being loaded into the table  |
| FINISHED_TIME       | TIMESTAMP (6) WITH TIME ZONE |          | Date and time at which the Kafka data finished being loaded into the table |

## 6.163 DBA\_KAFKA\_OPS

DBA\_KAFKA\_OPS describes operations for all Oracle SQL Access to Kafka (OSAK) views in the database.

### Related View

USER\_KAFKA\_OPS describes operations for OSAK views owned by the current user. This view does not display the OWNER or CLUSTER\_ID columns.

| Column                  | Datatype       | NULL     | Description                                                                                                                                                                                              |
|-------------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                   | VARCHAR2 (128) | NOT NULL | Owner of the OSAK view                                                                                                                                                                                   |
| OP_KEY                  | VARCHAR2 (30)  | NOT NULL | Unique operation key (replacement for the location file)                                                                                                                                                 |
| OP_TYPE                 | VARCHAR2 (30)  | NOT NULL | Generic operation type                                                                                                                                                                                   |
| OP                      | VARCHAR2 (30)  | NOT NULL | Specific type of operation within OP_TYPE                                                                                                                                                                |
| CLUSTER_ID              | VARCHAR2 (40)  | NOT NULL | ID of the OSAK cluster associated with the operation                                                                                                                                                     |
| CLUSTER_NAME            | VARCHAR2 (30)  | NOT NULL | Name of the OSAK cluster associated with the operation                                                                                                                                                   |
| APPLICATION_NAME        | VARCHAR2 (30)  |          | Name of the OSAK application associated with the operation (also used as the Kafka group name)                                                                                                           |
| TOPIC_NAME              | VARCHAR2 (249) |          | Name of the Kafka topic associated with the operation                                                                                                                                                    |
| PARTITION_ID            | NUMBER (38)    |          | Partition ID of the Kafka topic associated with the operation                                                                                                                                            |
| OFFSET                  | NUMBER (38)    |          | Next offset from which an SEQ operation will start reading                                                                                                                                               |
| RELATIVE_OFFSET         | NUMBER (38)    |          | Number of offsets, including the watermark, from which an SEQ operation will start reading                                                                                                               |
| WATERMARK               | VARCHAR2 (5)   |          | Basis for the start read offset for an SEQ operation (WMH or WML)                                                                                                                                        |
| START_OFFSET_EPOCH_TIME | NUMBER (38)    |          | Timestamp (in milliseconds) that determines the next offset from which the operation will start reading<br>This value is used by the DBMS_KAFKA.INIT_OFFSET_TS and DBMS_KAFKA.SEEK_OFFSET_TS procedures. |
| END_OFFSET_EPOCH_TIME   | NUMBER (38)    |          | Timestamp (in milliseconds) that determines the end offset at which the operation will stop reading<br>This value is used by the DBMS_KAFKA.SEEK_OFFSET_TS procedure.                                    |

## 6.164 DBA\_KAFKA\_OPS\_RESULTS

`DBA_KAFKA_OPS_RESULTS` displays the results of operations for all Oracle SQL Access to Kafka (OSAK) views in the database.

### Related View

`USER_KAFKA_OPS_RESULTS` displays the results of operations for Oracle SQL Access to Kafka (OSAK) views owned by the current user. This view does not display the `OWNER` column.

| Column      | Datatype       | NULL     | Description                                                |
|-------------|----------------|----------|------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of OSAK view                                         |
| OP_KEY      | VARCHAR2 (30)  |          | Unique operation key (replacement for the location file)   |
| ROWS_READ   | NUMBER (38)    |          | Number of Kafka records read and returned by the operation |
| LAST_OFFSET | NUMBER (38)    |          | Kafka offset of the last record read by the operation      |

## 6.165 DBA\_KAFKA\_PARTITIONS

`DBA_KAFKA_PARTITIONS` describes partitions for Kafka topics associated with all Oracle SQL Access to Kafka (OSAK) views in the database.

### Related View

USER\_KAFKA\_PARTITIONS describes partitions for Kafka topics associated with OSAK views owned by the current user. This view does not display the OWNER or CLUSTER\_ID columns.

| Column           | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER            | VARCHAR2 (128) | NOT NULL | Owner of the OSAK view                                                                                                                                                                                                                                                                                                                        |
| CLUSTER_ID       | VARCHAR2 (40)  | NOT NULL | ID of the OSAK cluster associated with the topic/partition                                                                                                                                                                                                                                                                                    |
| CLUSTER_NAME     | VARCHAR2 (30)  | NOT NULL | User-supplied name of the associated Kafka server/cluster                                                                                                                                                                                                                                                                                     |
| APPLICATION_NAME | VARCHAR2 (30)  | NOT NULL | Application name (also used as the Kafka group name)                                                                                                                                                                                                                                                                                          |
| TOPIC_NAME       | VARCHAR2 (249) | NOT NULL | Kafka topic name associated with the topic/partition                                                                                                                                                                                                                                                                                          |
| PARTITION_ID     | NUMBER (38)    | NOT NULL | Partition ID of the Kafka topic                                                                                                                                                                                                                                                                                                               |
| VIEW_ID          | NUMBER (38)    | NOT NULL | ID of the OSAK view associated with the topic/partition                                                                                                                                                                                                                                                                                       |
| VIEW_NAME        | VARCHAR2 (128) | NOT NULL | Name of the OSAK view associated with the topic/partition                                                                                                                                                                                                                                                                                     |
| TEMP_TABLE_NAME  | VARCHAR2 (128) |          | Name of the OSAK global temporary table associated with the topic/partition<br>The value of this column is null if the application type is LOAD, that is, if the application was created using the DBMS_KAFKA.CREATE_LOAD_APP procedure. The application type is displayed in the APPLICATION_TYPE column of the DBA_KAFKA_APPLICATIONS view. |

## 6.166 DBA\_KGLLOCK

DBA\_KGLLOCK lists all the locks and pins held on KGL objects (objects in the Kernel Generic Library cache).

| Column   | Datatype | NULL | Description                                            |
|----------|----------|------|--------------------------------------------------------|
| kgllkuse | RAW (4)  |      | Address of the user session that holds the lock or pin |
| kgllkhd1 | RAW (4)  |      | Address of the handle for the KGL object               |

| Column    | Datatype     | NULL | Description                                 |
|-----------|--------------|------|---------------------------------------------|
| kgllkmod  | NUMBER       |      | Current mode of the lock or pin             |
| kgllkreq  | NUMBER       |      | Mode in which the lock or pin was requested |
| kgllktype | VARCHAR2 (4) |      | Whether this is a lock or a pin             |

## 6.167 DBA\_LIBRARIES

DBA\_LIBRARIES describes all libraries in the database. Its columns are the same as those in ALL\_LIBRARIES.

**See Also:**

"ALL\_LIBRARIES"

## 6.168 DBA\_LMT\_FREE\_SPACE

DBA\_LMT\_FREE\_SPACE describes the free extents in all locally managed tablespaces in the database.

| Column        | Datatype | NULL | Description                                               |
|---------------|----------|------|-----------------------------------------------------------|
| TABLESPACE_ID | NUMBER   |      | Identifier number of the tablespace containing the extent |
| FILE_ID       | NUMBER   |      | File identifier number of the file containing the extent  |
| BLOCK_ID      | NUMBER   |      | Starting block number of the extent                       |
| BLOCKS        | NUMBER   |      | Size of the extent (in Oracle blocks)                     |

## 6.169 DBA\_LMT\_USED\_EXTENTS

DBA\_LMT\_USED\_EXTENTS describes the extents comprising the segments in all locally managed tablespaces in the database.

| Column         | Datatype | NULL | Description                                               |
|----------------|----------|------|-----------------------------------------------------------|
| SEGMENT_FILEID | NUMBER   |      | File number of the segment header of the extent           |
| SEGMENT_BLOCK  | NUMBER   |      | Block number of the segment header of the extent          |
| TABLESPACE_ID  | NUMBER   |      | Identifier number of the tablespace containing the extent |
| EXTENT_ID      | NUMBER   |      | Extent number in the segment                              |
| FILEID         | NUMBER   |      | File identifier number of the file containing the extent  |
| BLOCK          | NUMBER   |      | Starting block number of the extent                       |
| LENGTH         | NUMBER   |      | Number of blocks in the extent                            |

## 6.170 DBA\_LOB\_PARTITIONS

DBA\_LOB\_PARTITIONS displays all LOB partitions in the database. Its columns are the same as those in ALL\_LOB\_PARTITIONS.

**See Also:**

["ALL\\_LOB\\_PARTITIONS"](#)

## 6.171 DBA\_LOB\_SUBPARTITIONS

DBA\_LOB\_SUBPARTITIONS displays partition-level attributes of all LOB data subpartitions in the database. Its columns are the same as those in ALL\_LOB\_SUBPARTITIONS.

**See Also:**

["ALL\\_LOB\\_SUBPARTITIONS"](#)

## 6.172 DBA\_LOB\_TEMPLATES

DBA\_LOB\_TEMPLATES describes all LOB subpartition templates in the database. Its columns are the same as those in ALL\_LOB\_TEMPLATES.

**See Also:**

["ALL\\_LOB\\_TEMPLATES"](#)

## 6.173 DBA\_LOBS

DBA\_LOBS displays the BLOBs and CLOBs contained in all tables in the database. BFILEs are stored outside the database, so they are not described by this view. This view's columns are the same as those in ALL\_LOBS.

**See Also:**

["ALL\\_LOBS"](#)

## 6.174 DBA\_LOCK

DBA\_LOCK lists all locks or latches held in the database, and all outstanding requests for a lock or latch.

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|---------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID      | NUMBER        |      | Session holding or acquiring the lock                                                                                                                                                                                                                                                                                                                                                                                                                |
| LOCK_TYPE       | VARCHAR2 (26) |      | Lock type<br><b>See Also:</b> For a listing of lock types, see <a href="#">Oracle Enqueue Names</a>                                                                                                                                                                                                                                                                                                                                                  |
| MODE_HELD       | VARCHAR2 (40) |      | Lock mode                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MODE_REQUESTED  | VARCHAR2 (40) |      | Lock mode requested                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LOCK_ID1        | VARCHAR2 (40) |      | Type-specific lock identifier, part 1                                                                                                                                                                                                                                                                                                                                                                                                                |
| LOCK_ID2        | VARCHAR2 (40) |      | Type-specific lock identifier, part 2                                                                                                                                                                                                                                                                                                                                                                                                                |
| LAST_CONVERT    | NUMBER        |      | The last convert                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BLOCKING_OTHERS | VARCHAR2 (40) |      | Whether the lock is currently blocking others                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER        |      | The ID of the container to which the data pertains.<br>Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 6.175 DBA\_LOCK\_INTERNAL

DBA\_LOCK\_INTERNAL displays a row for each lock or latch that is being held, and one row for each outstanding request for a lock or latch.

| Column         | Datatype        | NULL | Description                                                                                         |
|----------------|-----------------|------|-----------------------------------------------------------------------------------------------------|
| SESSION_ID     | NUMBER          |      | Session holding or acquiring the lock                                                               |
| LOCK_TYPE      | VARCHAR2 (56)   |      | Lock type<br><b>See Also:</b> For a listing of lock types, see <a href="#">Oracle Enqueue Names</a> |
| MODE_HELD      | VARCHAR2 (40)   |      | Lock mode                                                                                           |
| MODE_REQUESTED | VARCHAR2 (40)   |      | Lock mode requested                                                                                 |
| LOCK_ID1       | VARCHAR2 (1130) |      | Type-specific lock identifier, part 1                                                               |
| LOCK_ID2       | VARCHAR2 (40)   |      | Type-specific lock identifier, part 2                                                               |

| Column | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   |      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.176 DBA\_LOCKDOWN\_PROFILES

DBA\_LOCKDOWN\_PROFILES provides information about lockdown profiles.

The PRIVATE\_DBAAS, PUBLIC\_DBAAS, and SAAS lockdown profiles are empty placeholder profiles for the lockdown profiles of their corresponding deployment type. You can modify and add restrictions to these profiles based on their deployment purpose. For example, if you have a Software as a Service (SAAS) application, you can modify the SAAS lockdown profile and use it. You can also delete and re-create these profiles.

| Column        | Datatype        | NULL     | Description                                                                                                                                                                                                                                                      |
|---------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROFILE_NAME  | VARCHAR2 (128)  | NOT NULL | Name of the lockdown profile                                                                                                                                                                                                                                     |
| RULE_TYPE     | VARCHAR2 (128)  |          | Rule type. A lockdown profile is used to restrict operations that can be performed by users connected to a given PDB. It provides the ability to add or remove different types of rules like STATEMENT, FEATURES or OPTIONS which will be restricted in the PDB. |
| RULE          | VARCHAR2 (128)  |          | Rule to be enabled or disabled                                                                                                                                                                                                                                   |
| CLAUSE        | VARCHAR2 (128)  |          | Clause of the statement                                                                                                                                                                                                                                          |
| CLAUSE_OPTION | VARCHAR2 (128)  |          | Option of the clause                                                                                                                                                                                                                                             |
| OPTION_VALUE  | VARCHAR2 (4000) |          | Value of the option                                                                                                                                                                                                                                              |
| MIN_VALUE     | VARCHAR2 (4000) |          | Minimum value allowed for the option                                                                                                                                                                                                                             |
| MAX_VALUE     | VARCHAR2 (4000) |          | Maximum value allowed for the option                                                                                                                                                                                                                             |
| LIST          | VARCHAR2 (4000) |          | List of allowed values for the option                                                                                                                                                                                                                            |
| STATUS        | VARCHAR2 (7)    |          | <p>Status of the lockdown profile:</p> <ul style="list-style-type: none"> <li>ENABLE</li> <li>DISABLE</li> <li>EMPTY</li> </ul>                                                                                                                                  |
| USERS         | VARCHAR2 (6)    |          | <p>User type. Possible values:</p> <ul style="list-style-type: none"> <li>COMMON</li> <li>LOCAL</li> <li>ALL</li> </ul>                                                                                                                                          |
| EXCEPT_USERS  | CLOB            |          | For internal use only                                                                                                                                                                                                                                            |

## 6.177 DBA\_LOCKS

DBA\_LOCKS is a synonym for DBA\_LOCK.

 **See Also:**

["DBA\\_LOCK"](#)

## 6.178 DBA\_LOG\_GROUP\_COLUMNS

DBA\_LOG\_GROUP\_COLUMNS describes all columns in the database that are specified in log groups. Its columns are the same as those in ALL\_LOG\_GROUP\_COLUMNS.

 **See Also:**

["ALL\\_LOG\\_GROUP\\_COLUMNS"](#)

## 6.179 DBA\_LOG\_GROUPS

DBA\_LOG\_GROUPS describes log group definitions on all tables in the database. Its columns are the same as those in ALL\_LOG\_GROUPS.

 **See Also:**

["ALL\\_LOG\\_GROUPS"](#)

## 6.180 DBA\_LOGMNR\_DICTIONARY\_BUILDLOG

DBA\_LOGMNR\_DICTIONARY\_BUILDLOG describes all successful LogMiner dictionary builds available for GoldenGate REGISTER EXTRACT.

When this view is queried from a PDB, it returns only LogMiner dictionary builds performed in that PDB.

| Column            | Datatype       | NULL | Description                                                                                                              |
|-------------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2 (384) |      | User-supplied name of the LogMiner dictionary build                                                                      |
| DATE_OF_BUILD     | VARCHAR2 (20)  |      | Date and time at which the LogMiner dictionary build was performed                                                       |
| START_SCN         | NUMBER         |      | Begin SCN of the LogMiner dictionary build operation                                                                     |
| END_SCN           | NUMBER         |      | End SCN of the LogMiner dictionary build operation                                                                       |
| BUILD_TYPE        | VARCHAR2 (20)  |      | Internal string that identifies how the LogMiner dictionary build was initiated                                          |
| BUILD_OP          | NUMBER         |      | Internal number that identifies how the LogMiner dictionary build was initiated                                          |
| CONTAINER_ID      | NUMBER         |      | ID of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)                         |
| CONTAINER_UID     | NUMBER         |      | Unique number that identifies the container in which the LogMiner dictionary build was performed (the CDB root or a PDB) |
| CONTAINER_NAME    | VARCHAR2 (384) |      | Name of the container in which the LogMiner dictionary build was performed (the CDB root or a PDB)                       |
| RESETLOGS_CHANGE# | NUMBER         |      | SCN that identifies the redo branch of the LogMiner dictionary build                                                     |

## 6.181 DBA\_LOGMNR\_LOG

DBA\_LOGMNR\_LOG displays all archived logs registered with active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

| Column            | Datatype       | NULL     | Description                                                                                             |
|-------------------|----------------|----------|---------------------------------------------------------------------------------------------------------|
| LOGMNR_SESSION_ID | NUMBER         | NOT NULL | Unique identifier of the persistent session                                                             |
| NAME              | VARCHAR2 (513) |          | Name of the archived log                                                                                |
| DBID              | NUMBER         | NOT NULL | Database identifier that produced the archived log                                                      |
| RESETLOGS_SCN     | NUMBER         | NOT NULL | SCN at which resetlogs operation was performed at the source database generating the archived log       |
| RESETLOGS_TIME    | NUMBER         | NOT NULL | Timestamp at which resetlogs operation was performed at the source database generating the archived log |
| MODIFIED_TIME     | DATE           |          | Time at which the archived log was registered with LogMiner                                             |

| Column           | Datatype     | NULL     | Description                                                                                                                   |
|------------------|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------|
| THREAD#          | NUMBER       | NOT NULL | Redo thread at the source database that generated the archived log                                                            |
| SEQUENCE#        | NUMBER       | NOT NULL | Logfile sequence number                                                                                                       |
| FIRST_SCN        | NUMBER       | NOT NULL | Lowest SCN of the redo record contained in the logfile                                                                        |
| NEXT_SCN         | NUMBER       |          | Highest possible SCN of the redo record contained in the logfile                                                              |
| FIRST_TIME       | DATE         |          | Time of the first redo record contained in the logfile                                                                        |
| NEXT_TIME        | DATE         |          | Time of the last redo record contained in the logfile                                                                         |
| DICTIONARY_BEGIN | VARCHAR2 (3) |          | Indicates whether the archived log contains the beginning of a LogMiner dictionary (YES) or not (NO)                          |
| DICTIONARY_END   | VARCHAR2 (3) |          | Indicates whether the archived log contains the end of a LogMiner dictionary (YES) or not (NO)                                |
| KEEP             | VARCHAR2 (3) |          | Indicates whether the logfile is still required for this LogMiner session (YES) or not (NO)                                   |
| SUSPECT          | VARCHAR2 (3) |          | Indicates whether the archived log content was deemed to be corrupt or the archived log is partially filled (YES) or not (NO) |

## 6.182 DBA\_LOGMNR\_PURGED\_LOG

DBA\_LOGMNR\_PURGED\_LOG displays archived redo log files that have been applied to the logical standby database and can be deleted because they are no longer needed.

Files in this view are refreshed as a result of executing the DBMS\_LOGSTDBY.PURGE\_SESSION PL/SQL procedure for Oracle Data Guard SQL Apply:

| Column    | Datatype       | NULL | Description                                                                                                                              |
|-----------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME | VARCHAR2 (513) |      | Fully qualified names of the archived redo log files that are no longer needed by SQL Apply and can be deleted from the operating system |

### See Also:

*Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_LOGSTDBY.PURGE\_SESSION procedure

## 6.183 DBA\_LOGMNR\_SESSION

DBA\_LOGMNR\_SESSION displays all active LogMiner persistent sessions in the database.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.

| Column | Datatype | NULL     | Description               |
|--------|----------|----------|---------------------------|
| ID     | NUMBER   | NOT NULL | Unique session identifier |

| Column                | Datatype       | NULL     | Description                                                                                                                                                                                   |
|-----------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                  | VARCHAR2 (128) | NOT NULL | Unique session name                                                                                                                                                                           |
| SOURCE_DATABASE       | VARCHAR2 (128) |          | Global name of the source database whose archived logs are to be mined in this persistent LogMiner session                                                                                    |
| SOURCE_DBID           | NUMBER         |          | Database ID of the source database                                                                                                                                                            |
| SOURCE_RESETLOGS_SCN  | NUMBER         |          | Resetlogs SCN associated with the incarnation of the source database whose archived logs are mined                                                                                            |
| SOURCE_RESETLOGS_TIME | NUMBER         |          | Resetlogs time associated with the incarnation of the source database whose archived logs are mined                                                                                           |
| FIRST_SCN             | NUMBER         |          | Only modifications that occurred on or after this SCN can be mined using this persistent session                                                                                              |
| END_SCN               | NUMBER         |          | No modifications that occurred on or after this SCN can be mined using this persistent session                                                                                                |
| BRANCH_SCN            | NUMBER         |          | SCN at which a branch will be taken in terms of the incarnation corresponding to the source database. This implies a point-in-time recovery was performed at the source database at this SCN. |
| WAIT_FOR_LOG          | VARCHAR2 (3)   |          | Indicates whether the persistent session waits for RFS to register new archived logs or to fill gaps (YES) or not (NO)                                                                        |
| HOT_MINE              | VARCHAR2 (3)   |          | Indicates whether real-time mining is on (YES) or not (NO)                                                                                                                                    |
| SAFE_PURGE_SCN        | NUMBER         |          | Persistent session can safely be purged up to this SCN                                                                                                                                        |
| CHECKPOINT_SCN        | NUMBER         |          | SCN at which the latest checkpoint is taken by the persistent LogMiner session                                                                                                                |
| PURGE_SCN             | NUMBER         |          | The session has been purged up to this SCN                                                                                                                                                    |

## 6.184 DBA\_LOGSTDBY\_EVENTS

DBA\_LOGSTDBY\_EVENTS displays information about the activity of the logical standby database system.

It can be used to determine the cause of failures that occur when applying redo data to logical standby databases. This view is for logical standby databases only.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                           |
|-----------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT_TIME      | DATE          |          | Time when the event was logged                                                                                                                                                                                        |
| EVENT_TIMESTAMP | TIMESTAMP (6) | NOT NULL | Timestamp when the event was logged                                                                                                                                                                                   |
| START_SCN       | NUMBER        |          | The SCN at which the associated transaction started at the primary database. This SCN refers to the system change number at the primary database.                                                                     |
| CURRENT_SCN     | NUMBER        |          | SCN associated with the change at the primary database. If a failure occurred, then examine this column to determine which archived log file contains the source of the failure (for example, an unsupported record). |

| Column       | Datatype        | NULL | Description                                                                                                                       |
|--------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------|
| COMMIT_SCN   | NUMBER          |      | SCN value on which the change was committed at the primary database                                                               |
| XIDUSN       | NUMBER          |      | Transaction ID undo segment number at the primary database of the associated transaction                                          |
| XIDSLT       | NUMBER          |      | Transaction ID slot number at the primary database of the associated transaction                                                  |
| XIDSQN       | NUMBER          |      | Transaction ID sequence number at the primary database of the associated transaction                                              |
| EVENT        | CLOB            |      | Statement that was being processed when the failure occurred                                                                      |
| STATUS_CODE  | NUMBER          |      | Status (or Oracle error code) belonging to the STATUS message                                                                     |
| STATUS       | VARCHAR2 (2000) |      | Description of the current activity of the process or the reason why the apply operation stopped                                  |
| SRC_CON_NAME | VARCHAR2 (30)   |      | Identifies the PDB name at the primary database where the transaction was executed                                                |
| SRC_CON_ID   | NUMBER          |      | Contains the PDB ID (the PDB_ID column from the DBA_PDBS view) of the primary database where the associated change was generated. |

**Note:**

In a CDB, this view shows data only when queried in the root.

## 6.185 DBA\_LOGSTDBY\_HISTORY

DBA\_LOGSTDBY\_HISTORY displays the history of switchovers and failovers in a Data Guard configuration.

It does this by showing the complete sequence of redo log streams processed or created on the local system, across all role transitions. (After a role transition, a new log stream is started and the log stream sequence number is incremented by the new primary database.). This view is for logical standby databases only.

| Column           | Datatype | NULL | Description                                                                                                                                                                                       |
|------------------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STREAM_SEQUENCE# | NUMBER   |      | Lists the sequence numbers for all log streams created or applied on the local system.<br><b>Note:</b> A value of 0 indicates an unknown sequence order; this is reserved for future log streams. |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS        | VARCHAR2 (16)  |      | <p>Description of the log stream processing:</p> <ul style="list-style-type: none"> <li>Past - The log stream has already been processed</li> <li>Immediate Past - This is the most recently processed log stream; its status is transitioning from Current to Past</li> <li>Current - The log stream is currently being processed</li> <li>Immediate Future - This is the next log stream to be processed; its status is transitioning from Future to Current</li> <li>Future - The log stream will be processed</li> </ul>    |
| SOURCE        | VARCHAR2 (5)   |      | <p>Describes how the log stream was started:</p> <ul style="list-style-type: none"> <li>RFS - The RFS process created the log stream</li> <li>User - A user registered the initial log file for the log stream</li> <li>Synch - A user issued the ALTER DATABASE START LOGICAL STANDBY APPLY NEW PRIMARY DDL statement</li> <li>Redo - The log stream information was recorded in the redo log</li> </ul>                                                                                                                       |
| DBID          | NUMBER         |      | Database identifier of the primary database that created the log stream                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FIRST_CHANGE# | NUMBER         |      | Lowest system change number (SCN) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_CHANGE#  | NUMBER         |      | Highest system change number (SCN) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FIRST_TIME    | DATE           |      | Time of the first SCN entry (FIRST_CHANGE#) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_TIME     | DATE           |      | Time of the last SCN entry (LAST_CHANGE#) in the current log file                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DGNAME        | VARCHAR2 (255) |      | Unique database name (DB_UNIQUE_NAME) of the primary database that produced the log stream. See V\$DATAGUARD_CONFIG to display all database DB_UNIQUE_NAME values defined in the Data Guard configuration.                                                                                                                                                                                                                                                                                                                      |
| MERGE_CHANGE# | NUMBER         |      | SCN that should be used to flashback a failed primary (that created the log stream) or to flashback a bystander logical standby database following a failover, in the context of the associated redo log stream. It is the SCN up to which redo for the associated log stream can be merged safely in all databases using local copies of archived logs received from the primary database. In order to apply changes beyond this following a failover, you will need to fetch and mine the redo logs from the failover target. |

| Column            | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                |
|-------------------|----------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROCESSED_CHANGE# | NUMBER   |      | Strict upper bound on the SCN up to which SQL Apply has applied redo records before it switched to a new log stream (either because it was activated and became the primary database, or in the case of a bystander logical standby database where it switched to a new log stream to accommodate a new primary database). |

**Note:**

In a CDB, this view shows data only when queried in the root.

## 6.186 DBA\_LOGSTDBY\_LOG

DBA\_LOGSTDBY\_LOG displays information about the logs registered for a logical standby database.

This view is for logical standby databases only.

| Column            | Datatype       | NULL     | Description                                                                                                                                            |
|-------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| THREAD#           | NUMBER         | NOT NULL | Thread ID of the archive log. The THREAD number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers. |
| RESETLOGS_CHANGE# | NUMBER         | NOT NULL | Start SCN of the branch                                                                                                                                |
| RESETLOGS_ID      | NUMBER         | NOT NULL | Resetlogs identifier (a numeric form of the timestamp of the branch)                                                                                   |
| SEQUENCE#         | NUMBER         | NOT NULL | Sequence number of the archive log file                                                                                                                |
| FIRST_CHANGE#     | NUMBER         | NOT NULL | System change number (SCN) of the current archive log                                                                                                  |
| NEXT_CHANGE#      | NUMBER         |          | SCN of the next archive log                                                                                                                            |
| FIRST_TIME        | DATE           |          | Date of the current archive log                                                                                                                        |
| NEXT_TIME         | DATE           |          | Date of the next archive log                                                                                                                           |
| FILE_NAME         | VARCHAR2 (513) |          | Name of the archive log                                                                                                                                |
| TIMESTAMP         | DATE           |          | Time when the archive log was registered                                                                                                               |
| DICT_BEGIN        | VARCHAR2 (3)   |          | Indicates whether the beginning of the dictionary build is in this archive log (YES) or not (NO)                                                       |
| DICT_END          | VARCHAR2 (3)   |          | Indicates whether the end of the dictionary build is in this archive log (YES) or not (NO)                                                             |

| Column     | Datatype     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLIED    | VARCHAR2 (8) |      | Indicates primarily whether a given foreign archived log has been applied fully by SQL Apply: <ul style="list-style-type: none"> <li>• YES - SQL Apply has fully applied the foreign archived log and no longer needs it</li> <li>• CURRENT - SQL Apply is currently applying changes contained in the foreign archived log</li> <li>• NO - SQL Apply has not started applying any changes contained in the foreign archived log</li> <li>• FETCHING - SQL Apply encountered a corruption while reading redo records from this foreign archived log, and is currently using the automatic gap resolution to refetch a new copy of the log from the primary database</li> <li>• CORRUPT - SQL Apply encountered a corruption while reading redo records from this foreign archived log, and refetching a new copy of the archived log did not resolve the problem. SQL Apply will not refetch a new copy of this archived log automatically, and will require user intervention to manually register a new copy of the foreign archived log.</li> </ul> |
| BLOCKS     | NUMBER       |      | Number of blocks in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| BLOCK_SIZE | NUMBER       |      | Size of each block in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Note:**

The SCN values in this view correlate to the SCN values shown in the `DBA_LOGSTDBY_PROGRESS` view.

**Note:**

In a CDB, this view shows data only when queried in the root.

## 6.187 DBA\_LOGSTDBY\_NOT\_UNIQUE

`DBA_LOGSTDBY_NOT_UNIQUE` displays all tables that have no primary and no non-null unique indexes.

Most of the tables displayed by this view are supported because their columns contain enough information to be maintained in a logical standby database. Some tables, however, cannot be supported because their columns do not contain the necessary information. Unsupported tables usually contain a column defined using an unsupported data type.

In a CDB, the data displayed pertains to the container in which the view is queried.

| Column | Datatype       | NULL | Description                         |
|--------|----------------|------|-------------------------------------|
| OWNER  | VARCHAR2 (128) |      | Schema name of the non-unique table |

| Column     | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_NAME | VARCHAR2 (128) |      | Table name of the non-unique table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| BAD_COLUMN | VARCHAR2 (1)   |      | <ul style="list-style-type: none"><li>• <b>Y</b> - Table column is defined using an unbounded data type, such as <code>LONG</code> or <code>BLOB</code>. If two rows in the table match except in their LOB columns, then the table cannot be maintained properly. Log apply services will attempt to maintain these tables, but you must ensure the application does not allow uniqueness only in the unbounded columns.</li><li>• <b>N</b> - Enough column information is present to maintain the table in the logical standby database but the log transport services and log apply services would run more efficiently if you added a primary key. You should consider adding a disabled <code>RELY</code> constraint to these tables.</li></ul> |

## 6.188 DBA\_LOGSTDBY\_PARAMETERS

DBA\_LOGSTDBY\_PARAMETERS displays the list of parameters used by SQL apply for logical standby databases.

This view is for logical standby databases only.

| Column  | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

In a CDB, this view shows data when queried in the root.

## 6.189 DBA\_LOGSTDBY\_PLSQL\_MAP

DBA\_LOGSTDBY\_PLSQL\_MAP shows the mapping between a supported user invokable (/external) PL/SQL procedure to the corresponding replicated internal PL/SQL procedure.

| Column             | Datatype       | NULL     | Description                                    |
|--------------------|----------------|----------|------------------------------------------------|
| OWNER              | VARCHAR2 (128) | NOT NULL | Owner name of the procedure                    |
| PKG_NAME           | VARCHAR2 (128) |          | Package name of the user invokable procedure   |
| PROC_NAME          | VARCHAR2 (128) |          | Procedure name of the user invokable procedure |
| INTERNAL_PKG_NAME  | VARCHAR2 (128) |          | Package name of the internal procedure         |
| INTERNAL_PROC_NAME | VARCHAR2 (128) |          | Procedure name of the internal procedure       |

**Note:**

In a CDB, this view shows data when queried in the root or a PDB.

## 6.190 DBA\_LOGSTDBY\_PLSQL\_SUPPORT

DBA\_LOGSTDBY\_PLSQL\_SUPPORT shows the PL/SQL packages that are only supported during rolling operations.

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER         | VARCHAR2 (128) | NOT NULL | Owner name of the package                                                                                                                                                                                                                                                                                                                         |
| PKG_NAME      | VARCHAR2 (128) |          | Package name of the user invokable procedure                                                                                                                                                                                                                                                                                                      |
| SUPPORT_LEVEL | VARCHAR2 (12)  |          | Logical standby PL/SQL support level for the package: <ul style="list-style-type: none"> <li>• ALWAYS - PL/SQL replication is always supported for this package, whether it is called inside or outside of DBMS_ROLLING</li> <li>• DBMS_ROLLING: PL/SQL replication is supported only when the procedure is called inside DBMS_ROLLING</li> </ul> |

**Note:**

In a CDB, this view shows data when queried in the root or a PDB.

## 6.191 DBA\_LOGSTDBY\_PROGRESS

`DBA_LOGSTDBY_PROGRESS` is deprecated. The information that was provided in this view is now provided in the `V$LOGSTDBY_PROGRESS` view.

**See Also:**

`"V$LOGSTDBY_PROGRESS"`

## 6.192 DBA\_LOGSTDBY\_SKIP

`DBA_LOGSTDBY_SKIP` displays the skip rules that are used by SQL Apply.

This view is for logical standby databases only.

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                  |
|---------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR         | VARCHAR2 (1)   |      | Indicates how the skip rule was created: <ul style="list-style-type: none"><li>Y - For rules from <code>DBMS_LOGSTDBY.SKIP_ERROR</code></li><li>N - For rules from <code>DBMS_LOGSTDBY.SKIP</code></li></ul> |
| STATEMENT_OPT | VARCHAR2 (128) |      | Specifies the type of statement that should be skipped                                                                                                                                                       |
| OWNER         | VARCHAR2 (128) |      | Name of the schema under which the skip option should be used                                                                                                                                                |
| NAME          | VARCHAR2 (261) |      | Name of the object that is being skipped                                                                                                                                                                     |
| USE_LIKE      | VARCHAR2 (1)   |      | Indicates whether the statement should use a SQL wildcard search when matching names (Y) or not (N)                                                                                                          |
| ESC           | VARCHAR2 (1)   |      | Escape character used when performing wildcard matches                                                                                                                                                       |
| PROC          | VARCHAR2 (392) |      | Name of a stored procedure that will be executed when processing the skip option                                                                                                                             |

**See Also:**

## 6.193 DBA\_LOGSTDBY\_SKIP\_TRANSACTION

DBA\_LOGSTDBY\_SKIP\_TRANSACTION displays the skip settings chosen. This view is for logical standby databases only.

| Column   | Datatype       | NULL | Description                        |
|----------|----------------|------|------------------------------------|
| XIDUSN   | NUMBER         |      | Transaction ID undo segment number |
| XIDSLT   | NUMBER         |      | Transaction ID slot number         |
| XIDSQN   | NUMBER         |      | Transaction ID sequence number     |
| CON_NAME | VARCHAR2 (384) |      | Container name                     |

## 6.194 DBA\_LOGSTDBY\_SUPPORT\_MODE

DBA\_LOGSTDBY\_SUPPORT\_MODE displays information about whether tables in the database are supported for logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database *is* undergoing such an upgrade, then this view displays information about whether tables in the database are supported for transient logical standby. If the database *is not* undergoing such an upgrade, then this view displays information about whether tables in the database are supported for logical standby.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER        | VARCHAR2 (128) |      | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TABLE_NAME   | VARCHAR2 (128) |      | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SUPPORT_MODE | VARCHAR2 (11)  |      | <p>If the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases, then this column indicates whether the table is supported for transient logical standby. Otherwise, this column indicates whether the table is supported for logical standby.</p> <p>Possible values:</p> <ul style="list-style-type: none"><li>• <b>SUPPORTED</b> - The table is fully supported</li><li>• <b>INTERNAL</b> - The table is not supported because it contains data that should not be replicated. Such tables include mapping tables for index-organized tables, storage tables for nested tables, materialized view logs, secondary objects associated with domain indexes, and temporary tables.</li><li>• <b>UNSUPPORTED</b> - The table is not supported because it contains a data type that is not supported or uses a feature that is not supported</li></ul> |

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPLANATION | VARCHAR2 (4000) |      | Reason the table is not fully supported for transient logical standby<br>This column is populated only when all of the following conditions are met: <ul style="list-style-type: none"> <li>The database is currently undergoing a manual rolling upgrade using transient logical standby databases</li> <li>The value of the <code>COMPATIBLE</code> initialization parameter is 20.0 or higher</li> <li>The value of the <code>SUPPORT_MODE</code> column is <code>INTERNAL</code> or <code>UNSUPPORTED</code></li> </ul> |

## 6.195 DBA\_LOGSTDBY\_UNSUPPORTED

DBA\_LOGSTDBY\_UNSUPPORTED displays the schemas, tables, and columns in those tables that contain data types that are unsupported by logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database is undergoing such an upgrade, then this view displays information about tables in the database that are unsupported for transient logical standby. If the database is *not* undergoing such an upgrade, then this view displays information about tables in the database are unsupported for logical standby.

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                                               |
|-------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128)  |      | Owner of the unsupported table                                                                                                                                                                                                                                                            |
| TABLE_NAME  | VARCHAR2 (128)  |      | Name of the unsupported table                                                                                                                                                                                                                                                             |
| COLUMN_NAME | VARCHAR2 (128)  |      | Name of the unsupported column                                                                                                                                                                                                                                                            |
| ATTRIBUTES  | VARCHAR2 (4000) |      | If the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases and the value of the <code>COMPATIBLE</code> initialization parameter is 20.0 or higher, then this column displays the reason the table is unsupported by SQL Apply. |
| DATA_TYPE   | VARCHAR2 (106)  |      | Data type of the unsupported column                                                                                                                                                                                                                                                       |

### Note:

When the value of the `COMPATIBLE` initialization parameter is 20.0 or higher, this view displays all columns in unsupported tables. Otherwise, this view displays only the unsupported columns in unsupported tables.

**Note:**

A rolling upgrade performed using the `DBMS_ROLLING` PL/SQL package supports more object types than a manual rolling upgrade performed using transient logical standby databases.

**See Also:**

- *Oracle Data Guard Concepts and Administration* for more information about unsupported tables for rolling upgrade operations
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

## 6.196 DBA\_LOGSTDBY\_UNSUPPORTED\_TABLE

`DBA_LOGSTDBY_UNSUPPORTED_TABLE` displays the data tables that are unsupported by logical standby.

The query results for this view depend on whether the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases. If the database *is* undergoing such an upgrade, then this view displays information about tables in the database that are unsupported for transient logical standby. If the database *is not* undergoing such an upgrade, then this view displays information about tables in the database are unsupported for logical standby.

The data displayed pertains to the container in which the view is queried.

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128)  |      | Owner of the unsupported table                                                                                                                                                                                                                                                                                                                                                                                                             |
| TABLE_NAME  | VARCHAR2 (128)  |      | Name of the unsupported table                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXPLANATION | VARCHAR2 (4000) |      | If the database is currently undergoing a manual rolling upgrade performed using transient logical standby databases, then this column displays the reason the table is unsupported for transient logical standby. Otherwise, this column displays the reason the table is unsupported for logical standby.<br><br>This column is populated only when the value of the <code>COMPATIBLE</code> initialization parameter is 20.0 or higher. |

## 6.197 DBA\_MEASURE\_FOLDER\_CONTENTS

DBA\_MEASURE\_FOLDER\_CONTENTS describes the contents of all OLAP measure folders in the database. Its columns are the same as those in ALL\_MEASURE\_FOLDER\_CONTENTS.

**See Also:**

["ALL\\_MEASURE\\_FOLDER\\_CONTENTS"](#)

## 6.198 DBA\_MEASURE\_FOLDER\_SUBFOLDERS

DBA\_MEASURE\_FOLDER\_SUBFOLDERS describes the OLAP measure folders contained within the database OLAP measure folders. Its columns are the same as those in ALL\_MEASURE\_FOLDER\_SUBFOLDERS.

**See Also:**

["ALL\\_MEASURE\\_FOLDER\\_SUBFOLDERS"](#)

## 6.199 DBA\_MEASURE\_FOLDERS

DBA\_MEASURE\_FOLDERS describes all OLAP measure folders in the database. Its columns are the same as those in ALL\_MEASURE\_FOLDERS.

**See Also:**

["ALL\\_MEASURE\\_FOLDERS"](#)

## 6.200 DBA\_METADATA\_PROPERTIES

DBA\_METADATA\_PROPERTIES describes OLAP metadata properties in the database. Its columns are the same as those in ALL\_METADATA\_PROPERTIES.

**See Also:**

["ALL\\_METADATA\\_PROPERTIES"](#)

## 6.201 DBA\_METHOD\_PARAMS

DBA\_METHOD\_PARAMS describes the method parameters of all object types in the database. Its columns are the same as those in ALL\_METHOD\_PARAMS.

**See Also:**

["ALL\\_METHOD\\_PARAMS"](#)

## 6.202 DBA\_METHOD\_RESULTS

DBA\_METHOD\_RESULTS describes the method results of all object types in the database. Its columns are the same as those in ALL\_METHOD\_RESULTS.

**See Also:**

["ALL\\_METHOD\\_RESULTS"](#)

## 6.203 DBA\_MINING\_MODEL\_ATTRIBUTES

DBA\_MINING\_MODEL\_ATTRIBUTES describes all machine learning model attributes in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_ATTRIBUTES.

**See Also:**

["ALL\\_MINING\\_MODEL\\_ATTRIBUTES"](#)

## 6.204 DBA\_MINING\_MODEL\_PARTITIONS

DBA\_MINING\_MODEL\_PARTITIONS describes all the model partitions accessible to the system. Its columns are the same as those in ALL\_MINING\_MODEL\_PARTITIONS.

**See Also:**

["ALL\\_MINING\\_MODEL\\_PARTITIONS"](#)

## 6.205 DBA\_MINING\_MODEL\_SETTINGS

DBA\_MINING\_MODEL\_SETTINGS describes all machine learning model settings in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_SETTINGS.

**See Also:**

["ALL\\_MINING\\_MODEL\\_SETTINGS"](#)

## 6.206 DBA\_MINING\_MODEL\_TABLES

DBA\_MINING\_MODEL\_TABLES describes the tables that contain metadata about the machine learning models in the database.

Machine learning models are schema objects created by Oracle Machine Learning for SQL (OML4SQL).

Model tables reside in the schema of the machine learning model owner. The metadata stored in the tables is controlled by OML4SQL APIs. The tables are read-only. They should not be modified by users.

| Column     | Datatype       | NULL     | Description                              |
|------------|----------------|----------|------------------------------------------|
| OWNER      | VARCHAR2 (128) | NOT NULL | Owner of the machine learning model      |
| MODEL_NAME | VARCHAR2 (128) | NOT NULL | Name of the machine learning model       |
| TABLE_NAME | VARCHAR2 (128) | NOT NULL | Name of the table                        |
| TABLE_TYPE | VARCHAR2 (21)  |          | The type of metadata stored in the table |

## 6.207 DBA\_MINING\_MODEL\_VIEWS

DBA\_MINING\_MODEL\_VIEWS describes all model views in the database. Its columns are the same as those in ALL\_MINING\_MODEL\_VIEWS.

**See Also:**

["ALL\\_MINING\\_MODEL\\_VIEWS"](#)

## 6.208 DBA\_MINING\_MODEL\_XFORMS

DBA\_MINING\_MODEL\_XFORMS describes the user-specified transformations embedded in all models accessible in the system. Its columns are the same as those in ALL\_MINING\_MODEL\_XFORMS.

### See Also:

"ALL\_MINING\_MODEL\_XFORMS"

## 6.209 DBA\_MINING\_MODELS

DBA\_MINING\_MODELS describes all machine learning models in the database. Its columns are the same as those in ALL\_MINING\_MODELS.

### See Also:

"ALL\_MINING\_MODELS"

## 6.210 DBA\_MLE\_ENV\_IMPORTS

DBA\_MLE\_ENV\_IMPORTS describes import name to module mappings in all Oracle Database Multilingual Engine (MLE) environments in the database. Its columns are the same as those in ALL\_MLE\_ENV\_IMPORTS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_MLE\_ENV\_IMPORTS"

## 6.211 DBA\_MLE\_ENVS

DBA\_MLE\_ENVS describes all Oracle Database Multilingual Engine (MLE) environments in the database. Its columns are the same as those in ALL\_MLE\_ENVS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_MLE\_ENVS"

## 6.212 DBA\_MLE\_MODULES

DBA\_MLE\_MODULES describes all Oracle Database Multilingual Engine (MLE) modules in the database. Its columns are the same as those in ALL\_MLE\_MODULES.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_MLE\_MODULES"

## 6.213 DBA\_MLE\_PROCEDURES

DBA\_MLE\_PROCEDURES describes all Oracle Database Multilingual Engine (MLE) functions and procedures in the database. Its columns are the same as those in ALL\_MLE\_PROCEDURES.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_MLE\\_PROCEDURES"](#)

## 6.214 DBA\_MVIEW\_AGGREGATES

DBA\_MVIEW\_AGGREGATES describes the grouping functions (aggregated measures) that appear in the SELECT list of all aggregated materialized view in the database. Its columns are the same as those in ALL\_MVIEW\_AGGREGATES.

**See Also:**

["ALL\\_MVIEW\\_AGGREGATES"](#)

## 6.215 DBA\_MVIEW\_ANALYSIS

DBA\_MVIEW\_ANALYSIS describes all materialized views in the database that potentially support query rewrite and that provide additional information for analysis by applications. Its columns are the same as those in ALL\_MVIEW\_ANALYSIS.

**Note:**

This view excludes materialized views that reference remote tables or that include references to non-static values such as SYSDATE or USER. This view also excludes materialized views that were created as snapshots before Oracle8i and that were never altered to enable query rewrite.

**See Also:**

["ALL\\_MVIEW\\_ANALYSIS"](#)

## 6.216 DBA\_MVIEW\_COMMENTS

DBA\_MVIEW\_COMMENTS displays comments on all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_COMMENTS.

**See Also:**

["ALL\\_MVIEW\\_COMMENTS"](#)

## 6.217 DBA\_MVIEW\_DETAIL\_LOGICAL\_PARTITION

DBA\_MVIEW\_DETAIL\_LOGICAL\_PARTITION displays freshness information, with respect to logical partition change tracking (LPCT) detail partitions, for all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_LOGICAL\_PARTITION.

### See Also:

"ALL\_MVIEW\_DETAIL\_LOGICAL\_PARTITION"

## 6.218 DBA\_MVIEW\_DETAIL\_PARTITION

DBA\_MVIEW\_DETAIL\_PARTITION displays freshness information, with respect to partition change tracking (PCT) detail partitions, for all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_PARTITION.

### See Also:

"ALL\_MVIEW\_DETAIL\_PARTITION".

## 6.219 DBA\_MVIEW\_DETAIL\_RELATIONS

DBA\_MVIEW\_DETAIL\_RELATIONS represents the named detail relations that are either in the FROM list of a materialized view, or that are indirectly referenced through views in the FROM list. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_RELATIONS.

### See Also:

"ALL\_MVIEW\_DETAIL\_RELATIONS"

## 6.220 DBA\_MVIEW\_DETAIL\_SUBPARTITION

DBA\_MVIEW\_DETAIL\_SUBPARTITION displays freshness information, with respect to partition change tracking (PCT) detail subpartitions, for all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_DETAIL\_SUBPARTITION.

### See Also:

"ALL\_MVIEW\_DETAIL\_SUBPARTITION"

## 6.221 DBA\_MVIEW\_JOINS

DBA\_MVIEW\_JOINS describes a join between two columns in the WHERE clause of a subquery that defines a materialized view. Its columns are the same as those in ALL\_MVIEW\_JOINS.

**See Also:**

"ALL\_MVIEW\_JOINS"

## 6.222 DBA\_MVIEW\_KEYS

DBA\_MVIEW\_KEYS describes the columns or expressions in the SELECT list upon which materialized views in the database are based. Its columns are the same as those in ALL\_MVIEW\_KEYS.

**See Also:**

"ALL\_MVIEW\_KEYS"

## 6.223 DBA\_MVIEW\_LOG\_FILTER\_COLS

DBA\_MVIEW\_LOG\_FILTER\_COLS displays all columns (excluding primary key columns) being logged in the materialized view logs.

| Column      | Datatype       | NULL | Description                            |
|-------------|----------------|------|----------------------------------------|
| OWNER       | VARCHAR2 (128) |      | Owner of the master table being logged |
| NAME        | VARCHAR2 (128) |      | Name of the master table being logged  |
| COLUMN_NAME | VARCHAR2 (128) |      | Column being logged                    |

## 6.224 DBA\_MVIEW\_LOGS

DBA\_MVIEW\_LOGS describes all materialized view logs in the database. Its columns are the same as those in ALL\_MVIEW\_LOGS.

**See Also:**

"ALL\_MVIEW\_LOGS"

## 6.225 DBA\_MVIEW\_REFRESH\_TIMES

DBA\_MVIEW\_REFRESH\_TIMES describes refresh times of all materialized views in the database. Its columns are the same as those in ALL\_MVIEW\_REFRESH\_TIMES.

**See Also:**

"ALL\_MVIEW\_REFRESH\_TIMES"

## 6.226 DBA\_MVIEWS

DBA\_MVIEWS describes all materialized views in the database. Its columns are the same as those in ALL\_MVIEWS.

**See Also:**

"ALL\_MVIEWS"

## 6.227 DBA\_MVREF\_CHANGE\_STATS

DBA\_MVREF\_CHANGE\_STATS displays the change data load information on the base tables associated with a refresh run for all the materialized views for the database.

### Related View

USER\_MVREF\_CHANGE\_STATS displays the change data load information on the master tables associated with a refresh run for all the materialized views in the database that are accessible to the current user.

| Column       | Datatype       | NULL     | Description                                                                                                                |
|--------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------|
| TBL_OWNER    | VARCHAR2 (128) | NOT NULL | Owner of the master table for the materialized view                                                                        |
| TBL_NAME     | VARCHAR2 (128) | NOT NULL | Name of the master table for the materialized view                                                                         |
| MV_OWNER     | VARCHAR2 (128) | NOT NULL | Owner of the materialized view                                                                                             |
| MV_NAME      | VARCHAR2 (128) | NOT NULL | Name of the materialized view                                                                                              |
| REFRESH_ID   | NUMBER         | NOT NULL | The refresh ID of the refresh run                                                                                          |
| NUM_ROWS_INS | NUMBER         |          | The number of inserts in the materialized view log of the table (applicable only if the table has a materialized view log) |
| NUM_ROWS_UPD | NUMBER         |          | The number of updates in the materialized view log of the table (applicable only if the table has a materialized view log) |
| NUM_ROWS_DEL | NUMBER         |          | The number of deletes in the materialized view log of the table (applicable only if the table has a materialized view log) |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                    |
|-----------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_ROWS_DL_INS | NUMBER         |      | The number of direct load inserts on the table                                                                                                                                                 |
| PMOPS_OCCURRED  | CHAR(1)        |      | Indicates whether a partition-maintenance operation (PMOP) occurred. Possible values: <ul style="list-style-type: none"> <li>Y</li> <li>N</li> <li>NULL: Indicates an unknown value</li> </ul> |
| PMOP_DETAILS    | VARCHAR2(4000) |      | Details of the PMOPs in the following format: <ul style="list-style-type: none"> <li>TRUNCATE (low_bound, high_bound)</li> <li>EXECHANGE (low_bound, high_bound)</li> </ul>                    |
| NUM_ROWS        | NUMBER         |      | The number of rows in the table at the start of the refresh operation                                                                                                                          |

**See Also:**

"USER\_MVREF\_CHANGE\_STATS"

## 6.228 DBA\_MVREF\_RUN\_STATS

DBA\_MVREF\_RUN\_STATS has information about each refresh run for all the materialized views for the database, with each run being identified by the REFRESH\_ID. The information includes timing statistics related to the run and the parameters specified in that run.

### Related View

USER\_MVREF\_RUN\_STATS has information about each refresh run for the materialized views accessible for the current database user, with each run being identified by the REFRESH\_ID. The information includes timing statistics related to the run and the parameters specified in that run. This view does not display the RUN\_OWNER column.

| Column               | Datatype       | NULL     | Description                                                                                                   |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------|
| RUN_OWNER            | VARCHAR2(128)  | NOT NULL | Owner of the refresh operation (the user who launched the operation)                                          |
| REFRESH_ID           | NUMBER         | NOT NULL | The refresh ID of the refresh run                                                                             |
| NUM_MVS              | NUMBER         | NOT NULL | The number of materialized views being refreshed in the run                                                   |
| MVIEWS               | VARCHAR2(4000) |          | Shows the list of comma separated parameters specified in the API for the materialized view refresh operation |
| BASE_TABLES          | VARCHAR2(4000) |          | For internal use only                                                                                         |
| METHOD               | VARCHAR2(4000) |          | The METHOD parameter specified by the API                                                                     |
| ROLLBACK_SEG         | VARCHAR2(4000) |          | The ROLLBACK_SEG parameter specified by the API                                                               |
| PUSH_DEFERRED_RPC    | CHAR(1)        |          | The PUSH_DEFERRED_RPC parameter specified by the API                                                          |
| REFRESH_AFTER_ERRORS | CHAR(1)        |          | The REFRESH_AFTER_ERRORS parameter specified by the API                                                       |

| Column                   | Datatype     | NULL | Description                                                                                                                                                                                                              |
|--------------------------|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PURGE_OPTION             | NUMBER       |      | The PURGE_OPTION parameter specified by the API                                                                                                                                                                          |
| PARALLELISM              | NUMBER       |      | The PARALLELISM parameter specified by the API                                                                                                                                                                           |
| HEAP_SIZE                | NUMBER       |      | The HEAP_SIZE parameter specified by the API                                                                                                                                                                             |
| ATOMIC_REFRESH           | CHAR(1)      |      | The ATOMIC_REFRESH parameter specified by the API                                                                                                                                                                        |
| NESTED                   | CHAR(1)      |      | The NESTED parameter specified by the API                                                                                                                                                                                |
| OUT_OF_PLACE             | CHAR(1)      |      | The OUT_OF_PLACE parameter specified by the API                                                                                                                                                                          |
| NUMBER_OF_FAILURES       | NUMBER       |      | The number of failures that occurred in processing the API                                                                                                                                                               |
| START_TIME               | TIMESTAMP(6) |      | Start time of the refresh run                                                                                                                                                                                            |
| END_TIME                 | TIMESTAMP(6) |      | End time of the refresh run                                                                                                                                                                                              |
| ELAPSED_TIME             | NUMBER       |      | The length of time for the refresh run, in seconds                                                                                                                                                                       |
| LOG_SETUP_TIME           | NUMBER       |      | Log setup time (in seconds) for the materialized view for a non-atomic refresh; NULL for an atomic refresh                                                                                                               |
| LOG_PURGE_TIME           | NUMBER       |      | Log purge time (in seconds) for the materialized view in the case of atomic refresh; NULL in the case of non-atomic refresh                                                                                              |
| COMPLETE_STATS_AVAILABLE | CHAR(1)      |      | Indicates whether all the complete refresh statistics are available for this run: <ul style="list-style-type: none"> <li>Y: All the statistics are available</li> <li>N: All the statistics are not available</li> </ul> |

## 6.229 DBA\_MVREF\_STATS

DBA\_MVREF\_STATS shows the REFRESH\_ID associated with each refresh run of each materialized view for the database. It also provides some basic timing statistics related to that materialized view's refresh in that run.

#### Related View

USER\_MVREF\_STATS shows the REFRESH\_ID associated with each refresh run of each materialized view for the database that is accessible to the current user. It also provides some basic timing statistics related to that materialized view's refresh in that run. This view does not display the MV\_OWNER column.

| Column     | Datatype      | NULL     | Description                       |
|------------|---------------|----------|-----------------------------------|
| MV_OWNER   | VARCHAR2(128) | NOT NULL | Owner of the materialized view    |
| MV_NAME    | VARCHAR2(128) | NOT NULL | Name of the materialized view     |
| REFRESH_ID | NUMBER        | NOT NULL | The refresh ID of the refresh run |

| Column                | Datatype        | NULL | Description                                                                                                                                                                                                                                     |
|-----------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REFRESH_METHOD        | VARCHAR2 (30)   |      | The refresh method used to refresh the materialized view: <ul style="list-style-type: none"> <li>• FAST</li> <li>• PCT</li> <li>• COMPLETE</li> <li>• OUT OF PLACE FAST</li> <li>• OUT OF PLACE PCT</li> <li>• OUT OF PLACE COMPLETE</li> </ul> |
| REFRESH_OPTIMIZATIONS | VARCHAR2 (4000) |      | The refresh optimization, for example, a null refresh, or a primary key/foreign key that is applied during refresh of the materialize view                                                                                                      |
| ADDITIONAL_EXECUTIONS | VARCHAR2 (4000) |      | The additional executions, for example, an index rebuild, or log operations involved during refresh of the materialized view                                                                                                                    |
| START_TIME            | TIMESTAMP (6)   |      | Start time of the refresh run                                                                                                                                                                                                                   |
| END_TIME              | TIMESTAMP (6)   |      | End time of the refresh run                                                                                                                                                                                                                     |
| ELAPSED_TIME          | NUMBER          |      | The length of time for the refresh run, in seconds                                                                                                                                                                                              |
| LOG_SETUP_TIME        | NUMBER          |      | Log setup time (in seconds) for the materialized view for a non-atomic refresh; <b>NULL</b> for an atomic refresh                                                                                                                               |
| LOG_PURGE_TIME        | NUMBER          |      | Log purge time (in seconds) for the materialized view in the case of atomic refresh; <b>NULL</b> in the case of non-atomic refresh                                                                                                              |
| INITIAL_NUM_ROWS      | NUMBER          |      | Initial number of rows in the materialized view (at the start of the refresh)                                                                                                                                                                   |
| FINAL_NUM_ROWS        | NUMBER          |      | Final number of rows in the materialized view (at the end of the refresh)                                                                                                                                                                       |

## 6.230 DBA\_MVREF\_STATS\_PARAMS

DBA\_MVREF\_STATS\_PARAMS displays the refresh statistics properties associated with each materialized view. These properties can be modified with the DBMS\_MVIEW\_STATS.SET\_MVREF\_STATS\_PARAMS procedure.

### Related View

USER\_MVREF\_STATS\_PARAMS displays the refresh statistics properties associated with each materialized view accessible to the current user. These properties can be modified with the DBMS\_MVIEW\_STATS.SET\_MVREF\_STATS\_PARAMS procedure.

| Column   | Datatype       | NULL     | Description                    |
|----------|----------------|----------|--------------------------------|
| MV_OWNER | VARCHAR2 (128) | NOT NULL | Owner of the materialized view |
| MV_NAME  | VARCHAR2 (128) | NOT NULL | Name of the materialized view  |

| Column           | Datatype     | NULL | Description                                    |
|------------------|--------------|------|------------------------------------------------|
| COLLECTION_LEVEL | VARCHAR2 (8) |      | The collection level for the materialized view |
| RETENTION_PERIOD | NUMBER       |      | The retention period for the materialize view  |

## 6.231 DBA\_MVREF\_STATS\_SYS\_DEFAULTS

DBA\_MVREF\_STATS\_SYS\_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views. These values can be altered with the SET\_SYSTEM\_DEFAULTS procedure by a database administrator.

This view contains exactly two rows corresponding to the collection-level and retention-period properties; their initial values are TYPICAL and 31 respectively.

### Related View

USER\_MVREF\_STATS\_SYS\_DEFAULTS displays the system-wide defaults for the refresh history statistics properties for materialized views accessible to the current user. These values can be altered with the SET\_SYSTEM\_DEFAULTS procedure by a database administrator.

| Column         | Datatype      | NULL | Description                                                                                                                      |
|----------------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER_NAME | CHAR (16)     |      | Value of the parameter_name parameter: <ul style="list-style-type: none"><li>COLLECTION_LEVEL</li><li>RETENTION_PERIOD</li></ul> |
| VALUE          | VARCHAR2 (40) |      | The system-wide default value for the parameter                                                                                  |

## 6.232 DBA\_MVREF\_STMT\_STATS

DBA\_MVREF\_STMT\_STATS shows information associated with each refresh statement of a materialized view in a refresh run.

### Related View

USER\_MVREF\_STMT\_STATS shows information associated with each refresh statement of a materialized view accessible to the current user in a refresh run.

| Column         | Datatype                                       | NULL     | Description                                                                                                                                                       |
|----------------|------------------------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MV_OWNER       | VARCHAR2 (128)                                 | NOT NULL | Owner of the materialized view                                                                                                                                    |
| MV_NAME        | VARCHAR2 (128)                                 | NOT NULL | Name of the materialized view                                                                                                                                     |
| REFRESH_ID     | NUMBER                                         | NOT NULL | The refresh ID of the refresh run                                                                                                                                 |
| STEP           | NUMBER                                         | NOT NULL | A number indicating the step in the refresh process in which the statement is executed for the materialized view. Steps are numbered consecutively starting at 1. |
| SQLID          | VARCHAR2 (14)                                  | NOT NULL | The SQL ID of the statement                                                                                                                                       |
| STMT           | CLOB                                           | NOT NULL | The text of the SQL statement                                                                                                                                     |
| EXECUTION_TIME | NUMBER                                         | NOT NULL | The time it took to execute the statement (in seconds)                                                                                                            |
| EXECUTION_PLAN | XMLTYPE STORAGE<br>NOT TRANSPORTABLE<br>BINARY |          | For internal use only                                                                                                                                             |

**See Also:**["USER\\_MVREF\\_STMT\\_STATS"](#)

## 6.233 DBA\_NESTED\_TABLE\_COLS

DBA\_NESTED\_TABLE\_COLS describes the columns of all nested tables in the database. Its columns are the same as those in ALL\_NESTED\_TABLE\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

**See Also:**["ALL\\_NESTED\\_TABLE\\_COLS"](#)

## 6.234 DBA\_NESTED\_TABLES

DBA\_NESTED\_TABLES describes all nested tables contained in all tables in the database. Its columns are the same as those in ALL\_NESTED\_TABLES.

**See Also:**["ALL\\_NESTED\\_TABLES"](#)

## 6.235 DBA\_NETWORK\_ACL\_PRIVILEGES

DBA\_NETWORK\_ACL\_PRIVILEGES describes the network privileges defined in all access control lists that are currently assigned to network hosts.

### Note:

This DBA\_NETWORK\_ACL\_PRIVILEGES view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA\_HOST\_ACES view, instead.

| Column     | Datatype        | NULL     | Description                                                                                                  |
|------------|-----------------|----------|--------------------------------------------------------------------------------------------------------------|
| ACL        | VARCHAR2 (4000) |          | Path of the access control list                                                                              |
| ACLID      | RAW (8)         | NOT NULL | Object ID of the access control list                                                                         |
| PRINCIPAL  | VARCHAR2 (128)  |          | Principal (database user or role) whom the privilege is granted to or denied from                            |
| PRIVILEGE  | VARCHAR2 (128)  |          | Network privilege                                                                                            |
| IS_GRANT   | VARCHAR2 (5)    |          | Indicates whether the privilege is granted ( <i>true</i> ) or denied ( <i>false</i> )                        |
| INVERT     | VARCHAR2 (5)    |          | Indicates whether the access control entry contains invert principal ( <i>true</i> ) or not ( <i>false</i> ) |
| START_DATE | TIMESTAMP (6)   |          | Start date of the access control entry                                                                       |
| END_DATE   | TIMESTAMP (6)   |          | End date of the access control entry                                                                         |
| ACL_OWNER  | VARCHAR2 (128)  |          | Owner of the access control list                                                                             |

"DBA\_HOST\_ACES"

## 6.236 DBA\_NETWORK\_ACLS

DBA\_NETWORK\_ACLS describes the access control list assignments to network hosts.

### Note:

This DBA\_NETWORK\_ACLS view is deprecated in Oracle Database 12c Release 1 (12.1). Oracle recommends that you use the DBA\_HOST\_ACLS view, instead.

| Column     | Datatype        | NULL     | Description                   |
|------------|-----------------|----------|-------------------------------|
| HOST       | VARCHAR2 (1000) | NOT NULL | Network host                  |
| LOWER_PORT | NUMBER (5)      |          | Lower bound of the port range |

| Column     | Datatype        | NULL | Description                          |
|------------|-----------------|------|--------------------------------------|
| UPPER_PORT | NUMBER (5)      |      | Upper bound of the port range        |
| ACL        | VARCHAR2 (4000) |      | Path of the access control list      |
| ACLID      | RAW (8)         |      | Object ID of the access control list |
| ACL_OWNER  | VARCHAR2 (128)  |      | Owner of the access control list     |

## 6.237 DBA\_OBJ\_AUDIT\_OPTS

DBA\_OBJ\_AUDIT\_OPTS describes auditing options on all objects.

#### Note:

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

#### Related View

USER\_OBJ\_AUDIT\_OPTS describes auditing options on all objects owned by the current user. This view does not display the OWNER column.

| Column      | Datatype       | NULL | Description                                         |
|-------------|----------------|------|-----------------------------------------------------|
| OWNER       | VARCHAR2 (128) |      | Owner of the object                                 |
| OBJECT_NAME | VARCHAR2 (128) |      | Name of the object                                  |
| OBJECT_TYPE | VARCHAR2 (23)  |      | Type of the object                                  |
| ALT         | VARCHAR2 (3)   |      | Auditing ALTER WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| AUD         | VARCHAR2 (3)   |      | Auditing AUDIT WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| COM         | VARCHAR2 (3)   |      | Auditing COMMENT WHENEVER SUCCESSFUL / UNSUCCESSFUL |
| DEL         | VARCHAR2 (3)   |      | Auditing DELETE WHENEVER SUCCESSFUL / UNSUCCESSFUL  |
| GRA         | VARCHAR2 (3)   |      | Auditing GRANT WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| IND         | VARCHAR2 (3)   |      | Auditing INDEX WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| INS         | VARCHAR2 (3)   |      | Auditing INSERT WHENEVER SUCCESSFUL / UNSUCCESSFUL  |
| LOC         | VARCHAR2 (3)   |      | Auditing LOCK WHENEVER SUCCESSFUL / UNSUCCESSFUL    |

| Column | Datatype     | NULL | Description                                                  |
|--------|--------------|------|--------------------------------------------------------------|
| REN    | VARCHAR2 (3) |      | <b>Auditing</b> RENAME WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| SEL    | VARCHAR2 (3) |      | <b>Auditing</b> SELECT WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| UPD    | VARCHAR2 (3) |      | <b>Auditing</b> UPDATE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| EXE    | VARCHAR2 (3) |      | <b>Auditing</b> EXECUTE WHENEVER SUCCESSFUL / UNSUCCESSFUL   |
| CRE    | VARCHAR2 (3) |      | <b>Auditing</b> CREATE WHENEVER SUCCESSFUL / UNSUCCESSFUL    |
| REA    | VARCHAR2 (3) |      | <b>Auditing</b> READ WHENEVER SUCCESSFUL / UNSUCCESSFUL      |
| WRI    | VARCHAR2 (3) |      | <b>Auditing</b> WRITE WHENEVER SUCCESSFUL / UNSUCCESSFUL     |
| FBK    | VARCHAR2 (3) |      | <b>Auditing</b> FLASHBACK WHENEVER SUCCESSFUL / UNSUCCESSFUL |

## 6.238 DBA\_OBJ\_COLATTRS

DBA\_OBJ\_COLATTRS describes object columns and attributes contained in all tables in the database. Its columns are the same as those in ALL\_OBJ\_COLATTRS.

**See Also:**

- ["ALL\\_OBJ\\_COLATTRS"](#)

## 6.239 DBA\_OBJECT\_SIZE

DBA\_OBJECT\_SIZE lists the sizes, in bytes, of various PL/SQL objects.

**Related View**

- `USER_OBJECT_SIZE` lists the size of PL/SQL objects owned by the current user.

| Column      | Datatype       | NULL     | Description                                                                                                                                               |
|-------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the object                                                                                                                                       |
| NAME        | VARCHAR2 (128) | NOT NULL | Name of the object                                                                                                                                        |
| TYPE        | VARCHAR2 (18)  |          | Type of the object: TYPE, TYPE BODY, TABLE, VIEW, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, JAVA SOURCE, JAVA CLASS or JAVA RESOURCE |
| SOURCE_SIZE | NUMBER         |          | Size of the source in bytes. Must be in memory during compilation, or dynamic recompilation.                                                              |
| PARSED_SIZE | NUMBER         |          | Size of the parsed form of the object, in bytes. Must be in memory when an object is being compiled that references this object.                          |
| CODE_SIZE   | NUMBER         |          | Code size, in bytes. Must be in memory when this object is executing.                                                                                     |
| ERROR_SIZE  | NUMBER         |          | Size of error messages, in bytes. In memory during the compilation of the object when there are compilation errors.                                       |

**See Also:**["USER\\_OBJECT\\_SIZE"](#)

## 6.240 DBA\_OBJECT\_TABLES

DBA\_OBJECT\_TABLES describes all object tables in the database. Its columns are the same as those in ALL\_OBJECT\_TABLES.

**See Also:**["ALL\\_OBJECT\\_TABLES"](#)

## 6.241 DBA\_OBJECT\_USAGE

DBA\_OBJECT\_USAGE displays statistics about index usage gathered from the database for all the indexes in the database.

You can use this view to monitor index usage. All indexes that have been used at least once can be monitored and displayed in this view.

### Related View

- **USER\_OBJECT\_USAGE** displays statistics about index usage gathered from the database for the indexes owned by the current user.

| Column           | Datatype       | NULL     | Description                                                                                                                                   |
|------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER            | VARCHAR2 (128) | NOT NULL | Index owner                                                                                                                                   |
| INDEX_NAME       | VARCHAR2 (128) | NOT NULL | Index name in sys.obj\$.name                                                                                                                  |
| TABLE_NAME       | VARCHAR2 (128) | NOT NULL | Table name in sys.obj\$.name                                                                                                                  |
| MONITORING       | VARCHAR2 (3)   |          | Indicates whether the monitoring feature is turned on.<br>Possible values: <ul style="list-style-type: none"><li>• YES</li><li>• NO</li></ul> |
| USED             | VARCHAR2 (3)   |          | Indicates whether the index has been accessed.<br>Possible values: <ul style="list-style-type: none"><li>• YES</li><li>• NO</li></ul>         |
| START_MONITORING | VARCHAR2 (19)  |          | Start monitoring time in<br>sys.object_stats.start_monitoring                                                                                 |
| END_MONITORING   | VARCHAR2 (19)  |          | End monitoring time in<br>sys.object_stats.end_monitoring                                                                                     |

**See Also:**["USER\\_OBJECT\\_USAGE"](#)

## 6.242 DBA\_OBJECTS

DBA\_OBJECTS describes all objects in the database. Its columns are the same as those in ALL\_OBJECTS.

**See Also:**["ALL\\_OBJECTS"](#)

## 6.243 DBA\_OBJECTS\_AE

DBA\_OBJECTS\_AE describes all objects (across all editions) in the database. Its columns are the same as those in ALL\_OBJECTS\_AE.

**See Also:**["ALL\\_OBJECTS\\_AE"](#)

## 6.244 DBA\_OGG\_AUTO\_CAPTURED\_TABLES

DBA\_OGG\_AUTO\_CAPTURED\_TABLES describes all tables in the database that are enabled for Oracle GoldenGate automatic capture.

### Related View

USER\_OGG\_AUTO\_CAPTURED\_TABLES describes the tables owned by the current user that are enabled for Oracle GoldenGate automatic capture. This view does not display the OWNER column.

| Column              | Datatype       | NULL     | Description                                                                                                                      |
|---------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2 (128) | NOT NULL | Owner of the table                                                                                                               |
| NAME                | VARCHAR2 (128) | NOT NULL | Name of the table                                                                                                                |
| ALLOW_NOVALIDATE_PK | VARCHAR2 (3)   |          | Indicates whether a primary key constraint in NOVALIDATE mode can be used as a unique identifier for the table (YES) or not (NO) |

### See Also:

"USER\_OGG\_AUTO\_CAPTURED\_TABLES"

## 6.245 DBA\_OPANCILLARY

DBA\_OPANCILLARY provides ancillary information for all operator bindings in the database. Its columns are the same as those in ALL\_OPANCILLARY.

### See Also:

"ALL\_OPANCILLARY"

## 6.246 DBA\_OPARGUMENTS

DBA\_OPARGUMENTS provides argument information for all operator bindings in the database. Its columns are the same as those in ALL\_OPARGUMENTS.

### See Also:

"ALL\_OPARGUMENTS"

## 6.247 DBA\_OPBINDINGS

DBA\_OPBINDINGS describes the binding functions and methods on all operators in the database. Its columns are the same as those in ALL\_OPBINDINGS.

**See Also:**

["ALL\\_OPBINDINGS"](#)

## 6.248 DBA\_OPERATOR\_COMMENTS

DBA\_OPERATOR\_COMMENTS displays comments for all user-defined operators in the database. Its columns are the same as those in ALL\_OPERATOR\_COMMENTS.

**See Also:**

["ALL\\_OPERATOR\\_COMMENTS"](#)

## 6.249 DBA\_OPERATORS

DBA\_OPERATORS describes all operators in the database. Its columns are the same as those in ALL\_OPERATORS.

**See Also:**

["ALL\\_OPERATORS"](#)

## 6.250 DBA\_OPTSTAT\_OPERATION\_TASKS

DBA\_OPTSTAT\_OPERATION\_TASKS displays the history of tasks that are performed as part of statistics operations (recorded in DBA\_OPTSTAT\_OPERATIONS). Each task represents a target object to be processed in the corresponding parent operation.

| Column      | Datatype       | NULL | Description                                                               |
|-------------|----------------|------|---------------------------------------------------------------------------|
| OPID        | NUMBER         |      | Internal identifier for the statistics operation that the task belongs to |
| TARGET      | VARCHAR2 (100) |      | Name of the object that this task operates on                             |
| TARGET_OBJN | NUMBER         |      | Object number of the target object                                        |

| Column         | Datatype                     | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|------------------------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TARGET_TYPE    | VARCHAR2 (40)                |      | Type of the target object. Possible values are: <ul style="list-style-type: none"> <li>TABLE</li> <li>TABLE (GLOBAL STATS ONLY):<br/>Task is created to gather only global statistics of a partitioned table</li> <li>TABLE (COORDINATOR JOB):<br/>Coordinator task for a partitioned table when concurrency is on</li> <li>TABLE PARTITION</li> <li>TABLE SUBPARTITION</li> <li>INDEX</li> <li>INDEX PARTITION</li> <li>INDEX SUBPARTITION</li> </ul>                                                                                                        |
| TARGET_SIZE    | NUMBER                       |      | Target size (in number of blocks) when the task started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| START_TIME     | TIMESTAMP (6) WITH TIME ZONE |      | Task start time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| END_TIME       | TIMESTAMP (6) WITH TIME ZONE |      | Task end time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STATUS         | VARCHAR2 (49)                |      | Current task status. Possible values are: <ul style="list-style-type: none"> <li>PENDING: Task is queued for processing</li> <li>IN PROGRESS: Task is currently running</li> <li>COMPLETED: Task has completed successfully</li> <li>FAILED: Task has failed</li> <li>SKIPPED: Task has been skipped, as it does not exist any more, or its stats are not stale (applies only to only automatic statistics gathering)</li> <li>TIMED OUT: Maintenance window was not enough to complete this task (applies only to automatic statistics gathering)</li> </ul> |
| JOB_NAME       | VARCHAR2 (50)                |      | Name of the scheduler job that executes this task (for example, when concurrency is on)                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ESTIMATED_COST | NUMBER                       |      | Estimated cost of the task (measured as elapsed time in seconds). This column is populated only when concurrency is on.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BATCHING_COEFF | NUMBER                       |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ACTIONS        | NUMBER                       |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PRIORITY       | NUMBER                       |      | Rank of the task among all target objects for the parent operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FLAGS          | NUMBER                       |      | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NOTES          | VARCHAR2 (4000)              |      | Notes about the underlying task, such as the failure message for tasks with status FAILED.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 6.252 DBA\_ORPHAN\_KEY\_TABLE

DBA\_ORPHAN\_KEY\_TABLE reports key values from indexes where the underlying base table has block corruptions.

To create the view, run the DBMS\_REPAIR.ADMIN\_TABLES procedure. To populate the orphan key table for an index, run the DBMS\_REPAIR.DUMP\_ORPHAN\_KEYS procedure on the index. For each key in the index that points to a corrupt data block, Oracle inserts a row into the orphan key table.

| Column         | Datatype       | NULL     | Description                                                 |
|----------------|----------------|----------|-------------------------------------------------------------|
| SCHEMA_NAME    | VARCHAR2 (128) | NOT NULL | Schema name of the index                                    |
| INDEX_NAME     | VARCHAR2 (128) | NOT NULL | Name of the index                                           |
| IPART_NAME     | VARCHAR2 (128) | NULL     | Name of the index partition or subpartition                 |
| INDEX_ID       | NUMBER         | NOT NULL | Dictionary object ID of the index                           |
| TABLE_NAME     | VARCHAR2 (128) | NOT NULL | Name of the base table of the index                         |
| PART_NAME      | VARCHAR2 (128) | NULL     | Name of the base table partition or subpartition            |
| TABLE_ID       | NUMBER         | NOT NULL | Dictionary object ID of the base table                      |
| KEYROWID       | ROWID          | NOT NULL | Physical rowid of the corrupt data row                      |
| KEY            | ROWID          | NOT NULL | Key values for the index entry                              |
| DUMP_TIMESTAMP | DATE           | NOT NULL | Timestamp when the entry was made into the orphan key table |

## 6.253 DBA\_OUTLINE\_HINTS

DBA\_OUTLINE\_HINTS describes the set of hints stored in all outlines in the database.

### Related View

USER\_OUTLINE\_HINTS describes the set of hints stored in the outlines owned by the current user. This view does not display the OWNER column.

| Column   | Datatype       | NULL | Description                                                                                                                                                             |
|----------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | VARCHAR2 (128) |      | Name of the outline                                                                                                                                                     |
| OWNER    | VARCHAR2 (128) |      | Name of the user who created the outline                                                                                                                                |
| NODE     | NUMBER         |      | ID of the query or subquery to which the hint applies. The top-level query is labeled 1. Subqueries are assigned sequentially numbered labels, starting with 2.         |
| STAGE    | NUMBER         |      | Outline hints can be applied at three different stages during the compilation process. This column indicates the stage at which this hint was applied.                  |
| JOIN_POS | NUMBER         |      | Position of the table in the join order. The value is 0 for all hints except access method hints, which identify a table to which the hint and the join position apply. |
| HINT     | CLOB           |      | Text of the hint                                                                                                                                                        |

| CON_ID                  | NUMBER                       | NOT NULL | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 6.256 DBA\_PARALLEL\_EXECUTE\_CHUNKS

DBA\_PARALLEL\_EXECUTE\_CHUNKS displays the chunks for all tasks in the database.

### Related View

USER\_PARALLEL\_EXECUTE\_CHUNKS displays the chunks for tasks created by the current user. This view does not display the TASK\_OWNER column.

| Column        | Datatype        | NULL     | Description                                                                                                                                             |
|---------------|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHUNK_ID      | NUMBER          | NOT NULL | Unique ID for the chunk                                                                                                                                 |
| TASK_OWNER    | VARCHAR2 (128)  | NOT NULL | Owner of the task                                                                                                                                       |
| TASK_NAME     | VARCHAR2 (128)  | NOT NULL | Name of the task                                                                                                                                        |
| STATUS        | VARCHAR2 (20)   |          | Status of the chunk: <ul style="list-style-type: none"><li>• UNASSIGNED</li><li>• ASSIGNED</li><li>• PROCESSED</li><li>• PROCESSED_WITH_ERROR</li></ul> |
| START_ROWID   | ROWID           |          | Rowid for the first row in the chunk                                                                                                                    |
| END_ROWID     | ROWID           |          | Rowid for the last row in the chunk                                                                                                                     |
| START_ID      | NUMBER          |          | Number column value of the first row in the chunk                                                                                                       |
| END_ID        | NUMBER          |          | Number column value of the last row in the chunk                                                                                                        |
| JOB_NAME      | VARCHAR2 (128)  |          | Name of the job which processed this chunk                                                                                                              |
| START_TS      | TIMESTAMP (6)   |          | Processing start time for the chunk                                                                                                                     |
| END_TS        | TIMESTAMP (6)   |          | Processing end time for the chunk                                                                                                                       |
| ERROR_CODE    | NUMBER          |          | Error code returned during the execution of the chunk if the STATUS column is PROCESSED_WITH_ERROR                                                      |
| ERROR_MESSAGE | VARCHAR2 (4000) |          | Error message returned during the execution of the chunk if the STATUS column is PROCESSED_WITH_ERROR                                                   |

## 6.258 DBA\_PART\_COL\_STATISTICS

DBA\_PART\_COL\_STATISTICS displays column statistics and histogram information for all table partitions in the database. Its columns are the same as those in ALL\_PART\_COL\_STATISTICS.

**See Also:**

["ALL\\_PART\\_COL\\_STATISTICS"](#)

## 6.259 DBA\_PART\_HISTOGRAMS

DBA\_PART\_HISTOGRAMS displays the histogram data (endpoints per histogram) for the histograms on all table partitions in the database. Its columns are the same as those in ALL\_PART\_HISTOGRAMS.

**See Also:**

["ALL\\_PART\\_HISTOGRAMS"](#)

## 6.260 DBA\_PART\_INDEXES

DBA\_PART\_INDEXES displays the object-level partitioning information for all partitioned indexes in the database. Its columns are the same as those in ALL\_PART\_INDEXES.

**See Also:**

["ALL\\_PART\\_INDEXES"](#)

## 6.261 DBA\_PART\_KEY\_COLUMNS

DBA\_PART\_KEY\_COLUMNS describes the partitioning key columns for all partitioned objects in the database. Its columns are the same as those in ALL\_PART\_KEY\_COLUMNS.

**See Also:**

["ALL\\_PART\\_KEY\\_COLUMNS"](#)

## 6.262 DBA\_PART\_LOBS

DBA\_PART\_LOBS displays table-level information for all partitioned LOBs in the database, including default attributes for LOB data partitions. Its columns are the same as those in ALL\_PART\_LOBS.

**See Also:**

"ALL\_PART\_LOBS"

## 6.263 DBA\_PART\_TABLES

DBA\_PART\_TABLES displays the object-level partitioning information for all partitioned tables in the database. Its columns are the same as those in ALL\_PART\_TABLES.

**See Also:**

"ALL\_PART\_TABLES"

## 6.264 DBA\_PARTIAL\_DROP\_TABS

DBA\_PARTIAL\_DROP\_TABS describes all tables in the database that have partially completed DROP COLUMN operations. Its columns are the same as those in ALL\_PARTIAL\_DROP\_TABS.

**See Also:**

"ALL\_PARTIAL\_DROP\_TABS"

## 6.265 DBA\_PDB\_HISTORY

DBA\_PDB\_HISTORY describes the lineage of the PDB to which it belongs.

| Column    | Datatype       | NULL     | Description                                                                     |
|-----------|----------------|----------|---------------------------------------------------------------------------------|
| PDB_NAME  | VARCHAR2 (128) | NOT NULL | Name of this PDB in one of its incarnations                                     |
| PDB_ID    | NUMBER         | NOT NULL | Container ID of this PDB in one of its incarnations.                            |
| PDB_DBID  | NUMBER         | NOT NULL | Database ID of this PDB in one of its incarnations                              |
| PDB_GUID  | RAW (16)       | NOT NULL | Globally unique ID of this PDB in one of its incarnations                       |
| OP_SCNBAS | NUMBER         | NOT NULL | SCN base when an operation was performed on one of the incarnations of this PDB |

| Column               | Datatype       | NULL     | Description                                                                           |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------|
| OP_SCNWRP            | NUMBER         | NOT NULL | SCN wrap when an operation was performed on one of incarnations of this PDB           |
| OP_TIMESTAMP         | DATE           | NOT NULL | Timestamp of an operation performed on one of the incarnations of this PDB            |
| OPERATION            | VARCHAR2 (16)  | NOT NULL | Operation that was performed on one of the incarnations of this PDB                   |
| DB_VERSION           | NUMBER         | NOT NULL | Database version                                                                      |
| CLONED_FROM_PDB_NAME | VARCHAR2 (128) |          | Name of a PDB from which one of the incarnations of this PDB was cloned               |
| CLONED_FROM_PDB_DBID | NUMBER         |          | Database ID of a PDB from which one of the incarnations of this PDB was cloned        |
| CLONED_FROM_PDB_GUID | RAW (16)       |          | Globally unique ID of a PDB from which one of the incarnations of this PDB was cloned |
| DB_NAME              | VARCHAR2 (128) |          | Name of a CDB in which one of the incarnations of this PDB was created                |
| DB_UNIQUE_NAME       | VARCHAR2 (128) |          | Unique name of a CDB in which one of the incarnations of this PDB was created         |
| DB_DBID              | NUMBER         |          | Database ID of a CDB in which one of the incarnations of this PDB was created         |
| CLONETAG             | VARCHAR2 (128) |          | Clone tag name for the PDB if the PDB was cloned using the snapshot copy mechanism    |
| DB_VERSION_STRING    | VARCHAR2 (204) |          | Database version string                                                               |

## 6.266 DBA\_PDB\_SAVED\_STATES

DBA\_PDB\_SAVED\_STATES shows information about the current saved PDB states in the CDB.

This view is a data link, so the data is also available within the PDB.

| Column        | Datatype       | NULL     | Description                                                       |
|---------------|----------------|----------|-------------------------------------------------------------------|
| CON_ID        | NUMBER         | NOT NULL | The ID of the PDB                                                 |
| CON_NAME      | VARCHAR2 (128) | NOT NULL | Name of the PDB                                                   |
| INSTANCE_NAME | VARCHAR2 (128) | NOT NULL | Name of the instance for which the state is saved                 |
| CON_UID       | NUMBER         | NOT NULL | Unique ID assigned to the PDB at creation time                    |
| GUID          | RAW (16)       |          | Globally unique immutable ID assigned to the PDB at creation time |
| STATE         | VARCHAR2 (14)  |          | Open state of the PDB                                             |
| RESTRICTED    | VARCHAR2 (3)   |          | Restricted mode of the PDB                                        |

## 6.267 DBA\_PDB\_SNAPSHOTFILE

DBA\_PDB\_SNAPSHOTFILE displays the files associated with snapshots taken of pluggable databases (PDBs).

You can use this view in conjunction with the DBA\_PDB\_SNAPSHOT view. Join the SNAPSHOT\_SCN column in this view with the SNAPSHOT\_SCN column in DBA\_PDB\_SNAPSHOT to determine the files associated with a particular PDB snapshot. A PDB snapshot consists of an archive log file, one or more data files, and one or more XML files. A row is added to this view for each file associated with a PDB snapshot.

| Column            | Datatype       | NULL     | Description                                                                                                                                                   |
|-------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID            | NUMBER         | NOT NULL | The ID of the PDB                                                                                                                                             |
| SNAPSHOT_SCN      | NUMBER         | NOT NULL | SCN at which the snapshot was taken                                                                                                                           |
| SNAPSHOT_FILENAME | VARCHAR2 (513) | NOT NULL | Snapshot file name                                                                                                                                            |
| SNAPSHOT_FILETYPE | VARCHAR2 (8)   | NOT NULL | Snapshot file type. Possible values: <ul style="list-style-type: none"> <li>ARCH: Archive log file</li> <li>DATA: Data file</li> <li>XML: XML file</li> </ul> |

## 6.268 DBA\_PDB\_SNAPSHOTS

DBA\_PDB\_SNAPSHOTS describes the snapshots taken of pluggable databases (PDBs).

Rows are added to this view when a snapshot of a PDB is taken by using the ALTER PLUGGABLE DATABASE SNAPSHOT SQL statement.

| Column                 | Datatype        | NULL     | Description                                              |
|------------------------|-----------------|----------|----------------------------------------------------------|
| CON_ID                 | NUMBER          | NOT NULL | The ID of the PDB                                        |
| CON_UID                | NUMBER          | NOT NULL | Unique ID assigned to the PDB at creation time           |
| CON_NAME               | VARCHAR2 (128)  | NOT NULL | Name of the PDB                                          |
| SNAPSHOT_NAME          | VARCHAR2 (128)  | NOT NULL | Snapshot name of the PDB                                 |
| SNAPSHOT_SCN           | NUMBER          | NOT NULL | SCN at which the snapshot was taken                      |
| PREVIOUS_SNAPSHOT_SCN  | NUMBER          | NOT NULL | SCN at which the previous snapshot for the PDB was taken |
| SNAPSHOT_TIME          | NUMBER          | NOT NULL | Timestamp at which the snapshot was taken                |
| PREVIOUS_SNAPSHOT_TIME | NUMBER          | NOT NULL | Timestamp of the previous snapshot for this PDB          |
| FULL_SNAPSHOT_PATH     | VARCHAR2 (4000) | NOT NULL | Full path for the snapshot                               |

**Note:**

This view does not display snapshot copy PDBs, which are created by using the `CREATE PLUGGABLE DATABASE ... SNAPSHOT COPY SQL` statement.

**See Also:**

## 6.269 DBA\_PDBS

DBA\_PDBS describes PDBs belonging to a given CDB.

When queried from a CDB root, this view describes all PDBs that belong to the CDB. When queried from an application root, it describes all PDBs that belong to the application container. When queried from a regular PDB or from an application PDB, it describes the regular PDB or the application PDB.

| Column   | Datatype       | NULL     | Description                                                                                              |
|----------|----------------|----------|----------------------------------------------------------------------------------------------------------|
| PDB_ID   | NUMBER         | NOT NULL | Container ID of the PDB                                                                                  |
| PDB_NAME | VARCHAR2 (128) | NOT NULL | Name of the PDB                                                                                          |
| DBID     | NUMBER         | NOT NULL | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB |
| CON_UID  | NUMBER         | NOT NULL | Unique identifier associated with the container                                                          |
| GUID     | RAW (16)       |          | Globally unique immutable ID assigned to the PDB at creation time                                        |

| Column                  | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|---------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                  | VARCHAR2 (10) |      | <p>State of the PDB. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>NEW</b> - The PDB has never been opened since it was created. It must be opened in <b>READ WRITE</b> mode for Oracle to perform processing needed to complete the integration of the PDB into the CDB and mark it <b>NORMAL</b>. An error will be thrown if an attempt is made to open the PDB read only.</li> <li>• <b>NORMAL</b> - The PDB is ready to be used.</li> <li>• <b>UNPLUGGED</b> - The PDB has been unplugged. The only operation that can be performed on it is <b>DROP PLUGGABLE DATABASE</b>.</li> <li>• <b>RELOCATING</b>: The PDB is in the process of being relocated to a different CDB.</li> <li>• <b>RELOCATED</b>: The PDB has been relocated to a different CDB.</li> <li>• <b>REFRESHING</b>: The PDB is a refresh PDB.</li> <li>• <b>UNDEFINED</b>: The PDB is in an undefined state.</li> <li>• <b>UNUSABLE</b> - The PDB is being created or an unrecoverable error was encountered during its creation. The PDB cannot be opened while its state is set to <b>UNUSABLE</b>. If the PDB remains in this state because of an error encountered during its creation, it can only be dropped. The alert log can be checked to determine if there was an error during PDB creation.</li> </ul> |
| CREATION_SCN            | NUMBER        |      | Creation SCN                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| VSN                     | NUMBER        |      | The version number of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| LAST_REFRESH_TIME | DATE            |          | Time of the last refresh operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CLOUD_IDENTITY    | VARCHAR2 (4000) |          | Cloud identifier for the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SOURCE_PDB_NAME   | VARCHAR2 (128)  |          | Name of the source PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SOURCE_DB_LINK    | VARCHAR2 (128)  |          | Name of the source database link                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PRIORITY          | NUMBER          |          | The priority of the PDB when performing an OPEN or SAVE STATE operation on multiple PDBs with a single ALTER PLUGGABLE DATABASE or ALTER DATABASE statement<br><br>If a priority is not assigned to the PDB, then the value of this column is null.<br><br>An operation is performed first on the PDB with the lowest PRIORITY number, then on the PDB with the second lowest PRIORITY number, and so on. The operation is then performed on PDBs with no assigned priority, if any, in no particular order. |

## 6.270 DBA\_PENDING\_CONV\_TABLES

DBA\_PENDING\_CONV\_TABLES describes all pending conversion tables in the database. Its columns are the same as those in ALL\_PENDING\_CONV\_TABLES.

### See Also:

"ALL\_PENDING\_CONV\_TABLES"

## 6.271 DBA\_PENDING\_TRANSACTIONS

DBA\_PENDING\_TRANSACTIONS describes unresolved transactions (either due to failure or if the coordinator has not sent a commit/rollback).

| Column   | Datatype | NULL | Description                                                |
|----------|----------|------|------------------------------------------------------------|
| FORMATID | NUMBER   |      | The format identifier of the transaction identifier        |
| GLOBALID | RAW (64) |      | The global part (gtrid) of the transaction identifier      |
| BRANCHID | RAW (64) |      | The branch qualifier (bqual) of the transaction identifier |

## 6.272 DBA\_PG\_EDGE\_RELATIONSHIPS

DBA\_PG\_EDGE\_RELATIONSHIPS describes edge relationships in all property graphs in the database. Its columns are the same as those in ALL\_PG\_EDGE\_RELATIONSHIPS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_PG\_EDGE\_RELATIONSHIPS"

## 6.273 DBA\_PG\_ELEMENT\_LABELS

DBA\_PG\_ELEMENT\_LABELS describes labels for the element tables in all property graphs in the database. Its columns are the same as those in ALL\_PG\_ELEMENT\_LABELS.

### Note:

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_ELEMENT\\_LABELS"](#)

## 6.274 DBA\_PG\_ELEMENTS

DBA\_PG\_ELEMENTS describes element tables in all property graphs in the database. Its columns are the same as those in ALL\_PG\_ELEMENTS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_ELEMENTS"](#)

## 6.275 DBA\_PG\_KEYS

DBA\_PG\_KEYS describes key columns in all property graphs in the database. Its columns are the same as those in ALL\_PG\_KEYS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_KEYS"](#)

## 6.276 DBA\_PG\_LABEL\_PROPERTIES

DBA\_PG\_LABEL\_PROPERTIES describes properties in all property graphs in the database. Its columns are the same as those in ALL\_PG\_LABEL\_PROPERTIES.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_LABEL\\_PROPERTIES"](#)

## 6.277 DBA\_PG\_LABELS

DBA\_PG\_LABELS describes labels in all property graphs in the database. Its columns are the same as those in ALL\_PG\_LABELS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_LABELS"](#)

## 6.278 DBA\_PG\_PROP\_DEFINITIONS

DBA\_PG\_PROP\_DEFINITIONS describes columns and expressions exposed as properties in all property graphs in the database. Its columns are the same as those in ALL\_PG\_PROP\_DEFINITIONS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_PG\\_PROP\\_DEFINITIONS"](#)

## 6.279 DBA\_PLSQL\_COLL\_TYPES

DBA\_PLSQL\_COLL\_TYPES describes all named PL/SQL collection types in the database. Its columns (except for CHAR\_USED) are the same as those in ALL\_PLSQL\_COLL\_TYPES.

**See Also:**

["ALL\\_PLSQL\\_COLL\\_TYPES"](#)

## 6.280 DBA\_PLSQL\_OBJECT\_SETTINGS

DBA\_PLSQL\_OBJECT\_SETTINGS displays information about the compiler settings for all stored objects in the database. Its columns are the same as those in ALL\_PLSQL\_OBJECT\_SETTINGS.

**See Also:**

["ALL\\_PLSQL\\_OBJECT\\_SETTINGS"](#)

## 6.281 DBA\_PLSQL\_TYPE\_ATTRS

DBA\_PLSQL\_TYPE\_ATTRS describes the attributes of all PL/SQL types in the database. Its columns are the same as those in ALL\_PLSQL\_TYPE\_ATTRS.

**See Also:**

["ALL\\_PLSQL\\_TYPE\\_ATTRS"](#)

## 6.282 DBA\_PLSQL\_TYPES

DBA\_PLSQL\_TYPES describes all PL/SQL types in the database. Its columns are the same as those in ALL\_PLSQL\_TYPES.

**See Also:**

["ALL\\_PLSQL\\_TYPES"](#)

## 6.283 DBA\_POLICIES

DBA\_POLICIES describes all Oracle Virtual Private Database (VPD) security policies in the database. Its columns are the same as those in ALL\_POLICIES.

A security policy is a list of security requirements and rules that regulate row level access to database objects.

**See Also:**

["ALL\\_POLICIES"](#)

## 6.284 DBA\_POLICY\_ATTRIBUTES

DBA\_POLICY\_ATTRIBUTES lists the attribute associations {Namespaces, Attributes} of all context-sensitive and shared context-sensitive Oracle Virtual Private Database (VPD) policies in the database. Its columns are the same as those in ALL\_POLICY\_ATTRIBUTES.

**See Also:**

["ALL\\_POLICY\\_ATTRIBUTES"](#)

## 6.285 DBA\_POLICY\_CONTEXTS

DBA\_POLICY\_CONTEXTS describes all driving contexts in the database. Its columns are the same as those in ALL\_POLICY\_CONTEXTS.

**See Also:**

["ALL\\_POLICY\\_CONTEXTS"](#)

## 6.286 DBA\_POLICY\_GROUPS

DBA\_POLICY\_GROUPS describes all policy groups in the database. Its columns are the same as those in ALL\_POLICY\_GROUPS.

**See Also:**

["ALL\\_POLICY\\_GROUPS"](#)

## 6.287 DBA\_PRIV\_AUDIT\_OPTS

DBA\_PRIV\_AUDIT\_OPTS describes current system privileges being audited across the system and by user.

### Note:

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column     | Datatype       | NULL     | Description                                                                                                                         |
|------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------|
| USER_NAME  | VARCHAR2 (128) |          | User name if by user auditing; ANY CLIENT if access by a proxy on behalf of a client is being audited; NULL for systemwide auditing |
| PROXY_NAME | VARCHAR2 (128) |          | Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly     |
| PRIVILEGE  | VARCHAR2 (40)  | NOT NULL | Name of the system privilege being audited                                                                                          |
| SUCCESS    | VARCHAR2 (10)  |          | Mode for WHENEVER SUCCESSFUL system auditing                                                                                        |
| FAILURE    | VARCHAR2 (10)  |          | Mode for WHENEVER NOT SUCCESSFUL system auditing                                                                                    |

## 6.288 DBA\_PRIV\_CAPTURES

DBA\_PRIV\_CAPTURES lists the privilege analysis policies in the database.

| Column      | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                        |
|-------------|-----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2 (128)  | NOT NULL | Name of the privilege analysis policy                                                                                                                                                                                                                                                                              |
| DESCRIPTION | VARCHAR2 (1024) |          | Description of the privilege analysis                                                                                                                                                                                                                                                                              |
| TYPE        | VARCHAR2 (16)   |          | Type of the privilege analysis policy.<br>Possible values: <ul style="list-style-type: none"> <li>G_DATABASE: Database wide privilege analysis</li> <li>G_ROLE: Role privilege analysis</li> <li>G_CONTEXT: Context privilege analysis</li> <li>G_ROLE_AND_CONTEXT: Role and context privilege analysis</li> </ul> |
| ENABLED     | VARCHAR2 (1)    |          | Enabling status of the privilege analysis                                                                                                                                                                                                                                                                          |
| ROLES       | ROLE_ID_LIST    |          | List of roles whose privileges to analyze if the privilege analysis type is G_ROLE or G_ROLE_AND_CONTEXT                                                                                                                                                                                                           |
| CONTEXT     | VARCHAR2 (4000) |          | Context condition if the privilege analysis type is G_CONTEXT or G_ROLE_AND_CONTEXT                                                                                                                                                                                                                                |
| RUN_NAME    | VARCHAR2 (128)  |          | Displays run name information for each run                                                                                                                                                                                                                                                                         |

**See Also:**

*Oracle Database Security Guide* for more information about privilege analysis

## 6.289 DBA\_PRIVATE\_TEMP\_TABLES

DBA\_PRIVATE\_TEMP\_TABLES describes all of the private temporary tables in the database.

### Related View

USER\_PRIVATE\_TEMP\_TABLES describes the private temporary tables in the current session. This view does not display the INST\_ID column.

| Column          | Datatype       | NULL | Description                                                                   |
|-----------------|----------------|------|-------------------------------------------------------------------------------|
| SID             | NUMBER         |      | Session ID of the session that created the private temporary table            |
| SERIAL#         | NUMBER         |      | Session serial number of the session that created the private temporary table |
| INST_ID         | NUMBER         |      | Instance ID of the session that created the private temporary table           |
| OWNER           | VARCHAR2 (128) |      | Owner name of the private temporary table                                     |
| TABLE_NAME      | VARCHAR2 (128) |      | Private temporary table name                                                  |
| TABLESPACE_NAME | VARCHAR2 (128) |      | Private temporary table's tablespace name                                     |
| DURATION        | VARCHAR2 (128) |      | Private temporary table's duration (for example, SESSION or TRANSACTION)      |
| NUM_ROWS        | NUMBER         |      | Number of rows in the private temporary table when analyzed                   |
| BLOCKS          | NUMBER         |      | Number of blocks used by private temporary table                              |
| AVG_ROW_LEN     | NUMBER         |      | Average row length                                                            |
| LAST_ANALYZED   | DATE           |      | Timestamp of last analyze                                                     |
| TXN_ID          | RAW (8)        |      | Transaction ID of the transaction duration private temporary table            |
| SAVE_POINT_NUM  | NUMBER         |      | Save point number of the transaction duration private temporary table         |

## 6.290 DBA\_PROCEEDURES

DBA\_PROCEEDURES lists all functions and procedures that are available in the database, along with their associated properties. Its columns are the same as those in ALL\_PROCEEDURES.

### See Also:

- ["ALL\\_PROCEEDURES"](#)
- ["DBA\\_ARGUMENTS"](#) for information about the arguments of all of the functions and procedures that are available in the database

## 6.291 DBA\_PROFILES

DBA\_PROFILES displays all profiles and their limits.

| Column            | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                 |
|-------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROFILE           | VARCHAR2 (128) | NOT NULL | Profile name                                                                                                                                                                                                                                                                                |
| RESOURCE_NAME     | VARCHAR2 (32)  | NOT NULL | Resource name                                                                                                                                                                                                                                                                               |
| RESOURCE_TYPE     | VARCHAR2 (8)   |          | Indicates whether the resource profile is a <code>KERNEL</code> or a <code>PASSWORD</code> parameter                                                                                                                                                                                        |
| LIMIT             | VARCHAR2 (128) |          | Limit placed on this resource for the profile                                                                                                                                                                                                                                               |
| COMMON            | VARCHAR2 (3)   |          | Indicates whether the profile is common. Possible values: <ul style="list-style-type: none"><li>• <code>YES</code> if a profile is common</li><li>• <code>NO</code> if a profile is local (not common)</li></ul>                                                                            |
| INHERITED         | VARCHAR2 (3)   |          | Indicates whether the profile definition was inherited from another container ( <code>YES</code> ) or not ( <code>NO</code> )                                                                                                                                                               |
| IMPLICIT          | VARCHAR2 (3)   |          | Indicates whether the profile was created by an implicit application ( <code>YES</code> ) or not ( <code>NO</code> )                                                                                                                                                                        |
| ORACLE_MAINTAINED | VARCHAR2 (3)   |          | Indicates whether the profile was created by Oracle-supplied scripts ( <code>YES</code> ) or not ( <code>NO</code> )<br><br>Note that a profile created by Oracle-supplied scripts is local to all PDBs and can be changed inside a PDB to accommodate individual application requirements. |
| MANDATORY         | VARCHAR2 (3)   |          | Indicates whether the profile is a mandatory user profile ( <code>YES</code> ) or not ( <code>NO</code> )<br><br><b>See Also:</b> The <a href="#">MANDATORY_USER_PROFILE</a> initialization parameter                                                                                       |

## 6.292 DBA\_PROPERTY\_GRAPHS

DBA\_PROPERTY\_GRAPHS describes all property graphs in the database. Its columns are the same as those in ALL\_PROPERTY\_GRAPHS.

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_PROPERTY\_GRAPHS"

## 6.293 DBA\_PROPAGATION

DBA\_PROPAGATION displays information about all propagations in the database. Its columns are the same as those in ALL\_PROPAGATION.

### See Also:

"ALL\_PROPAGATION"

## 6.294 DBA\_PROXIES

DBA\_PROXIES displays information about all proxy connections in the database.

### Related View

USER\_PROXIES displays information about connections the current user is allowed to proxy. This view does not display the PROXY or PROXY\_AUTHORITY columns.

| Column                   | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                        |
|--------------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROXY                    | VARCHAR2 (128) |          | Name of the proxy user                                                                                                                                                                                                                                                             |
| CLIENT                   | VARCHAR2 (128) | NOT NULL | Name of the client user who the proxy user can act on behalf of                                                                                                                                                                                                                    |
| AUTHENTICATION           | VARCHAR2 (3)   |          | Indicates whether the proxy is required to supply the client's authentication credentials (YES) or not (NO)                                                                                                                                                                        |
| AUTHORIZATION_CONSTRAINT | VARCHAR2 (35)  |          | Indicates the proxy's authority to exercise roles on the client's behalf: <ul style="list-style-type: none"><li>• NO CLIENT ROLES MAY BE ACTIVATED</li><li>• PROXY MAY ACTIVATE ROLE</li><li>• PROXY MAY ACTIVATE ALL CLIENT ROLES</li><li>• PROXY MAY NOT ACTIVATE ROLE</li></ul> |

| Column          | Datatype       | NULL | Description                                                                                                                                                                                  |
|-----------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROLE            | VARCHAR2 (128) |      | Name of the role referenced in AUTHORIZATION_CONSTRAINT                                                                                                                                      |
| PROXY_AUTHORITY | VARCHAR2 (9)   |      | Value is either: <ul style="list-style-type: none"> <li>DIRECTORY if EUS proxy is enabled for that database user</li> <li>DATABASE if this row describes a local proxy permission</li> </ul> |

## 6.295 DBA\_QUARANTINED\_TRANSACTIONS

DBA\_QUARANTINED\_TRANSACTIONS lists all quarantined transactions in the current container.

| Column              | Datatype        | NULL     | Description                                                                                                                              |
|---------------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------|
| USN                 | NUMBER          | NOT NULL | Undo segment number of the quarantined transaction                                                                                       |
| SLT                 | NUMBER          | NOT NULL | Slot number of the quarantined transaction                                                                                               |
| SQN                 | NUMBER          | NOT NULL | Sequence number of the quarantined transaction                                                                                           |
| REASON              | VARCHAR2 (256)  |          | Reason the transaction failed to recover                                                                                                 |
| TRACE_FILE_NAME     | VARCHAR2 (4096) |          | Name of the trace file containing the reason for the transaction's recovery failure, along with diagnostic information about the failure |
| UNDO_TSN            | NUMBER          |          | Undo tablespace number for the quarantined transaction                                                                                   |
| UNDO_RECORD_OBJN    | NUMBER          |          | Dictionary object number of the object (OBJN)                                                                                            |
| UNDO_RECORD_OBJD    | NUMBER          |          | Dictionary object number of the segment that contains the object (OBJD)                                                                  |
| DATA_BLOCK_TSN      | NUMBER          |          | Tablespace ID for the object                                                                                                             |
| PREV_UNDO_BLOCK_DBA | NUMBER          |          | Previous undo block address, which was used for rollback                                                                                 |
| UBA_RDBA            | NUMBER          |          | Relative data block address of the current undo block being applied for rollback                                                         |
| UBA_SQN             | NUMBER          |          | Undo block sequence number of the current undo block being applied for rollback                                                          |
| UBA_RECORD_NUMBER   | NUMBER          |          | Undo record number of the current undo block being applied for rollback                                                                  |
| TXN_START_SCN       | NUMBER          |          | Start SCN of the quarantined transaction                                                                                                 |
| INCIDENT_TIME       | VARCHAR2 (64)   |          | Time at which the incident occurred                                                                                                      |

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["V\\$FAST\\_START\\_TRANSACTIONS"](#)

## 6.296 DBA\_QUEUE\_EVENT\_STREAMS

DBA\_QUEUE\_EVENT\_STREAMS describes all Transactional Event Queue (TxEventQ) event streams in the database. Its columns are the same as those in ALL\_QUEUE\_EVENT\_STREAMS.

**See Also:**

["ALL\\_QUEUE\\_EVENT\\_STREAMS"](#)

## 6.297 DBA\_QUEUE\_SCHEDULES

DBA\_QUEUE\_SCHEDULES describes all propagation schedules in the database. Its columns are the same as those in ALL\_QUEUE\_SCHEDULES.

**See Also:**

["ALL\\_QUEUE\\_SCHEDULES"](#)

## 6.298 DBA\_QUEUE\_SUBSCRIBERS

DBA\_QUEUE\_SUBSCRIBERS displays all subscribers on all queues in the database. Its columns are the same as those in ALL\_QUEUE\_SUBSCRIBERS.

**See Also:**

["ALL\\_QUEUE\\_SUBSCRIBERS"](#)

## 6.299 DBA\_QUEUE\_TABLES

DBA\_QUEUE\_TABLES contains information about the owner instance for a queue table.

A queue table can contain multiple queues. In this case, each queue in a queue table has the same owner instance as the queue table. Its columns are the same as those in ALL\_QUEUE\_TABLES.

### See Also:

"ALL\_QUEUE\_TABLES"

## 6.300 DBA\_QUEUES

DBA\_QUEUES describes the operational characteristics of every queue in a database. Its columns are the same as those in ALL\_QUEUES.

### See Also:

- "ALL\_QUEUES"
- *Oracle Database Advanced Queuing User's Guide* for more information about Advanced Queuing

## 6.301 DBA\_RAT\_CAPTURE\_SCHEMA\_INFO

DBA\_RAT\_CAPTURE\_SCHEMA\_INFO displays the login schema and current schema that were in effect when SQL statements were recorded in a workload capture.

This view is useful when you perform a workload replay in extended PL/SQL mode. This type of replay may include SQL statements that perform table operations such as `SELECT`, `UPDATE`, and `DELETE`. If the current schema was different from the login schema at the time of the workload capture, then those table operations may have been performed with the privileges of the current user, not the login user. During workload replay, all operations are performed with the privileges of the login user. Therefore, errors can occur during replay if the login user does not have the necessary privileges to perform the table operations.

To resolve this issue, you can use this view in conjunction with the `DBA_WORKLOAD_CAPTURE_SQLTEXT` view. Join the `CAPTURE_ID` column in this view with the `CAPTURE_ID` column in `DBA_WORKLOAD_CAPTURE_SQLTEXT` to determine the login schema and current schema that were in effect when each SQL statement in `DBA_WORKLOAD_CAPTURE_SQLTEXT` was captured. Examine the `SQL_TEXT` column in `DBA_WORKLOAD_CAPTURE_SQLTEXT` to determine whether the SQL statement involved any table operations, and whether those table operations were performed with the privileges of the current user or the login user. You can then grant to the login user the necessary privileges for performing those table operations before performing a workload replay.

| Column         | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAPTURE_ID     | NUMBER (38)    |      | Internal key for the workload capture                                                                                                                                                                                                                                                                                              |
| SQL_ID         | VARCHAR2 (13)  |      | SQL identifier for the parent cursor in the library cache                                                                                                                                                                                                                                                                          |
| LOGIN_SCHEMA   | VARCHAR2 (128) |      | The schema of the user who logged on to the session in which the SQL statement was recorded in the workload capture. This value does not change during a session.                                                                                                                                                                  |
| CURRENT_SCHEMA | VARCHAR2 (128) |      | The currently active default schema for the session when the SQL statement was recorded in the workload capture. This value may change during a session through use of an <code>ALTER SESSION SET CURRENT_SCHEMA</code> statement. It may also change during a session to reflect the owner of any active definer's rights object. |

## 6.302 DBA\_RCHILD

DBA\_RCHILD displays all the children in any refresh group.

| Column   | Datatype       | NULL     | Description                              |
|----------|----------------|----------|------------------------------------------|
| REFGROUP | NUMBER         |          | Internal identifier of the refresh group |
| OWNER    | VARCHAR2 (128) | NOT NULL | Owner of the object in the refresh group |
| NAME     | VARCHAR2 (128) | NOT NULL | Name of the object in the refresh group  |
| TYPE#    | VARCHAR2 (128) |          | Type of the object in the refresh group  |

## 6.303 DBA\_RECOVERABLE\_SCRIPT

DBA\_RECOVERABLE\_SCRIPT provides details about recoverable operations.

| Column                 | Datatype       | NULL | Description                                                                              |
|------------------------|----------------|------|------------------------------------------------------------------------------------------|
| SCRIPT_ID              | RAW (16)       |      | Unique ID of the operation                                                               |
| CREATION_TIME          | DATE           |      | Time the operation was invoked                                                           |
| INVOKING_PACKAGE_OWNER | VARCHAR2 (128) |      | Invoking package owner of the operation                                                  |
| INVOKING_PACKAGE       | VARCHAR2 (128) |      | Invoking package of the operation                                                        |
| INVOKING_PROCEDURE     | VARCHAR2 (128) |      | Invoking procedure of the operation                                                      |
| INVOKING_USER          | VARCHAR2 (128) |      | Script owner                                                                             |
| STATUS                 | VARCHAR2 (12)  |      | State of the recoverable script: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR |
| TOTAL_BLOCKS           | NUMBER         |      | Total number of blocks for the recoverable script to be executed                         |

| Column         | Datatype        | NULL | Description                        |
|----------------|-----------------|------|------------------------------------|
| DONE_BLOCK_NUM | NUMBER          |      | Last block executed, thus far      |
| SCRIPT_COMMENT | VARCHAR2 (4000) |      | Comment for the recoverable script |

## 6.304 DBA\_RECOVERABLE\_SCRIPT\_BLOCKS

DBA\_RECOVERABLE\_SCRIPT\_BLOCKS provides details about recoverable script blocks.

| Column               | Datatype        | NULL | Description                                                                            |
|----------------------|-----------------|------|----------------------------------------------------------------------------------------|
| SCRIPT_ID            | RAW (16)        |      | Global unique ID of the recoverable script to which this block belongs                 |
| BLOCK_NUM            | NUMBER          |      | The <i>n</i> th block in the recoverable script to be executed                         |
| FORWARD_BLOCK        | CLOB            |      | Forward block to be executed                                                           |
| FORWARD_BLOCK_DBLINK | VARCHAR2 (128)  |      | Database where the forward block is executed                                           |
| UNDO_BLOCK           | CLOB            |      | Block to roll back the forward operation                                               |
| UNDO_BLOCK_DBLINK    | VARCHAR2 (128)  |      | Database where the undo block is executed                                              |
| STATUS               | VARCHAR2 (12)   |      | Status of the block execution: GENERATING, NOT EXECUTED, EXECUTING, EXECUTED, or ERROR |
| BLOCK_COMMENT        | VARCHAR2 (4000) |      | Comment for the block                                                                  |

## 6.305 DBA\_RECOVERABLE\_SCRIPT\_ERRORS

DBA\_RECOVERABLE\_SCRIPT\_ERRORS provides details about errors that occurred during script execution.

| Column              | Datatype        | NULL | Description                                               |
|---------------------|-----------------|------|-----------------------------------------------------------|
| SCRIPT_ID           | RAW (16)        |      | Global unique ID of the recoverable script                |
| BLOCK_NUM           | NUMBER          |      | The <i>n</i> th block that failed                         |
| ERROR_NUMBER        | NUMBER          |      | Number of the error encountered while executing the block |
| ERROR_MESSAGE       | VARCHAR2 (4000) |      | Error message encountered while executing the block       |
| ERROR_CREATION_TIME | DATE            |      | Time that the error was created                           |

## 6.306 DBA\_RECOVERABLE\_SCRIPT\_HIST

DBA\_RECOVERABLE\_SCRIPT\_HIST displays details about executed or purged recoverable operations.

| Column                 | Datatype       | NULL | Description                             |
|------------------------|----------------|------|-----------------------------------------|
| SCRIPT_ID              | RAW (16)       |      | Unique id of the operation              |
| CREATION_TIME          | DATE           |      | Time the operation was invoked          |
| INVOKING_PACKAGE_OWNER | VARCHAR2 (128) |      | Invoking package owner of the operation |
| INVOKING_PACKAGE       | VARCHAR2 (128) |      | Invoking package of the operation       |

| Column             | Datatype        | NULL | Description                                                      |
|--------------------|-----------------|------|------------------------------------------------------------------|
| INVOKING_PROCEDURE | VARCHAR2 (128)  |      | Invoking procedure of the operation                              |
| INVOKING_USER      | VARCHAR2 (128)  |      | Script owner                                                     |
| STATUS             | VARCHAR2 (8)    |      | state of the recoverable script: EXECUTED, PURGED                |
| TOTAL_BLOCKS       | NUMBER          |      | total number of blocks for the recoverable script to be executed |
| DONE_BLOCK_NUM     | NUMBER          |      | last block so far executed                                       |
| SCRIPT_COMMENT     | VARCHAR2 (4000) |      | comment for the recoverable script                               |

## 6.307 DBA\_RECOVERABLE\_SCRIPT\_PARAMS

DBA\_RECOVERABLE\_SCRIPT\_PARAMS provides details about recoverable operation parameters.

| Column      | Datatype        | NULL | Description                      |
|-------------|-----------------|------|----------------------------------|
| SCRIPT_ID   | RAW (16)        |      | Unique ID of the operation       |
| PARAMETER   | VARCHAR2 (128)  |      | Name of the parameter            |
| PARAM_INDEX | NUMBER          |      | Index for multi-valued parameter |
| VALUE       | VARCHAR2 (4000) |      | Value of the parameter           |

## 6.308 DBA\_RECYCLEBIN

DBA\_RECYCLEBIN displays information about all recycle bins in the database.

### Related View

USER\_RECYCLEBIN displays information about the recycle bin owned by the current user. This view does not display the OWNER column.

| Column        | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                     |
|---------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER         | VARCHAR2 (128) | NOT NULL | Name of the original owner of the object                                                                                                                                                                                                                                                                        |
| OBJECT_NAME   | VARCHAR2 (128) | NOT NULL | New name of the object                                                                                                                                                                                                                                                                                          |
| ORIGINAL_NAME | VARCHAR2 (128) |          | Original name of the object                                                                                                                                                                                                                                                                                     |
| OPERATION     | VARCHAR2 (9)   |          | Operation carried out on the object: <ul style="list-style-type: none"><li>• DROP - Object was dropped</li><li>• TRUNCATE - Object was truncated</li></ul> <b>Note:</b> The Oracle Database currently only supports recovering dropped objects from the recycle bin. The truncated objects cannot be recovered. |

| Column         | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE           | VARCHAR2 (25)  |          | Type of the object: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• NORMAL INDEX</li> <li>• BITMAP INDEX</li> <li>• NESTED TABLE</li> <li>• LOB</li> <li>• LOB INDEX</li> <li>• DOMAIN INDEX</li> <li>• IOT TOP INDEX</li> <li>• IOT OVERFLOW SEGMENT</li> <li>• IOT MAPPING TABLE</li> <li>• TRIGGER</li> <li>• Table Partition</li> <li>• Table Composite Partition</li> <li>• Index Partition</li> <li>• Index Composite Partition</li> <li>• LOB Partition</li> <li>• LOB Composite Partition</li> </ul> |
| TS_NAME        | VARCHAR2 (30)  |          | Name of the tablespace to which the object belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATETIME     | VARCHAR2 (19)  |          | Timestamp for the creation of the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DROPTIME       | VARCHAR2 (19)  |          | Timestamp for the dropping of the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DROPSCN        | NUMBER         |          | System change number (SCN) of the transaction which moved the object to the recycle bin                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PARTITION_NAME | VARCHAR2 (128) |          | Name of the partition which was dropped                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CAN_UNDROP     | VARCHAR2 (3)   |          | Indicates whether the object can be undropped (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CAN_PURGE      | VARCHAR2 (3)   |          | Indicates whether the object can be purged (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| RELATED        | NUMBER         | NOT NULL | Object number of the parent object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BASE_OBJECT    | NUMBER         | NOT NULL | Object number of the base object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PURGE_OBJECT   | NUMBER         | NOT NULL | Object number for the object which gets purged                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SPACE          | NUMBER         |          | Number of blocks used by the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 6.311 DBA\_REDEFINITION\_STATUS

DBA\_REDEFINITION\_STATUS is an online redefinition view. It provides information about the online redefinition status.

| Column               | Datatype       | NULL     | Description                                                                                                                                                                                            |
|----------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REDEFINITION_ID      | NUMBER(38)     | NOT NULL | ID for the redefinition object                                                                                                                                                                         |
| BASE_TABLE_OWNER     | VARCHAR2(128)  |          | Owner of the base table of the redefinition object                                                                                                                                                     |
| BASE_TABLE_NAME      | VARCHAR2(128)  |          | Name of the base table of the redefinition object                                                                                                                                                      |
| BASE_OBJECT_NAME     | VARCHAR2(128)  | NOT NULL | Name of the base object of the redefinition object                                                                                                                                                     |
| BASE_OBJECT_TYPE     | VARCHAR2(9)    |          | Type of the base object of the redefinition object                                                                                                                                                     |
| INTERIM_OBJECT_OWNER | VARCHAR2(128)  |          | Owner of the interim object of the redefinition object                                                                                                                                                 |
| INTERIM_OBJECT_NAME  | VARCHAR2(128)  |          | Name of the interim object of the redefinition object                                                                                                                                                  |
| OPERATION            | VARCHAR2(128)  | NOT NULL | The current redefinition operation: <ul style="list-style-type: none"> <li>• START_REDEF_TABLE</li> <li>• SYNC_INTERIM_TABLE</li> <li>• COPY_TABLE_DEPENDENTS</li> <li>• FINISH_REDEF_TABLE</li> </ul> |
| STATUS               | VARCHAR2(128)  | NOT NULL | Status of the previous redefinition operation: <ul style="list-style-type: none"> <li>• FAILURE</li> <li>• SUCCESS</li> </ul>                                                                          |
| RESTARTABLE          | VARCHAR2(1)    | NOT NULL | Indicates whether the previous operation can be restarted                                                                                                                                              |
| ERR_TXT              | VARCHAR2(1000) |          | The error message raised from the previous operation                                                                                                                                                   |
| ACTION               | VARCHAR2(400)  |          | The suggested action                                                                                                                                                                                   |
| REFRESH_DEP_MVIEWS   | VARCHAR2(1)    |          | Indicates whether the online redefinition will also refresh dependent materialized views when syncing the interim table (Y) or not (N)                                                                 |

**See Also:***Oracle Database Administrator's Guide* for more information about online redefinition

## 6.312 DBA\_REFRESH

DBA\_REFRESH describes all refresh groups in the database. Its columns are the same as those in ALL\_REFRESH.

**See Also:**

"ALL\_REFRESH"

## 6.313 DBA\_REFRESH\_CHILDREN

DBA\_REFRESH\_CHILDREN lists all of the objects in all refresh groups in the database. Its columns are the same as those in ALL\_REFRESH\_CHILDREN.

**See Also:**

"ALL\_REFRESH\_CHILDREN"

## 6.314 DBA\_REFS

DBA\_REFS describes the REF columns and REF attributes in object type columns of all the objects in the database. Its columns are the same as those in ALL\_REFS.

**See Also:**

"ALL\_REFS"

## 6.315 DBA\_REGISTERED\_ARCHIVED\_LOG

DBA\_REGISTERED\_ARCHIVED\_LOG displays information about all registered archived logfiles in the database.

| Column          | Datatype       | NULL     | Description                                                                                                                                                      |
|-----------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONSUMER_NAME   | VARCHAR2 (128) | NOT NULL | Consumer name of the archived logs                                                                                                                               |
| SOURCE_DATABASE | VARCHAR2 (128) |          | Name of the database which generated the redo logs                                                                                                               |
| THREAD#         | NUMBER         | NOT NULL | Thread number of the archived redo log. The thread number is 1 for a single instance. For Real Application Clusters, this column will contain different numbers. |
| SEQUENCE#       | NUMBER         | NOT NULL | Sequence number of the archived redo log file                                                                                                                    |
| FIRST_SCN       | NUMBER         | NOT NULL | System change number (SCN) of the current archived redo log                                                                                                      |

| Column             | Datatype       | NULL     | Description                                                                                           |
|--------------------|----------------|----------|-------------------------------------------------------------------------------------------------------|
| NEXT_SCN           | NUMBER         |          | System change number (SCN) of the next archived redo log                                              |
| FIRST_TIME         | DATE           |          | Date and time of the current archived redo log                                                        |
| NEXT_TIME          | DATE           |          | Date and time of the next archived redo log                                                           |
| NAME               | VARCHAR2 (513) |          | Name of the archived redo log                                                                         |
| MODIFIED_TIME      | DATE           |          | Time when the archived redo log was registered                                                        |
| DICTIONARY_BEGIN   | VARCHAR2 (3)   |          | Indicates whether the beginning of the dictionary build is in the archived redo log (YES) or not (NO) |
| DICTIONARY_END     | VARCHAR2 (3)   |          | Indicates whether the end of the dictionary build is in the archived redo log (YES) or not (NO)       |
| PURGEABLE          | VARCHAR2 (3)   |          | Indicates whether the redo log can be permanently removed (YES) or not (NO)                           |
| RESET_LOGS_CHANGE# | NUMBER         | NOT NULL | Resetlogs change number of the database when the log was written                                      |
| RESET_TIMESTAMP    | NUMBER         | NOT NULL | Resetlogs time of the database when the log was written                                               |

## 6.316 DBA\_REGISTERED\_MVIEWS

DBA\_REGISTERED\_MVIEWS describes all registered materialized views (registered at a master site or a master materialized view site) in the database. Its columns are the same as those in ALL\_REGISTERED\_MVIEWS.

**See Also:**

"ALL\_REGISTERED\_MVIEWS"

## 6.317 DBA\_REGISTRY

DBA\_REGISTRY displays information about all components in the database that are loaded into the component registry.

The component registry tracks components that can be separately loaded into the Oracle Database. When a SQL script loads the PL/SQL packages and other database objects for a component into the database, the script records the component name, status, and version. If scripts are used to upgrade/downgrade the dictionary elements for the component, then those scripts also record status and version information.

### Related View

USER\_REGISTRY displays information about the components owned by the current user that are loaded into the component registry.

| Column  | Datatype      | NULL     | Description          |
|---------|---------------|----------|----------------------|
| COMP_ID | VARCHAR2 (30) | NOT NULL | Component identifier |

| Column        | Datatype        | NULL     | Description                                                                                                                                                                                                                                                      |
|---------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMP_NAME     | VARCHAR2 (255)  |          | Component name                                                                                                                                                                                                                                                   |
| VERSION       | VARCHAR2 (30)   |          | Component version loaded                                                                                                                                                                                                                                         |
| VERSION_FULL  | VARCHAR2 (30)   |          | Component full version                                                                                                                                                                                                                                           |
| STATUS        | VARCHAR2 (11)   |          | Component status: <ul style="list-style-type: none"> <li>• INVALID</li> <li>• VALID</li> <li>• LOADING</li> <li>• LOADED</li> <li>• UPGRADING</li> <li>• UPGRADED</li> <li>• DOWNGRADING</li> <li>• DOWNGRADED</li> <li>• REMOVING</li> <li>• REMOVED</li> </ul> |
| MODIFIED      | VARCHAR2 (20)   |          | Time when the component was last modified                                                                                                                                                                                                                        |
| NAMESPACE     | VARCHAR2 (30)   | NOT NULL | Component namespace                                                                                                                                                                                                                                              |
| CONTROL       | VARCHAR2 (128)  | NOT NULL | User that created the component entry                                                                                                                                                                                                                            |
| SCHEMA        | VARCHAR2 (128)  | NOT NULL | User that contains the objects for the component                                                                                                                                                                                                                 |
| PROCEDURE     | VARCHAR2 (61)   |          | Validation procedure                                                                                                                                                                                                                                             |
| STARTUP       | VARCHAR2 (8)    |          | Indicates whether the component requires a startup after the upgrade (REQUIRED) or not                                                                                                                                                                           |
| PARENT_ID     | VARCHAR2 (30)   |          | Parent component identifier                                                                                                                                                                                                                                      |
| OTHER_SCHEMAS | VARCHAR2 (4000) |          | A list of ancillary schema names associated with the component                                                                                                                                                                                                   |

## 6.318 DBA\_REGISTRY\_BACKPORTS

DBA\_REGISTRY\_BACKPORTS displays backported bug fixes that were applied to the database. This view displays only bug fixes that changed the data dictionary of the database.

| Column        | Datatype      | NULL     | Description                                                                                                                                                               |
|---------------|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUGNO         | NUMBER        | NOT NULL | Bug number                                                                                                                                                                |
| VERSION_FULL  | VARCHAR2 (30) | NOT NULL | Component full version                                                                                                                                                    |
| COMP_ID       | VARCHAR2 (30) | NOT NULL | Component identifier                                                                                                                                                      |
| NAMESPACE     | VARCHAR2 (30) | NOT NULL | Component namespace                                                                                                                                                       |
| BACKPORT_TYPE | VARCHAR2 (30) | NOT NULL | Type of backported bug fix<br>The value of this columns is always <code>DICTIONARY</code> , which indicates that the bug fix changed the data dictionary of the database. |

| Column        | Datatype      | NULL     | Description                                               |
|---------------|---------------|----------|-----------------------------------------------------------|
| BACKPORT_TIME | TIMESTAMP (6) | NOT NULL | Date and time at which the backported bug fix was applied |

## 6.319 DBA\_REGISTRY\_HIERARCHY

DBA\_REGISTRY\_HIERARCHY displays information about the components loaded into the database, grouped by owner and organized in the component hierarchy.

| Column       | Datatype        | NULL     | Description                                                                                                                                                                                                                                                      |
|--------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAMESPACE    | VARCHAR2 (30)   | NOT NULL | Component namespace                                                                                                                                                                                                                                              |
| COMP_ID      | VARCHAR2 (4000) |          | Component identifier                                                                                                                                                                                                                                             |
| VERSION      | VARCHAR2 (30)   |          | Component version loaded                                                                                                                                                                                                                                         |
| VERSION_FULL | VARCHAR2 (30)   |          | Component full version                                                                                                                                                                                                                                           |
| STATUS       | VARCHAR2 (11)   |          | Component status: <ul style="list-style-type: none"> <li>• INVALID</li> <li>• VALID</li> <li>• LOADING</li> <li>• LOADED</li> <li>• UPGRADING</li> <li>• UPGRADED</li> <li>• DOWNGRADING</li> <li>• DOWNGRADED</li> <li>• REMOVING</li> <li>• REMOVED</li> </ul> |
| MODIFIED     | VARCHAR2 (20)   |          | Time when the component was last modified                                                                                                                                                                                                                        |

## 6.320 DBA\_REGISTRY\_HISTORY

DBA\_REGISTRY\_HISTORY provides information about upgrades, downgrades, and critical patch updates that have been performed on the database.

| Column        | Datatype       | NULL | Description                                                    |
|---------------|----------------|------|----------------------------------------------------------------|
| ACTION_TIME   | TIMESTAMP (6)  |      | The time the upgrade, downgrade, or patch action was completed |
| ACTION        | VARCHAR2 (30)  |      | The specific action (for example, UPGRADE or DOWNGRADE)        |
| NAMESPACE     | VARCHAR2 (30)  |      | The namespace of the components affected (for example, SERVER) |
| VERSION       | VARCHAR2 (30)  |      | The version number of the server (for example, 10.2.0.1.0)     |
| ID            | NUMBER         |      | Bundle ID                                                      |
| COMMENTS      | VARCHAR2 (255) |      | Additional comments about the action taken                     |
| BUNDLE_SERIES | VARCHAR2 (30)  |      | If a bundle patch, the series (for example, PSU or DBBP)       |

## 6.321 DBA\_REGISTRY\_LOG

DBA\_REGISTRY\_LOG displays operating information about components loaded into the database.

| Column    | Datatype        | NULL | Description          |
|-----------|-----------------|------|----------------------|
| OPTIME    | VARCHAR2 (20)   |      | Operation time       |
| NAMESPACE | VARCHAR2 (30)   |      | Component namespace  |
| COMP_ID   | VARCHAR2 (30)   |      | Component identifier |
| OPERATION | VARCHAR2 (11)   |      | Operation name       |
| MESSAGE   | VARCHAR2 (1000) |      | Message              |

## 6.322 DBA\_REGISTRY\_SCHEMAS

DBA\_REGISTRY\_SCHEMAS lists the primary and ancillary schemas included in the component registry. The ancillary schemas that are listed in this view are the same schemas that would be included in the OTHER\_SCHEMAS column of the DBA\_REGISTRY view.

| Column    | Datatype       | NULL | Description                                      |
|-----------|----------------|------|--------------------------------------------------|
| NAMESPACE | VARCHAR2 (30)  |      | Component namespace                              |
| COMP_ID   | VARCHAR2 (30)  |      | Component identifier                             |
| SCHEMA    | VARCHAR2 (128) |      | User that contains the objects for the component |

## 6.323 DBA\_REGISTRY\_SQLPATCH

DBA\_REGISTRY\_SQLPATCH contains information about the SQL patches that have been installed in the database.

A SQL patch is a patch that contains SQL scripts which need to be run after OPatch completes. DBA\_REGISTRY\_SQLPATCH is updated by the datapatch utility. Each row contains information about an installation attempt (apply or roll back) for a given patch.

| Column     | Datatype | NULL     | Description                                                                                                                                              |
|------------|----------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTALL_ID | NUMBER   | NOT NULL | Unique numeric identifier for this datapatch session. All patches installed in the same invocation of datapatch will have the same value for INSTALL_ID. |
| PATCH_ID   | NUMBER   | NOT NULL | ID associated with the patch                                                                                                                             |
| PATCH_UID  | NUMBER   | NOT NULL | UPI (Universal Patch ID) associated with the patch                                                                                                       |

| Column                   | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                   |
|--------------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATCH_TYPE               | VARCHAR2 (10)  | NOT NULL | Type of the patch. Possible values: <ul style="list-style-type: none"> <li>• INTERIM: Interim patch</li> <li>• RU: Release Update</li> <li>• RUI: Release Update Increment</li> <li>• RUR: Release Update Revision</li> <li>• CU: Cumulative Update</li> </ul>                                                |
| ACTION                   | VARCHAR2 (15)  | NOT NULL | APPLY or ROLLBACK                                                                                                                                                                                                                                                                                             |
| STATUS                   | VARCHAR2 (25)  | NOT NULL | Possible values: <ul style="list-style-type: none"> <li>• SUCCESS: Patch application has completed with no errors</li> <li>• WITH ERRORS: Patch application finished with errors</li> </ul>                                                                                                                   |
| ACTION_TIME              | TIMESTAMP (6)  | NOT NULL | Timestamp when the install was performed                                                                                                                                                                                                                                                                      |
| DESCRIPTION              | VARCHAR2 (100) |          | Description of this patch from OPatch metadata                                                                                                                                                                                                                                                                |
| LOGFILE                  | VARCHAR2 (500) | NOT NULL | Location of the logfile for this apply or rollback attempt                                                                                                                                                                                                                                                    |
| RU_LOGFILE               | VARCHAR2 (500) |          | Logfile location for RU specific commands                                                                                                                                                                                                                                                                     |
| FLAGS                    | VARCHAR2 (10)  |          | One or more of the following: <ul style="list-style-type: none"> <li>• J: Patch is a JVM patch</li> <li>• M: Patch installation was merged with another patch</li> <li>• N: Patch requires normal mode</li> <li>• R: Patch installation has been retried</li> <li>• U: Patch requires upgrade mode</li> </ul> |
| PATCH_DESCRIPTOR         | XMLTYPE        |          | Contents of the XML descriptor for the patch                                                                                                                                                                                                                                                                  |
| PATCH_DIRECTORY          | BLOB           |          | Contents of the patch directory under ORACLE_HOME/sqlpatch                                                                                                                                                                                                                                                    |
| SOURCE_VERSION           | VARCHAR2 (15)  |          | 5 digit version (for example, 18.3.2.0.0) for the version on which the patch was applied                                                                                                                                                                                                                      |
| SOURCE_BUILD_DESCRIPTION | VARCHAR2 (80)  |          | Build description (for example, Release_Update or Release_Update_Revision) for the version on which the patch was applied                                                                                                                                                                                     |
| SOURCE_BUILD_TIMESTAMP   | TIMESTAMP (6)  |          | Build timestamp for the version on which the patch was applied                                                                                                                                                                                                                                                |
| TARGET_VERSION           | VARCHAR2 (15)  |          | 5 digit version (for example, 18.4.0.0.0) for the version to be installed                                                                                                                                                                                                                                     |
| TARGET_BUILD_DESCRIPTION | VARCHAR2 (80)  |          | Build description (for example, Release_Update or Release_Update_Revision) for the version to be installed                                                                                                                                                                                                    |
| TARGET_BUILD_TIMESTAMP   | TIMESTAMP (6)  |          | Build timestamp for the version to be installed                                                                                                                                                                                                                                                               |

## 6.324 DBA\_REPAIR\_TABLE

DBA\_REPAIR\_TABLE describes any corruptions found by the DBMS\_REPAIR.CHECK\_OBJECT procedure.

This information is used by the DBMS\_REPAIR.FIX\_CORRUPT\_BLOCKS procedure on execution. To create this view, first run the DBMS\_REPAIR.ADMIN\_TABLES procedure. To populate the resulting repair table for an object, run the DBMS\_REPAIR.CHECK\_OBJECT procedure on the object.

 **Note:**

The table created by the DBMS\_REPAIR.ADMIN\_TABLES procedure is called REPAIR\_TABLE by default. If you specify a different name, this view will have the name you specify, preceded by "DBA\_REPAIR\_".

| Column              | Datatype        | NULL     | Description                                                                                  |
|---------------------|-----------------|----------|----------------------------------------------------------------------------------------------|
| OBJECT_ID           | NUMBER          | NOT NULL | Dictionary object number of the object with the corruption                                   |
| TABLESPACE_ID       | NUMBER          | NOT NULL | Tablespace number of the corrupt object                                                      |
| RELATIVE_FILE_ID    | NUMBER)         | NOT NULL | Relative file number of the corrupt object                                                   |
| BLOCK_ID            | NUMBER          | NOT NULL | Block number of the corruption                                                               |
| CORRUPT_TYPE        | NUMBER          | NOT NULL | Type of corruption encountered                                                               |
| SCHEMA_NAME         | VARCHAR2 (128)  | NOT NULL | Schema of the corrupt object                                                                 |
| OBJECT_NAME         | VARCHAR2 (128)  | NOT NULL | Name of the corrupt object                                                                   |
| BASEOBJECT_NAME     | VARCHAR2 (128)  | NULL     | If the object is an index, the name of its base table                                        |
| PARTITION_NAME      | VARCHAR2 (128)  | NULL     | Partition or subpartition name, if applicable                                                |
| CORRUPT_DESCRIPTION | VARCHAR2 (2000) | NULL     | Description of corruption                                                                    |
| REPAIR_DESCRIPTION  | VARCHAR2 (200)  | NULL     | Description of repair action                                                                 |
| MARKED_CORRUPT      | VARCHAR2 (10)   | NOT NULL | Whether the block is marked corrupt (TRUE   FALSE)                                           |
| CHECK_TIMESTAMP     | DATE            | NOT NULL | Date and time when this row was inserted into the repair table                               |
| FIX_TIMESTAMP       | DATE            | NULL     | Date and time when the block was modified by the FIX_CORRUPT_BLOCKS procedure, if applicable |
| REFORMAT_TIMESTAMP  | DATE            | NULL     | Reserved for future use                                                                      |

## 6.325 DBA\_REPL\_DBNAME\_MAPPING

DBA\_REPL\_DBNAME\_MAPPING provides details about the database name mapping in replication. Its columns are the same as those in ALL\_REPL\_DBNAME\_MAPPING.

**See Also:**

["ALL\\_REPL\\_DBNAME\\_MAPPING"](#)

## 6.326 DBA\_REPLICATION\_PROCESS\_EVENTS

DBA\_REPLICATION\_PROCESS\_EVENTS provides information about the replication processes events in the database. Its columns are the same as those in ALL\_REPLICATION\_PROCESS\_EVENTS.

**See Also:**

["ALL\\_REPLICATION\\_PROCESS\\_EVENTS"](#)

## 6.327 DBA\_RESOURCE\_INCARNATIONS

DBA\_RESOURCE\_INCARNATIONS lists all resource incarnations that are running or eligible for HA status notification.

| Column         | Datatype                        | NULL     | Description                                   |
|----------------|---------------------------------|----------|-----------------------------------------------|
| RESOURCE_TYPE  | VARCHAR2 (30)                   | NOT NULL | Type of resource                              |
| RESOURCE_NAME  | VARCHAR2 (256)                  |          | Name of resource                              |
| DB_UNIQUE_NAME | VARCHAR2 (30)                   | NOT NULL | Database unique name                          |
| DB_DOMAIN      | VARCHAR2 (128)                  | NOT NULL | Database domain                               |
| INSTANCE_NAME  | VARCHAR2 (30)                   | NOT NULL | Name of instance at which resource is located |
| HOST_NAME      | VARCHAR2 (512)                  |          | Name of host at which resource is located     |
| STARTUP_TIME   | TIMESTAMP (9) WITH<br>TIME ZONE |          | Resource startup date and time                |

## 6.328 DBA\_RESUMABLE

DBA\_RESUMABLE displays all resumable statements executed in the system.

### Related View

USER\_RESUMABLE displays the resumable statements executed by the current user. This view does not display the USER\_ID column.

| Column            | Datatype        | NULL | Description                                                                                                                                                                |
|-------------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER_ID           | NUMBER          |      | User ID Number of the Resumable Statement Owner                                                                                                                            |
| SESSION_ID        | NUMBER          |      | Session Identifier of the Resumable Statement                                                                                                                              |
| INSTANCE_ID       | NUMBER          |      | Instance Number of the Resumable Statement                                                                                                                                 |
| COORD_INSTANCE_ID | NUMBER          |      | Instance Number on which the Parallel Coordinator is Running                                                                                                               |
| COORD_SESSION_ID  | NUMBER          |      | Session Identifier of the Parallel Coordinator                                                                                                                             |
| STATUS            | VARCHAR2 (9)    |      | Status of the resumable statement: <ul style="list-style-type: none"> <li>• RUNNING</li> <li>• SUSPENDED</li> <li>• TIMEOUT</li> <li>• ERROR</li> <li>• ABORTED</li> </ul> |
| TIMEOUT           | NUMBER          |      | Timeout of the resumable statement                                                                                                                                         |
| START_TIME        | VARCHAR2 (20)   |      | Start time of the resumable statement                                                                                                                                      |
| SUSPEND_TIME      | VARCHAR2 (20)   |      | Last time the resumable statement was suspended (initialized to NULL)                                                                                                      |
| RESUME_TIME       | VARCHAR2 (20)   |      | Last time the suspended resumable statement was resumed (initialized to NULL)                                                                                              |
| NAME              | VARCHAR2 (4000) |      | Name given in the resumable clause of the resumable statement                                                                                                              |
| SQL_TEXT          | VARCHAR2 (1000) |      | Resumable statement, selected from the V\$SQL view                                                                                                                         |
| ERROR_NUMBER      | NUMBER          |      | Error code of the last correctable error. When STATUS is set to RUNNING, its value will be 0.                                                                              |
| ERROR_PARAMETER1  | VARCHAR2 (80)   |      | First parameter for the error message (NULL if no error)                                                                                                                   |
| ERROR_PARAMETER2  | VARCHAR2 (80)   |      | Second parameter for the error message (NULL if no error)                                                                                                                  |
| ERROR_PARAMETER3  | VARCHAR2 (80)   |      | Third parameter for the error message (NULL if no error)                                                                                                                   |
| ERROR_PARAMETER4  | VARCHAR2 (80)   |      | Forth parameter for the error message (NULL if no error)                                                                                                                   |
| ERROR_PARAMETERS5 | VARCHAR2 (80)   |      | Fifth parameter for the error message (NULL if no error)                                                                                                                   |
| ERROR_MSG         | VARCHAR2 (4000) |      | Error message corresponding to ERROR_NUMBER. It will be NULL when ERROR_NUMBER is 0.                                                                                       |

## 6.329 DBA\_REWRITE\_EQUIVALENCES

DBA\_REWRITE\_EQUIVALENCES describes all rewrite equivalences in the database. Its columns are the same as those in ALL\_REWRITE\_EQUIVALENCES.

**See Also:**["ALL\\_REWRITE\\_EQUIVALENCES"](#)

## 6.330 DBA\_RGROUP

DBA\_RGROUP displays all refresh groups.

| Column               | Datatype       | NULL     | Description                                                                                                                |
|----------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------|
| REFGROUP             | NUMBER         |          | Internal identifier of the refresh group                                                                                   |
| OWNER                | VARCHAR2 (128) | NOT NULL | Owner of the object in the refresh group                                                                                   |
| NAME                 | VARCHAR2 (128) | NOT NULL | Name of the object in the refresh group                                                                                    |
| IMPLICIT_DESTROY     | VARCHAR2 (1)   |          | Indicates whether the refresh group is destroyed when its last item is removed (Y) or not (N)                              |
| PUSH_DEFERRED_RPC    | VARCHAR2 (1)   |          | Indicates whether changes are pushed from the snapshot to the master before refresh (Y) or not (N)                         |
| REFRESH_AFTER_ERRORS | VARCHAR2 (1)   |          | Indicates whether to proceed with refresh despite errors when pushing deferred RPCs (Y) or not (N)                         |
| ROLLBACK_SEG         | VARCHAR2 (128) |          | Name of the rollback segment to use while refreshing                                                                       |
| JOB                  | NUMBER         | NOT NULL | Identifier of the job used to refresh the group automatically                                                              |
| PURGE_OPTION         | NUMBER (38)    |          | Method for purging the transaction queue after each push. 1 indicates quick purge option; 2 indicates precise purge option |
| PARALLELISM          | NUMBER (38)    |          | Level of parallelism for transaction propagation                                                                           |
| HEAP_SIZE            | NUMBER (38)    |          | Size of the heap                                                                                                           |
| JOB_NAME             | VARCHAR2 (128) |          | The name of the job used to automatically refresh the group                                                                |

## 6.331 DBA\_ROLE\_PRIVS

DBA\_ROLE\_PRIVS describes the roles granted to all users and roles in the database.

### Related View

USER\_ROLE\_PRIVS describes the roles granted to the current user.

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                  |
|-----------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE         | VARCHAR2 (128) |      | Name of the user or role receiving the grant                                                                                                                                                                                                 |
| GRANTED_ROLE    | VARCHAR2 (128) |      | Granted role name                                                                                                                                                                                                                            |
| ADMIN_OPTION    | VARCHAR2 (3)   |      | Indicates whether the grant was with the ADMIN OPTION (YES) or not (NO)                                                                                                                                                                      |
| DELEGATE_OPTION | VARCHAR2 (3)   |      | Indicates whether the grant was with the DELEGATE OPTION (YES) or not (NO)                                                                                                                                                                   |
| DEFAULT_ROLE    | VARCHAR2 (3)   |      | Indicates whether the role is designated as a DEFAULT ROLE for the user (YES) or not (NO)                                                                                                                                                    |
| COMMON          | VARCHAR2 (3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the role was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the role was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED       | VARCHAR2 (3)   |      | Indicates whether the role grant was inherited from another container (YES) or not (NO)                                                                                                                                                      |

## 6.332 DBA\_ROLES

DBA\_ROLES describes all roles in the database.

| Column            | Datatype       | NULL     | Description                                                          |
|-------------------|----------------|----------|----------------------------------------------------------------------|
| ROLE              | VARCHAR2 (128) | NOT NULL | Name of the role                                                     |
| ROLE_ID           | NUMBER         | NOT NULL | ID number of the role                                                |
| PASSWORD_REQUIRED | VARCHAR2 (8)   |          | This column is deprecated in favor of the AUTHENTICATION_TYPE column |

| Column              | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTHENTICATION_TYPE | VARCHAR2 (11)   |      | Indicates the authentication mechanism for the role: <ul style="list-style-type: none"> <li>NONE - CREATE ROLE <i>role1</i>;</li> <li>EXTERNAL - CREATE ROLE <i>role2</i> IDENTIFIED EXTERNALLY;</li> <li>GLOBAL - CREATE ROLE <i>role3</i> IDENTIFIED GLOBALLY;</li> <li>APPLICATION - CREATE ROLE <i>role4</i> IDENTIFIED USING <i>schema.package</i>;</li> <li>PASSWORD - CREATE ROLE <i>role5</i> IDENTIFIED BY <i>role5</i>;</li> </ul> |
| COMMON              | VARCHAR2 (3)    |      | Indicates whether a given role is common. Possible values: <ul style="list-style-type: none"> <li>YES if the role is common</li> <li>NO if the role is local (not common)</li> </ul>                                                                                                                                                                                                                                                         |
| ORACLE_MAINTAINED   | VARCHAR2 (1)    |      | Denotes whether the role was created, and is maintained, by Oracle-supplied scripts (such as catalog.sql or catproc.sql). A role for which this column has the value Y must not be changed in any way except by running an Oracle-supplied script.                                                                                                                                                                                           |
| INHERITED           | VARCHAR2 (3)    |      | Indicates whether the role was inherited from another container (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                            |
| IMPLICIT            | VARCHAR2 (3)    |      | Indicates whether the role is a common role created by an implicit application (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                             |
| EXTERNAL_NAME       | VARCHAR2 (4000) |      | For a global role, the external name refers to the DN of a group from a directory service that is mapped to the global role. This is not applicable to a local role.                                                                                                                                                                                                                                                                         |

## 6.333 DBA\_ROLLBACK\_SEGS

DBA\_ROLLBACK\_SEGS describes rollback segments.

| Column          | Datatype      | NULL     | Description                                                                                          |
|-----------------|---------------|----------|------------------------------------------------------------------------------------------------------|
| SEGMENT_NAME    | VARCHAR2 (30) | NOT NULL | Name of the rollback segment                                                                         |
| OWNER           | VARCHAR2 (6)  |          | Owner of the rollback segment: <ul style="list-style-type: none"> <li>PUBLIC</li> <li>SYS</li> </ul> |
| TABLESPACE_NAME | VARCHAR2 (30) | NOT NULL | Name of the tablespace containing the rollback segment                                               |
| SEGMENT_ID      | NUMBER        | NOT NULL | ID number of the rollback segment                                                                    |
| FILE_ID         | NUMBER        | NOT NULL | Absolute file number of the data file containing the segment header                                  |
| BLOCK_ID        | NUMBER        | NOT NULL | ID number of the block containing the segment header                                                 |
| INITIAL_EXTENT  | NUMBER        |          | Initial extent size in bytes                                                                         |
| NEXT_EXTENT     | NUMBER        |          | Secondary extent size in bytes                                                                       |
| MIN_EXTENTS     | NUMBER        | NOT NULL | Minimum number of extents                                                                            |
| MAX_EXTENTS     | NUMBER        | NOT NULL | Maximum number of extent                                                                             |
| PCT_INCREASE    | NUMBER        |          | Percent increase for extent size                                                                     |

| Column       | Datatype      | NULL     | Description                                                                                                                                                                       |
|--------------|---------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS       | VARCHAR2 (16) |          | Rollback segment status: <ul style="list-style-type: none"> <li>• OFFLINE</li> <li>• ONLINE</li> <li>• NEEDS RECOVERY</li> <li>• PARTLY AVAILABLE</li> <li>• UNDEFINED</li> </ul> |
| INSTANCE_NUM | VARCHAR2 (40) |          | Rollback segment owning Oracle Real Application Clusters instance number                                                                                                          |
| RELATIVE_FNO | NUMBER        | NOT NULL | Relative file number of the segment header                                                                                                                                        |

## 6.334 DBA\_ROLLING\_DATABASES

DBA\_ROLLING\_DATABASES lists all the databases eligible for configuration with rolling operations.

| Column          | Datatype       | NULL | Description                                                                                 |
|-----------------|----------------|------|---------------------------------------------------------------------------------------------|
| RDBID           | NUMBER         |      | Rolling operation database identifier                                                       |
| DBID            | NUMBER         |      | Oracle database identifier                                                                  |
| DBUN            | VARCHAR2 (128) |      | Database unique name                                                                        |
| ROLE            | VARCHAR2 (8)   |      | Database role                                                                               |
| OPEN_MODE       | VARCHAR2 (15)  |      | Open mode information                                                                       |
| PARTICIPANT     | VARCHAR2 (3)   |      | Indicates whether the database is participating in the rolling operation (YES) or not (NO)  |
| VERSION         | VARCHAR2 (128) |      | RDBMS version number                                                                        |
| ENGINE_STATUS   | VARCHAR2 (14)  |      | Running status of the MRP-recovery or LSP-apply process                                     |
| RAC             | VARCHAR2 (3)   |      | Indicates whether the database is an Oracle Real Application Clusters (Oracle RAC) database |
| UPDATE_PROGRESS | VARCHAR2 (11)  |      | Upgrade status of the system catalog                                                        |
| PROD_RSCN       | VARCHAR (40)   |      | Resetlogs SCN at which redo is currently being produced                                     |
| PROD_RID        | VARCHAR (40)   |      | Resetlogs ID at which redo is currently being produced                                      |
| PROD_SCN        | VARCHAR (40)   |      | Last SCN at which redo was produced                                                         |
| REDO_SOURCE     | VARCHAR2 (128) |      | Database unique name of the producer of redo being consumed                                 |
| CONS_RSCN       | VARCHAR (40)   |      | Resetlogs SCN at which redo is currently being consumed                                     |
| CONS_RID        | VARCHAR (40)   |      | Resetlogs ID at which redo is currently being consumed                                      |
| CONS_SCN        | VARCHAR (40)   |      | Last SCN at which redo was consumed                                                         |
| UPDATE_TIME     | TIMESTAMP (6)  |      | Time of the last record update                                                              |

## 6.335 DBA\_ROLLING\_EVENTS

DBA\_ROLLING\_EVENTS lists all the events reported from the DBMS\_ROLLING PL/SQL package.

| Column     | Datatype       | NULL | Description                                    |
|------------|----------------|------|------------------------------------------------|
| EVENTID    | NUMBER         |      | Event identifier which identifies event order  |
| EVENT_TIME | TIMESTAMP (6)  |      | Time associated with the event                 |
| TYPE       | VARCHAR2 (7)   |      | Type of event: INFO, NOTICE, WARNING, or ERROR |
| MESSAGE    | VARCHAR2 (256) |      | Text describing the event details              |
| STATUS     | NUMBER         |      | Status code associated with an event           |
| INSTID     | NUMBER         |      | Instruction ID associated with an event        |
| REVISION   | NUMBER         |      | Plan revision number associated with an event  |

**See Also:**

## 6.336 DBA\_ROLLING\_PARAMETERS

DBA\_ROLLING\_PARAMETERS lists the available parameters of the DBMS\_ROLLING PL/SQL package.

| Column      | Datatype       | NULL | Description                                      |
|-------------|----------------|------|--------------------------------------------------|
| SCOPE       | VARCHAR2 (128) |      | Database unique name associated with a parameter |
| TYPE        | VARCHAR2 (7)   |      | Type of parameter                                |
| NAME        | VARCHAR2 (32)  |      | Name of the parameter                            |
| DESCRIPTION | VARCHAR2 (256) |      | Description of the parameter                     |
| CURVAL      | VARCHAR2 (256) |      | Current value of the parameter                   |
| LSTVAL      | VARCHAR2 (256) |      | Prior value of the parameter                     |
| DEFVAL      | VARCHAR2 (256) |      | Default value of the parameter                   |
| MINVAL      | NUMBER         |      | Minimum value of the parameter                   |
| MAXVAL      | NUMBER         |      | Maximum value of the parameter                   |

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

## 6.337 DBA\_ROLLING\_PLAN

`DBA_ROLLING_PLAN` displays the instructions which constitute the active upgrade plan.

Each row in `DBA_ROLLING_PLAN` identifies a specific instruction scheduled to execute at a specific database. Instructions are created as a result of successful calls to the `DBMS_ROLLING.BUILD_PLAN` procedure.

During execution, groups of instructions are scheduled in batches to execute at remote databases. Groups of instructions are guaranteed to complete in `BATCHID` order.

| Column      | Datatype       | NULL | Description                                                         |
|-------------|----------------|------|---------------------------------------------------------------------|
| REVISION    | NUMBER         |      | Plan revision number associated with an instruction                 |
| BATCHID     | NUMBER         |      | Identifier for a batch of instructions which are requested together |
| INSTID      | NUMBER         |      | Identifier for a single instruction                                 |
| SOURCE      | VARCHAR2 (128) |      | Database unique name where an instruction executes                  |
| TARGET      | VARCHAR2 (128) |      | The site where a given instruction will execute                     |
| PHASE       | VARCHAR2 (14)  |      | rolling operation phase in which an instruction executes            |
| STATUS      | VARCHAR2 (7)   |      | Scheduling status of the instruction                                |
| PROGRESS    | VARCHAR2 (10)  |      | Execution progress of the instruction                               |
| DESCRIPTION | VARCHAR2 (256) |      | Description of the instruction                                      |
| EXEC_STATUS | NUMBER         |      | Status code returned from instruction execution                     |
| EXEC_INFO   | VARCHAR2 (256) |      | Supplemental information obtained during instruction execution      |
| EXEC_TIME   | TIMESTAMP (6)  |      | Time of instruction execution                                       |
| FINISH_TIME | TIMESTAMP (6)  |      | Time of instruction completion                                      |

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_ROLLING` package

## 6.338 DBA\_ROLLING\_STATISTICS

DBA\_ROLLING\_STATISTICS provides a list of rolling operation statistics.

| Column      | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | VARCHAR2 (256) |      | Name of the statistic. Possible values: <ul style="list-style-type: none"><li>• DBMS_ROLLING execution time</li><li>• logical to primary switchover finish time</li><li>• primary services offline for</li><li>• primary to logical switchover start time</li><li>• rolling upgrade finish time</li><li>• rolling upgrade start time</li><li>• time for former primary to fully recover upgrade redo</li><li>• time for former primary to start upgrade redo recovery</li><li>• total time former primary in physical role</li><li>• transient logical creation finish time</li><li>• transient logical creation start time</li><li>• transient logical protection finish time</li><li>• transient logical protection start time</li><li>• user upgrade time</li></ul> |
| VALUE       | VARCHAR2 (256) |      | Value of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| UPDATE_TIME | TIMESTAMP (6)  |      | Time of last update                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### See Also:

## 6.339 DBA\_ROLLING\_STATUS

DBA\_ROLLING\_STATUS displays the overall status of the rolling operation.

| Column                 | Datatype      | NULL | Description                                                           |
|------------------------|---------------|------|-----------------------------------------------------------------------|
| REVISION               | NUMBER        |      | Revision number of the current upgrade plan                           |
| STATUS                 | VARCHAR2 (12) |      | Readiness of the facility to begin or resume the rolling operation    |
| PHASE                  | VARCHAR2 (14) |      | Current phase of the plan                                             |
| NEXT_INSTRUCTION       | NUMBER        |      | Instruction ID of the next pending instruction                        |
| REMAINING_INSTRUCTIONS | NUMBER        |      | Number of remaining instructions to execute in the plan               |
| COORDINATOR_INSTANCE   | NUMBER        |      | Instance number from which the rolling operation is being coordinated |
| COORDINATOR_PID        | NUMBER        |      | Process PID in which the rolling operation is being coordinated       |

| Column                  | Datatype       | NULL | Description                                                                |
|-------------------------|----------------|------|----------------------------------------------------------------------------|
| ORIGINAL_PRIMARY        | VARCHAR2 (128) |      | Database unique name of the original primary                               |
| FUTURE_PRIMARY          | VARCHAR2 (128) |      | Database unique name of the future primary                                 |
| TOTAL_DATABASES         | NUMBER         |      | Number of total databases eligible to participate in the rolling operation |
| PARTICIPATING_DATABASES | NUMBER         |      | Number of databases configured to participate in the rolling operation     |
| INIT_TIME               | TIMESTAMP (6)  |      | Time of the last call to DBMS_ROLLING.INIT_PLAN                            |
| BUILD_TIME              | TIMESTAMP (6)  |      | Time of the last call to DBMS_ROLLING.BUILD                                |
| START_TIME              | TIMESTAMP (6)  |      | Time of the last call to DBMS_ROLLING.START_UPGRADE                        |
| SWITCH_TIME             | TIMESTAMP (6)  |      | Time of the last call to DBMS_ROLLING.SWITCHOVER                           |
| FINISH_TIME             | TIMESTAMP (6)  |      | Time of the last call to DBMS_ROLLING.FINISH                               |

## 6.340 DBA\_ROLLING\_SUPPORT\_MODE

DBA\_ROLLING\_SUPPORT\_MODE displays information about whether tables in the database are supported for rolling upgrades performed using the DBMS\_ROLLING package.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER        | VARCHAR2 (128) |      | Table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TABLE_NAME   | VARCHAR2 (128) |      | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SUPPORT_MODE | VARCHAR2 (11)  |      | Indicates whether the table is supported<br>Possible values: <ul style="list-style-type: none"><li>• SUPPORTED - The table is fully supported</li><li>• INTERNAL - The table is not supported because it contains data that should not be replicated. Such tables include mapping tables for index-organized tables, storage tables for nested tables, materialized view logs, secondary objects associated with domain indexes, and temporary tables.</li><li>• UNSUPPORTED - The table is not supported because it contains a data type that is not supported or uses a feature that is not supported</li></ul> |

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPLANATION | VARCHAR2 (4000) |      | Reason why the table is not fully supported<br>This column is populated only when both of the following conditions are met: <ul style="list-style-type: none"> <li>The value of the <code>COMPATIBLE</code> initialization parameter is 20.0 or higher</li> <li>The value of the <code>SUPPORT_MODE</code> column is <code>INTERNAL</code> or <code>UNSUPPORTED</code></li> </ul> |

## 6.341 DBA\_ROLLING\_UNSUPPORTED

`DBA_ROLLING_UNSUPPORTED` displays the schemas, tables, and columns in those tables that contain unsupported data types for a rolling upgrade operation for a logical standby database using the `DBMS_ROLLING` PL/SQL package.

Use this view before you perform a rolling upgrade using `DBMS_ROLLING` to determine what is unsupported.

The data pertains to the container in which the view is queried.

| Column      | Datatype        | NULL | Description                                                                                                                                                                                                                                                             |
|-------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128)  |      | Schema name of the unsupported column                                                                                                                                                                                                                                   |
| TABLE_NAME  | VARCHAR2 (128)  |      | Name of the table that the unsupported column belongs to                                                                                                                                                                                                                |
| COLUMN_NAME | VARCHAR2 (128)  |      | Name of the unsupported column                                                                                                                                                                                                                                          |
| ATTRIBUTES  | VARCHAR2 (4000) |      | When the value of the <code>COMPATIBLE</code> initialization parameter is 20.0 or higher, this column displays the reason the table is unsupported.<br>Otherwise, this column displays the reason the table is unsupported only if the reason is not a data type issue. |
| DATA_TYPE   | VARCHAR2 (106)  |      | Data type of the unsupported column                                                                                                                                                                                                                                     |

### Note:

When the value of the `COMPATIBLE` initialization parameter is 20.0 or higher, this view displays all columns in unsupported tables. Otherwise, this view displays only the unsupported columns in unsupported tables.

### Note:

A rolling upgrade using `DBMS_ROLLING` supports more object types than a manual rolling upgrade using transient logical standby databases

 **See Also:**

## 6.342 DBA\_RSRC\_CATEGORIES

`DBA_RSRC_CATEGORIES` displays all resource consumer group categories.

| Column    | Datatype        | NULL | Description                                                                                                                     |
|-----------|-----------------|------|---------------------------------------------------------------------------------------------------------------------------------|
| NAME      | VARCHAR2 (128)  |      | Name of the consumer group category                                                                                             |
| COMMENTS  | VARCHAR2 (2000) |      | Text comment on the consumer group category                                                                                     |
| STATUS    | VARCHAR2 (128)  |      | Indicates whether the consumer group category is part of the pending area ( <code>PENDING</code> ) or not ( <code>NULL</code> ) |
| MANDATORY | VARCHAR2 (3)    |      | Indicates whether the consumer group category is mandatory ( <code>YES</code> ) or not ( <code>NO</code> )                      |

## 6.343 DBA\_RSRC\_CONSUMER\_GROUP\_PRIVS

`DBA_RSRC_CONSUMER_GROUP_PRIVS` displays information about all resource consumer groups and the users and roles assigned to them.

The grant referred to in this view and the related view is the grant of the `SWITCH_CONSUMER_GROUP` object privilege, which is granted using the `DBMS_RESOURCE_MANAGER_PRIVS` package. This privilege is not granted through the `GRANT SQL` statement.

### Related View

`USER_RSRC_CONSUMER_GROUP_PRIVS` displays information about the resource consumer groups to which the current user is assigned. This view does not display the `GRANTEE` column.

| Column        | Datatype       | NULL     | Description                                                                                                                             |
|---------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE       | VARCHAR2 (128) | NOT NULL | User or role receiving the grant                                                                                                        |
| GRANTED_GROUP | VARCHAR2 (128) |          | Granted consumer group name                                                                                                             |
| GRANT_OPTION  | VARCHAR2 (3)   |          | Indicates whether the grant was with the <code>GRANT</code> option ( <code>YES</code> ) or not ( <code>NO</code> )                      |
| INITIAL_GROUP | VARCHAR2 (3)   |          | Indicates whether the consumer group is designated as the default for this user or role ( <code>YES</code> ) or not ( <code>NO</code> ) |

 **See Also:**

- ["USER\\_RSRC\\_CONSUMER\\_GROUP\\_PRIVS"](#)

## 6.344 DBA\_RSRC\_CONSUMER\_GROUPS

DBA\_RSRC\_CONSUMER\_GROUPS displays information about all resource consumer groups in the database.

| Column            | Datatype        | NULL     | Description                                                                              |
|-------------------|-----------------|----------|------------------------------------------------------------------------------------------|
| CONSUMER_GROUP_ID | NUMBER          | NOT NULL | ID of the consumer group                                                                 |
| CONSUMER_GROUP    | VARCHAR2 (128)  |          | Name of the consumer group                                                               |
| CPU_METHOD        | VARCHAR2 (128)  |          | CPU resource allocation method for the consumer group                                    |
| MGMT_METHOD       | VARCHAR2 (128)  |          | Resource allocation method for the consumer group                                        |
| INTERNAL_USE      | VARCHAR2 (3)    |          | Indicates whether the consumer group is for internal use only (YES) or not (NO)          |
| COMMENTS          | VARCHAR2 (2000) |          | Text comment on the consumer group                                                       |
| CATEGORY          | VARCHAR2 (128)  |          | Category of the consumer group                                                           |
| STATUS            | VARCHAR2 (128)  |          | Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL) |
| MANDATORY         | VARCHAR2 (3)    |          | Indicates whether the consumer group is mandatory (YES) or not (NO)                      |

## 6.345 DBA\_RSRC\_GROUP\_MAPPINGS

DBA\_RSRC\_GROUP\_MAPPINGS displays the mapping between session attributes and consumer groups in the database.

| Column         | Datatype       | NULL | Description                                                                              |
|----------------|----------------|------|------------------------------------------------------------------------------------------|
| ATTRIBUTE      | VARCHAR2 (128) |      | Session attribute to match                                                               |
| VALUE          | VARCHAR2 (128) |      | Attribute value                                                                          |
| CONSUMER_GROUP | VARCHAR2 (128) |      | Target consumer group name                                                               |
| STATUS         | VARCHAR2 (128) |      | Indicates whether the consumer group is part of the pending area (PENDING) or not (NULL) |

## 6.346 DBA\_RSRC\_IO\_CALIBRATE

DBA\_RSRC\_IO\_CALIBRATE displays I/O calibration results for the latest calibration run.

| Column             | Datatype        | NULL | Description                                                                                  |
|--------------------|-----------------|------|----------------------------------------------------------------------------------------------|
| START_TIME         | TIMESTAMP (6)   |      | Start time of the most recent I/O calibration                                                |
| END_TIME           | TIMESTAMP (6)   |      | End time of the most recent I/O calibration                                                  |
| MAX_IOPS           | NUMBER          |      | Maximum number of data block read requests that can be sustained per second                  |
| MAX_MBPS           | NUMBER          |      | Maximum megabytes per second of maximum-sized read requests that can be sustained            |
| MAX_PMBPS          | NUMBER          |      | Maximum megabytes per second of large I/O requests that can be sustained by a single process |
| LATENCY            | NUMBER          |      | Latency for data block read requests                                                         |
| NUM_PHYSICAL_DISKS | NUMBER          |      | Number of physical disks in the storage subsystem (as specified by the user)                 |
| ADDITIONAL_INFO    | VARCHAR2 (1024) |      | Additional information about the most recent calibration run                                 |

## 6.347 DBA\_RSRC\_MANAGER\_SYSTEM\_PRIVS

DBA\_RSRC\_MANAGER\_SYSTEM\_PRIVS displays information about all the users and roles that have been granted the ADMINISTER\_RESOURCE\_MANAGER system privilege, which is granted using the DBMS\_RESOURCE\_MANAGER\_PRIVS package.

This privilege is not granted through the GRANT SQL statement.

### Related View

USER\_RSRC\_MANAGER\_SYSTEM\_PRIVS displays information about the users who are granted system privileges for the DBMS\_RESOURCE\_MANAGER package. This view does not display the GRANTEE column.

| Column       | Datatype       | NULL     | Description                                                             |
|--------------|----------------|----------|-------------------------------------------------------------------------|
| GRANTEE      | VARCHAR2 (128) | NOT NULL | User or role receiving the grant                                        |
| PRIVILEGE    | VARCHAR2 (40)  | NOT NULL | Name of the system privilege                                            |
| ADMIN_OPTION | VARCHAR2 (3)   |          | Indicates whether the grant was with the ADMIN option (YES) or not (NO) |

## 6.348 DBA\_RSRC\_MAPPING\_PRIORITY

DBA\_RSRC\_MAPPING\_PRIORITY displays information about all consumer group mapping attribute priorities.

| Column    | Datatype       | NULL | Description                                                                                                            |
|-----------|----------------|------|------------------------------------------------------------------------------------------------------------------------|
| ATTRIBUTE | VARCHAR2 (128) |      | Session attribute                                                                                                      |
| PRIORITY  | NUMBER         |      | Priority (1 is the highest)                                                                                            |
| STATUS    | VARCHAR2 (128) |      | Indicates whether the consumer group is part of the pending area ( <code>PENDING</code> ) or not ( <code>NULL</code> ) |

## 6.349 DBA\_RSRC\_PLAN\_DIRECTIVES

DBA\_RSRC\_PLAN\_DIRECTIVES displays information about all resource plan directives in the database.

| Column              | Datatype       | NULL | Description                                                                                                                   |
|---------------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------|
| PLAN                | VARCHAR2 (128) |      | Name of the plan to which the directive belongs                                                                               |
| GROUP_OR_SUBPLAN    | VARCHAR2 (128) |      | Name of the consumer group or subplan referred to                                                                             |
| TYPE                | VARCHAR2 (14)  |      | Indicates whether GROUP_OR_SUBPLAN refers to a consumer group ( <code>CONSUMER_GROUP</code> ) or a plan ( <code>PLAN</code> ) |
| CPU_P1              | NUMBER         |      | This column is deprecated. Use the MGMT_P1 column instead.                                                                    |
| CPU_P2              | NUMBER         |      | This column is deprecated. Use the MGMT_P2 column instead.                                                                    |
| CPU_P3              | NUMBER         |      | This column is deprecated. Use the MGMT_P3 column instead.                                                                    |
| CPU_P4              | NUMBER         |      | This column is deprecated. Use the MGMT_P4 column instead.                                                                    |
| CPU_P5              | NUMBER         |      | This column is deprecated. Use the MGMT_P5 column instead.                                                                    |
| CPU_P6              | NUMBER         |      | This column is deprecated. Use the MGMT_P6 column instead.                                                                    |
| CPU_P7              | NUMBER         |      | This column is deprecated. Use the MGMT_P7 column instead.                                                                    |
| CPU_P8              | NUMBER         |      | This column is deprecated. Use the MGMT_P8 column instead.                                                                    |
| MGMT_P1             | NUMBER         |      | Resource allocation at level 1. For share-based plans, indicates the number of shares.                                        |
| MGMT_P2             | NUMBER         |      | Resource allocation at level 2.                                                                                               |
| MGMT_P3             | NUMBER         |      | Resource allocation at level 3.                                                                                               |
| MGMT_P4             | NUMBER         |      | Resource allocation at level 4.                                                                                               |
| MGMT_P5             | NUMBER         |      | Resource allocation at level 5.                                                                                               |
| MGMT_P6             | NUMBER         |      | Resource allocation at level 6.                                                                                               |
| MGMT_P7             | NUMBER         |      | Resource allocation at level 7.                                                                                               |
| MGMT_P8             | NUMBER         |      | Resource allocation at level 8.                                                                                               |
| ACTIVE_SESS_POOL_P1 | NUMBER         |      | Maximum number of calls this consumer group can run concurrently                                                              |
| QUEUEING_P1         | NUMBER         |      | Timeout in seconds for waits in the Active Session Limit queue                                                                |

| Column                     | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARALLEL_TARGET_PERCENTAGE | NUMBER         |      | This column is deprecated. Use the <code>PARALLEL_SERVER_LIMIT</code> column instead.                                                                                                                                                                                                                                                                                                                                                                                           |
| PARALLEL_DEGREE_LIMIT_P1   | NUMBER         |      | Sessions in this consumer group are limited to this maximum degree of parallelism for all parallel operations                                                                                                                                                                                                                                                                                                                                                                   |
| SWITCH_GROUP               | VARCHAR2 (128) |      | Group to switch to once the switch time is reached                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SWITCH_FOR_CALL            | VARCHAR2 (5)   |      | Indicates whether to switch back to the initial consumer group once the top call has completed (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                            |
| SWITCH_TIME                | NUMBER         |      | Amount of run time (in seconds) within a group before the session is automatically switched. As with other switch directives, if <code>SWITCH_FOR_CALL</code> is TRUE, the run time is accumulated from the start of a call. Otherwise, the run time is accumulated for the length of the session.                                                                                                                                                                              |
| SWITCH_IO_MEGABYTES        | NUMBER         |      | The maximum megabytes of I/O within a group that will trigger the action specified by <code>SWITCH_GROUP</code> . As with other switch directives, if <code>SWITCH_FOR_CALL</code> is TRUE, the maximum megabytes of I/O is accumulated from the start of a call. Otherwise, the maximum megabytes of I/O is accumulated for the length of the session.                                                                                                                         |
| SWITCH_IO_REQS             | NUMBER         |      | The maximum I/O requests within a group that will trigger the action specified by <code>SWITCH_GROUP</code> . As with other switch directives, if <code>SWITCH_FOR_CALL</code> is TRUE, the maximum I/O requests is accumulated from the start of a call. Otherwise, the maximum I/O requests is accumulated for the length of the session.                                                                                                                                     |
| SWITCH_ESTIMATE            | VARCHAR2 (5)   |      | Indicates whether estimated execution time should be used for switch criteria (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                             |
| MAX_EST_EXEC_TIME          | NUMBER         |      | Maximum estimated execution time                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| UNDO_POOL                  | NUMBER         |      | Undo pool size for the consumer group                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MAX_IDLE_TIME              | NUMBER         |      | Maximum idle time for the session                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_IDLE_BLOCKER_TIME      | NUMBER         |      | Maximum idle time for the session when blocking other sessions                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAX_UTILIZATION_LIMIT      | NUMBER         |      | This column is deprecated. Use <code>UTILIZATION_LIMIT</code> instead.                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARALLEL_QUEUE_TIMEOUT     | NUMBER         |      | Time (in seconds) that a query can remain in the parallel statement queue for the consumer group before it is removed from the queue.<br><br>The <code>PQ_TIMEOUT_ACTION</code> directive in a Resource Manager plan can be used in conjunction with the <code>PARALLEL_QUEUE_TIMEOUT</code> directive to either cancel or run the removed query. If the <code>PQ_TIMEOUT_ACTION</code> directive is not specified, the default behavior is to cancel the query with ORA-07454. |
| SWITCH_TIME_IN_CALL        | NUMBER         |      | This column is deprecated. Specify the time in the <code>SWITCH_TIME</code> directive and set <code>SWITCH_FOR_CALL</code> to TRUE.                                                                                                                                                                                                                                                                                                                                             |

| Column                 | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|-----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SWITCH_IO_LOGICAL      | NUMBER          |      | The number of logical I/Os that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the number of logical I/Os is accumulated from the start of a call. Otherwise, the number of logical I/Os is accumulated for the length of the session.                                                                                                                                                                                                                                                                                                                            |
| SWITCH_ELAPSED_TIME    | NUMBER          |      | The elapsed time that will trigger the action specified by SWITCH_GROUP. As with other switch directives, if SWITCH_FOR_CALL is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.                                                                                                                                                                                                                                                                                                                                                          |
| PARALLEL_SERVER_LIMIT  | NUMBER          |      | Maximum percentage of the parallel target used before queuing subsequent parallel queries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| UTILIZATION_LIMIT      | NUMBER          |      | Maximum resource utilization allowed, expressed in percentage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARALLEL_STMT_CRITICAL | VARCHAR2 (12)   |      | Indicates whether parallel statements from this consumer group are eligible for queuing in the parallel statement queue: <ul style="list-style-type: none"> <li>• BYPASS_QUEUE - Parallel statements in this consumer group are critical and should never be queued.</li> <li>• QUEUE - All parallel statements in this consumer group, irrespective of the PARALLEL_DEGREE_POLICY initialization parameter value, are eligible for being queued.</li> <li>• FALSE - Certain parallel statements are eligible for queuing, depending on the PARALLEL_DEGREE_POLICY initialization parameter value. This is the default.</li> </ul> |
| SESSION_PGA_LIMIT      | NUMBER          |      | The maximum amount of untunable PGA in MB that sessions in this consumer group can allocate before being terminated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PQ_TIMEOUT_ACTION      | VARCHAR2 (6)    |      | Indicates the action to be taken on a parallel query in the parallel queue when its queue time exceeds the limit set by the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT directive: <ul style="list-style-type: none"> <li>• CANCEL - The statement terminates with error ORA-07454</li> <li>• RUN - The statement runs immediately, and may get downgraded if parallel servers are unavailable</li> </ul>                                                                                                                                                                                                                       |
| COMMENTS               | VARCHAR2 (2000) |      | Text comment on the plan directive                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STATUS                 | VARCHAR2 (128)  |      | Indicates whether the plan directive is part of the pending area (PENDING) or not (NULL). <p><b>Note:</b> PDB resource plans must be single-level, they cannot contain subplans, and they must have 8 or fewer consumer groups. If a resource plan is imported into a PDB and it violates any of these PDB requirements, then the import will automatically convert the resource plan to a compliant version. The original, unmodified resource plan will be stored with a STATUS of LEGACY.</p>                                                                                                                                   |

| Column    | Datatype     | NULL | Description                                                                                             |
|-----------|--------------|------|---------------------------------------------------------------------------------------------------------|
| MANDATORY | VARCHAR2 (3) |      | Indicates whether the plan directive is mandatory (YES) or not (NO). Mandatory plans cannot be deleted. |

## 6.350 DBA\_RSRC\_PLANS

DBA\_RSRC\_PLANS displays information about all resource plans in the database.

For a list of currently active plans, see "[V\\$RSRC\\_PLAN](#)".

| Column                    | Datatype        | NULL     | Description                                                                                   |
|---------------------------|-----------------|----------|-----------------------------------------------------------------------------------------------|
| PLAN_ID                   | NUMBER          | NOT NULL | ID number of the resource plan                                                                |
| PLAN                      | VARCHAR2 (128)  |          | Name of the resource plan                                                                     |
| NUM_PLAN_DIRECTIVES       | NUMBER          |          | Number of plan directives for the plan                                                        |
| CPU_METHOD                | VARCHAR2 (128)  |          | CPU resource allocation method for the plan                                                   |
| MGMT_METHOD               | VARCHAR2 (128)  |          | Resource allocation method for the plan                                                       |
| ACTIVE_SESS_POOL_MTH      | VARCHAR2 (128)  |          | Active session pool resource allocation method for the plan                                   |
| PARALLEL_DEGREE_LIMIT_MTH | VARCHAR2 (128)  |          | Parallel degree limit resource allocation method for the plan                                 |
| QUEUING_MTH               | VARCHAR2 (128)  |          | Queuing resource allocation method for the plan                                               |
| SUB_PLAN                  | VARCHAR2 (3)    |          | Indicates whether the plan is a subplan (YES) or not (NO)                                     |
| COMMENTS                  | VARCHAR2 (2000) |          | Text comment on the plan                                                                      |
| STATUS                    | VARCHAR2 (128)  |          | Indicates whether the plan is part of the pending area (PENDING) or not (NULL)                |
| MANDATORY                 | VARCHAR2 (3)    |          | Indicates whether the plan is mandatory (YES) or not (NO). Mandatory plans cannot be deleted. |

- *Oracle Database PL/SQL Packages and Types Reference* for more information on creating resource plans with the `DBMS_RESOURCE_MANAGER` package

## 6.351 DBA\_RULE\_SET\_RULES

`DBA_RULE_SET_RULES` describes the rules in all rule sets in the database. Its columns are the same as those in `ALL_RULE_SET_RULES`.

 **See Also:**

["ALL\\_RULE\\_SET\\_RULES"](#)

## 6.352 DBA\_RULE\_SETS

`DBA_RULE_SETS` describes all rule sets in the database. Its columns are the same as those in `ALL_RULE_SETS`.

 **See Also:**

["ALL\\_RULE\\_SETS"](#)

## 6.353 DBA\_RULES

`DBA_RULES` describes all rules in the database. Its columns are the same as those in `ALL_RULES`.

 **See Also:**

["ALL\\_RULES"](#)

## 6.354 DBA\_SAGA\_BROKERS

DBA\_SAGA\_BROKERS displays all saga brokers in the database.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_SAGA\\_BROKERS"](#)

## 6.355 DBA\_SAGA\_DETAILS

DBA\_SAGA\_DETAILS displays details for all sagas in the database. Its columns are the same as those in ALL\_SAGA\_DETAILS.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_SAGA\\_DETAILS"](#)

## 6.356 DBA\_SAGA\_ERRORS

DBA\_SAGA\_ERRORS describes errors generated by all sagas in the database. Its columns are the same as those in ALL\_SAGA\_ERRORS.

This view displays sagas that were either initiated in the current PDB or joined by participants in the current PDB.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_SAGA\_ERRORS"

## 6.357 DBA\_SAGA\_FINALIZATION

DBA\_SAGA\_FINALIZATION displays information about pending finalization actions for all sagas in the database. Its columns are the same as those in ALL\_SAGA\_FINALIZATION.

This view displays one row for each unique reservable table updated as part of a participant transaction for sagas that were either initiated in the current PDB or joined by participants in the current PDB.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_SAGA\_FINALIZATION"

## 6.358 DBA\_SAGA\_PARTICIPANT\_SET

DBA\_SAGA\_PARTICIPANT\_SET displays information about saga participants for all sagas in the database. Its columns are the same as those in ALL\_SAGA\_PARTICIPANT\_SET.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"ALL\_SAGA\_PARTICIPANT\_SET"

## 6.359 DBA\_SAGA\_PARTICIPANTS

DBA\_SAGA\_PARTICIPANTS describes all saga participants in the database. Its columns are the same as those in ALL\_SAGA\_PARTICIPANTS.

This view displays sagas that were either initiated in the current PDB or joined by participants or coordinators in the current PDB.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"[ALL\\_SAGA\\_PARTICIPANTS](#)"

## 6.360 DBA\_SAGA\_PENDING

DBA\_SAGA\_PENDING describes all pending sagas in the database. Its columns are the same as those in ALL\_SAGA\_PENDING.

This view displays sagas that were initiated in the current PDB.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"[ALL\\_SAGA\\_PENDING](#)"

## 6.361 DBA\_SAGAS

DBA\_SAGAS describes all active sagas in the database. Its columns are the same as those in ALL\_SAGAS.

This view displays sagas that were either initiated in the current PDB or joined by participants in the current PDB.

**Note:**

This view displays active sagas. Completed sagas are displayed in the [DBA\\_HIST\\_SAGAS](#) view.

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

["ALL\\_SAGAS"](#)

## 6.362 DBA\_SCHEDULER\_CHAIN\_RULES

DBA\_SCHEDULER\_CHAIN\_RULES displays information about the rules for all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAIN\_RULES.

**See Also:**

["ALL\\_SCHEDULER\\_CHAIN\\_RULES"](#)

## 6.363 DBA\_SCHEDULER\_CHAIN\_STEPS

DBA\_SCHEDULER\_CHAIN\_STEPS displays information about the defined steps of all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAIN\_STEPS.

**See Also:**

["ALL\\_SCHEDULER\\_CHAIN\\_STEPS"](#)

## 6.364 DBA\_SCHEDULER\_CHAINS

DBA\_SCHEDULER\_CHAINS displays information about all chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_CHAINS.

**See Also:**

["ALL\\_SCHEDULER\\_CHAINS"](#)

## 6.365 DBA\_SCHEDULER\_CREDENTIALS

DBA\_SCHEDULER\_CREDENTIALS displays information about all credentials in the database. Its columns are the same as those in ALL\_SCHEDULER\_CREDENTIALS.

### Note:

This view is deprecated in favor of the DBA\_CREDENTIALS view. Oracle recommends that you use DBA\_CREDENTIALS instead. DBA\_SCHEDULER\_CREDENTIALS is retained for backward compatibility only.

### See Also:

- ["DBA\\_CREDENTIALS"](#)
- ["ALL\\_SCHEDULER\\_CREDENTIALS"](#)

## 6.366 DBA\_SCHEDULER\_DB\_DESTS

DBA\_SCHEDULER\_DB\_DESTS displays information about all destination objects in the database pointing to remote databases. Its columns are the same as those in ALL\_SCHEDULER\_DB\_DESTS.

### See Also:

- ["ALL\\_SCHEDULER\\_DB\\_DESTS"](#)

## 6.367 DBA\_SCHEDULER\_DESTS

DBA\_SCHEDULER\_DESTS displays information about all destination objects for jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_DESTS.

### See Also:

- ["ALL\\_SCHEDULER\\_DESTS"](#)

## 6.368 DBA\_SCHEDULER\_EXTERNAL\_DESTS

DBA\_SCHEDULER\_EXTERNAL\_DESTS displays information about all destination objects in the database pointing to remote agents. Its columns are the same as those in ALL\_SCHEDULER\_EXTERNAL\_DESTS.

### See Also:

"ALL\_SCHEDULER\_EXTERNAL\_DESTS"

## 6.369 DBA\_SCHEDULER\_FILE\_WATCHERS

DBA\_SCHEDULER\_FILE\_WATCHERS displays information about all scheduler file watch requests in the database. Its columns are the same as those in ALL\_SCHEDULER\_FILE\_WATCHERS.

### See Also:

"ALL\_SCHEDULER\_FILE\_WATCHERS"

## 6.370 DBA\_SCHEDULER\_GLOBAL\_ATTRIBUTE

DBA\_SCHEDULER\_GLOBAL\_ATTRIBUTE displays the values of all scheduler attributes in the database (for example, DEFAULT\_TIMEZONE and CURRENT\_OPEN\_WINDOW). Its columns are the same as those in ALL\_SCHEDULER\_GLOBAL\_ATTRIBUTE.

### See Also:

"ALL\_SCHEDULER\_GLOBAL\_ATTRIBUTE"

## 6.371 DBA\_SCHEDULER\_GROUP\_MEMBERS

DBA\_SCHEDULER\_GROUP\_MEMBERS displays information about the members of all Scheduler object groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_GROUP\_MEMBERS.

### See Also:

"ALL\_SCHEDULER\_GROUP\_MEMBERS"

## 6.372 DBA\_SCHEDULER\_GROUPS

DBA\_SCHEDULER\_GROUPS displays information about all Scheduler object groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_GROUPS.

### See Also:

"ALL\_SCHEDULER\_GROUPS"

## 6.373 DBA\_SCHEDULER\_IN\_MEMORY\_TRACE

DBA\_SCHEDULER\_IN\_MEMORY\_TRACE displays scheduler in-memory trace information generated by all user processes in the database.

| Column      | Datatype       | NULL | Description                                                           |
|-------------|----------------|------|-----------------------------------------------------------------------|
| USER#       | NUMBER         |      | Oracle identifier of the user generating scheduler trace              |
| USERNAME    | VARCHAR2 (128) |      | Name of the user generating scheduler trace                           |
| PROCESSNAME | VARCHAR2 (5)   |      | Name of the process generating scheduler trace                        |
| SPID        | VARCHAR2 (24)  |      | Operating system identifier of the process generating scheduler trace |
| PADDR       | RAW (8)        |      | Address of the process state object generating scheduler trace        |
| TRACE_ST    | CLOB           |      | Scheduler trace generated by the process                              |

### Note:

This view is available starting with Oracle Database 23ai.

## 6.374 DBA\_SCHEDULER\_INCOMPAT\_MEMBER

DBA\_SCHEDULER\_INCOMPAT\_MEMBER displays all Scheduler incompatibility resource objects members in the database. Its columns are the same as those in ALL\_SCHEDULER\_INCOMPAT\_MEMBER.

### See Also:

"ALL\_SCHEDULER\_INCOMPAT\_MEMBER"

## 6.375 DBA\_SCHEDULER\_INCOMPATS

DBA\_SCHEDULER\_INCOMPATS displays all Scheduler incompatibility resource objects in the database. Its columns are the same as those in ALL\_SCHEDULER\_INCOMPATS.

**See Also:**

"ALL\_SCHEDULER\_INCOMPATS"

## 6.376 DBA\_SCHEDULER\_JOB\_ARGS

DBA\_SCHEDULER\_JOB\_ARGS displays information about the arguments of all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_ARGS.

**See Also:**

"ALL\_SCHEDULER\_JOB\_ARGS"

## 6.377 DBA\_SCHEDULER\_JOB\_CLASSES

DBA\_SCHEDULER\_JOB\_CLASSES displays information about all Scheduler job classes in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_CLASSES.

**See Also:**

"ALL\_SCHEDULER\_JOB\_CLASSES"

## 6.378 DBA\_SCHEDULER\_JOB\_DESTS

DBA\_SCHEDULER\_JOB\_DESTS displays information about the state of all jobs in the database at each of their destinations. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_DESTS.

**See Also:**

"ALL\_SCHEDULER\_JOB\_DESTS"

## 6.379 DBA\_SCHEDULER\_JOB\_LOG

DBA\_SCHEDULER\_JOB\_LOG displays log information for all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_LOG.

**See Also:**

"ALL\_SCHEDULER\_JOB\_LOG"

## 6.380 DBA\_SCHEDULER\_JOB\_ROLES

DBA\_SCHEDULER\_JOB\_ROLES displays information about all Scheduler jobs in the database by database role.

| Column         | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|-----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER          | VARCHAR2 (128)  | NOT NULL | Owner of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| JOB_NAME       | VARCHAR2 (128)  | NOT NULL | Name of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| JOB_SUBNAME    | VARCHAR2 (128)  |          | Subname of the Scheduler job (for a job running a chain step)                                                                                                                                                                                                                                                                                                                                                                                                                                |
| JOB_CREATOR    | VARCHAR2 (128)  |          | Creator of the Scheduler job                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATABASE_ROLE  | VARCHAR2 (16)   |          | Name of the database role                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PROGRAM_OWNER  | VARCHAR2 (4000) |          | Owner of the program associated with the job                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PROGRAM_NAME   | VARCHAR2 (4000) |          | Name of the program associated with the job                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| JOB_TYPE       | VARCHAR2 (16)   |          | Inline job action type: <ul style="list-style-type: none"> <li>• PLSQL_BLOCK</li> <li>• STORED_PROCEDURE</li> <li>• EXECUTABLE</li> <li>• CHAIN</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| JOB_ACTION     | VARCHAR2 (4000) |          | Inline job action                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| JOB_CLASS      | VARCHAR2 (128)  |          | Name of the job class associated with the job                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SCHEDULE_OWNER | VARCHAR2 (4000) |          | Owner of the schedule that the job uses (can be a window or a window group)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SCHEDULE_NAME  | VARCHAR2 (4000) |          | Name of the schedule that the job uses (can be a window or a window group)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SCHEDULE_TYPE  | VARCHAR2 (12)   |          | Type of the schedule that the job uses: <ul style="list-style-type: none"> <li>• IMMEDIATE - Start date and repeat interval are NULL</li> <li>• ONCE - Repeat interval is NULL</li> <li>• PLSQL - PL/SQL expression used as schedule</li> <li>• CALENDAR - Oracle calendaring expression used as schedule</li> <li>• EVENT - Event schedule</li> <li>• NAMED - Named schedule</li> <li>• WINDOW - Window used as schedule</li> <li>• WINDOW_GROUP - Window group used as schedule</li> </ul> |

| Column          | Datatype                     | NULL | Description                                                                                                                                                                                                                                                             |
|-----------------|------------------------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START_DATE      | TIMESTAMP (6) WITH TIME ZONE |      | Original scheduled start date of the job (for an inline schedule)                                                                                                                                                                                                       |
| REPEAT_INTERVAL | VARCHAR2 (4000)              |      | Inline schedule PL/SQL expression or calendar string                                                                                                                                                                                                                    |
| END_DATE        | TIMESTAMP (6) WITH TIME ZONE |      | Date after which the job will no longer run (for an inline schedule)                                                                                                                                                                                                    |
| LAST_START_DATE | TIMESTAMP (6) WITH TIME ZONE |      | Last date on which the job ran                                                                                                                                                                                                                                          |
| ENABLED         | VARCHAR2 (5)                 |      | Indicates whether the job is enabled (TRUE) or disabled (FALSE)                                                                                                                                                                                                         |
| STATE           | VARCHAR2 (15)                |      | Current state of the job: <ul style="list-style-type: none"><li>• DISABLED</li><li>• RETRY SCHEDULED</li><li>• SCHEDULED</li><li>• RUNNING</li><li>• COMPLETED</li><li>• BROKEN</li><li>• FAILED</li><li>• REMOTE</li><li>• SUCCEEDED</li><li>• CHAIN_STALLED</li></ul> |
| COMMENTS        | VARCHAR2 (4000)              |      | Comments on the job                                                                                                                                                                                                                                                     |

## 6.381 DBA\_SCHEDULER\_JOB\_RUN\_DETAILS

DBA\_SCHEDULER\_JOB\_RUN\_DETAILS displays log run details for all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOB\_RUN\_DETAILS.

### See Also:

"ALL\_SCHEDULER\_JOB\_RUN\_DETAILS"

## 6.382 DBA\_SCHEDULER\_JOBS

DBA\_SCHEDULER\_JOBS displays information about all Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_JOBS.

### See Also:

"ALL\_SCHEDULER\_JOBS"

## 6.383 DBA\_SCHEDULER\_NOTIFICATIONS

DBA\_SCHEDULER\_NOTIFICATIONS displays information about the E-mail notifications for all jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_NOTIFICATIONS.

**See Also:**

["ALL\\_SCHEDULER\\_NOTIFICATIONS"](#)

## 6.384 DBA\_SCHEDULER\_PROGRAM\_ARGS

DBA\_SCHEDULER\_PROGRAM\_ARGS displays information about the arguments of all Scheduler programs in the database. Its columns are the same as those in ALL\_SCHEDULER\_PROGRAM\_ARGS.

**See Also:**

["ALL\\_SCHEDULER\\_PROGRAM\\_ARGS"](#)

## 6.385 DBA\_SCHEDULER\_PROGRAMS

DBA\_SCHEDULER\_PROGRAMS displays information about all Scheduler programs in the database. Its columns are the same as those in ALL\_SCHEDULER\_PROGRAMS.

**See Also:**

["ALL\\_SCHEDULER\\_PROGRAMS"](#)

## 6.386 DBA\_SCHEDULER\_REMOTE\_DATABASES

DBA\_SCHEDULER\_REMOTE\_DATABASES displays information about all remote databases that have been registered as sources and destinations for remote database jobs. Its columns are the same as those in ALL\_SCHEDULER\_REMOTE\_DATABASES.

**See Also:**

["ALL\\_SCHEDULER\\_REMOTE\\_DATABASES"](#)

## 6.387 DBA\_SCHEDULER\_REMOTE\_JOBSTATE

DBA\_SCHEDULER\_REMOTE\_JOBSTATE displays information about the state of all jobs at remote databases. Its columns are the same as those in ALL\_SCHEDULER\_REMOTE\_JOBSTATE.

**See Also:**

["ALL\\_SCHEDULER\\_REMOTE\\_JOBSTATE"](#)

## 6.388 DBA\_SCHEDULER\_RESOURCES

DBA\_SCHEDULER\_RESOURCES displays all scheduler resource objects in the database. Its columns are the same as those in ALL\_SCHEDULER\_RESOURCES.

**See Also:**

["ALL\\_SCHEDULER\\_RESOURCES"](#)

## 6.389 DBA\_SCHEDULER\_RSC\_CONSTRAINTS

DBA\_SCHEDULER\_RSC\_CONSTRAINTS lists all Oracle Scheduler resource constraint members in the database. Its columns are the same as those in ALL\_SCHEDULER\_RSC\_CONSTRAINTS.

**See Also:**

["ALL\\_SCHEDULER\\_RSC\\_CONSTRAINTS"](#)

## 6.390 DBA\_SCHEDULER\_RUNNING\_CHAINS

DBA\_SCHEDULER\_RUNNING\_CHAINS displays information about the chain steps of all running chains in the database. Its columns are the same as those in ALL\_SCHEDULER\_RUNNING\_CHAINS.

**See Also:**

["ALL\\_SCHEDULER\\_RUNNING\\_CHAINS"](#)

## 6.391 DBA\_SCHEDULER\_RUNNING\_JOBS

DBA\_SCHEDULER\_RUNNING\_JOBS displays information about all running Scheduler jobs in the database. Its columns are the same as those in ALL\_SCHEDULER\_RUNNING\_JOBS.

**See Also:**

"ALL\_SCHEDULER\_RUNNING\_JOBS"

## 6.392 DBA\_SCHEDULER\_SCHEDULES

DBA\_SCHEDULER\_SCHEDULES displays information about all Scheduler schedules in the database. Its columns are the same as those in ALL\_SCHEDULER\_SCHEDULES.

**See Also:**

"ALL\_SCHEDULER\_SCHEDULES"

## 6.393 DBA\_SCHEDULER\_WINDOW\_DETAILS

DBA\_SCHEDULER\_WINDOW\_DETAILS displays log details for all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_DETAILS.

**See Also:**

"ALL\_SCHEDULER\_WINDOW\_DETAILS"

## 6.394 DBA\_SCHEDULER\_WINDOW\_GROUPS

DBA\_SCHEDULER\_WINDOW\_GROUPS displays information about all Scheduler window groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_GROUPS.

**See Also:**

"ALL\_SCHEDULER\_WINDOW\_GROUPS"

## 6.395 DBA\_SCHEDULER\_WINDOW\_LOG

DBA\_SCHEDULER\_WINDOW\_LOG displays log information for all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOW\_LOG.

### See Also:

"ALL\_SCHEDULER\_WINDOW\_LOG"

## 6.396 DBA\_SCHEDULER\_WINDOWS

DBA\_SCHEDULER\_WINDOWS displays information about all Scheduler windows in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINDOWS.

### See Also:

"ALL\_SCHEDULER\_WINDOWS"

## 6.397 DBA\_SCHEDULER\_WINGROUP\_MEMBERS

DBA\_SCHEDULER\_WINGROUP\_MEMBERS displays the members of all Scheduler window groups in the database. Its columns are the same as those in ALL\_SCHEDULER\_WINGROUP\_MEMBERS.

### See Also:

"ALL\_SCHEDULER\_WINGROUP\_MEMBERS"

## 6.398 DBA\_SCHEMA\_PRIVS

DBA\_SCHEMA\_PRIVS describes schema privileges granted to users and roles.

| Column       | Datatype       | NULL | Description                                                             |
|--------------|----------------|------|-------------------------------------------------------------------------|
| GRANTEE      | VARCHAR2 (128) |      | Grantee name, user, or role receiving the grant                         |
| PRIVILEGE    | VARCHAR2 (40)  |      | Schema privilege                                                        |
| SCHEMA       | VARCHAR2 (128) |      | Schema on which the privilege was granted                               |
| ADMIN_OPTION | VARCHAR2 (3)   |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO) |

| Column    | Datatype     | NULL | Description                                                                                                                                                                                                                                               |
|-----------|--------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMON    | VARCHAR2 (3) |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED | VARCHAR2 (3) |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                        |

**Note:**

This view is available starting with Oracle Database 23ai.

**See Also:**

"[USER\\_SCHEMA\\_PRIVS](#)"

## 6.399 DBA\_SEC\_RELEVANT\_COLS

DBA\_SEC\_RELEVANT\_COLS describes the security relevant columns of all security policies in the database. Its columns are the same as those in ALL\_SEC\_RELEVANT\_COLS.

**See Also:**

"[ALL\\_SEC\\_RELEVANT\\_COLS](#)"

## 6.400 DBA\_SECONDARY\_OBJECTS

DBA\_SECONDARY\_OBJECTS provides information about all secondary objects that are associated with domain indexes in the database.

This view is only relevant in the context of domain indexes. Its columns are the same as those in "[ALL\\_SECONDARY\\_OBJECTS](#)".

## 6.401 DBA\_SEGMENTS

DBA\_SEGMENTS describes the storage allocated for all segments in the database.

**Related View**

USER\_SEGMENTS describes the storage allocated for the segments owned by the current user's objects. This view does not display the OWNER, HEADER\_FILE, HEADER\_BLOCK, or RELATIVE\_FNO columns.

| Column          | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) |      | Username of the segment owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SEGMENT_NAME    | VARCHAR2 (128) |      | Name, if any, of the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARTITION_NAME  | VARCHAR2 (128) |      | Object Partition Name (Set to NULL for nonpartitioned objects)                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SEGMENT_TYPE    | VARCHAR2 (18)  |      | Type of segment: <ul style="list-style-type: none"> <li>• NESTED TABLE</li> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• CLUSTER</li> <li>• LOBINDEX</li> <li>• INDEX</li> <li>• INDEX PARTITION</li> <li>• LOBSEGMENT</li> <li>• TABLE SUBPARTITION</li> <li>• INDEX SUBPARTITION</li> <li>• LOB PARTITION</li> <li>• LOB SUBPARTITION</li> <li>• ROLLBACK</li> <li>• TYPE2 UNDO</li> <li>• DEFERRED ROLLBACK</li> <li>• TEMPORARY</li> <li>• CACHE</li> <li>• SPACE HEADER</li> <li>• UNDEFINED</li> </ul> |
| SEGMENT_SUBTYPE | VARCHAR2 (10)  |      | Subtype of LOB segment: SECUREFILE, ASSM, MSSM, and NULL                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TABLESPACE_NAME | VARCHAR2 (30)  |      | Name of the tablespace containing the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HEADER_FILE     | NUMBER         |      | Absolute file number of the data file containing the segment header                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| HEADER_BLOCK    | NUMBER         |      | ID of the block containing the segment header                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BYTES           | NUMBER         |      | Size, in bytes, of the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BLOCKS          | NUMBER         |      | Size, in Oracle blocks, of the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| EXTENTS         | NUMBER         |      | Number of extents allocated to the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INITIAL_EXTENT  | NUMBER         |      | Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.)                                                                                                                                                                                                                                                                                                                            |
| NEXT_EXTENT     | NUMBER         |      | Size in bytes of the next extent to be allocated to the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MIN_EXTENTS     | NUMBER         |      | Minimum number of extents allowed in the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAX_EXTENTS     | NUMBER         |      | Maximum number of extents allowed in the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAX_SIZE        | NUMBER         |      | Maximum number of blocks allowed in the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RETENTION       | VARCHAR2 (7)   |      | Retention option for SECUREFILE segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MINRETENTION    | NUMBER         |      | Minimum retention duration for SECUREFILE segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PCT_INCREASE    | NUMBER         |      | Percent by which to increase the size of the next extent to be allocated                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| FREELISTS       | NUMBER         |      | Number of process freelists allocated to this segment                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Column               | Datatype      | NULL | Description                                                                                                                                                                                                                                               |
|----------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREELIST_GROUPS      | NUMBER        |      | Number of freelist groups allocated to this segment                                                                                                                                                                                                       |
| RELATIVE_FNO         | NUMBER        |      | Relative file number of the segment header                                                                                                                                                                                                                |
| BUFFER_POOL          | VARCHAR2 (7)  |      | Buffer pool to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> </ul>                                                                                                                 |
| FLASH_CACHE          | VARCHAR2 (7)  |      | Database Smart Flash Cache hint to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> Solaris and Oracle Linux functionality only.                                                   |
| CELL_FLASH_CACHE     | VARCHAR2 (7)  |      | Cell flash cache hint to be used for segment blocks: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• NONE</li> </ul> <b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information               |
| INMEMORY             | VARCHAR2 (8)  |      | Indicates whether the In-Memory Column Store (IM column store) is enabled (ENABLED) or disabled (DISABLED) for this segment                                                                                                                               |
| INMEMORY_PRIORITY    | VARCHAR2 (8)  |      | Indicates the priority for In-Memory Column Store (IM column store) population: <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> <li>• NULL</li> </ul>                             |
| INMEMORY_DISTRIBUTE  | VARCHAR2 (15) |      | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>• AUTO</li> <li>• BY ROWID RANGE</li> <li>• BY PARTITION</li> <li>• BY SUBPARTITION</li> </ul>   |
| INMEMORY_DUPLICATE   | VARCHAR2 (13) |      | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> <li>• NO DUPLICATE</li> <li>• DUPLICATE</li> <li>• DUPLICATE ALL</li> </ul>                                                      |
| INMEMORY_COMPRESSION | VARCHAR2 (17) |      | Indicates the compression level for the IM column store: <ul style="list-style-type: none"> <li>• NO MEMCOMPRESS</li> <li>• FOR DML</li> <li>• FOR QUERY [ LOW   HIGH ]</li> <li>• FOR CAPACITY [ LOW   HIGH ]</li> <li>• AUTO</li> <li>• NULL</li> </ul> |

| Column                   | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CELLMEMORY <sup>11</sup> | VARCHAR2 (24) |      | <p>The value for columnar compression in the storage cell flash cache. Possible values:</p> <ul style="list-style-type: none"> <li>ENABLED: Oracle Exadata Storage will decide automatically whether to cache in columnar form</li> <li>DISABLED: Oracle Exadata Storage is prevented from caching in columnar form</li> <li>NO CACHECOMPRESS: Oracle Exadata Storage will cache in HCC format (no recompression)</li> <li>FOR QUERY: Oracle Exadata Storage will recompress and cache in INMEMORY query high format</li> <li>FOR CAPACITY: Oracle Exadata Storage will recompress and cache in INMEMORY capacity low format</li> </ul> |

<sup>11</sup> This column is intended for use with Oracle Exadata

## 6.402 DBA\_SEGMENTS\_OLD

DBA\_SEGMENTS\_OLD lists information about storage allocated for all database segments.

| Column          | Datatype       | NULL | Description                                                                                                                                                                            |
|-----------------|----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128) |      | Username of the segment owner                                                                                                                                                          |
| SEGMENT_NAME    | VARCHAR2 (128) |      | Name, if any, of the segment                                                                                                                                                           |
| PARTITION_NAME  | VARCHAR2 (128) |      | Name of the partition                                                                                                                                                                  |
| SEGMENT_TYPE    | VARCHAR2 (18)  |      | Type of segment: INDEX PARTITION, TABLE PARTITION, TABLE, CLUSTER, INDEX, ROLLBACK, DEFERRED ROLLBACK, TEMPORARY, CACHE, LOBSEGMENT and LOBINDEX                                       |
| TABLESPACE_NAME | VARCHAR2 (30)  |      | Name of the tablespace containing the segment                                                                                                                                          |
| HEADER_FILE     | NUMBER         |      | ID of the file containing the segment header                                                                                                                                           |
| HEADER_BLOCK    | NUMBER         |      | ID of the block containing the segment header                                                                                                                                          |
| BYTES           | NUMBER         |      | Size, in bytes, of the segment                                                                                                                                                         |
| BLOCKS          | NUMBER         |      | Size, in Oracle blocks, of the segment                                                                                                                                                 |
| EXTENTS         | NUMBER         |      | Number of extents allocated to the segment                                                                                                                                             |
| INITIAL_EXTENT  | NUMBER         |      | Size in bytes requested for the initial extent of the segment at create time. (Oracle rounds the extent size to multiples of 5 blocks if the requested size is greater than 5 blocks.) |
| NEXT_EXTENT     | NUMBER         |      | Size in bytes of the next extent to be allocated to the segment                                                                                                                        |
| MIN_EXTENTS     | NUMBER         |      | Minimum number of extents allowed in the segment                                                                                                                                       |

| Column          | Datatype     | NULL | Description                                                              |
|-----------------|--------------|------|--------------------------------------------------------------------------|
| MAX_EXTENTS     | NUMBER       |      | Maximum number of extents allowed in the segment                         |
| PCT_INCREASE    | NUMBER       |      | Percent by which to increase the size of the next extent to be allocated |
| FREELISTS       | NUMBER       |      | Number of process freelists allocated to the segment                     |
| FREELIST_GROUPS | NUMBER       |      | Number of freelist groups allocated to this segment                      |
| RELATIVE_FNO    | NUMBER       |      | Relative file number of the segment header                               |
| BUFFER_POOL     | VARCHAR2 (7) |      | Buffer pool for the object                                               |

## 6.403 DBA\_SENSITIVE\_COLUMN\_TYPES

DBA\_SENSITIVE\_COLUMN\_TYPES describes sensitive column types in the database.

| Column       | Datatype        | NULL | Description                                                                                                                                     |
|--------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME         | VARCHAR2 (128)  |      | The name of the sensitive column type                                                                                                           |
| USER_COMMENT | VARCHAR2 (4000) |      | User comment on the sensitive column type                                                                                                       |
| SOURCE_NAME  | VARCHAR2 (128)  |      | The name of the discovery source for the sensitive column type                                                                                  |
| SOURCE_TYPE  | VARCHAR2 (3)    |      | The type of the discovery source: <ul style="list-style-type: none"> <li>ADM: import from ADM</li> <li>DB: added within the database</li> </ul> |

## 6.404 DBA\_SENSITIVE\_DATA

DBA\_SENSITIVE\_DATA describes the sensitive columns in the database.

| Column         | Datatype        | NULL     | Description                                                        |
|----------------|-----------------|----------|--------------------------------------------------------------------|
| SENSITIVE#     | NUMBER          | NOT NULL | Dictionary ID for the sensitive data                               |
| SCHEMA_NAME    | VARCHAR2 (128)  | NOT NULL | The schema containing the sensitive data                           |
| TABLE_NAME     | VARCHAR2 (128)  | NOT NULL | The table containing the sensitive data                            |
| COLUMN_NAME    | VARCHAR2 (128)  | NOT NULL | The name of the column identified as sensitive                     |
| SENSITIVE_TYPE | VARCHAR2 (128)  |          | The sensitive column type of the data                              |
| SOURCE_NAME    | VARCHAR2 (128)  |          | The name of the discovery source for the sensitive data            |
| USER_COMMENT   | VARCHAR2 (4000) |          | User comment on the sensitive data                                 |
| TS             | TIMESTAMP (6)   |          | The time when the data was identified as sensitive in the database |

## 6.405 DBA\_SEQUENCES

DBA\_SEQUENCES describes all sequences in the database. Its columns are the same as those in ALL\_SEQUENCES.

**See Also:**

"ALL\_SEQUENCES"

## 6.406 DBA\_SERVER\_REGISTRY

DBA\_SERVER\_REGISTRY displays information about all server components in the database that are loaded into the component registry.

| Column        | Datatype        | NULL     | Description                                                                                                                                                                                                                                                      |
|---------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMP_ID       | VARCHAR2 (30)   | NOT NULL | Component identifier                                                                                                                                                                                                                                             |
| COMP_NAME     | VARCHAR2 (255)  |          | Component name                                                                                                                                                                                                                                                   |
| VERSION       | VARCHAR2 (30)   |          | Component version loaded                                                                                                                                                                                                                                         |
| VERSION_FULL  | VARCHAR2 (30)   |          | Component full version                                                                                                                                                                                                                                           |
| STATUS        | VARCHAR2 (11)   |          | Component status: <ul style="list-style-type: none"> <li>• INVALID</li> <li>• VALID</li> <li>• LOADING</li> <li>• LOADED</li> <li>• UPGRADING</li> <li>• UPGRADED</li> <li>• DOWNGRADING</li> <li>• DOWNGRADED</li> <li>• REMOVING</li> <li>• REMOVED</li> </ul> |
| MODIFIED      | VARCHAR2 (20)   |          | Time when the component was last modified                                                                                                                                                                                                                        |
| CONTROL       | VARCHAR2 (128)  | NOT NULL | User that created the component entry                                                                                                                                                                                                                            |
| SCHEMA        | VARCHAR2 (128)  | NOT NULL | User that contains the objects for the component                                                                                                                                                                                                                 |
| PROCEDURE     | VARCHAR2 (61)   |          | Validation procedure                                                                                                                                                                                                                                             |
| STARTUP       | VARCHAR2 (8)    |          | Indicates whether the component requires a startup after the upgrade (REQUIRED) or not                                                                                                                                                                           |
| PARENT_ID     | VARCHAR2 (30)   |          | Parent component identifier                                                                                                                                                                                                                                      |
| OTHER_SCHEMAS | VARCHAR2 (4000) |          | A list of ancillary schema names associated with the component                                                                                                                                                                                                   |

## 6.407 DBA\_SERVICES

DBA\_SERVICES displays all services in the database. The view excludes rows marked for deletion. Its columns are the same as those in ALL\_SERVICES.

**See Also:**

["ALL\\_SERVICES"](#)

## 6.408 DBA\_SODA\_COLLECTIONS

DBA\_SODA\_COLLECTIONS describes all Simple Oracle Document Access (SODA) collections in the database.

### Related View

USER\_SODA\_COLLECTIONS describes the SODA collections owned by the current user. This view does not display the OWNER column.

| Column          | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URI_NAME        | NVARCHAR2(255) | NOT NULL | Collection name                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OWNER           | VARCHAR2(128)  | NOT NULL | Owner of the collection                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OBJECT_TYPE     | VARCHAR2(10)   | NOT NULL | Indicates whether the collection is table-based (TABLE) or view-based (VIEW)                                                                                                                                                                                                                                                                                                                                                            |
| OBJECT_SCHEMA   | VARCHAR2(128)  | NOT NULL | Name of the schema that includes the table or view on which the collection is based                                                                                                                                                                                                                                                                                                                                                     |
| OBJECT_NAME     | VARCHAR2(128)  | NOT NULL | Name of the table or view on which the collection is based                                                                                                                                                                                                                                                                                                                                                                              |
| CREATED_ON      | TIMESTAMP(6)   | NOT NULL | Collection creation time                                                                                                                                                                                                                                                                                                                                                                                                                |
| CREATE_MODE     | VARCHAR2(10)   | NOT NULL | Creation mode. Possible values: <ul style="list-style-type: none"><li>DDL: A new table was created at collection creation time</li><li>MAP: The collection was created by mapping a preexisting table or view</li></ul> <b>Note:</b> For view-based collections, the value of this column is always MAP. New views are not created for view-based collections. A view-based collection is always created by mapping a preexisting view. |
| JSON_DESCRIPTOR | VARCHAR2(4000) | NOT NULL | Collection metadata, expressed in JavaScript Object Notation (JSON)                                                                                                                                                                                                                                                                                                                                                                     |

**See Also:**

["USER\\_SODA\\_COLLECTIONS"](#)

## 6.409 DBA\_SOURCE

DBA\_SOURCE describes the text source of all stored objects in the database. Its columns are the same as those in ALL\_SOURCE.

**See Also:**

["ALL\\_SOURCE"](#)

## 6.410 DBA\_SOURCE\_AE

DBA\_SOURCE\_AE describes the text source of all stored objects (across all editions) in the database. Its columns are the same as those in ALL\_SOURCE\_AE.

**See Also:**

["ALL\\_SOURCE\\_AE"](#)

## 6.411 DBA\_SQL\_ERROR\_MITIGATIONS

DBA\_SQL\_ERROR\_MITIGATIONS describes automatic error mitigations for SQL statements.

| Column         | Datatype                     | NULL | Description                                                                                                 |
|----------------|------------------------------|------|-------------------------------------------------------------------------------------------------------------|
| SQL_ID         | VARCHAR2 (13)                |      | Identifier for the relevant SQL statement                                                                   |
| SIGNATURE      | NUMBER                       |      | Unique SQL identifier generated from normalized SQL text                                                    |
| FORCE_MATCHING | VARCHAR2 (3)                 |      | Indicates whether the signature is force matching (YES) or exact matching (NO)                              |
| SQL_TEXT       | CLOB                         |      | SQL text                                                                                                    |
| INCIDENT_ID    | NUMBER                       |      | ID for the incident associated with the error mitigation                                                    |
| PROBLEM_KEY    | VARCHAR2 (64)                |      | Description of the problem                                                                                  |
| PROBLEM_TYPE   | VARCHAR2 (17)                |      | Problem type: <ul style="list-style-type: none"><li>• COMPILATION ERROR</li><li>• EXECUTION ERROR</li></ul> |
| CREATED        | TIMESTAMP (6) WITH TIME ZONE |      | Date and time at which the first automatic error mitigation was created on this SQL                         |
| START_TIME     | TIMESTAMP (6) WITH TIME ZONE |      | Start date and time of automatic error mitigation                                                           |
| END_TIME       | TIMESTAMP (6) WITH TIME ZONE |      | End date and time of automatic error mitigation                                                             |
| NOTES          | CLOB                         |      | Mitigation notes                                                                                            |

| Column             | Datatype                     | NULL | Description                                                                                              |
|--------------------|------------------------------|------|----------------------------------------------------------------------------------------------------------|
| MITIGATION_TYPE    | VARCHAR2 (14)                |      | Mitigation type: <ul style="list-style-type: none"> <li>• ALTERNATE PLAN</li> <li>• SQL PATCH</li> </ul> |
| MITIGATION_NAME    | VARCHAR2 (128)               |      | Mitigation name                                                                                          |
| MITIGATION_DETAILS | CLOB                         |      | Mitigation details                                                                                       |
| STATUS             | CHAR (7)                     |      | Mitigation status: <ul style="list-style-type: none"> <li>• SUCCESS</li> <li>• FAILURE</li> </ul>        |
| LAST_VERIFIED      | TIMESTAMP (6) WITH TIME ZONE |      | Date and time at which the auto patch was last verified                                                  |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.412 DBA\_SQL\_FIREWALL\_ALLOW\_LISTS

DBA\_SQL\_FIREWALL\_ALLOW\_LISTS displays information about SQL Firewall allow-lists.

| Column            | Datatype                     | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME          | VARCHAR2 (128)               |          | Name of the target user                                                                                                                                                                                                                                                                                                                                                                |
| GENERATED_ON      | TIMESTAMP (6) WITH TIME ZONE | NOT NULL | Date and time of allow-list generation                                                                                                                                                                                                                                                                                                                                                 |
| STATUS            | VARCHAR2 (8)                 |          | Allow-list status (ENABLED or DISABLED)                                                                                                                                                                                                                                                                                                                                                |
| STATUS_UPDATED_ON | TIMESTAMP (6) WITH TIME ZONE | NOT NULL | Date and time of the most recent allow-list status change                                                                                                                                                                                                                                                                                                                              |
| TOP_LEVEL_ONLY    | VARCHAR2 (14)                |          | Indicates whether the allow-list should be enforced on only top-level SQL commands, that is, SQL commands issued directly from the user (Y) or on all SQL commands, including top-level SQL commands and SQL commands from PL/SQL units (N)                                                                                                                                            |
| ENFORCE           | VARCHAR2 (15)                |          | Option of the allow-list enforcement: <ul style="list-style-type: none"> <li>• ENFORCE_CONTEXT - Allowed contexts will be checked and enforced during database connection</li> <li>• ENFORCE_SQL - Allowed SQLs will be checked and enforced for every SQL statement execution</li> <li>• ENFORCE_ALL - Both allowed contexts and allowed SQLs will be checked and enforced</li> </ul> |
| BLOCK             | VARCHAR2 (14)                |          | If the allow-list is enabled, indicates whether the allow-list is enabled in blocking mode (Y) or non-blocking mode (N)                                                                                                                                                                                                                                                                |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.413 DBA\_SQL\_FIREWALL\_ALLOWED\_IP\_ADDR

DBA\_SQL\_FIREWALL\_ALLOWED\_IP\_ADDR lists the IP addresses that SQL Firewall target users are allowed to use to connect to the database.

| Column     | Datatype       | NULL     | Description               |
|------------|----------------|----------|---------------------------|
| USERNAME   | VARCHAR2 (128) |          | Name of the target user   |
| IP_ADDRESS | VARCHAR2 (128) | NOT NULL | Allowed client IP address |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.414 DBA\_SQL\_FIREWALL\_ALLOWED\_OS\_PROG

DBA\_SQL\_FIREWALL\_ALLOWED\_OS\_PROG lists the OS programs that SQL Firewall target users are allowed to use to connect to the database.

| Column     | Datatype       | NULL     | Description             |
|------------|----------------|----------|-------------------------|
| USERNAME   | VARCHAR2 (128) |          | Name of the target user |
| OS_PROGRAM | VARCHAR2 (128) | NOT NULL | Allowed OS program name |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.415 DBA\_SQL\_FIREWALL\_ALLOWED\_OS\_USER

DBA\_SQL\_FIREWALL\_ALLOWED\_OS\_USER lists the OS user names that SQL Firewall target users are allowed to use to connect to the database.

| Column   | Datatype       | NULL     | Description             |
|----------|----------------|----------|-------------------------|
| USERNAME | VARCHAR2 (128) |          | Name of the target user |
| OS_USER  | VARCHAR2 (128) | NOT NULL | Allowed OS user name    |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.416 DBA\_SQL\_FIREWALL\_ALLOWED\_SQL

DBA\_SQL\_FIREWALL\_ALLOWED\_SQL displays information about allowed SQL for SQL Firewall allow-lists.

| Column           | Datatype        | NULL     | Description                                                                                                                                                                           |
|------------------|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME         | VARCHAR2 (128)  |          | Name of the target user                                                                                                                                                               |
| ALLOWED_SQL_ID   | NUMBER          | NOT NULL | Unique ID of allowed SQL entry for the target user                                                                                                                                    |
| SQL_SIGNATURE    | VARCHAR2 (64)   | NOT NULL | Allowed SQL signature                                                                                                                                                                 |
| SQL_TEXT         | VARCHAR2 (4000) |          | SQL text (up to 1000 characters)<br>To view the full SQL text, query the SQL_TEXT column of the DBA_SQL_FIREWALL_SQL_LOGS view.                                                       |
| ACCESSED_OBJECTS | VARCHAR2 (4000) |          | List of accessed objects (up to 1000 characters)<br>To view the full list of accessed objects, query the ACCESSED_OBJECTS column of the DBA_SQL_FIREWALL_SQL_LOGS view.               |
| CURRENT_USER     | VARCHAR2 (128)  |          | Name of the user who invoked the SQL command                                                                                                                                          |
| TOP_LEVEL        | VARCHAR2 (9)    |          | Indicates whether the allowed SQL entry is a top-level SQL command, that is, a SQL command issued directly from the user (Y) or a SQL command from a PL/SQL unit (N)                  |
| VERSION          | NUMBER          | NOT NULL | Version number for the allow-list when the allowed SQL was added<br>You can use this value to determine whether specific allowed SQLs were added to the allow-list in the same batch. |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.418 DBA\_SQL\_FIREWALL\_CAPTURES

`DBA_SQL_FIREWALL_CAPTURES` displays information about SQL Firewall captures.

| Column         | Datatype       | NULL | Description                                                                                                                                                                                                                     |
|----------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME       | VARCHAR2 (128) |      | Name of the target user                                                                                                                                                                                                         |
| TOP_LEVEL_ONLY | VARCHAR2 (14)  |      | Indicates whether SQL Firewall should capture only top-level SQL commands, that is, SQL commands issued directly from the user (Y) or all SQL commands, including top-level SQL commands and SQL commands from PL/SQL units (N) |
| STATUS         | VARCHAR2 (8)   |      | Capture status (ENABLED or DISABLED)                                                                                                                                                                                            |

| Column          | Datatype                     | NULL | Description                                         |
|-----------------|------------------------------|------|-----------------------------------------------------|
| LAST_STARTED_ON | TIMESTAMP (6) WITH TIME ZONE |      | Date and time at which the capture was last started |
| LAST_STOPPED_ON | TIMESTAMP (6) WITH TIME ZONE |      | Date and time at which the capture was last stopped |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.419 DBA\_SQL\_FIREWALL\_SESSION\_LOGS

DBA\_SQL\_FIREWALL\_SESSION\_LOGS displays SQL Firewall session logs.

| Column         | Datatype                     | NULL     | Description                                                      |
|----------------|------------------------------|----------|------------------------------------------------------------------|
| SESSION_ID     | NUMBER                       | NOT NULL | SQL Firewall session ID                                          |
| USERNAME       | VARCHAR2 (128)               |          | Name of the target user                                          |
| LOGIN_TIME     | TIMESTAMP (6) WITH TIME ZONE |          | Date and time at which the target user logged in to the database |
| IP_ADDRESS     | VARCHAR2 (48)                |          | Client IP address                                                |
| CLIENT_PROGRAM | VARCHAR2 (84)                |          | Name of the client program                                       |
| OS_USER        | VARCHAR2 (128)               |          | Name of the OS user of the client process                        |

**Note:**

## 6.420 DBA\_SQL\_FIREWALL\_SQL\_LOGS

DBA\_SQL\_FIREWALL\_SQL\_LOGS displays information about SQL logs for SQL Firewall.

| Column           | Datatype      | NULL | Description                   |
|------------------|---------------|------|-------------------------------|
| COMMAND_TYPE     | VARCHAR2 (64) |      | Type of SQL command           |
| SQL_SIGNATURE    | VARCHAR2 (64) |      | SQL signature                 |
| SQL_TEXT         | CLOB          |      | SQL text                      |
| ACCESSED_OBJECTS | CLOB          |      | List of accessed objects      |
| CHARSET          | VARCHAR2 (64) |      | Character set of the SQL text |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.421 DBA\_SQL\_FIREWALL\_STATUS

DBA\_SQL\_FIREWALL\_STATUS displays the status of SQL Firewall.

| Column            | Datatype                     | NULL     | Description                                                                                                                                                        |
|-------------------|------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS            | VARCHAR2 (8)                 |          | SQL Firewall status (ENABLED or DISABLED)                                                                                                                          |
| STATUS_UPDATED_ON | TIMESTAMP (6) WITH TIME ZONE | NOT NULL | Date and time of the most recent SQL Firewall status change                                                                                                        |
| EXCLUDE_JOBS      | VARCHAR2 (12)                |          | Indicates whether the SQL Firewall will capture or enforce allow-lists for database connections and SQL executions of Oracle scheduler job sessions (Y) or not (N) |

**Note:**

This view is available starting with Oracle Database 23ai.

## 6.422 DBA\_SQL\_FIREWALL\_VIOLATIONS

DBA\_SQL\_FIREWALL\_VIOLATIONS lists SQL Firewall violations.

| Column           | Datatype        | NULL | Description                                                                                                                                                             |
|------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USERNAME         | VARCHAR2 (128)  |      | Name of the target user                                                                                                                                                 |
| COMMAND_TYPE     | VARCHAR2 (64)   |      | Type of SQL command                                                                                                                                                     |
| SQL_SIGNATURE    | VARCHAR2 (64)   |      | SQL signature                                                                                                                                                           |
| SQL_TEXT         | VARCHAR2 (4000) |      | SQL text (up to 1000 characters)<br>To view the full SQL text, query the SQL_TEXT column of the DBA_SQL_FIREWALL_SQL_LOGS view.                                         |
| ACCESSED_OBJECTS | VARCHAR2 (4000) |      | List of accessed objects (up to 1000 characters)<br>To view the full list of accessed objects, query the ACCESSED_OBJECTS column of the DBA_SQL_FIREWALL_SQL_LOGS view. |
| CURRENT_USER     | VARCHAR2 (128)  |      | Name of the user who invoked the SQL command                                                                                                                            |
| TOP_LEVEL        | VARCHAR2 (9)    |      | Indicates whether the SQL command is a top-level SQL command, that is, a SQL command issued directly from the user (Y) or a SQL command from a PL/SQL unit (N)          |
| IP_ADDRESS       | VARCHAR2 (48)   |      | Client IP address                                                                                                                                                       |
| CLIENT_PROGRAM   | VARCHAR2 (84)   |      | Name of the client program                                                                                                                                              |

| Column          | Datatype                     | NULL | Description                                                                                                        |
|-----------------|------------------------------|------|--------------------------------------------------------------------------------------------------------------------|
| OS_USER         | VARCHAR2 (128)               |      | Name of the OS user of the client process                                                                          |
| CAUSE           | VARCHAR2 (17)                |      | Cause of the violation: <ul style="list-style-type: none"> <li>Context violation</li> <li>SQL violation</li> </ul> |
| FIREWALL_ACTION | VARCHAR2 (7)                 |      | Indicates whether the SQL Firewall action was Allowed or Blocked                                                   |
| OCCURRED_AT     | TIMESTAMP (6) WITH TIME ZONE |      | Date and time of the violation                                                                                     |

## 6.423 DBA\_SQL\_MANAGEMENT\_CONFIG

DBA\_SQL\_MANAGEMENT\_CONFIG displays the configuration parameters of the SQL management base.

You must have the DBA role in order to change the configuration parameter values.

| Column          | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                  |
|-----------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PARAMETER_NAME  | VARCHAR2 (128)  | NOT NULL | Name of the configuration parameter: <ul style="list-style-type: none"> <li>AUTO_CAPTURE_ACTION</li> <li>AUTO_CAPTURE_MODULE</li> <li>AUTO_CAPTURE_PARSING_SCHEMA_NAME</li> <li>AUTO_CAPTURE_SQL_TEXT</li> <li>PLAN_RETENTION_WEEKS</li> <li>SPACE_BUDGET_PERCENT</li> </ul> |
| PARAMETER_VALUE | VARCHAR2 (4000) |          | Value of the configuration parameter                                                                                                                                                                                                                                         |
| LAST_MODIFIED   | TIMESTAMP (6)   |          | Time the parameter value was last updated                                                                                                                                                                                                                                    |
| MODIFIED_BY     | VARCHAR2 (128)  |          | User who last updated the parameter value                                                                                                                                                                                                                                    |

## 6.424 DBA\_SQL\_QUARANTINE

DBA\_SQL\_QUARANTINE displays information about SQL Quarantine configurations.

Each row in this view represents a quarantine configuration for a SQL plan.

| Column          | Datatype        | NULL     | Description                                                                                                                                                                                                 |
|-----------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIGNATURE       | NUMBER          | NOT NULL | Unique SQL identifier generated from normalized SQL text                                                                                                                                                    |
| NAME            | VARCHAR2 (128)  | NOT NULL | Unique plan identifier in string form as a search key                                                                                                                                                       |
| SQL_TEXT        | CLOB            | NOT NULL | Un-normalized SQL text                                                                                                                                                                                      |
| PLAN_HASH_VALUE | NUMBER          |          | Unique plan identifier in numeric form as a search key                                                                                                                                                      |
| CPU_TIME        | VARCHAR2 (4000) |          | CPU time threshold (in seconds)                                                                                                                                                                             |
| IO_MEGABYTES    | VARCHAR2 (4000) |          | I/O threshold (in megabytes)                                                                                                                                                                                |
| IO_REQUESTS     | VARCHAR2 (4000) |          | Physical I/O threshold (number of physical I/O requests)                                                                                                                                                    |
| ELAPSED_TIME    | VARCHAR2 (4000) |          | Elapsed time threshold (in seconds)                                                                                                                                                                         |
| IO_LOGICAL      | VARCHAR2 (4000) |          | Logical I/O threshold (number of logical I/O requests)                                                                                                                                                      |
| CREATOR         | VARCHAR2 (128)  |          | User who created the quarantine configuration                                                                                                                                                               |
| ORIGIN          | VARCHAR2 (16)   |          | Method by which the quarantine configuration was created. The only possible value is <code>RESOURCE-MANAGER</code> , which indicates that the quarantine configuration was created by the Resource Manager. |
| DESCRIPTION     | VARCHAR2 (500)  |          | Text description                                                                                                                                                                                            |
| CREATED         | TIMESTAMP (6)   | NOT NULL | Time at which the quarantine configuration was created                                                                                                                                                      |
| LAST_EXECUTED   | TIMESTAMP (6)   |          | Time at which the quarantine configuration was last used                                                                                                                                                    |
| ENABLED         | VARCHAR2 (3)    |          | Indicates whether the quarantine configuration is enabled ( <code>YES</code> ) or disabled ( <code>NO</code> )                                                                                              |
| AUTOPURGE       | VARCHAR2 (3)    |          | Indicates whether the quarantine configuration is auto-purged ( <code>YES</code> ) or not ( <code>NO</code> )                                                                                               |

## 6.425 DBA\_SQL\_PATCHES

DBA\_SQL\_PATCHES displays the set of SQL patches.

| Column        | Datatype       | NULL     | Description                                          |
|---------------|----------------|----------|------------------------------------------------------|
| NAME          | VARCHAR2 (128) | NOT NULL | Name of the SQL patch                                |
| CATEGORY      | VARCHAR2 (128) | NOT NULL | Category of the SQL patch                            |
| SIGNATURE     | NUMBER         | NOT NULL | Unique identifier generated from normalized SQL text |
| SQL_TEXT      | CLOB           | NOT NULL | Un-normalized SQL text                               |
| CREATED       | TIMESTAMP (6)  | NOT NULL | Timestamp when the SQL patch was created             |
| LAST_MODIFIED | TIMESTAMP (6)  |          | Timestamp when the SQL patch was last modified       |

| Column         | Datatype       | NULL | Description                                                                                                                   |
|----------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------|
| DESCRIPTION    | VARCHAR2 (500) |      | Text description provided for the SQL patch                                                                                   |
| ORIGIN         | VARCHAR2 (22)  |      | Origin of the patch: <ul style="list-style-type: none"> <li>AUTO-FOREGROUND-REPAIR</li> <li>PATCH</li> <li>UNKNOWN</li> </ul> |
| STATUS         | VARCHAR2 (8)   |      | Status of the SQL patch: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                          |
| FORCE_MATCHING | VARCHAR2 (3)   |      | Indicates whether the signature is force matching (YES) or exact matching (NO)                                                |
| TASK_ID        | NUMBER         |      | Advisor task ID that generated the SQL patch                                                                                  |
| TASK_EXEC_NAME | VARCHAR2 (128) |      | Advisor execution name for the SQL patch                                                                                      |
| TASK_OBJ_ID    | NUMBER         |      | Advisor object ID for the SQL patch                                                                                           |
| TASK_FND_ID    | NUMBER         |      | Advisor finding ID for the SQL patch                                                                                          |
| TASK_REC_ID    | NUMBER         |      | Advisor recommendation ID for the SQL patch                                                                                   |

## 6.426 DBA\_SQL\_PLAN\_BASELINES

DBA\_SQL\_PLAN\_BASELINES displays information about the SQL plan baselines currently created for specific SQL statements.

| Column              | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIGNATURE           | NUMBER         | NOT NULL | Unique SQL identifier generated from normalized SQL text                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_HANDLE          | VARCHAR2 (30)  | NOT NULL | Unique SQL identifier in string form as a search key                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| FIXED                     | VARCHAR2 (3)  |          | Indicates whether the plan baseline is fixed (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| REPRODUCED                | VARCHAR2 (3)  |          | Indicates whether the optimizer was able to reproduce the plan (YES) or not (NO). The value of this column is set to YES when a plan is initially added to the plan baseline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| AUTOPURGE                 | VARCHAR2 (3)  |          | Indicates whether the plan baseline is auto-purged (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ADAPTIVE                  | VARCHAR2 (3)  |          | Indicates whether a plan that is automatically captured by SQL plan management is marked adaptive or not. When a new adaptive plan is found for a SQL statement that has an existing SQL plan baseline, that new plan will be added to the SQL plan baseline as an unaccepted plan, and the ADAPTIVE column will be marked YES. When this new plan is verified (either manually or via the auto evolve task), the plan will be test executed and the final plan determined at execution will become an accepted plan if its performance is better than the existing plan baseline. At this point, the value of the ADAPTIVE column is set to NO since the plan is no longer adaptive, but resolved. |
| OPTIMIZER_COST            | NUMBER        |          | Optimizer cost at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MODULE                    | VARCHAR2 (64) |          | Application module name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ACTION                    | VARCHAR2 (64) |          | Application action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| ELAPSED_TIME <sup>1</sup> | NUMBER        |          | Total elapsed time (in microseconds) at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CPU_TIME <sup>1</sup>     | NUMBER        |          | Total CPU time (in microseconds) at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| BUFFER_GETS <sup>1</sup>  | NUMBER        |          | Total buffer gets at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DISK_READS <sup>1</sup>   | NUMBER        |          | Total disk reads at the time the plan baseline was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column                          | Datatype      | NULL | Description                                                                        |
|---------------------------------|---------------|------|------------------------------------------------------------------------------------|
| DIRECT_WRITES <sup>1</sup>      | NUMBER        |      | Total direct writes at the time the plan baseline was created                      |
| ROWS_PROCESSED <sup>1</sup>     | NUMBER        |      | Total rows processed at the time the plan baseline was created                     |
| FETCHES <sup>1</sup>            | NUMBER        |      | Total number of fetches at the time the plan baseline was created                  |
| END_OF_FETCH_COUNT <sup>1</sup> | NUMBER        |      | Total number of full fetches at the time the plan baseline was created             |
| FOREGROUND_LAST_VERIFIED        | TIMESTAMP (6) |      | Timestamp when the SQL plan baseline was verified by real-time SQL plan management |
| NOTES                           | CLOB          |      | Internal SQL plan baseline verification information                                |

<sup>1</sup> If the value of the ORIGIN column is equal to AUTO-CAPTURE, then data for this column is not populated.

## 6.427 DBA\_SQL\_PLAN\_DIR\_OBJECTS

DBA\_SQL\_PLAN\_DIR\_OBJECTS displays the objects created in the SQL plan directive.

| Column         | Datatype       | NULL | Description                                                               |
|----------------|----------------|------|---------------------------------------------------------------------------|
| DIRECTIVE_ID   | NUMBER         |      | The identifier of the SQL plan directive                                  |
| OWNER          | VARCHAR2 (128) |      | The username of the owner of the object in the SQL plan directive         |
| OBJECT_NAME    | VARCHAR2 (128) |      | The name of the object in the SQL plan directive                          |
| SUBOBJECT_NAME | VARCHAR2 (128) |      | The name of the subobject (for example, column) in the SQL plan directive |
| OBJECT_TYPE    | VARCHAR2 (6)   |      | The type of the subobject in the SQL plan directive                       |
| NUM_ROWS       | NUMBER         |      | The number of rows in the object when the directive is created            |
| NOTES          | XMLTYPE        |      | Other notes about the object                                              |

## 6.428 DBA\_SQL\_PLAN\_DIRECTIVES

DBA\_SQL\_PLAN\_DIRECTIVES displays information about the SQL plan directives in the system.

| Column        | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|---------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIRECTIVE_ID  | NUMBER        | NOT NULL | The identifier of the SQL plan directive                                                                                                                                                                                                                                                                                                                                                               |
| TYPE          | VARCHAR2 (16) |          | The type of the SQL plan directive: <ul style="list-style-type: none"><li>• DYNAMIC SAMPLING: SQL plan directive</li><li>• DYNAMIC SAMPLING RESULT: Dynamic sampling query results. This value appears only in Oracle Database 12c Release 2 (12.2.0.1) and later releases.</li><li>• UNKNOWN: Unknown</li></ul>                                                                                       |
| ENABLED       | VARCHAR2 (3)  |          | Indicates whether the SQL plan directive is enabled. Possible values: <ul style="list-style-type: none"><li>• YES: The SQL plan directive is enabled.</li><li>• NO: The SQL plan directive is not enabled.</li></ul>                                                                                                                                                                                   |
| STATE         | VARCHAR2 (10) |          | The state of the SQL plan directive. Possible values include: <ul style="list-style-type: none"><li>• SUPERSEDED: This value indicates that the corresponding column or groups have an extension or histogram, or that another SQL plan directive exists that can be used for the directive.</li><li>• USABLE: This value indicates that the SQL plan directive is usable for the optimizer.</li></ul> |
| AUTO_DROP     | VARCHAR2 (3)  |          | If YES, the SQL plan directive gets dropped when unused beyond SPD_RETENTION_WEEKS                                                                                                                                                                                                                                                                                                                     |
| REASON        | VARCHAR2 (36) |          | The reason for creating the SQL plan directive                                                                                                                                                                                                                                                                                                                                                         |
| CREATED       | TIMESTAMP (6) |          | The creation timestamp of the SQL plan directive                                                                                                                                                                                                                                                                                                                                                       |
| LAST_MODIFIED | TIMESTAMP (6) |          | The timestamp of most recent modification of the SQL plan directive                                                                                                                                                                                                                                                                                                                                    |
| LAST_USED     | TIMESTAMP (9) |          | The timestamp of most recent usage of the SQL plan directive                                                                                                                                                                                                                                                                                                                                           |
| NOTES         | XMLTYPE       |          | Extra information about the SQL plan directive                                                                                                                                                                                                                                                                                                                                                         |

| NAME           | VARCHAR2 (128) | NOT NULL | Name of the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CATEGORY       | VARCHAR2 (128) | NOT NULL | Category of the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SIGNATURE      | NUMBER         | NOT NULL | Unique identifier generated from normalized SQL text                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_TEXT       | CLOB           | NOT NULL | Un-normalized SQL text                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CREATED        | TIMESTAMP (6)  | NOT NULL | Timestamp when the SQL profile was created                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LAST_MODIFIED  | TIMESTAMP (6)  |          | Timestamp when the SQL profile was last modified                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DESCRIPTION    | VARCHAR2 (500) |          | Text description provided for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TYPE           | VARCHAR2 (7)   |          | Type of the SQL profile (how it was created): <ul style="list-style-type: none"> <li>• MANUAL</li> <li>• AUTO</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                 |
| STATUS         | VARCHAR2 (8)   |          | Status of the SQL profile: <ul style="list-style-type: none"> <li>• ENABLED</li> <li>• DISABLED</li> <li>• VOID</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                               |
| FORCE_MATCHING | VARCHAR2 (3)   |          | If YES, this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values to bind variables. If a combination of literal values and bind variables is used in the same SQL text, then no transformation occurs. This is analogous to the matching algorithm use by the FORCE option of the CURSOR_SHARING parameter.<br><br>If NO, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter. |
| TASK_ID        | NUMBER         |          | Advisor task ID that generated the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TASK_EXEC_NAME | VARCHAR2 (128) |          | Advisor execution name for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TASK_OBJ_ID    | NUMBER         |          | Advisor object ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TASK_FND_ID    | NUMBER         |          | Advisor finding ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TASK_REC_ID    | NUMBER         |          | Advisor recommendation ID for the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TASK_CON_DBID  | NUMBER         |          | Database ID for the PDB tuning task generating the SQL profile                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The `DBMS_SQLTUNE` package in *Oracle Database PL/SQL Packages and Types Reference*

## 6.430 DBA\_SQL\_TRANSLATION\_PROFILES

`DBA_SQL_TRANSLATION_PROFILES` describes all SQL translation profiles in the database. Its columns are the same as those in `ALL_SQL_TRANSLATION_PROFILES`.

**See Also:**

[`"ALL\_SQL\_TRANSLATION\_PROFILES"`](#)

## 6.431 DBA\_SQL\_TRANSLATIONS

`DBA_SQL_TRANSLATIONS` describes all SQL translations in the database. Its columns are the same as those in `ALL_SQL_TRANSLATIONS`.

**See Also:**

[`"ALL\_SQL\_TRANSLATIONS"`](#)

## 6.432 DBA\_SQLJ\_TYPE\_ATTRS

`DBA_SQLJ_TYPE_ATTRS` describes the attributes of all SQLJ object types in the database. Its columns are the same as those in `ALL_SQLJ_TYPE_ATTRS`.

**See Also:**

[`"ALL\_SQLJ\_TYPE\_ATTRS"`](#)

## 6.433 DBA\_SQLJ\_TYPE\_METHODS

`DBA_SQLJ_TYPE_METHODS` describes the methods of all SQLJ object types in the database. Its columns are the same as those in `ALL_SQLJ_TYPE_METHODS`.

**See Also:**

[`"ALL\_SQLJ\_TYPE\_METHODS"`](#)

## 6.434 DBA\_SQLJ\_TYPES

DBA\_SQLJ\_TYPES describes all SQLJ object types in the database. Its columns are the same as those in ALL\_SQLJ\_TYPES.

**See Also:**

"ALL\_SQLJ\_TYPES"

## 6.435 DBA\_SQLSET

DBA\_SQLSET displays information about all SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET.

**See Also:**

"ALL\_SQLSET"

## 6.436 DBA\_SQLSET\_BINDS

DBA\_SQLSET\_BINDS displays the bind values associated with all SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET\_BINDS.

**See Also:**

"ALL\_SQLSET\_BINDS"

## 6.437 DBA\_SQLSET\_PLANS

DBA\_SQLSET\_PLANS describes captured plans in the SQL tuning sets in the database. Its columns are the same as those in ALL\_SQLSET\_PLANS.

**See Also:**

"ALL\_SQLSET\_PLANS"

## 6.438 DBA\_SQLSET\_REFERENCES

DBA\_SQLSET\_REFERENCES describes whether or not all SQL tuning sets in the database are active. A SQL tuning set cannot be dropped if it is referenced. Its columns are the same as those in ALL\_SQLSET\_REFERENCES.

**See Also:**

"ALL\_SQLSET\_REFERENCES"

## 6.439 DBA\_SQLSET\_STATEMENTS

DBA\_SQLSET\_STATEMENTS displays information about the SQL statements, along with their statistics, that form all SQL tuning sets in the database. Its columns, except for PARSING\_SCHEMA\_ID, are the same as those in ALL\_SQLSET\_STATEMENTS.

| Column                   | Datatype       | NULL     | Description                                                                                                                                                      |
|--------------------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQLSET_NAME              | VARCHAR2 (128) | NOT NULL | Name of the SQL tuning set for the statement                                                                                                                     |
| SQLSET_OWNER             | VARCHAR2 (128) |          | User name of the SQL tuning set owner                                                                                                                            |
| SQLSET_ID                | NUMBER         | NOT NULL | ID of the SQL tuning set for the statement                                                                                                                       |
| CON_DBID                 | NUMBER         | NOT NULL | The database ID of the PDB                                                                                                                                       |
| SQL_ID                   | VARCHAR2 (13)  | NOT NULL | SQL identifier of the parent cursor in the library cache                                                                                                         |
| FORCE_MATCHING_SIGNATURE | NUMBER         | NOT NULL | The signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                             |
| SQL_TEXT                 | CLOB           |          | Full text for the SQL statement exposed as a CLOB column.                                                                                                        |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) |          | Name of the user in whose schema the statement was parsed                                                                                                        |
| PARSING_SCHEMA_ID        | NUMBER         |          | ID of the schema in which the statement was parsed                                                                                                               |
| PLAN_HASH_VALUE          | NUMBER         | NOT NULL | Hash value for the plan corresponding to statistics in this record                                                                                               |
| BIND_DATA                | RAW (2000)     |          | Bind data                                                                                                                                                        |
| BINDS_CAPTURED           | CHAR (1)       |          | Binds captured                                                                                                                                                   |
| MODULE                   | VARCHAR2 (64)  |          | Contains the name of the module that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE |
| ACTION                   | VARCHAR2 (64)  |          | Contains the name of the action that was executing at the time that the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION |
| ELAPSED_TIME             | NUMBER         |          | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                          |
| CPU_TIME                 | NUMBER         |          | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                              |
| BUFFER_GETS              | NUMBER         |          | Number of buffer gets for this child cursor                                                                                                                      |

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|---------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISK_READS           | NUMBER        |          | Number of disk reads for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DIRECT_WRITES        | NUMBER        |          | Number of direct writes for this child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ROWS_PROCESSED       | NUMBER        |          | Total number of rows that the parsed SQL statement returns                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FETCHES              | NUMBER        |          | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXECUTIONS           | NUMBER        |          | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_OF_FETCH_COUNT   | NUMBER        |          | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the <code>END_OF_FETCH_COUNT</code> column should be less than, or equal to, the value of the <code>EXECUTIONS</code> column. |
| OPTIMIZER_COST       | NUMBER        |          | Cost of this query, given by the optimizer                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIMIZER_ENV        | RAW (2000)    |          | Optimizer environment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 6.440 DBA\_SQLTUNE\_BINDS

DBA\_SQLTUNE\_BINDS displays the bind values associated with all tuned SQL statements in the database.

### Related View

USER\_SQLTUNE\_BINDS displays the bind values associated with the tuned SQL statements owned by the current user.

| Column    | Datatype   | NULL     | Description                                            |
|-----------|------------|----------|--------------------------------------------------------|
| TASK_ID   | NUMBER(38) | NOT NULL | Tuning task identifier                                 |
| OBJECT_ID | NUMBER(38) | NOT NULL | Advisor framework object identifier                    |
| POSITION  | NUMBER(38) | NOT NULL | Bind position                                          |
| VALUE     | ANYDATA    |          | Bind value. This column is NULL for PL/SQL bind types. |

| STATEMENT_ID    | VARCHAR2(30)  |          | Optional statement identifier specified in the EXPLAIN PLAN statement                                                                                                                                                                                                                                                                               |
| PLAN_HASH_VALUE | NUMBER        | NOT NULL | Numerical representation of the execution plan                                                                                                                                                                                                                                                                                                      |
| PLAN_ID         | NUMBER        |          | Plan identifier                                                                                                                                                                                                                                                                                                                                     |

| Column          | Datatype        | NULL     | Description                                                                                                |
|-----------------|-----------------|----------|------------------------------------------------------------------------------------------------------------|
| TIMESTAMP       | DATE            |          | Date and time when the EXPLAIN PLAN statement was issued                                                   |
| REMARKS         | VARCHAR2 (4000) |          | Place for comments that can be added to the steps of the execution plan                                    |
| OPERATION       | VARCHAR2 (30)   |          | Name of the operation performed at this step                                                               |
| OPTIONS         | VARCHAR2 (255)  |          | Options used for the operation performed at this step                                                      |
| OBJECT_NODE     | VARCHAR2 (128)  |          | Name of the database link used to reference the object                                                     |
| OBJECT_OWNER    | VARCHAR2 (128)  |          | Owner of the object                                                                                        |
| OBJECT_NAME     | VARCHAR2 (128)  |          | Name of the object                                                                                         |
| OBJECT_ALIAS    | VARCHAR2 (261)  |          | Object alias                                                                                               |
| OBJECT_INSTANCE | NUMBER (38)     |          | Numbered position of the object name in the original SQL statement                                         |
| OBJECT_TYPE     | VARCHAR2 (30)   |          | Descriptive modifier that further describes the type of object                                             |
| OPTIMIZER       | VARCHAR2 (255)  |          | Current mode of the optimizer                                                                              |
| SEARCH_COLUMNS  | NUMBER          |          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates) |
| ID              | NUMBER (38)     | NOT NULL | Identification number for this step in the execution plan                                                  |
| PARENT_ID       | NUMBER (38)     |          | ID of the next step that operates on the results of this step                                              |
| DEPTH           | NUMBER (38)     |          | Depth                                                                                                      |
| POSITION        | NUMBER (38)     |          | Order of processing for steps with the same parent ID                                                      |
| COST            | NUMBER (38)     |          | Cost of the current operation estimated by the cost-based optimizer (CBO)                                  |
| CARDINALITY     | NUMBER (38)     |          | Number of rows returned by the current operation (estimated by the CBO)                                    |
| BYTES           | NUMBER (38)     |          | Number of bytes returned by the current operation                                                          |

| Column            | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OTHER_TAG         | VARCHAR2 (255)  |      | Describes the function of the SQL text in the OTHER column. Values for OTHER_TAG are: <ul style="list-style-type: none"> <li>SERIAL - SQL is the text of a locally-executed, serial query plan. Currently, SQL is not loaded in OTHER for this case.</li> <li>SERIAL_FROM_REMOTE - SQL text shown in the OTHER column will be executed at a remote site</li> <li>PARALLEL_COMBINED_WITH_PARENT - Parent of this operation is a DFO that performs both operations in the parallel execution plan</li> <li>PARALLEL_COMBINED_WITH_CHILD - Child of this operation is a DFO that performs both operations in the parallel execution plan.</li> <li>PARALLEL_TO_SERIAL - SQL text shown in the OTHER column is the top-level of the parallel plan.</li> <li>PARALLEL_TO_PARALLEL - SQL text shown in the OTHER column is executed and output in parallel</li> <li>PARALLEL_FROM_SERIAL - Operation consumes data from a serial operation and outputs it in parallel</li> </ul> |
| PARTITION_START   | VARCHAR2 (255)  |      | Start partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARTITION_STOP    | VARCHAR2 (255)  |      | Stop partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PARTITION_ID      | NUMBER (38)     |      | Step that has computed the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OTHER             | LONG            |      | Information about parallel execution servers and parallel queries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 6.444 DBA\_SR\_GRP\_STATUS

DBA\_SR\_GRP\_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database. It has the same columns as the DBA\_SR\_GRP\_STATUS\_ALL view.

Refresh operations are controlled using the DBMS\_SYNC\_REFRESH package.

### Related View

USER\_SR\_GRP\_STATUS provides information on the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS.

| Column                | Datatype        | NULL     | Description                                                                                                                                                                                                                   |
|-----------------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER                 | VARCHAR2 (128)  | NOT NULL | Owner of the refresh operation, which is the user who launched the operation                                                                                                                                                  |
| GROUP_ID              | NUMBER          | NOT NULL | Group ID of the synchronous refresh group                                                                                                                                                                                     |
| OPERATION             | VARCHAR2 (7)    |          | The phase of the refresh operation performed: <ul style="list-style-type: none"> <li>• PREPARE</li> <li>• EXECUTE</li> </ul>                                                                                                  |
| STATUS                | VARCHAR2 (10)   |          | The status of the refresh operation: <ul style="list-style-type: none"> <li>• RUNNING</li> <li>• NOT PROCESSED</li> <li>• COMPLETE</li> <li>• ERROR-SOFT</li> <li>• ERROR-HARD</li> <li>• ABORT</li> <li>• PARTIAL</li> </ul> |
| NUM_TBLS              | NUMBER          | NOT NULL | The number of tables in the synchronous refresh group                                                                                                                                                                         |
| NUM_MVS               | NUMBER          | NOT NULL | The number of materialized views in the synchronous refresh group                                                                                                                                                             |
| BASE_TBLS_REFR_STATUS | VARCHAR2 (13)   |          | Indicates the refresh status of base tables in the synchronous refresh group. The possible values are: <ul style="list-style-type: none"> <li>• NOT PROCESSED</li> <li>• COMPLETE</li> <li>• ABORT</li> </ul>                 |
| NUM_MVS_COMPLETED     | NUMBER          |          | The number of materialized views which have completed refresh in the synchronous refresh group                                                                                                                                |
| NUM_MVS_ABORTED       | NUMBER          |          | The number of materialized views which have terminated refresh in the synchronous refresh group                                                                                                                               |
| ERROR_NUMBER          | NUMBER          |          | Error number of the run (if any)                                                                                                                                                                                              |

## 6.445 DBA\_SR\_GRP\_STATUS\_ALL

DBA\_SR\_GRP\_STATUS\_ALL provides information on the refresh operations on the synchronous refresh groups in the database.

A refresh operation is also called a run, and it has two phases: PREPARE\_REFRESH and EXECUTE\_REFRESH. These phases are controlled using the DBMS\_SYNC\_REFRESH package.

Each row in this view provides information on a run of a group, identified by its GROUP\_ID. The view contains information on the status of the objects of both current and past runs of both current and defunct synchronous refresh groups. Therefore, this view can be used to examine the history of synchronous refresh operations.

The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To view the status of refresh operations for the most recent runs of only the current groups, use the DBA\_SR\_GRP\_STATUS view.

### Related View

USER\_SR\_GRP\_STATUS\_ALL provides information on the refresh operations on the synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_GRP\_STATUS\_ALL.

| Column    | Datatype       | NULL     | Description                                                                                                               |
|-----------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------|
| OWNER     | VARCHAR2 (128) | NOT NULL | Owner of the refresh operation, which is the user who launched the operation                                              |
| GROUP_ID  | NUMBER         | NOT NULL | Group ID of the synchronous refresh group                                                                                 |

## 6.447 DBA\_SR\_OBJ\_ALL

DBA\_SR\_OBJ\_ALL provides information on the objects registered for synchronous refresh for current and defunct groups.

To see information on the objects registered for synchronous refresh for only the current groups, use the DBA\_SR\_OBJ view.

### Related View

USER\_SR\_OBJ\_ALL provides information on the objects registered for synchronous refresh for current and defunct groups for the current user. Its columns are the same as those in DBA\_SR\_OBJ\_ALL.

| Column   | Datatype       | NULL     | Description                                                                                                 |
|----------|----------------|----------|-------------------------------------------------------------------------------------------------------------|
| OWNER    | VARCHAR2 (128) | NOT NULL | Owner of the synchronous refresh object                                                                     |
| NAME     | VARCHAR2 (128) | NOT NULL | Name of the synchronous refresh object                                                                      |
| TYPE     | VARCHAR2 (5)   |          | Type of synchronous refresh object: <ul style="list-style-type: none"><li>• MVIEW</li><li>• TABLE</li></ul> |
| GROUP_ID | NUMBER         | NOT NULL | Group ID of the synchronous refresh group to which this object belongs                                      |

| Column           | Datatype       | NULL | Description                                                                                                                     |
|------------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------|
| CURRENT_GROUP    | VARCHAR2 (1)   |      | Indicates whether the record is for a current group: <ul style="list-style-type: none"><li>• Y - Yes</li><li>• N - No</li></ul> |
| STAGING_LOG_NAME | VARCHAR2 (128) |      | Name of the staging log for tables. This column has a value of NULL for materialized views.                                     |

## 6.448 DBA\_SR\_OBJ\_STATUS

DBA\_SR\_OBJ\_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database.

To see information on the status of objects registered for synchronous refresh, use the DBA\_SR\_OBJ\_STATUS\_ALL view.

### Related View

USER\_SR\_OBJ\_STATUS provides information on the status of objects registered for synchronous refresh for the current refresh operations for the current synchronous refresh groups in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_OBJ\_STATUS.

| Column             | Datatype        | NULL     | Description                                                                                                                                  |
|--------------------|-----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER              | VARCHAR2 (128)  | NOT NULL | Owner of the synchronous refresh object                                                                                                      |
| NAME               | VARCHAR2 (128)  | NOT NULL | Name of the synchronous refresh object                                                                                                       |

| GROUP_ID           | NUMBER          | NOT NULL | Group ID of the synchronous refresh group to which this object belongs                                                                       |
| STATUS             | VARCHAR2 (13)   |          | Status of the synchronous refresh object: <ul style="list-style-type: none"><li>• NOT PROCESSED</li><li>• COMPLETE</li><li>• ABORT</li></ul> |
| ERROR_NUMBER       | NUMBER          |          | Error number of the run (if any)                                                                                                             |
| ERROR_MESSAGE      | VARCHAR2 (4000) |          | Error message of the run (if any)                                                                                                            |
| LAST_MODIFIED_TIME | DATE            |          | Last modification time of the synchronous refresh object                                                                                     |

**See Also:**["USER\\_SR\\_OBJ\\_STATUS"](#)

## 6.449 DBA\_SR\_OBJ\_STATUS\_ALL

DBA\_SR\_OBJ\_STATUS\_ALL provides information on the status of objects registered for synchronous refresh.

The view contains information on the status of the objects of both the current and past runs of both current and defunct groups. Therefore, this view can be used to examine the history of synchronous refresh operations. The current run of a group is the most recent run of a group; a current group is a currently valid group, which is capable of being refreshed. A group becomes defunct when it is unregistered for any reason, either explicitly by the user or implicitly as a side-effect when the user registers materialized views related to the materialized views in the group.

To see information on the status of refresh operations for the most recent runs of only the current groups, use the DBA\_SR\_OBJ\_STATUS view.

### Related View

USER\_SR\_OBJ\_STATUS\_ALL provides information on the status of objects registered for synchronous refresh in the database which are owned by the current user. Its columns are the same as those in DBA\_SR\_OBJ\_STATUS\_ALL.

| Column             | Datatype        | NULL     | Description                                                                                                                                                       |
|--------------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 6.450 DBA\_SR\_PARTN\_OPS

DBA\_SR\_PARTN\_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh.

These rows last only as long as the registrations are active; that is, they disappear after EXECUTE\_REFRESH or ABORT\_REFRESH of the base table by the DBMS\_SYNC\_REFRESH package.

### Related View

USER\_SR\_PARTN\_OPS provides information on the partition operations registered on the base tables of the materialized views registered for synchronous refresh belonging to the current user. Its columns are the same as those in DBA\_SR\_PARTN\_OPS.

| Column               | Datatype       | NULL     | Description                                                                                                               |
|----------------------|----------------|----------|---------------------------------------------------------------------------------------------------------------------------|
| OWNER                | VARCHAR2 (128) | NOT NULL | Owner of the base table registered for synchronous refresh                                                                |
| TABLE_NAME           | VARCHAR2 (128) | NOT NULL | Name of the table                                                                                                         |
| PARTITION_OP         | VARCHAR2 (128) | NOT NULL | Type of partition operation: <ul style="list-style-type: none"><li>• DROP</li><li>• EXCHANGE</li><li>• TRUNCATE</li></ul> |
| PARTITION_NAME       | VARCHAR2 (128) | NOT NULL | Name of the partition to be changed                                                                                       |
| OUTSIDE_TABLE_SCHEMA | VARCHAR2 (128) |          | Schema in which the outside table (for EXCHANGE PARTITION) was created                                                    |
| OUTSIDE_TABLE_NAME   | VARCHAR2 (128) |          | Name of the outside table (for EXCHANGE PARTITION)                                                                        |

## 6.451 DBA\_SR\_STLOG\_EXCEPTIONS

DBA\_SR\_STLOG\_EXCEPTIONS provides information on the exceptions in the staging logs for the tables processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG.

### Related View

USER\_SR\_STLOG\_EXCEPTIONS provides information on the exceptions in the staging logs for the tables belonging to the current user processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG. Its columns are the same as those in DBA\_SR\_STLOG\_EXCEPTIONS.

| Column           | Datatype        | NULL     | Description                                                                                 |
|------------------|-----------------|----------|---------------------------------------------------------------------------------------------|
| OWNER            | VARCHAR2 (128)  | NOT NULL | Owner of the base table registered for synchronous refresh                                  |
| TABLE_NAME       | VARCHAR2 (128)  | NOT NULL | Name of the base table registered for synchronous refresh                                   |
| STAGING_LOG_NAME | VARCHAR2 (128)  | NOT NULL | Name of the staging log for tables. This column has a value of NULL for materialized views. |
| BAD_ROWID        | ROWID           | NOT NULL | Row ID of the staging log row causing the exception for the synchronous refresh             |
| ERROR_NUMBER     | NUMBER          |          | Error number of the exception for the synchronous refresh                                   |
| ERROR_MESSAGE    | VARCHAR2 (4000) |          | Error message associated with the ERROR_NUMBER for the synchronous refresh                  |

### See Also:

## 6.452 DBA\_SR\_STLOG\_STATS

DBA\_SR\_STLOG\_STATS provides information on the statistics in the staging logs for the tables processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG.

These three statistics columns in the staging log are filled in PREPARE\_STAGING\_LOG:

- The number of inserts (NUM\_INSERTS)
- The number of deletes (NUM\_DELETES)
- The number of updates (NUM\_UPDATES)

After the data in the staging logs of a synchronous refresh group have been processed by PREPARE\_REFRESH and EXECUTE\_REFRESH, the statistics columns for the tables in the group are cleared and appear as NULL.

**Related View**

USER\_SR\_STLOG\_STATS provides information on the statistics in the staging logs for the tables belonging to the current user processed by DBMS\_SYNC\_REFRESH.PREPARE\_STAGING\_LOG.

| Column           | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER            | VARCHAR2 (128) | NOT NULL | Owner of the base table registered for synchronous refresh                                                                                                                                                                                                                                                                                                                             |

| STAGING_LOG_NAME | VARCHAR2 (128) | NOT NULL | Name of the staging log for tables. NULL for materialized views                                                                                                                                                                                                                                                                                                                        |
| NUM_INSERTS      | NUMBER         | NOT NULL | The number of inserts in the staging log                                                                                                                                                                                                                                                                                                                                               |
| NUM_DELETES      | NUMBER         | NOT NULL | The number of deletes in the staging log                                                                                                                                                                                                                                                                                                                                               |
| NUM_UPDATES      | NUMBER         | NOT NULL | The number of updates in the staging log                                                                                                                                                                                                                                                                                                                                               |
| PSL_MODE         | VARCHAR2 (33)  |          | The mode specified by the user in running DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG. Possible values: <ul style="list-style-type: none"> <li>DELETE_TRUSTED</li> <li>DELETE_TRUSTED and UPDATE_TRUSTED</li> <li>ENFORCED</li> <li>INSERT_TRUSTED</li> <li>INSERT_TRUSTED and DELETE_TRUSTED</li> <li>TRUSTED</li> <li>UPDATE_TRUSTED</li> <li>UPDATE_TRUSTED and INSERT_TRUSTED</li> </ul> |

## 6.453 DBA\_SSCR\_CAPTURE

DBA\_SSCR\_CAPTURE displays session state capture statistics.

| Column          | Datatype        | NULL     | Description                               |
|-----------------|-----------------|----------|-------------------------------------------|
| DB_NAME         | VARCHAR2 (4000) |          | Database name of captured session         |
| INST_NAME       | VARCHAR2 (4000) |          | Instance name of captured session         |
| INST_ID         | NUMBER          |          | Instance ID of captured session           |
| SESSION_ID      | NUMBER          |          | Session ID of captured session            |
| SESSION_SERIAL# | NUMBER          |          | Session serial number of captured session |
| USER_NAME       | VARCHAR2 (128)  | NOT NULL | User name of captured session             |
| SCHEMA_NAME     | VARCHAR2 (128)  | NOT NULL | Schema name of captured session           |
| SEQUENCE#       | NUMBER          |          | Sequence number of captured session       |

| Column          | Datatype       | NULL | Description                       |
|-----------------|----------------|------|-----------------------------------|
| CAPTURE_MODE    | VARCHAR2 (7)   |      | Mode of capture operation         |
| CAPTURE_SCOPE   | VARCHAR2 (7)   |      | Scope of capture operation        |
| CAPTURE_FORMAT  | VARCHAR2 (9)   |      | Format of capture files           |
| CAPTURE_DIR     | VARCHAR2 (128) |      | Directory object of capture files |
| CAPTURE_LOCATOR | RAW (64)       |      | Locator of primary capture file   |
| CAPTURE_TIME    | TIMESTAMP (6)  |      | Timestamp of capture operation    |

## 6.454 DBA\_SSCR\_RESTORE

DBA\_SSCR\_RESTORE displays session state restore statistics.

| Column          | Datatype        | NULL     | Description                               |
|-----------------|-----------------|----------|-------------------------------------------|
| DB_NAME         | VARCHAR2 (4000) |          | Database name of restored session         |
| INST_NAME       | VARCHAR2 (4000) |          | Instance name of restored session         |
| INST_ID         | NUMBER          |          | Instance ID of restored session           |
| SESSION_ID      | NUMBER          |          | Session ID of restored session            |
| SESSION_SERIAL# | NUMBER          |          | Session serial number of restored session |
| USER_NAME       | VARCHAR2 (128)  | NOT NULL | User name of restored session             |
| SCHEMA_NAME     | VARCHAR2 (128)  | NOT NULL | Schema name of restored session           |
| SEQUENCE#       | NUMBER          |          | Sequence number of restore operation      |
| RESTORE_MODE    | VARCHAR2 (7)    |          | Mode of restore operation                 |
| RESTORE_SCOPE   | VARCHAR2 (7)    |          | Scope of restore operation                |
| RESTORE_FORMAT  | VARCHAR2 (9)    |          | Format of restore files                   |
| RESTORE_DIR     | VARCHAR2 (128)  |          | Directory object of restore files         |
| RESTORE_LOCATOR | RAW (64)        |          | Locator of primary restore file           |
| RESTORE_TIME    | TIMESTAMP (6)   |          | Timestamp of restore operation            |

## 6.455 DBA\_STAT\_EXTENSIONS

DBA\_STAT\_EXTENSIONS displays information about all optimizer statistics extensions in the database.

**See Also:**

"ALL\_STAT\_EXTENSIONS"

## 6.456 DBA\_STATEMENTS

DBA\_STATEMENTS Statements in stored objects accessible to sys. Its columns are the same as those in ALL\_STATEMENTS.

### See Also:

"ALL\_STATEMENTS"

## 6.457 DBA\_STMT\_AUDIT\_OPTS

DBA\_STMT\_AUDIT\_OPTS describes current system auditing options across the system and by user.

### Note:

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column       | Datatype       | NULL     | Description                                                                                                                          |
|--------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| USER_NAME    | VARCHAR2 (128) |          | User name if by user auditing; ANY CLIENT if access by a proxy on behalf of a client is being audited; NULL for system-wide auditing |
| PROXY_NAME   | VARCHAR2 (128) |          | Name of the proxy user which is performing an operation for the client; NULL if the client is performing the operation directly      |
| AUDIT_OPTION | VARCHAR2 (40)  | NOT NULL | Name of the system auditing option                                                                                                   |
| SUCCESS      | VARCHAR2 (10)  |          | Mode for WHENEVER SUCCESSFUL system auditing                                                                                         |
| FAILURE      | VARCHAR2 (10)  |          | Mode for WHENEVER NOT SUCCESSFUL system auditing                                                                                     |

## 6.458 DBA\_STORED\_SETTINGS

DBA\_STORED\_SETTINGS lists information about the persistent parameter settings for stored PL/SQL units for which the current user has execute privileges.

It also returns parameter information for all objects in the database and is accessible only to users with the SELECT\_CATALOG\_ROLE privilege. Its columns are the same as those in ALL\_STORED\_SETTINGS.

**See Also:**

"ALL\_STORED\_SETTINGS"

# 7

## Static Data Dictionary Views: DBA\_STREAMS\_ADD\_COLUMN to USER\_ZONEMAPS

This chapter contains the static data dictionary views `DBA_STREAMS_ADD_COLUMN` through `USER_ZONEMAPS`.

### 7.1 DBA\_STREAMS\_ADD\_COLUMN

`DBA_STREAMS_ADD_COLUMN` displays information about declarative rule-based transformations that add a column to a row logical change record (LCR).

| Column                       | Datatype                     | NULL | Description                                                                                                                                |
|------------------------------|------------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>RULE_OWNER</code>      | <code>VARCHAR2 (128)</code>  |      | Owner of the rule                                                                                                                          |
| <code>RULE_NAME</code>       | <code>VARCHAR2 (128)</code>  |      | Name of the rule                                                                                                                           |
| <code>SCHEMA_NAME</code>     | <code>VARCHAR2 (128)</code>  |      | Schema of the column to be added                                                                                                           |
| <code>TABLE_NAME</code>      | <code>VARCHAR2 (128)</code>  |      | Table of the column to be added                                                                                                            |
| <code>COLUMN_NAME</code>     | <code>VARCHAR2 (4000)</code> |      | Name of the column to be added                                                                                                             |
| <code>COLUMN_VALUE</code>    | <code>ANYDATA</code>         |      | Value of the column to be added                                                                                                            |
| <code>COLUMN_TYPE</code>     | <code>VARCHAR2 (4000)</code> |      | Type of the column to be added                                                                                                             |
| <code>COLUMN_FUNCTION</code> | <code>VARCHAR2 (128)</code>  |      | Name of the default function used to add a column                                                                                          |
| <code>VALUE_TYPE</code>      | <code>VARCHAR2 (3)</code>    |      | Indicates whether to modify the old ( <code>OLD</code> ), new ( <code>NEW</code> ), or both ( <code>*</code> ) values of the LCR           |
| <code>PRECEDENCE</code>      | <code>NUMBER</code>          |      | 3 (the execution order relative to other transformations on the same <code>STEP_NUMBER</code> ; the smaller number will be executed first) |
| <code>STEP_NUMBER</code>     | <code>NUMBER</code>          |      | Order in which this transformation should be executed                                                                                      |

### 7.2 DBA\_STREAMS\_DELETE\_COLUMN

`DBA_STREAMS_DELETE_COLUMN` displays information about declarative rule-based transformations that delete a column from a row logical change record (LCR).

| Column                   | Datatype                     | NULL | Description                        |
|--------------------------|------------------------------|------|------------------------------------|
| <code>RULE_OWNER</code>  | <code>VARCHAR2 (128)</code>  |      | Owner of the rule                  |
| <code>RULE_NAME</code>   | <code>VARCHAR2 (128)</code>  |      | Name of the rule                   |
| <code>SCHEMA_NAME</code> | <code>VARCHAR2 (128)</code>  |      | Schema of the column to be deleted |
| <code>TABLE_NAME</code>  | <code>VARCHAR2 (128)</code>  |      | Table of the column to be deleted  |
| <code>COLUMN_NAME</code> | <code>VARCHAR2 (4000)</code> |      | Name of the column to delete       |

| Column      | Datatype     | NULL | Description                                                                                                                  |
|-------------|--------------|------|------------------------------------------------------------------------------------------------------------------------------|
| VALUE_TYPE  | VARCHAR2 (3) |      | Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR                                          |
| PRECEDENCE  | NUMBER       |      | 1 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER | NUMBER       |      | Order in which this transformation should be executed                                                                        |

## 7.3 DBA\_STREAMS\_GLOBAL\_RULES

DBA\_STREAMS\_GLOBAL\_RULES displays information about the global rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_GLOBAL\_RULES.

**See Also:**

"ALL\_STREAMS\_GLOBAL\_RULES"

## 7.4 DBA\_STREAMS\_KEEP\_COLUMNS

DBA\_STREAMS\_KEEP\_COLUMNS displays information about declarative rule-based transformations that keep a list of columns in a row logical change record (LCR).

| Column      | Datatype        | NULL | Description                                                                                                                  |
|-------------|-----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER  | VARCHAR2 (128)  |      | Owner of the rule which has an associated transformation                                                                     |
| RULE_NAME   | VARCHAR2 (128)  |      | Name of the rule which has an associated transformation                                                                      |
| SCHEMA_NAME | VARCHAR2 (128)  |      | Schema of the column to be kept                                                                                              |
| TABLE_NAME  | VARCHAR2 (128)  |      | Table of the column to be kept                                                                                               |
| COLUMN_NAME | VARCHAR2 (4000) |      | Column to keep                                                                                                               |
| VALUE_TYPE  | VARCHAR2 (3)    |      | Indicates whether to keep the old (OLD), new (NEW), or both (*) value of the LCR                                             |
| PRECEDENCE  | NUMBER          |      | 0 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER | NUMBER          |      | Order in which this transformation should be executed                                                                        |

## 7.5 DBA\_STREAMS\_MESSAGE\_CONSUMERS

DBA\_STREAMS\_MESSAGE\_CONSUMERS displays information about all Streams messaging clients in the database. Its columns are the same as those in ALL\_STREAMS\_MESSAGE\_CONSUMERS.

**See Also:**

"ALL\_STREAMS\_MESSAGE\_CONSUMERS"

## 7.6 DBA\_STREAMS\_NEWLY\_SUPPORTED

DBA\_STREAMS\_NEWLY\_SUPPORTED displays information about all tables in the database that are newly supported by capture processes. Its columns are the same as those in ALL\_STREAMS\_NEWLY\_SUPPORTED.

**See Also:**

"ALL\_STREAMS\_NEWLY\_SUPPORTED"

## 7.7 DBA\_STREAMS\_RENAME\_COLUMN

DBA\_STREAMS\_RENAME\_COLUMN displays information about declarative rule-based transformations that rename a column in a row logical change record (LCR).

| Column           | Datatype        | NULL | Description                                                                                                                  |
|------------------|-----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2 (128)  |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2 (128)  |      | Name of the rule                                                                                                             |
| SCHEMA_NAME      | VARCHAR2 (128)  |      | Schema of the column to be renamed                                                                                           |
| TABLE_NAME       | VARCHAR2 (128)  |      | Table of the column to be renamed                                                                                            |
| FROM_COLUMN_NAME | VARCHAR2 (4000) |      | Column to rename                                                                                                             |
| TO_COLUMN_NAME   | VARCHAR2 (4000) |      | New column name                                                                                                              |
| VALUE_TYPE       | VARCHAR2 (3)    |      | Indicates whether to modify the old (OLD), new (NEW), or both (*) values of the LCR                                          |
| PRECEDENCE       | NUMBER          |      | 2 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER          |      | Order in which this transformation should be executed                                                                        |

## 7.8 DBA\_STREAMS\_RENAME\_SCHEMA

DBA\_STREAMS\_RENAME\_SCHEMA displays information about declarative rule-based transformations that rename a schema in a row logical change record (LCR).

| Column           | Datatype       | NULL | Description                                                                                                                  |
|------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2 (128) |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2 (128) |      | Name of the rule                                                                                                             |
| FROM_SCHEMA_NAME | VARCHAR2 (128) |      | Schema to be renamed                                                                                                         |
| TO_SCHEMA_NAME   | VARCHAR2 (128) |      | New schema name                                                                                                              |
| PRECEDENCE       | NUMBER         |      | 5 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER         |      | Order in which this transformation should be executed                                                                        |

## 7.9 DBA\_STREAMS\_RENAME\_TABLE

DBA\_STREAMS\_RENAME\_TABLE displays information about declarative rule-based transformations that rename a table in a row logical change record (LCR).

| Column           | Datatype       | NULL | Description                                                                                                                  |
|------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| RULE_OWNER       | VARCHAR2 (128) |      | Owner of the rule                                                                                                            |
| RULE_NAME        | VARCHAR2 (128) |      | Name of the rule                                                                                                             |
| FROM_SCHEMA_NAME | VARCHAR2 (128) |      | Schema to be renamed                                                                                                         |
| TO_SCHEMA_NAME   | VARCHAR2 (128) |      | New schema name                                                                                                              |
| FROM_TABLE_NAME  | VARCHAR2 (128) |      | Table to be renamed                                                                                                          |
| TO_TABLE_NAME    | VARCHAR2 (128) |      | New table name                                                                                                               |
| PRECEDENCE       | NUMBER         |      | 4 (the execution order relative to other transformations on the same STEP_NUMBER; the smaller number will be executed first) |
| STEP_NUMBER      | NUMBER         |      | Order in which this transformation should be executed                                                                        |

## 7.10 DBA\_STREAMS\_SCHEMA\_RULES

DBA\_STREAMS\_SCHEMA\_RULES displays information about the schema rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_SCHEMA\_RULES.

**See Also:**

"ALL\_STREAMS\_SCHEMA\_RULES"

## 7.11 DBA\_STREAMS\_TABLE\_RULES

DBA\_STREAMS\_TABLE\_RULES displays information about the table rules created for all capture processes, propagations, and apply processes in the database. Its columns are the same as those in ALL\_STREAMS\_TABLE\_RULES.

### See Also:

"ALL\_STREAMS\_TABLE\_RULES"

## 7.12 DBA\_STREAMS\_TP\_COMPONENT

DBA\_STREAMS\_TP\_COMPONENT displays information about each Replication component at each database.

| Column                 | Datatype        | NULL     | Description                                                                                                                                                                              |
|------------------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID           | NUMBER          | NOT NULL | ID of the Replication component                                                                                                                                                          |
| COMPONENT_NAME         | VARCHAR2 (4000) |          | Name of the Replication component                                                                                                                                                        |
| COMPONENT_DB           | VARCHAR2 (128)  |          | Database where the Replication component resides                                                                                                                                         |
| COMPONENT_TYPE         | VARCHAR2 (20)   |          | Type of the Replication component: <ul style="list-style-type: none"><li>• CAPTURE</li><li>• PROPAGATION SENDER</li><li>• PROPAGATION RECEIVER</li><li>• APPLY</li><li>• QUEUE</li></ul> |
| COMPONENT_CHANGED_TIME | DATE            |          | Time that the Replication component was last changed                                                                                                                                     |

## 7.13 DBA\_STREAMS\_TP\_COMPONENT\_LINK

DBA\_STREAMS\_TP\_COMPONENT\_LINK displays information about how messages flow between Replication components.

| Column                | Datatype        | NULL     | Description                                                                                                                                                                                     |
|-----------------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE_COMPONENT_ID   | NUMBER          | NOT NULL | ID of the source Replication component                                                                                                                                                          |
| SOURCE_COMPONENT_NAME | VARCHAR2 (4000) |          | Name of the source Replication component                                                                                                                                                        |
| SOURCE_COMPONENT_DB   | VARCHAR2 (128)  |          | Database where the source Replication component resides                                                                                                                                         |
| SOURCE_COMPONENT_TYPE | VARCHAR2 (20)   |          | Type of the source Replication component: <ul style="list-style-type: none"><li>• CAPTURE</li><li>• PROPAGATION SENDER</li><li>• PROPAGATION RECEIVER</li><li>• APPLY</li><li>• QUEUE</li></ul> |

| Column                     | Datatype        | NULL     | Description                                                                                                                                                                                                |
|----------------------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DESTINATION_COMPONENT_ID   | NUMBER          | NOT NULL | ID of the destination Replication component                                                                                                                                                                |
| DESTINATION_COMPONENT_NAME | VARCHAR2 (4000) |          | Name of the destination Replication component                                                                                                                                                              |
| DESTINATION_COMPONENT_DB   | VARCHAR2 (128)  |          | Database where the destination Replication component resides                                                                                                                                               |
| DESTINATION_COMPONENT_TYPE | VARCHAR2 (20)   |          | Type of the destination Replication component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |
| PATH_ID                    | NUMBER          | NOT NULL | ID of the stream path                                                                                                                                                                                      |
| POSITION                   | NUMBER          |          | Position of the link within the stream path                                                                                                                                                                |

## 7.14 DBA\_STREAMS\_TP\_COMPONENT\_STAT

DBA\_STREAMS\_TP\_COMPONENT\_STAT displays temporary performance statistics and session statistics about each Replication component.

| Column             | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                       |
|--------------------|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID       | NUMBER          | NOT NULL | ID of the Replication component                                                                                                                                                                                                                                                                                   |
| COMPONENT_NAME     | VARCHAR2 (4000) |          | Name of the Replication component                                                                                                                                                                                                                                                                                 |
| COMPONENT_DB       | VARCHAR2 (128)  |          | Database where the Replication component resides                                                                                                                                                                                                                                                                  |

| SESSION_SERIAL#    | NUMBER          |          | Serial number of the Replication session for the Replication component                                                                                                                                                                                                                                            |
| STATISTIC_TIME     | DATE            |          | Time that the statistic was taken                                                                                                                                                                                                                                                                                 |
| STATISTIC_NAME     | VARCHAR2 (64)   |          | Name of the statistic                                                                                                                                                                                                                                                                                             |
| STATISTIC_VALUE    | VARCHAR2 (4000) |          | Value of the statistic                                                                                                                                                                                                                                                                                            |
| STATISTIC_UNIT     | VARCHAR2 (64)   |          | Unit of the statistic                                                                                                                                                                                                                                                                                             |

| Column           | Datatype | NULL | Description                                 |
|------------------|----------|------|---------------------------------------------|
| ADVISOR_RUN_ID   | NUMBER   |      | Logical number (1-based) of the Advisor run |
| ADVISOR_RUN_TIME | DATE     |      | Time that the Advisor was run               |

## 7.15 DBA\_STREAMS\_TP\_DATABASE

DBA\_STREAMS\_TP\_DATABASE displays information about each database that contains Replication components.

| Column                 | Datatype       | NULL     | Description                             |
|------------------------|----------------|----------|-----------------------------------------|
| GLOBAL_NAME            | VARCHAR2 (128) | NOT NULL | Global name of the database             |
| LAST_QUERIED           | DATE           | NOT NULL | Time that the database was last queried |
| VERSION                | VARCHAR2 (128) |          | Database version of the database        |
| COMPATIBILITY          | VARCHAR2 (128) |          | Compatible setting of the database      |
| MANAGEMENT_PACK_ACCESS | VARCHAR2 (128) |          | Management pack access of the database  |

## 7.16 DBA\_STREAMS\_TP\_PATH\_BOTTLENECK

DBA\_STREAMS\_TP\_PATH\_BOTTLENECK displays temporary information about Replication components that might be slowing down the flow of messages in a stream path.

| Column                | Datatype        | NULL | Description                                                                                                                                                                                   |
|-----------------------|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH_ID               | NUMBER          |      | ID of the stream path                                                                                                                                                                         |
| COMPONENT_ID          | NUMBER          |      | ID of the bottleneck component                                                                                                                                                                |
| COMPONENT_NAME        | VARCHAR2 (4000) |      | Name of the bottleneck component                                                                                                                                                              |
| COMPONENT_DB          | VARCHAR2 (128)  |      | Database where the bottleneck component resides                                                                                                                                               |
| COMPONENT_TYPE        | VARCHAR2 (20)   |      | Type of the bottleneck component: <ul style="list-style-type: none"> <li>• CAPTURE</li> <li>• PROPAGATION SENDER</li> <li>• PROPAGATION RECEIVER</li> <li>• APPLY</li> <li>• QUEUE</li> </ul> |
| TOP_SESSION_ID        | NUMBER          |      | ID of the top session for the bottleneck component                                                                                                                                            |
| TOP_SESSION_SERIAL#   | NUMBER          |      | Serial number of the top session for the bottleneck component                                                                                                                                 |
| ACTION_NAME           | VARCHAR2 (64)   |      | Action name for the bottleneck process                                                                                                                                                        |
| BOTTLENECK_IDENTIFIED | VARCHAR2 (30)   |      | Indicates whether the bottleneck was identified (YES) or not (NO)                                                                                                                             |
| ADVISOR_RUN_ID        | NUMBER          |      | Logical number (1-based) of the Advisor run                                                                                                                                                   |
| ADVISOR_RUN_TIME      | DATE            |      | Time that the Advisor was run                                                                                                                                                                 |

| Column             | Datatype        | NULL | Description                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADVISOR_RUN_REASON | VARCHAR2 (4000) |      | Reason for the bottleneck analysis result.: <ul style="list-style-type: none"><li>• NULL - Bottleneck is identified</li><li>• PRE-11.1 DATABASE EXISTS - A pre-release 11.1 database exists in the stream path</li><li>• DIAGNOSTIC PACK REQUIRED - A database in the stream path does not have the diagnostic package installed</li><li>• NO BOTTLENECK IDENTIFIED</li></ul> |

## 7.17 DBA\_STREAMS\_TP\_PATH\_STAT

DBA\_STREAMS\_TP\_PATH\_STAT displays temporary performance statistics about each stream path that exists in the Replication topology.

| Column           | Datatype      | NULL | Description                                 |
|------------------|---------------|------|---------------------------------------------|
| PATH_ID          | NUMBER        |      | ID of the stream path                       |
| STATISTIC_TIME   | DATE          |      | Time that the statistic was taken           |
| STATISTIC_NAME   | VARCHAR2 (64) |      | Name of the statistic                       |
| STATISTIC_VALUE  | NUMBER        |      | Value of the statistic                      |
| STATISTIC_UNIT   | VARCHAR2 (64) |      | Unit of the statistic                       |
| ADVISOR_RUN_ID   | NUMBER        |      | Logical number (1-based) of the Advisor run |
| ADVISOR_RUN_TIME | DATE          |      | Time that the Advisor was run               |

## 7.18 DBA\_STREAMS\_TRANSFORM\_FUNCTION

DBA\_STREAMS\_TRANSFORM\_FUNCTION displays information about all rule-based transformation functions in the database. Its columns are the same as those in ALL\_STREAMS\_TRANSFORM\_FUNCTION.

**See Also:**

"ALL\_STREAMS\_TRANSFORM\_FUNCTION"

## 7.19 DBA\_SUBPART\_COL\_STATISTICS

DBA\_SUBPART\_COL\_STATISTICS provides column statistics and histogram information for all subpartitions in the database. Its columns are the same as those in ALL\_SUBPART\_COL\_STATISTICS.

**See Also:**

["ALL\\_SUBPART\\_COL\\_STATISTICS"](#)

## 7.20 DBA\_SUBPART\_HISTOGRAMS

DBA\_SUBPART\_HISTOGRAMS lists actual histogram data (end-points per histogram) for histograms on all table subpartitions in the database. Its columns are the same as those in ALL\_SUBPART\_HISTOGRAMS.

**See Also:**

["ALL\\_SUBPART\\_HISTOGRAMS"](#)

## 7.21 DBA\_SUBPART\_KEY\_COLUMNS

DBA\_SUBPART\_KEY\_COLUMNS lists subpartitioning key columns for all composite-partitioned tables (and local indexes on composite-partitioned tables) in the database. Its columns are the same as those in ALL\_SUBPART\_KEY\_COLUMNS.

**See Also:**

["ALL\\_SUBPART\\_KEY\\_COLUMNS"](#)

## 7.22 DBA\_SUBPARTITION\_TEMPLATES

DBA\_SUBPARTITION\_TEMPLATES describes all subpartition templates in the database. Its columns are the same as those in ALL\_SUBPARTITION\_TEMPLATES.

**See Also:**

["ALL\\_SUBPARTITION\\_TEMPLATES"](#)

## 7.23 DBA\_SUBSCR\_REGISTRATIONS

DBA\_SUBSCR\_REGISTRATIONS displays information about all subscription registrations in the database.

### Related View

USER\_SUBSCR\_REGISTRATIONS displays information about the subscription registrations owned by the current user.

| Column            | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REG_ID            | NUMBER          |          | Registration ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SUBSCRIPTION_NAME | VARCHAR2 (128)  | NOT NULL | Name of the subscription registration. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queue.                                                                                                                                                                                                         |
| LOCATION_NAME     | VARCHAR2 (256)  | NOT NULL | Location endpoint of the registration                                                                                                                                                                                                                                                                                                                                                                                                             |
| USER#             | NUMBER          | NOT NULL | Internally generated user ID                                                                                                                                                                                                                                                                                                                                                                                                                      |
| USER_CONTEXT      | RAW (128)       |          | Context the user provided during registration of PL/SQL registrations or an internally generated context for OCI registrations                                                                                                                                                                                                                                                                                                                    |
| CONTEXT_SIZE      | NUMBER          |          | Size of the context                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NAMESPACE         | VARCHAR2 (9)    |          | Namespace of the subscription registration: <ul style="list-style-type: none"> <li>• ANONYMOUS</li> <li>• AQ</li> <li>• DBCHANGE</li> </ul>                                                                                                                                                                                                                                                                                                       |
| PRESENTATION      | VARCHAR2 (7)    |          | Presentation format of notifications: <ul style="list-style-type: none"> <li>• DEFAULT - Binary</li> <li>• XML</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| VERSION           | VARCHAR2 (8)    |          | Database version: <ul style="list-style-type: none"> <li>• 8.1.6</li> <li>• 10.2</li> <li>• 11.1</li> </ul>                                                                                                                                                                                                                                                                                                                                       |

## 7.24 DBA\_SUPPLEMENTAL\_LOGGING

DBA\_SUPPLEMENTAL\_LOGGING provides information about supplemental logging for a pluggable database (PDB) in a multitenant container database (CDB).

| Column       | Datatype     | NULL | Description                                                                          |
|--------------|--------------|------|--------------------------------------------------------------------------------------|
| MINIMAL      | VARCHAR2 (3) |      | Identifies whether minimal supplemental logging is on (YES or NO)                    |
| PRIMARY_KEY  | VARCHAR2 (3) |      | Identifies whether primary key supplemental logging is on (YES or NO)                |
| UNIQUE_INDEX | VARCHAR2 (3) |      | Identifies whether unique column supplemental logging is on (YES or NO)              |
| FOREIGN_KEY  | VARCHAR2 (3) |      | Identifies whether foreign key supplemental logging is on (YES or NO)                |
| ALL_COLUMN   | VARCHAR2 (3) |      | Identifies whether all column supplemental logging is on (YES or NO)                 |
| PROCEDURAL   | VARCHAR2 (3) |      | Identifies whether supplemental logging for procedural replication is on (YES or NO) |
| SUBSET_REP   | VARCHAR2 (3) |      | Indicates whether subset database replication is on (YES or NO)                      |

 **See Also:**

- *Oracle Database Utilities* for more information about supplemental logging
- "[V\\$DATABASE](#)" for information about supplemental logging in a CDB

## 7.25 DBA\_SYNC\_CAPTURE

DBA\_SYNC\_CAPTURE displays information about all synchronous capture processes in the database. Its columns are the same as those in ALL\_SYNC\_CAPTURE.

 **See Also:**

["ALL\\_SYNC\\_CAPTURE"](#)

## 7.26 DBA\_SYNC\_CAPTURE\_PREPARED\_TABS

DBA\_SYNC\_CAPTURE\_PREPARED\_TABS displays information about all tables in the database that are prepared for synchronous capture instantiation. Its columns are the same as those in ALL\_SYNC\_CAPTURE\_PREPARED\_TABS.

 **See Also:**

["ALL\\_SYNC\\_CAPTURE\\_PREPARED\\_TABS"](#)

## 7.27 DBA\_SYNC\_CAPTURE\_TABLES

DBA\_SYNC\_CAPTURE\_TABLES displays information about all tables in the database that are captured by synchronous captures. Its columns are the same as those in ALL\_SYNC\_CAPTURE\_TABLES.

 **See Also:**

["ALL\\_SYNC\\_CAPTURE\\_TABLES"](#)

## 7.28 DBA\_SYNONYMS

DBA\_SYNONYMS describes all synonyms in the database. Its columns are the same as those in ALL\_SYNONYMS.

**See Also:**

"ALL\_SYNONYMS"

## 7.29 DBA\_SYS\_PRIVS

DBA\_SYS\_PRIVS describes system privileges granted to users and roles.

| Column       | Datatype       | NULL | Description                                                                                                                                                                                                                                            |
|--------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE      | VARCHAR2 (128) |      | Grantee name, user, or role receiving the grant                                                                                                                                                                                                        |
| PRIVILEGE    | VARCHAR2 (40)  |      | System privilege                                                                                                                                                                                                                                       |
| ADMIN_OPTION | VARCHAR2 (3)   |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO)                                                                                                                                                                                |
| COMMON       | VARCHAR2 (3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"><li>• YES if the privilege was granted commonly (CONTAINER=ALL was used)</li><li>• NO if the privilege was granted locally (CONTAINER=ALL was not used)</li></ul> |
| INHERITED    | VARCHAR2 (3)   |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                     |

## 7.30 DBA\_SYS\_PRIVS\_ALL

DBA\_SYS\_PRIVS\_ALL describes system privileges and schema privileges granted to users and roles.

| Column    | Datatype       | NULL | Description                                                                                           |
|-----------|----------------|------|-------------------------------------------------------------------------------------------------------|
| GRANTEE   | VARCHAR2 (128) |      | Grantee name, user, or role receiving the grant                                                       |
| PRIVILEGE | VARCHAR2 (40)  |      | Privilege                                                                                             |
| SCHEMA    | VARCHAR2 (128) |      | Schema on which the privilege was granted<br>For system privileges, the value of this column is null. |

| Column       | Datatype     | NULL | Description                                                                                                                                                                                                                                           |
|--------------|--------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADMIN_OPTION | VARCHAR2 (3) |      | Indicates whether the grant was with the ADMIN option (YES) or not (NO)                                                                                                                                                                               |
| COMMON       | VARCHAR2 (3) |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| INHERITED    | VARCHAR2 (3) |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                    |

**Note:**

This view is available starting with Oracle Database 23ai.

## 7.31 DBA\_TAB\_COL\_STAT\_MODELS

DBA\_TAB\_COL\_STAT\_MODELS describes real-time statistics models for all tables in the database. Its columns are the same as those in ALL\_TAB\_COL\_STAT\_MODELS.

Real-time statistics models use machine learning algorithms to predict the number of distinct values (NDV) for table columns.

**See Also:**

"ALL\_TAB\_COL\_STAT\_MODELS"

## 7.32 DBA\_TAB\_COL\_STATISTICS

DBA\_TAB\_COL\_STATISTICS contains column statistics and histogram information extracted from DBA\_TAB\_COLUMNS. Its columns are the same as those in ALL\_TAB\_COL\_STATISTICS.

**See Also:**

- "DBA\_TAB\_COLUMNS"
- "ALL\_TAB\_COL\_STATISTICS"

## 7.33 DBA\_TAB\_COLS

DBA\_TAB\_COLS describes the columns of all tables, views, and clusters in the database.

Its columns (except for SENSITIVE\_COLUMN) are the same as those in ALL\_TAB\_COLS.

To gather statistics for this view, use the DBMS\_STATS package.

This view differs from DBA\_TAB\_COLUMNS in that system-generated hidden columns are not filtered out.

Columns marked with an asterisk (\*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]\_COL\_STATISTICS views.

| Column          | Datatype        | NULL     | Description                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER           | VARCHAR2 (128)  | NOT NULL | Owner of the table, view, or cluster                                                                                                                                                                                                                                                                                                    |
| TABLE_NAME      | VARCHAR2 (128)  | NOT NULL | Name of the table, view, or cluster                                                                                                                                                                                                                                                                                                     |
| COLUMN_NAME     | VARCHAR2 (128)  | NOT NULL | Column name                                                                                                                                                                                                                                                                                                                             |
| DATA_TYPE       | VARCHAR2 (128)  |          | Data type of the column                                                                                                                                                                                                                                                                                                                 |
| DATA_TYPE_MOD   | VARCHAR2 (3)    |          | Data type modifier of the column                                                                                                                                                                                                                                                                                                        |
| DATA_TYPE_OWNER | VARCHAR2 (128)  |          | Owner of the data type of the column                                                                                                                                                                                                                                                                                                    |
| DATA_LENGTH     | NUMBER          | NOT NULL | Length of the column (in bytes)                                                                                                                                                                                                                                                                                                         |
| DATA_PRECISION  | NUMBER          |          | Decimal precision for NUMBER data type; binary precision for FLOAT data type; NULL for all other data types                                                                                                                                                                                                                             |
| DATA_SCALE      | NUMBER          |          | Digits to the right of the decimal point in a number                                                                                                                                                                                                                                                                                    |
| NULLABLE        | VARCHAR2 (1)    |          | Indicates whether a column allows NULLs. The value is N if there is a NOT NULL constraint on the column or if the column is part of a PRIMARY KEY.                                                                                                                                                                                      |
| COLUMN_ID       | NUMBER          |          | Sequence number of the column as created                                                                                                                                                                                                                                                                                                |
| DEFAULT_LENGTH  | NUMBER          |          | Length of the default value for the column                                                                                                                                                                                                                                                                                              |
| DATA_DEFAULT    | LONG            |          | Default value for the column                                                                                                                                                                                                                                                                                                            |
| DATA_DEFAULT_VC | VARCHAR2 (4000) |          | Default value for the column<br>This column may truncate the default value.                                                                                                                                                                                                                                                             |
| NUM_DISTINCT*   | NUMBER          |          | Number of distinct values in the column                                                                                                                                                                                                                                                                                                 |
| LOW_VALUE*      | RAW (1000)      |          | Low value in the column                                                                                                                                                                                                                                                                                                                 |
| HIGH_VALUE*     | RAW (1000)      |          | High value in the column                                                                                                                                                                                                                                                                                                                |
| DENSITY*        | NUMBER          |          | If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram. It does not represent the selectivity of values that span 2 or more endpoints.<br>If a histogram is not available on COLUMN_NAME, then the value of this column is 1/NUM_DISTINCT. |
| NUM_NULLS       | NUMBER          |          | Number of NULLs in the column                                                                                                                                                                                                                                                                                                           |

| Column               | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_BUCKETS          | NUMBER        |          | Number of buckets in the histogram for the column<br><b>Note:</b> The number of buckets in a histogram is specified in the <code>SIZE</code> parameter of the <code>ANALYZE</code> SQL statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm. |
| LAST_ANALYZED        | DATE          |          | Date on which this column was most recently analyzed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SAMPLE_SIZE          | NUMBER        |          | Sample size used in analyzing this column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| AVG_COL_LEN          | NUMBER        |          | Average length of the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CHAR_LENGTH          | NUMBER        |          | Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none"> <li>CHAR</li> <li>VARCHAR2</li> <li>NCHAR</li> <li>NVARCHAR2</li> </ul>                                                                                                                                                                                                                                                                                                                                |
| CHAR_USED            | VARCHAR2 (1)  |          | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none"> <li>CHAR</li> <li>VARCHAR2</li> <li>NCHAR</li> <li>NVARCHAR2</li> </ul>                                                                                                                                                                                                                                                                                  |
| V80_FMT_IMAGE        | VARCHAR2 (3)  |          | Indicates whether the column data is in release 8.0 image format (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DATA_UPGRADED        | VARCHAR2 (3)  |          | Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| HIDDEN_COLUMN        | VARCHAR2 (3)  |          | Indicates whether the column is a hidden column (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VIRTUAL_COLUMN       | VARCHAR2 (3)  |          | Indicates whether the column is a virtual column (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SEGMENT_COLUMN_ID    | NUMBER        |          | Sequence number of the column in the segment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| INTERNAL_COLUMN_ID   | NUMBER        | NOT NULL | Internal sequence number of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column                | Datatype        | NULL | Description                                                                                                                                                                                |
|-----------------------|-----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HISTOGRAM             | VARCHAR2 (15)   |      | Indicates existence/type of histogram: <ul style="list-style-type: none"> <li>• NONE</li> <li>• FREQUENCY</li> <li>• TOP-FREQUENCY</li> <li>• HEIGHT BALANCED</li> <li>• HYBRID</li> </ul> |
| QUALIFIED_COL_NAME    | VARCHAR2 (4000) |      | Qualified column name                                                                                                                                                                      |
| USER_GENERATED        | VARCHAR2 (3)    |      | Indicates whether the column is a user-generated column (YES) or a system-generated column (NO)                                                                                            |
| DEFAULT_ON_NULL       | VARCHAR2 (3)    |      | Indicates whether the column has DEFAULT ON NULL for INSERT semantics (YES) or not (NO)                                                                                                    |
| DEFAULT_ON_NULL_UPD   | VARCHAR2 (3)    |      | Indicates whether the column has DEFAULT ON NULL for UPDATE semantics (YES) or not (NO)                                                                                                    |
| RESERVABLE_COLUMN     | VARCHAR2 (3)    |      | Indicates whether the column is a reservable column (YES) or not (NO)                                                                                                                      |
| IDENTITY_COLUMN       | VARCHAR2 (3)    |      | Indicates whether this is an identity column (YES) or not (NO)                                                                                                                             |
| SENSITIVE_COLUMN      | VARCHAR2 (3)    |      | Indicates whether this is a sensitive column (YES) or not (NO)                                                                                                                             |
| EVALUATION_EDITION    | VARCHAR2 (128)  |      | Name of the edition in which editioned objects referenced in an expression column are resolved                                                                                             |
| UNUSABLE_BEFORE       | VARCHAR2 (128)  |      | Name of the oldest edition in which the index may be used as part of a query plan                                                                                                          |
| UNUSABLE_BEGINNING    | VARCHAR2 (128)  |      | Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants                                                                  |
| COLLATION             | VARCHAR2 (100)  |      | Collation for the column. Only applies to columns with character data types.                                                                                                               |
| COLLATED_COLUMN_ID    | NUMBER          |      | Internal sequence number of a column, for which this virtual column generates a collation key                                                                                              |
| DOMAIN_OWNER          | VARCHAR2 (128)  |      | If a data use case domain is specified for the column, the owner of the data use case domain                                                                                               |
| DOMAIN_NAME           | VARCHAR2 (128)  |      | If a data use case domain is specified for the column, the name of the data use case domain                                                                                                |
| DOMAIN_COLUMN_NAME    | VARCHAR2 (128)  |      | If a data use case domain is specified for the column, the name of the data use case domain column                                                                                         |
| DOMAIN_ASSOCIATION_ID | NUMBER          |      | If a data use case domain is specified for the column, the domain association ID                                                                                                           |

| Column        | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JSON_MODIFIER | VARCHAR2 (448) |      | <p>JSON-type modifier for the column</p> <p>A value is displayed only for columns of data type JSON.</p> <p>If one or more JSON-type modifiers are specified for the column, then the following is displayed:</p> <pre>JSON( modifier [, modifier]... )</pre> <p>Possible values for <i>modifier</i>:</p> <ul style="list-style-type: none"> <li>• ARRAY - JSON array</li> <li>• OBJECT - JSON object</li> <li>• SCALAR - JSON scalar</li> <li>• <i>data_type</i> - JSON scalar of type <i>data_type</i></li> <li>• NULL - JSON null value</li> </ul> <p>If a JSON-type modifier is not specified for the column, then the following is displayed:</p> <pre>JSON( )</pre> |
| VECTOR_INFO   | VARCHAR2 (56)  |      | <p>Indicates the number of vectors and their data type in an ONNX model</p> <p>Format: VECTOR(<i>dimension</i>,<i>element_type</i>)</p> <p>Example: VECTOR(768,float32)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 7.34 DBA\_TAB\_COLUMNS

DBA\_TAB\_COLUMNS describes the columns of all tables, views, and clusters in the database.

Its columns (except for SENSITIVE\_COLUMN) are the same as those in ALL\_TAB\_COLUMNS.

To gather statistics for this view, use the DBMS\_STATS package.

This view filters out system-generated hidden columns. The DBA\_TAB\_COLS view does not filter out system-generated hidden columns.

Columns marked with an asterisk (\*) in the table below remain for backward compatibility with Oracle7. This information is now in the [TAB|PART]\_COL\_STATISTICS views.

| Column      | Datatype       | NULL     | Description                          |
|-------------|----------------|----------|--------------------------------------|
| OWNER       | VARCHAR2 (128) | NOT NULL | Owner of the table, view, or cluster |
| TABLE_NAME  | VARCHAR2 (128) | NOT NULL | Name of the table, view, or cluster  |
| COLUMN_NAME | VARCHAR2 (128) | NOT NULL | Column name                          |

| DENSITY*             | NUMBER          |          | If a histogram is available on <code>COLUMN_NAME</code> , then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram. It does not represent the selectivity of values that span 2 or more endpoints.<br><br>If a histogram is not available on <code>COLUMN_NAME</code> , then the value of this column is <code>1/NUM_DISTINCT</code> .                                                                                                                                                           |
| NUM_NULLS            | NUMBER          |          | Number of <code>NULL</code> s in the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NUM_BUCKETS          | NUMBER          |          | Number of buckets in the histogram for the column<br><b>Note:</b> The number of buckets in a histogram is specified in the <code>SIZE</code> parameter of the <code>ANALYZE SQL</code> statement. However, Oracle Database does not create a histogram with more buckets than the number of rows in the sample. Also, if the sample contains any values that are very repetitious, Oracle Database creates the specified number of buckets, but the value indicated by this column may be smaller because of an internal compression algorithm. |
| LAST_ANALYZED        | DATE            |          | Date on which this column was most recently analyzed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SAMPLE_SIZE          | NUMBER          |          | Sample size used in analyzing this column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CHARACTER_SET_NAME   | VARCHAR2 (44)   |          | Name of the character set: <ul style="list-style-type: none"> <li>• <code>CHAR_CS</code></li> <li>• <code>NCHAR_CS</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                            |
| CHAR_COL_DECL_LENGTH | NUMBER          |          | Declaration length of the character type column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| GLOBAL_STATS         | VARCHAR2 (3)    |          | <code>GLOBAL_STATS</code> will be <code>YES</code> if statistics are gathered or incrementally maintained, otherwise it will be <code>NO</code>                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column              | Datatype       | NULL | Description                                                                                                                                                                                                                                                            |
|---------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER_STATS          | VARCHAR2 (3)   |      | Indicates whether statistics were entered directly by the user (YES) or not (NO)                                                                                                                                                                                       |
| AVG_COL_LEN         | NUMBER         |      | Average length of the column (in bytes)                                                                                                                                                                                                                                |
| CHAR_LENGTH         | NUMBER         |      | Displays the length of the column in characters. This value only applies to the following data types: <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul>                                               |
| CHAR_USED           | VARCHAR2 (1)   |      | Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C), or whether the data type is not any of the following (NULL): <ul style="list-style-type: none"> <li>• CHAR</li> <li>• VARCHAR2</li> <li>• NCHAR</li> <li>• NVARCHAR2</li> </ul> |
| V80_FMT_IMAGE       | VARCHAR2 (3)   |      | Indicates whether the column data is in release 8.0 image format (YES) or not (NO)                                                                                                                                                                                     |
| DATA_UPGRADED       | VARCHAR2 (3)   |      | Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)                                                                                                                                                                |
| HISTOGRAM           | VARCHAR2 (15)  |      | Indicates existence/type of histogram: <ul style="list-style-type: none"> <li>• NONE</li> <li>• FREQUENCY</li> <li>• TOP-FREQUENCY</li> <li>• HEIGHT BALANCED</li> <li>• HYBRID</li> </ul>                                                                             |
| DEFAULT_ON_NULL     | VARCHAR2 (3)   |      | Indicates whether the column has DEFAULT ON NULL for INSERT semantics (YES) or not (NO)                                                                                                                                                                                |
| DEFAULT_ON_NULL_UPD | VARCHAR2 (3)   |      | Indicates whether the column has DEFAULT ON NULL for UPDATE semantics (YES) or not (NO)                                                                                                                                                                                |
| RESERVABLE_COLUMN   | VARCHAR2 (3)   |      | Indicates whether the column is a reservable column (YES) or not (NO)                                                                                                                                                                                                  |
| IDENTITY_COLUMN     | VARCHAR2 (3)   |      | Indicates whether this is an identity column (YES) or not (NO)                                                                                                                                                                                                         |
| SENSITIVE_COLUMN    | VARCHAR2 (3)   |      | Indicates whether this is a sensitive column (YES) or not (NO)                                                                                                                                                                                                         |
| EVALUATION_EDITION  | VARCHAR2 (128) |      | Name of the edition in which editioned objects referenced in an expression column are resolved                                                                                                                                                                         |
| UNUSABLE_BEFORE     | VARCHAR2 (128) |      | Name of the oldest edition in which the index may be used as part of a query plan                                                                                                                                                                                      |
| UNUSABLE_BEGINNING  | VARCHAR2 (128) |      | Name of the edition for which the index may not be used as part of a query plan in this edition or any of its descendants                                                                                                                                              |
| COLLATION           | VARCHAR2 (100) |      | Collation for the column. Only applies to columns with character data types.                                                                                                                                                                                           |
| DOMAIN_OWNER        | VARCHAR2 (128) |      | If a data use case domain is specified for the column, the owner of the data use case domain                                                                                                                                                                           |

| Column                | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOMAIN_NAME           | VARCHAR2 (128) |      | If a data use case domain is specified for the column, the name of the data use case domain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DOMAIN_COLUMN_NAME    | VARCHAR2 (128) |      | If a data use case domain is specified for the column, the name of the data use case domain column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DOMAIN_ASSOCIATION_ID | NUMBER         |      | If a data use case domain is specified for the column, the domain association ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| JSON_MODIFIER         | VARCHAR2 (448) |      | <p>JSON-type modifier for the column</p> <p>A value is displayed only for columns of data type JSON.</p> <p>If one or more JSON-type modifiers are specified for the column, then the following is displayed:<br/> JSON( <i>modifier</i> [, <i>modifier</i>]... )</p> <p>Possible values for <i>modifier</i>:</p> <ul style="list-style-type: none"> <li>• ARRAY - JSON array</li> <li>• OBJECT - JSON object</li> <li>• SCALAR - JSON scalar</li> <li>• <i>data_type</i> - JSON scalar of type <i>data_type</i></li> <li>• NULL - JSON null value</li> </ul> <p>If a JSON-type modifier is not specified for the column, then the following is displayed:<br/> JSON( )</p> |
| VECTOR_INFO           | VARCHAR2 (56)  |      | <p>Indicates the number of vectors and their data type in an ONNX model</p> <p>Format: VECTOR(<i>dimension</i>,<i>element_type</i>)</p> <p>Example: VECTOR(768,float32)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**See Also:**

- "ALL\_TAB\_COLUMNS"
- "DBA\_TAB\_COLS"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_STATS package

## 7.35 DBA\_TAB\_COMMENTS

DBA\_TAB\_COMMENTS displays comments on all tables and views in the database. Its columns are the same as those in ALL\_TAB\_COMMENTS.

**See Also:**

- "ALL\_TAB\_COMMENTS"

## 7.36 DBA\_TAB\_HISTGRM\_PENDING\_STATS

DBA\_TAB\_HISTGRM\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in ALL\_TAB\_HISTGRM\_PENDING\_STATS.

**See Also:**

["ALL\\_TAB\\_HISTGRM\\_PENDING\\_STATS"](#)

## 7.37 DBA\_TAB\_HISTOGRAMS

DBA\_TAB\_HISTOGRAMS describes histograms on columns of all tables in the database. Its columns are the same as those in ALL\_TAB\_HISTOGRAMS.

**See Also:**

["ALL\\_TAB\\_HISTOGRAMS"](#)

## 7.38 DBA\_TAB\_IDENTITY\_COLS

DBA\_TAB\_IDENTITY\_COLS describes all table identity columns. Its columns are the same as those in ALL\_TAB\_IDENTITY\_COLS.

**See Also:**

["ALL\\_TAB\\_IDENTITY\\_COLS"](#)

## 7.39 DBA\_TAB\_MODIFICATIONS

DBA\_TAB\_MODIFICATIONS describes modifications to all tables in the database that have been modified since the last time statistics were gathered on the tables. Its columns are the same as those in ALL\_TAB\_MODIFICATIONS.

**See Also:**

["ALL\\_TAB\\_MODIFICATIONS"](#)

## 7.40 DBA\_TAB\_PARTITIONS

DBA\_TAB\_PARTITIONS displays partition-level partitioning information, partition storage parameters, and partition statistics generated by the DBMS\_STATS package for all partitions in the database.

Its columns are the same as those in "ALL\_TAB\_PARTITIONS".

## 7.41 DBA\_TAB\_PENDING\_STATS

DBA\_TAB\_PENDING\_STATS describes pending statistics for tables, partitions, and subpartitions in the database. Its columns are the same as those in ALL\_TAB\_PENDING\_STATS.

**See Also:**

"ALL\_TAB\_PENDING\_STATS"

## 7.42 DBA\_TAB\_PRIVS

DBA\_TAB\_PRIVS describes all object grants in the database.

### Related View

USER\_TAB\_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee.

| Column     | Datatype       | NULL | Description                                                                                                                                                                                                                                           |
|------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANTEE    | VARCHAR2 (128) |      | Name of the user or role to whom access was granted                                                                                                                                                                                                   |
| OWNER      | VARCHAR2 (128) |      | Owner of the object                                                                                                                                                                                                                                   |
| TABLE_NAME | VARCHAR2 (128) |      | Name of the object. The object can be any object, including tables, packages, indexes, sequences, and so on.                                                                                                                                          |
| GRANTOR    | VARCHAR2 (128) |      | Name of the user who performed the grant                                                                                                                                                                                                              |
| PRIVILEGE  | VARCHAR2 (40)  |      | Privilege on the object                                                                                                                                                                                                                               |
| GRANTABLE  | VARCHAR2 (3)   |      | Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)                                                                                                                                                                   |
| HIERARCHY  | VARCHAR2 (3)   |      | Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)                                                                                                                                                               |
| COMMON     | VARCHAR2 (3)   |      | Indicates how the grant was made. Possible values: <ul style="list-style-type: none"> <li>YES if the privilege was granted commonly (CONTAINER=ALL was used)</li> <li>NO if the privilege was granted locally (CONTAINER=ALL was not used)</li> </ul> |
| TYPE       | VARCHAR2 (24)  |      | Type of the object                                                                                                                                                                                                                                    |
| INHERITED  | VARCHAR2 (3)   |      | Indicates whether the grant was inherited from another container (YES) or not (NO)                                                                                                                                                                    |

**See Also:**

["USER\\_TAB\\_PRIVS"](#)

## 7.43 DBA\_TAB\_STATISTICS

DBA\_TAB\_STATISTICS displays optimizer statistics for all tables in the database. Its columns are the same as those in ALL\_TAB\_STATISTICS.

**See Also:**

["ALL\\_TAB\\_STATISTICS"](#)

## 7.44 DBA\_TAB\_STAT\_PREFS

DBA\_TAB\_STAT\_PREFS displays information about statistics preferences for all tables in the database. Its columns are the same as those in ALL\_TAB\_STAT\_PREFS.

**See Also:**

["ALL\\_TAB\\_STAT\\_PREFS"](#).

## 7.45 DBA\_TAB\_STATS\_HISTORY

DBA\_TAB\_STATS\_HISTORY provides a history of table statistics modifications for all tables in the database. Its columns are the same as those in ALL\_TAB\_STATS\_HISTORY.

**See Also:**

["ALL\\_TAB\\_STATS\\_HISTORY"](#)

## 7.46 DBA\_TAB\_SUBPARTITIONS

DBA\_TAB\_SUBPARTITIONS displays, for each table subpartition, the subpartition name, name of the table and partition to which it belongs, its storage attributes, and statistics generated by the DBMS\_STATS package.

Its columns are the same as those in ["ALL\\_TAB\\_SUBPARTITIONS"](#).

## 7.47 DBA\_TABLE\_ACCESS\_STATS

DBA\_TABLE\_ACCESS\_STATS displays the scan count for all tables and partitions in the database. Its columns are the same as those in ALL\_TABLE\_ACCESS\_STATS.

### Note:

The ALL\_TABLE\_ACCESS\_STATS and DBA\_TABLE\_ACCESS\_STATS views do not display data for Oracle-maintained schemas. You can view data for an Oracle-maintained schema by connecting to the schema and querying the USER\_TABLE\_ACCESS\_STATS view.

### See Also:

- ["ALL\\_TABLE\\_ACCESS\\_STATS"](#)
- ["USER\\_TABLE\\_ACCESS\\_STATS"](#)

## 7.48 DBA\_TABLE\_VIRTUAL\_COLUMNS

DBA\_TABLE\_VIRTUAL\_COLUMNS describes virtual columns in all tables in the database. Its columns are the same as those in ALL\_TABLE\_VIRTUAL\_COLUMNS.

### See Also:

["ALL\\_TABLE\\_VIRTUAL\\_COLUMNS"](#)

## 7.49 DBA\_TABLES

DBA\_TABLES describes all relational tables in the database. Its columns are the same as those in ALL\_TABLES.

To gather statistics for this view, use the DBMS\_STATS package.

### See Also:

["ALL\\_TABLES"](#)

## 7.50 DBA\_TABLESPACE\_GROUPS

DBA\_TABLESPACE\_GROUPS describes all tablespace groups in the database.

| Column          | Datatype      | NULL     | Description                  |
|-----------------|---------------|----------|------------------------------|
| GROUP_NAME      | VARCHAR2 (30) | NOT NULL | Name of the tablespace group |
| TABLESPACE_NAME | VARCHAR2 (30) | NOT NULL | Name of the tablespace       |

## 7.51 DBA\_TABLESPACE\_THRESHOLDS

DBA\_TABLESPACE\_THRESHOLDS describes space utilization threshold settings for all tablespaces in the database.

| Column            | Datatype       | NULL | Description                                                                                                                                                                                                           |
|-------------------|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLESPACE_NAME   | VARCHAR2 (30)  |      | Tablespace name                                                                                                                                                                                                       |
| CONTENTS          | VARCHAR2 (9)   |      | Tablespace contents: <ul style="list-style-type: none"> <li>• UNDO</li> <li>• PERMANENT</li> <li>• TEMPORARY</li> </ul>                                                                                               |
| EXTENT_MANAGEMENT | VARCHAR2 (10)  |      | Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)                                                                                                        |
| THRESHOLD_TYPE    | VARCHAR2 (8)   |      | Indicates whether the threshold value is derived from a DEFAULT threshold or an EXPLICIT threshold                                                                                                                    |
| METRICS_NAME      | VARCHAR2 (64)  |      | Name of the metric for which the threshold is set                                                                                                                                                                     |
| WARNING_OPERATOR  | VARCHAR2 (12)  |      | Relational operator for warning thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO_NOT_CHECK</li> </ul>  |
| WARNING_VALUE     | VARCHAR2 (256) |      | Warning threshold value                                                                                                                                                                                               |
| CRITICAL_OPERATOR | VARCHAR2 (12)  |      | Relational operator for critical thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO_NOT_CHECK</li> </ul> |
| CRITICAL_VALUE    | VARCHAR2 (256) |      | Critical threshold value                                                                                                                                                                                              |

## 7.52 DBA\_TABLESPACE\_USAGE\_METRICS

DBA\_TABLESPACE\_USAGE\_METRICS describes tablespace usage metrics for all types of tablespaces, including permanent, temporary, and undo tablespaces.

| Column          | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) |      | Tablespace name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| USED_SPACE      | NUMBER        |      | Total space consumed by all objects created in the tablespace, expressed as number of data blocks<br>For undo tablespaces, the value of this column includes space consumed by both expired and unexpired undo segments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ALLOCATION_SIZE | NUMBER        |      | For smallfile tablespaces, the combined current size of all datafiles, expressed as number of data blocks<br>For bigfile tablespaces, the current size of the single datafile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TABLESPACE_SIZE | NUMBER        |      | The maximum size of the tablespace, expressed as number of data blocks <ul style="list-style-type: none"> <li>If the tablespace contains any datafiles with autoextend enabled, then this column displays the maximum size to which the tablespace can grow. Underlying storage free space, such as Oracle ASM or file system storage, is also taken into account when computing this value.<br/>For example: <ul style="list-style-type: none"> <li>If a tablespace has a current size of 5 GB, the combined maximum size of its datafiles is 32 GB, and its underlying storage has 20 GB of free space, then this column will have a value of approximately 25 GB.</li> <li>If a tablespace has a current size of 10 GB, the combined maximum size its datafiles is 20 GB, and its underlying storage has 25 GB of free space, then this column will have a value of approximately 20 GB.</li> </ul> </li> <li>If the tablespace contains only datafiles with autoextend disabled, then this column displays the combined size of all datafiles in the tablespace.</li> </ul> |
| USED_PERCENT    | NUMBER        |      | Percentage of used space, as a function of the maximum possible tablespace size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCK_SIZE      | NUMBER        |      | Tablespace block size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 7.53 DBA\_TABLESPACES

DBA\_TABLESPACES describes all tablespaces in the database.

### Related View

USER\_TABLESPACES describes the tablespaces accessible to the current user. This view does not display the PLUGGED\_IN column.

| Column          | Datatype      | NULL     | Description                                |
|-----------------|---------------|----------|--------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | NOT NULL | Name of the tablespace                     |
| BLOCK_SIZE      | NUMBER        | NOT NULL | Tablespace block size (in bytes)           |
| INITIAL_EXTENT  | NUMBER        |          | Default initial extent size (in bytes)     |
| NEXT_EXTENT     | NUMBER        |          | Default incremental extent size (in bytes) |

## 7.54 DBA\_TEMP\_FILES

`DBA_TEMP_FILES` describes all temporary files (tempfiles) in the database.

| Column          | Datatype       | NULL     | Description                                                                                                                               |
|-----------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NAME       | VARCHAR2 (513) |          | Name of the database temp file                                                                                                            |
| FILE_ID         | NUMBER         |          | File identifier number of the database temp file                                                                                          |
| TABLESPACE_NAME | VARCHAR2 (30)  | NOT NULL | Name of the tablespace to which the file belongs                                                                                          |
| BYTES           | NUMBER         |          | Size of the file (in bytes)                                                                                                               |
| BLOCKS          | NUMBER         |          | Size of the file (in Oracle blocks)                                                                                                       |
| STATUS          | VARCHAR2 (7)   |          | <p>File status:</p> <ul style="list-style-type: none"> <li>• <b>OFFLINE</b></li> <li>• <b>ONLINE</b></li> <li>• <b>UNKNOWN</b></li> </ul> |
| RELATIVE_FNO    | NUMBER         |          | Tablespace-relative file number                                                                                                           |

| Column         | Datatype      | NULL | Description                                                                                                                                                                                                                                                                               |
|----------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTOEXTENSIBLE | VARCHAR2 (3)  |      | Indicates whether the file is autoextensible (YES) or not (NO)                                                                                                                                                                                                                            |
| MAXBYTES       | NUMBER        |      | maximum size of the file (in bytes)                                                                                                                                                                                                                                                       |
| MAXBLOCKS      | NUMBER        |      | Maximum size of the file (in Oracle blocks)                                                                                                                                                                                                                                               |
| INCREMENT_BY   | NUMBER        |      | Default increment for autoextension (in Oracle blocks)                                                                                                                                                                                                                                    |
| USER_BYTES     | NUMBER        |      | Size of the useful portion of the file (in bytes)                                                                                                                                                                                                                                         |
| USER_BLOCKS    | NUMBER        |      | Size of the useful portion of the file (in Oracle blocks)                                                                                                                                                                                                                                 |
| SHARED         | VARCHAR2 (12) |      | Type of tablespace this file belongs to: <ul style="list-style-type: none"> <li>• SHARED: For shared tablespace</li> <li>• LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances</li> <li>• LOCAL_FOR_ALL: Local temporary tablespace for all instance types</li> </ul> |
| INST_ID        | NUMBER        |      | Instance ID of the instance to which the temp file belongs. This column has a NULL value for temp files that belong to shared tablespaces.                                                                                                                                                |

## 7.55 DBA\_TEMP\_FREE\_SPACE

DBA\_TEMP\_FREE\_SPACE displays temporary space usage information at tablespace level.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                               |
|-----------------|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | NOT NULL | Name of the tablespace                                                                                                                                                                                                                                                                    |
| TABLESPACE_SIZE | NUMBER        |          | Total size of the tablespace, in bytes                                                                                                                                                                                                                                                    |
| ALLOCATED_SPACE | NUMBER        |          | Total allocated space, in bytes, including space that is currently allocated and used and space that is currently allocated and available for reuse                                                                                                                                       |
| FREE_SPACE      | NUMBER        |          | Total free space available, in bytes, including space that is currently allocated and available for reuse and space that is currently unallocated                                                                                                                                         |
| SHARED          | VARCHAR2 (12) |          | Type of tablespace this file belongs to: <ul style="list-style-type: none"> <li>• SHARED: For shared tablespace</li> <li>• LOCAL_FOR_RIM: Local temporary tablespace for RIM (read-only) instances</li> <li>• LOCAL_FOR_ALL: Local temporary tablespace for all instance types</li> </ul> |
| INST_ID         | NUMBER        |          | Instance ID of the instance to which the tempfile belongs                                                                                                                                                                                                                                 |

## 7.56 DBA\_THRESHOLDS

DBA\_THRESHOLDS describes all thresholds.

| Column       | Datatype      | NULL | Description  |
|--------------|---------------|------|--------------|
| METRICS_NAME | VARCHAR2 (64) |      | Metrics name |

| Column                  | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|----------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WARNING_OPERATOR        | VARCHAR2 (12)  |      | Relational operator for warning thresholds: <ul style="list-style-type: none"> <li>• GT</li> <li>• EQ</li> <li>• LT</li> <li>• LE</li> <li>• GE</li> <li>• CONTAINS</li> <li>• NE</li> <li>• DO NOT CHECK</li> <li>• DO_NOT_CHECK</li> </ul>                                                                                                                                                                                                                                                                                                          |
| WARNING_VALUE           | VARCHAR2 (256) |      | Warning threshold value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| STATUS                  | VARCHAR2 (7)   |      | Indicates whether the threshold is applicable on a valid object (VALID) or not (INVALID) <p>Thresholds for non-tablespace metrics can only be set in ROOT and apply to a CDB as a whole. Any pre-existing non-tablespace thresholds that may exist in a PDB have a status of INVALID in the DBA_THRESHOLDS view. You can remove these threshold settings using the DBMS_SERVER_ALERT.SET_THRESHOLD API.</p> <p>See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the DBMS_SERVER_ALERT.SET_THRESHOLD API.</p> |

## 7.57 DBA\_TRANSFORMATIONS

DBA\_TRANSFORMATIONS displays information about all transformations in the database. These transformations can be specified with Advanced Queuing operations such as enqueue,

dequeue, and subscribe to automatically integrate transformations in AQ messaging. Its columns are the same as those in `ALL_TRANSFORMATIONS`.

**See Also:**

`"ALL_TRANSFORMATIONS"`

## 7.58 DBA\_TRIGGER\_COLS

`DBA_TRIGGER_COLS` describes the use of columns in all triggers in the database. Its columns are the same as those in `ALL_TRIGGER_COLS`.

**See Also:**

`"ALL_TRIGGER_COLS"`

## 7.59 DBA\_TRIGGER\_ORDERING

`DBA_TRIGGER_ORDERING` describes all triggers in the database that have `FOLLOWS` or `PRECEDES` ordering. Its columns are the same as those in `ALL_TRIGGER_ORDERING`.

**See Also:**

`"ALL_TRIGGER_ORDERING"`

## 7.60 DBA\_TRIGGERS

`DBA_TRIGGERS` describes all triggers in the database. Its columns are the same as those in `ALL_TRIGGERS`.

**See Also:**

`"ALL_TRIGGERS"`

## 7.61 DBA\_TRIGGERS\_AE

DBA\_TRIGGERS\_AE describes all triggers (across all editions) in the database. Its columns are the same as those in ALL\_TRIGGERS\_AE.

**See Also:**

"ALL\_TRIGGERS\_AE"

## 7.62 DBA\_TS\_QUOTAS

DBA\_TS\_QUOTAS describes tablespace quotas for all users.

### Related View

USER\_TS\_QUOTAS describes tablespace quotas for the current user. This view does not display the USERNAME column.

| Column          | Datatype       | NULL     | Description                                      |
|-----------------|----------------|----------|--------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30)  | NOT NULL | Tablespace name                                  |
| USERNAME        | VARCHAR2 (128) | NOT NULL | User with resource rights on the tablespace      |
| BYTES           | NUMBER         |          | Number of bytes charged to the user              |
| MAX_BYTES       | NUMBER         |          | User's quota in bytes, or -1 if no limit         |
| BLOCKS          | NUMBER         |          | Number of Oracle blocks charged to the user      |
| MAX_BLOCKS      | NUMBER         |          | User's quota in Oracle blocks, or -1 if no limit |
| DROPPED         | VARCHAR2 (3)   |          | Whether the tablespace has been dropped          |

**See Also:**

"USER\_TS\_QUOTAS"

## 7.63 DBA\_TSDP\_IMPORT\_ERRORS

DBA\_TSDP\_IMPORT\_ERRORS shows information about the errors encountered during import of the Transparent Sensitive Data Protection discovery result.

This error information corresponds to the last import of the discovery result done using the DBMS\_TSDP\_MANAGE.IMPORT\_DISCOVERY\_RESULT API.

| Column      | Datatype       | NULL     | Description                                 |
|-------------|----------------|----------|---------------------------------------------|
| ERROR_CODE  | NUMBER         | NOT NULL | The ORA error code of the error encountered |
| SCHEMA_NAME | VARCHAR2 (128) |          | The schema corresponding to the error       |
| TABLE_NAME  | VARCHAR2 (128) |          | The table corresponding to the error        |

| Column         | Datatype       | NULL | Description                                   |
|----------------|----------------|------|-----------------------------------------------|
| COLUMN_NAME    | VARCHAR2 (128) |      | The column corresponding to the error         |
| SENSITIVE_TYPE | VARCHAR2 (128) |      | The sensitive type corresponding to the error |

 **See Also:**

- *Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT` procedure

## 7.64 DBA\_TSDP\_POLICY\_CONDITION

`DBA_TSDP_POLICY_CONDITION` describes the Transparent Sensitive Data Protection policy and condition mapping. It also lists the property-value pairs for the condition.

| Column      | Datatype       | NULL     | Description                                                                                                                                                          |
|-------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME | VARCHAR2 (128) |          | The name of the Transparent Sensitive Data Protection policy                                                                                                         |
| SUB_POLICY  | NUMBER         | NOT NULL | The sub policy of the Transparent Sensitive Data Protection policy                                                                                                   |
| PROPERTY    | VARCHAR2 (11)  |          | The condition property. Possible values: <ul style="list-style-type: none"> <li>• DATATYPE</li> <li>• LENGTH</li> <li>• SCHEMA_NAME</li> <li>• TABLE_NAME</li> </ul> |
| VALUE       | VARCHAR2 (128) |          | The value of the condition property                                                                                                                                  |

 **See Also:**

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.65 DBA\_TSDP\_POLICY\_FEATURE

`DBA_TSDP_POLICY_FEATURE` shows the Transparent Sensitive Data Protection policy security feature mapping for all the TSDP policies in the database.

At this time, only Oracle Data Redaction is supported.

| Column      | Datatype       | NULL | Description                                                  |
|-------------|----------------|------|--------------------------------------------------------------|
| POLICY_NAME | VARCHAR2 (128) |      | The name of the Transparent Sensitive Data Protection policy |

| Column           | Datatype      | NULL | Description                                                                                           |
|------------------|---------------|------|-------------------------------------------------------------------------------------------------------|
| SECURITY_FEATURE | VARCHAR2 (12) |      | The Oracle security feature with which the Transparent Sensitive Data Protection policy is associated |

**See Also:**

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.66 DBA\_TSDP\_POLICY\_PARAMETER

DBA\_TSDP\_POLICY\_PARAMETER shows the parameter-value pairs for the condition of the Transparent Sensitive Data Protection policy.

| Column         | Datatype        | NULL     | Description                                                                                                                                                                                                                  |
|----------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POLICY_NAME    | VARCHAR2 (128)  |          | The name of the Transparent Sensitive Data Protection policy                                                                                                                                                                 |
| SUB_POLICY     | NUMBER          | NOT NULL | The sub policy of the Transparent Sensitive Data Protection policy                                                                                                                                                           |
| PARAMETER      | VARCHAR2 (128)  |          | The parameter for the Transparent Sensitive Data Protection sub policy                                                                                                                                                       |
| VALUE          | VARCHAR2 (4000) |          | The value of the parameter                                                                                                                                                                                                   |
| DEFAULT_OPTION | VARCHAR2 (5)    |          | Indicates whether this is the default option for the policy: <ul style="list-style-type: none"> <li>TRUE: This is the default option for the policy</li> <li>FALSE: This is not the default option for the policy</li> </ul> |

**See Also:**

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.67 DBA\_TSDP\_POLICY\_PROTECTION

DBA\_TSDP\_POLICY\_PROTECTION shows the list of columns that have been protected through Transparent Sensitive Data Protection.

| Column      | Datatype       | NULL     | Description                                                           |
|-------------|----------------|----------|-----------------------------------------------------------------------|
| SCHEMA_NAME | VARCHAR2 (128) | NOT NULL | The schema containing the sensitive data                              |
| TABLE_NAME  | VARCHAR2 (128) | NOT NULL | The table containing the sensitive column                             |
| COLUMN_NAME | VARCHAR2 (128) | NOT NULL | The name of the sensitive column                                      |
| TSDP_POLICY | VARCHAR2 (128) |          | The TSDP policy name based on which the column protection was enabled |

| Column                  | Datatype       | NULL     | Description                                                                                                  |
|-------------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------|
| SECURITY_FEATURE        | VARCHAR2 (12)  |          | The security feature enabled on the sensitive column                                                         |
| SECURITY_FEATURE_POLICY | VARCHAR2 (128) | NOT NULL | Name of the underlying Oracle security feature policy                                                        |
| SUBPOLICY#              | NUMBER         | NOT NULL | The subpolicy of the Transparent Sensitive Data Protection policy based on which protection has been enabled |

**See Also:**

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.68 DBA\_TSDP\_POLICY\_TYPE

DBA\_TSDP\_POLICY\_TYPE shows the Transparent Sensitive Data Protection policy to sensitive column type mapping.

| Column         | Datatype       | NULL | Description                                           |
|----------------|----------------|------|-------------------------------------------------------|
| POLICY_NAME    | VARCHAR2 (128) |      | The Transparent Sensitive Data Protection policy name |
| SENSITIVE_TYPE | VARCHAR2 (128) |      | The sensitive column type name                        |

**See Also:**

*Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection

## 7.69 DBA\_TSM\_DESTINATION

DBA\_TSM\_DESTINATION lists transparent session migration (TSM) destination session statistics.

| Column                      | Datatype                     | NULL | Description                                |
|-----------------------------|------------------------------|------|--------------------------------------------|
| SOURCE_DATABASE_NAME        | VARCHAR2 (4000)              |      | Database name of source session            |
| DESTINATION_DATABASE_NAME   | VARCHAR2 (4000)              |      | Database name of destination session       |
| DESTINATION_INSTANCE_NAME   | VARCHAR2 (4000)              |      | Instance name of destination session       |
| DESTINATION_INSTANCE_ID     | VARCHAR2 (4000)              |      | Instance ID of destination session         |
| DESTINATION_INST_START_TIME | TIMESTAMP (6) WITH TIME ZONE |      | Instance start time of destination session |
| SEQUENCE#                   | NUMBER                       |      | Migration sequence number                  |
| DESTINATION_SID             | NUMBER                       |      | Session ID of destination session          |

| Column                  | Datatype                    | NULL     | Description                                     |
|-------------------------|-----------------------------|----------|-------------------------------------------------|
| DESTINATION_SERIAL#     | NUMBER                      |          | Session serial number of destination session    |
| DESTINATION_START_TIME  | TIMESTAMP(6) WITH TIME ZONE |          | Start time for migration on destination session |
| DESTINATION_END_TIME    | TIMESTAMP(6) WITH TIME ZONE |          | End time for migration on destination session   |
| DESTINATION_USER_NAME   | VARCHAR2(128)               | NOT NULL | User associated with the destination session    |
| DESTINATION_SCHEMA_NAME | VARCHAR2(128)               | NOT NULL | Schema associated with the destination session  |
| DESTINATION_STATE       | VARCHAR2(24)                |          | Migration state of destination session          |

## 7.70 DBA\_TSM\_SOURCE

DBA\_TSM\_SOURCE lists transparent session migration (TSM) source session statistics.

| Column                     | Datatype                    | NULL     | Description                                          |
|----------------------------|-----------------------------|----------|------------------------------------------------------|
| SOURCE_DATABASE_NAME       | VARCHAR2(4000)              |          | Database name of source session                      |
| SOURCE_INSTANCE_NAME       | VARCHAR2(4000)              |          | Instance name of source session                      |
| SOURCE_INSTANCE_ID         | VARCHAR2(4000)              |          | Instance ID of source session                        |
| SOURCE_INSTANCE_START_TIME | TIMESTAMP(6) WITH TIME ZONE |          | Instance start time of source session                |
| SEQUENCE#                  | NUMBER                      |          | Migration sequence number                            |
| SOURCE_SID                 | NUMBER                      |          | Session ID of source session                         |
| SOURCE_SERIAL#             | NUMBER                      |          | Source serial number of source session               |
| SOURCE_STATE               | VARCHAR2(24)                |          | Migration state of source session                    |
| CONNECT_STRING             | VARCHAR2(4000)              |          | Connect string specified for migration               |
| SOURCE_START_TIME          | TIMESTAMP(6) WITH TIME ZONE |          | Start time for migration on source session           |
| COST                       | NUMBER                      |          | Estimate of migration cost                           |
| FAILURE_REASON             | VARCHAR2(34)                |          | Reason for migration failure, if any                 |
| SOURCE_END_TIME            | TIMESTAMP(6) WITH TIME ZONE |          | End time for migration on source session             |
| ROUNDTRIPS                 | NUMBER                      |          | Number of client/server round trips during migration |
| SOURCE_USER_NAME           | VARCHAR2(128)               | NOT NULL | User associated with the source session              |
| SOURCE_SCHEMA_NAME         | VARCHAR2(128)               | NOT NULL | Schema associated with the source session            |
| DESTINATION_DATABASE_NAME  | VARCHAR2(4000)              |          | Database name of the destination session             |

## 7.71 DBA\_TSTZ\_TAB\_COLS

DBA\_TSTZ\_TAB\_COLS displays information about the columns of all tables in the database, which have columns defined on **TIMESTAMP WITH TIME ZONE** data types or object types containing attributes of **TIMESTAMP WITH TIME ZONE** data types.

Its columns (except for **COLUMN\_NAME**, **NESTED**, **VIRTUAL\_COLUMN**, **SCALAR\_COLUMN**, and **UNUSED\_COLUMN**) are the same as those in **ALL\_TSTZ\_TAB\_COLS**.

**See Also:**

"ALL\_TSTZ\_TAB\_COLS"

## 7.72 DBA\_TSTZ\_TABLES

DBA\_TSTZ\_TABLES displays information about all tables in the database, which have columns defined on `TIMESTAMP WITH TIME ZONE` data types or object types containing attributes of `TIMESTAMP WITH TIME ZONE` data types.

Its columns are the same as those in ALL\_TSTZ\_TABLES.

**See Also:**

"ALL\_TSTZ\_TABLES"

## 7.73 DBA\_TUNE\_MVIEW

DBA\_TUNE\_MVIEW displays the result of executing the DBMS\_ADVISOR.TUNE\_MVIEW procedure.

**Related View**

USER\_TUNE\_MVIEW displays the result of executing the DBMS\_ADVISOR.TUNE\_MVIEW procedure. This view does not display the OWNER column.

| Column      | Datatype       | NULL     | Description                                                                                         |
|-------------|----------------|----------|-----------------------------------------------------------------------------------------------------|
| OWNER       | VARCHAR2 (128) |          | Owner of the task                                                                                   |
| TASK_NAME   | VARCHAR2 (128) |          | Name of the task                                                                                    |
| ACTION_ID   | NUMBER         | NOT NULL | Identifier of the action                                                                            |
| SCRIPT_TYPE | VARCHAR2 (14)  |          | Type of the script: <ul style="list-style-type: none"><li>• IMPLEMENTATION</li><li>• UNDO</li></ul> |
| STATEMENT   | CLOB           |          | Action statement                                                                                    |

**See Also:**

- "USER\_TUNE\_MVIEW"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS\_ADVISOR.TUNE\_MVIEW procedure

## 7.74 DBA\_TXEVENTQ\_MIGRATION\_STATUS

DBA\_TXEVENTQ\_MIGRATION\_STATUS provides information about all migrations from AQ classic queues to Transactional Event Queues (TxEventQs).

Its columns (except for SUFFIX) are the same as those in ALL\_TXEVENTQ\_MIGRATION\_STATUS.

| Column               | Datatype                        | NULL     | Description                                                                                                                 |
|----------------------|---------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------|
| SOURCE_SCHEMA_NAME   | VARCHAR2 (128)                  | NOT NULL | Source schema name                                                                                                          |
| SOURCE_QUEUE_NAME    | VARCHAR2 (128)                  | NOT NULL | Source AQ classic queue name                                                                                                |
| SOURCE_QUEUE_TABLE   | VARCHAR2 (128)                  |          | Source AQ classic queue table name                                                                                          |
| TARGET_SCHEMA_NAME   | VARCHAR2 (128)                  | NOT NULL | Target schema name                                                                                                          |
| TARGET_QUEUE_NAME    | VARCHAR2 (128)                  | NOT NULL | Target TxEventQ name                                                                                                        |
| EVENT_STATUS         | NUMBER                          |          | Migration event status                                                                                                      |
| EVENT                | VARCHAR2 (128)                  |          | Migration event                                                                                                             |
| EVENT_TIMESTAMP      | TIMESTAMP (6)<br>WITH TIME ZONE |          | Date and time at which the migration event occurred                                                                         |
| EVENT_ERROR_COMMENTS | VARCHAR2 (1024)                 |          | Migration event error comments, if any                                                                                      |
| SUFFIX               | VARCHAR2 (2)                    |          | Temporary TxEventQ name suffix, if any<br>This suffix is supplied by the user to avoid name conflicts during the migration. |

### Note:

This view is available starting with Oracle Database 23ai.

### See Also:

"ALL\_TXEVENTQ\_MIGRATION\_STATUS"

## 7.75 DBA\_TYPE\_ATTRS

DBA\_TYPE\_ATTRS describes the attributes of all object types in the database. Its columns (except for CHAR\_USED) are the same as those in ALL\_TYPE\_ATTRS.

### See Also:

"ALL\_TYPE\_ATTRS"

## 7.76 DBA\_TYPE\_METHODS

DBA\_TYPE\_METHODS describes the methods of all object types in the database. Its columns are the same as those in ALL\_TYPE\_METHODS.

**See Also:**

["ALL\\_TYPE\\_METHODS"](#)

## 7.77 DBA\_TYPE\_VERSIONS

DBA\_TYPE\_VERSIONS describes the versions of all object types in the database. Its columns are the same as those in ALL\_TYPE\_VERSIONS.

**See Also:**

["ALL\\_TYPE\\_VERSIONS"](#)

## 7.78 DBA\_TYPES

DBA\_TYPES describes all object types in the database. Its columns are the same as those in ALL\_TYPES.

**See Also:**

["ALL\\_TYPES"](#)

## 7.79 DBA\_UMF\_LINK

DBA\_UMF\_LINK displays information about the registered database links in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered database links in the topology if you are querying on a target node.

| Column        | Datatype       | NULL     | Description                        |
|---------------|----------------|----------|------------------------------------|
| TOPOLOGY_NAME | VARCHAR2 (128) | NOT NULL | Topology name for the link         |
| FROM_NODE_ID  | NUMBER         | NOT NULL | Node ID of the local node          |
| TO_NODE_ID    | NUMBER         | NOT NULL | Node ID of the remote node         |
| LINK_NAME     | VARCHAR2 (128) | NOT NULL | Fully qualified database link name |

**See Also:**

*Oracle Database Performance Tuning Guide* for information about configuring the Remote Management Framework (RMF) architecture

## 7.80 DBA\_UMF\_REGISTRATION

DBA\_UMF\_REGISTRATION displays information about the registered nodes in the Remote Management Framework (RMF).

This view returns no rows if you are querying on an RMF source node. It returns all the registered nodes in the topology if you are querying on a target node.

| Column              | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                          |
|---------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOPOLOGY_NAME       | VARCHAR2 (128) | NOT NULL | Topology name for the node                                                                                                                                                                                                                                                           |
| NODE_NAME           | VARCHAR2 (128) | NOT NULL | Unique node name in the topology                                                                                                                                                                                                                                                     |
| NODE_ID             | NUMBER         | NOT NULL | Unique node ID in the topology                                                                                                                                                                                                                                                       |
| NODE_TYPE           | NUMBER         | NOT NULL | Node type. Possible value: <ul style="list-style-type: none"> <li>0: RDBMS node</li> </ul>                                                                                                                                                                                           |
| AS_SOURCE           | VARCHAR2 (5)   |          | Indicates whether the node is a source node. Possible values: <ul style="list-style-type: none"> <li>TRUE: The node is a source node, and it can provide remote services</li> <li>FALSE: The node is not a source node, and it cannot provide remote services</li> </ul>             |
| AS_CANDIDATE_TARGET | VARCHAR2 (5)   |          | Node is a candidate target. Possible values: <ul style="list-style-type: none"> <li>TRUE: Node can be promoted to target role</li> <li>FALSE: Node cannot be promoted to target role</li> </ul>                                                                                      |
| STATE               | VARCHAR2 (20)  |          | Current state of the node. Possible values: <ul style="list-style-type: none"> <li>OK: Node is registered</li> <li>REGISTRATION_PENDING: Node registration has started, but has not been completed</li> <li>SYNC_FAILED: Unable to synchronize the topology with the node</li> </ul> |
